'But you will never be frightened any more,' said Lady Markham, drawing the girl's arm through her own, leading her away. Frances was giddy still, and stumbled as she went, though she had pledged herself never to be frightened again. She went in a dream up the softly carpeted stairs. She knew what handsome rooms were, the lofty bare grandeur of an Italian palazzo; but all this carpeting and cushioning, the softness, the warmth, the clothed and comfortable look, bewildered her. She could scarcely find her way through the drawing-room crowded with costly furniture, to the library by the side of which stood the tea-table, like, and yet how unlike that anxious copy of English ways which Frances had set up in the loggia. She was conscious, with a momentary gleam of complacency, that her cups and saucers were better, though not belonging to an ordinary modern set, like these; but, alas, in everything else how far short! Then she was taken up-stairs, through—a she thought—the sumptuous arrangements of her mother's room, to another smaller, which opened from it, and in which there was the same wealth of carpets, curtains, easy-chairs, and writing-tables, in addition to the necessary details of a sleeping-room. Frances looked round it admiringly. She knew nothing about the modern-taste, though something, a very little, about old art. The painted ceilings and old gilding of the Palazzo— which she began secretly and obstinately to call *home* from this moment forth—were intelligible to her; but she was quite unacquainted with Mr Morris's papers and the art fabrics at Liberty's. She looked at them with admiration, but doubt. She thought the walls 'killed' the pictures that were hung round, which were not like her own little gallery at home, which she had left with a little pang to her sister. 'Is this Constance's room?' she asked timidly, called back to a recollection of Constance, and wondering whether the transfer was to be complete.

'No, my love; it is Frances's room,' said Lady Markham. 'It has always been ready for you. I expected you to come some time. I have always hoped that; but I never thought that you would desert me.' Her voice faltered a little, which instantly touched Frances' heart.

'I asked,' she said, 'not just out of curiosity,

but because, when she came to us, I gave her my room. Our rooms are not like these; they have very few things in them. There are no carpets; it is warmer there, you know; but I thought she would find the blue room so bare, I gave her mine.

Lady Markham smiled upon her, and said, but with a taint, the very faintest indication of being less interested than Frances was. 'You have not many visitors, I suppose?'

'Oh, none!' cried Frances. 'I suppose we are—rather poor. We are not—like this—'

'My darling! you don't know how to speak to me, your own mother! What do you mean, dear, by *we*? You must learn to mean something else by *we*. Your father, if he had chosen, might have had—all that you see, and more. And Constance— But we will say nothing more to-night on that subject—This is Con's room, see, on the other side of mine. It was always my fancy, my hope, some time to have my two girls, one on each side.'

Frances followed her mother to the room on the other side with great interest. It was still more luxurious than the one appropriated to herself—more comfortable, as a room which has been occupied, which shows traces of its tenant's tastes and likings, must naturally be; and it was brighter, occupying the front of the house, while that of Frances looked to the side. She glanced round at all the fittings and decorations, which, to her unaccustomed eyes, were so splendid. 'Poor Constance!' she said under her breath.

'Why do you say poor Constance?' said Lady Markham, with something sharp and sudden in her tone. And then she, too, said regretfully. 'Poor Con! You think it will be disappointing to her, this other life which she has chosen. Was it—dear, for you, my poor child?'

Then there rose up in the tranquil mind of Frances a kind of tempest blast of opposition and resentment. 'It is the only life I know—it was—everything I liked best,' she cried. The first part of the sentence was very firmly, almost aggressively said. In the second, she wavered, hesitated, changed the tense—it *was*. She did not quite know herself what the change meant.

Lady Markham looked at her with a penetrating gaze. 'It was—everything you knew, my little Frances. I understand you, my dear. You will not be disloyal to the past. But to Constance, who does not know it, who knows something else—' Poor Con! I understand. But she will have to pay for her experience, like all the rest.'

Frances had been profoundly agitated, but in the way of happiness. She did not feel happy now. She felt disposed to cry, not because of the relief of tears, but because she did not know how else to express the sense of contrariety, of disturbance that had got into her mind. Was it that already a wrong note had sounded between herself and this unknown mother, whom it had been a rapture to see and touch? Or was it only that she was tired? Lady Markham saw the condition into which her nerves and temper were strained. She took her back tenderly into her room. 'My dear,' she said, 'if you would rather not, don't change your dress. Do just as you please to-night. I would stay and help you, or I would send Josephine, my maid, to help

you; but I think you will prefer to be left alone and quiet.'

'O yes,' cried Frances with fervour; then she added hastily: 'If you do not think me disagreeable to say so.'

'I am not prepared to think anything in you disagreeable, my dear,' said her mother, kissing her—but with a sigh. This sigh Frances echoed in a burst of tears when the door closed and she found herself alone—alone, quite alone, more so than she had ever been in her life, she whispered to herself, in the shock of the unreasonable and altogether fantastic disappointment which had followed her ecstasy of pleasure. Most likely it meant nothing at all but the reaction from that too highly raised level of feeling.

'No; I am not disappointed,' Lady Markham was saying down-stairs. She was standing before the genial blaze of the fire, looking into it with her head bent and a serious expression on her face. 'Perhaps I was too much delighted for a moment; and she too, poor child, now that she has looked at me a second time, she is a little, just a little disappointed in me. That's rather hard for a mother, you know; or I suppose you don't know.'

'I never was a mother,' said Markham. 'I should think it's very natural. The little thing has been forming the most romantic ideas. If you had been an angel from heaven!—'

'Which I am not,' she said with a smile, still looking into the fire.

'Heaven be praised,' said Markham. 'In that case, you would not have suited me, which you do, mammy, you know, down to the ground.'

She gave a half-glance at him, a half-smile, but did not disturb the chain of her reflections. 'That's something, Markham,' she said.

'Yes; it's something. On my side, it is a great deal. Don't go too fast with little Fannie. She has a deal in her. Have a little patience, and let her settle down her own way.'

'I don't feel sure that she has not got her father's temper; I saw something like it in her eyes.'

'That is non-sense, begging your pardon. She has got nothing of her father in her eyes. Her eyes are like yours, and so is everything about her. My dear mother, Con's like Waring, if you like. This one is of our side of the house.'

'Do you really think so?' Lady Markham looked up now and laid her hand affectionately upon his shoulder, and laughed. 'But, my dear boy, you are as like the Markhams as you can look. On my side of the house, there is nobody at all, unless, as you say!—'

'Frances,' said the little man. 'I told you—the best of the lot. I took to her in a moment by that very token. Therefore, don't go too fast with her, mother. She has her own notions. She is as staunch as a little—Turk,' said Markham, using the first word that offered. When he met his mother's eye, he retired a little, with the air of a man who does not mean to be questioned; which naturally stimulated curiosity in her mind.

'How have you found out that she is staunch, Markham?'

'Oh, in half-a-dozen ways,' he answered carelessly. 'And she will stick to her father through thick and thin, so mind what you say.'

Then Lady Markham began to bemoan herself a little gently, before the fire, in the most luxurious of easy-chairs.

'Was ever woman in such a position,' she said, 'to be making acquaintance, for the first time, at eighteen, with my own daughter, and to have to pick my words and to be careful what I say?'

'Well, mammy,' said Markham, 'it might have been worse. Let us make the best of it. He has always kept his word, which is something, and has never annoyed you. And it is quite a nice thing for Con to have him to go to, to find out how dull it is, and know her own mind. And now we've got the other one too.'

Lady Markham still rocked herself a little in her chair, and put her handkerchief to her eyes. 'For all that, it is very hard, both on her and me,' she said.

THE FISHERIES OF ICELAND.

ICELAND, though not, as the name would imply, and as many people suppose, a land covered with ice, a huge mass of glaciers, only diversified by the appearance here and there of a few burning mountains and boiling springs, is by no means a fruitful country. Large tracts of the interior are really barren, being covered either by snow-clad mountains or by lava wastes and plains of volcanic sand and ashes. The fertile parts of the country—though they yield rich pastures, and support large flocks of sheep and herds of ponies, besides considerable numbers of cattle, the rearing of which gives occupation and sustenance to nearly one-half of the population, and though by more energetic and economical cultivation their value might be doubled or trebled—do not and never will play such an important part in the existence and prosperity of the Icelanders as does the sea which washes their shores. It is in the sea, with its boundless and inexhaustible stores of life, that the real wealth of Iceland lies; and through the land products have been, and always will be, a considerable factor in the prosperity of the Icelanders, the chief source of their future progress must be the development of the fisheries. The principal of these is at present the cod-fishery. Immense numbers of cod and haddock are caught every year round the coasts of Iceland. The greater part is salted and exported, chiefly to Spain; a smaller portion is air-dried, and in this condition it forms a staple article of food in the country, the inland inhabitants travelling every summer long distances to the coast to secure their supplies of dried fish. Comparatively little cod is dried, as it brings a better price when salted; but haddock, halibut, skate, limpsuckers, and cod-heads form the bulk of the dried product. Enormous numbers of cod-heads are dried. In this condition they form a highly valued and much-sought-after article of food, though the economy of their use may be doubted, especially when the consumer has to fetch them from a long distance with considerable expenditure of time and labour. The fishing population live for the most part on fish, fresh and dried—the salted product being almost entirely reserved for export—so that about one-half of the total catch of fish is consumed in the country.

Fishing is carried on more or less all the year; but the *vertid* (pronounced *vertil*)—the fishing season proper—commences about the beginning of February. Then, in addition to the regular fishermen, great numbers of landsmen come from all parts of the country to pursue that industry. In many low-lying districts, almost all the able-bodied men go on foot to the coast, leaving the care of the farms and animals to the women, boys, and old men. They often travel long distances, and their journeys are at that inclement season attended with not a little difficulty and danger. Arrived at the coast, they join with the regular fishermen in forming boats' crews, varying in number from six to twelve or fifteen men, each boat being under the command of an experienced hand, the *for-maður* (pronounced *for-mathur*) or foreman. Besides these large boats, smaller craft, manned by two or four men, are used; but these, as a rule, fish near the land.

The spring fishing is carried on chiefly by means of hand lines; long lines are used at other times of the year; but the use of them during the *vertid* is considered inadvisable; and in the Faxa Flóa—the great bay on the south-west of Iceland, which is the chief seat of the cod-fishing—nets are also employed; their use, however, is not permitted before the 15th of March, as it is believed that laying nets earlier may hinder the fish from entering the bays and harbours, and possibly drive them away altogether. The owner of the boat provides the lines and hooks, and generally the nets also, when these are used, in which case he gets half the entire catch, the other half being divided equally among the crew; otherwise, the catch is divided into equal shares, one to each man, and one, or two, to the boat, according to its size. This division takes place at once on landing, and the fish are forthwith gutted and laid in salt. The heads and sounds (swimming-bladders) are cleaned and dried, and the livers and roes collected in barrels. After the fish have lain in salt for a period varying according to the nature of the weather and the convenience of the fishermen, they are washed in sea-water, to remove the excess of salt, piled in heaps to drain, and then alternately spread in the sun to dry, and pressed in heaps, covered by boards weighted with heavy stones, until the curing is complete. This process requires considerable time and great care in all its details. Much skill and experience are required to turn out good salt fish.

When cured, the fish, if not immediately exported, must be carefully stored in wind and weather tight houses, as damp and draughts exercise a deteriorating effect upon them. There are no professional curers; the curing is almost entirely done at home, each fisherman, with the assistance of his family, curing his own share, and selling it to the merchants. By so doing, the fishers provide occupation for their women and children, and get a better price than they would if they sold the fish fresh. But it is certain that if the fish were cured on a large scale by professional curers, a better article would be produced. Fish intended for export to Spain must be of a certain size and quality, and are examined before shipment by skilled men appointed for the purpose by the authorities, who reject all that do not come up to the

standard. The rejected fish, along with small cod and haddocks, which are less valued than large cod, go for the most part to England, Denmark, and Germany. Of the other parts of the fish above mentioned, the heads and the sounds are carefully dried, the former being, as before stated, used for food in the country; while the latter are exported and made into gelatine and isinglass. The roes are salted, and exported to France and the Mediterranean, where they are used as bait in the sardine-fishery. The livers are collected and the oil extracted, first in the cold, and then by the aid of heat; the oil obtained by the latter process being coarser and of less value. As the livers are generally kept till more or less putrid before extraction, and as the whole process is extremely rough, the oil obtained is of inferior quality; hence little or no pure cod-liver oil is prepared in Iceland. The bones and offal of the fish, instead of being collected and made into fish-guano, as in Norway, are allowed to lie and rot on the beach, though a few of the more thrifty fishermen collect them to manure their fields and vegetable gardens.

The life the men lead during the fishing season is hard and toilsome in the extreme. Owing to the large numbers who come from the country, there is a very dense population on the coast during the fishing-time. The writer knows of an isolated fishing-station which affords a permanent home for some twenty-four souls, but during the fishing season has to accommodate over three hundred. The men sleep in rude huts or booths of stone and turf, seldom weather-tight, live on the coarsest fare, and are often insufficiently clad for the rigorous weather they have to encounter, though, when at sea, they usually wear a complete wind and water tight suit of untanned sheepskin. When the fishing is good, they are scarcely ever on the sea, only allowing themselves a very little possible time for sleep and food on shore. Frequently they are surprised by sudden storms; and though their seamanship is excellent, and their boats, considering their small size and fragility, are wonderfully seaworthy, every year adds to the list of losses by drowning. They work, as a rule, extremely hard during the season, and with reason, for a good fisher may make as much in a good season as will keep him during the rest of the year.

In the middle of May, the boat-fishing closes, at least as far as the landmen are concerned, and they return to their farms. The fishermen proper, however, continue their pursuit; and now the smack-fishing begins. Smacks can of course fish with advantage during the whole boat-fishing season; but it is impossible to obtain crews sooner, as the men prefer the ordinary boats during the former period. The vessels vary in size from twenty to fifty tons, and are generally sloops or schooners. They are mostly old vessels bought cheap; English pleasure-yachts, Grumby smacks, and French luggers, are not uncommon. They carry twelve to twenty men, including the captain, mate, and cook, all of whom take a hand at the lines. They fish entirely by hand-line, and each man marks every fish he draws, so that at the end of the fishing each man's catch can be recognised and separated. The vessels go out with salt for a full catch and

three or four weeks' provisions; and return when full, or sooner, if necessitated by weather or want of food or salt. They gut and salt the fish as caught, preserving the livers, sounds, and roes, and the heads also, when practicable. On returning from each trip, the fish are landed, washed, and cured as above described, by the owner of the vessel or the merchant with whom he deals. It is probably owing to the fish being thus cured on a large scale and by experienced hands, that the smack salt fish are generally esteemed a better quality than the product of the boat-fishing.

At the close of the fishing, each man's catch is weighed separately, and along with the proportionate quantity of livers, sounds, and roes, is divided into two equal parts, the fisher getting one, and the owner of the ship the other. The fisher receives from the owner, merchant, or curer the market value of his share, after deduction of curing expenses. The owner supplies the lines and hooks, and provides the men with one warm meal daily, and coffee thrice a day; for the rest, they feed themselves. The captain, mate, and cook get their rations free; the two former have in addition various perquisites, the captain generally getting a premium of two kroner (two shillings and three pence) per hundred fish.

The advantages of smack-fishing over boat-fishing are universally admitted, and only the want of the necessary capital prevents the Icelanders from increasing their fleet of fishing-vessels. They pay, as a rule, extremely well. As an instance, one small vessel, costing about two hundred pounds, and hired for the first season she was used, though it was only an average season. The smacks can follow the fish from place to place, while the range of the small open boats is necessarily very limited. The former can lie on the fishing-ground and even fish in stormy weather, when the boats are unable to put to sea for days and weeks at a time; they also avoid the waste of time and labour involved in rowing to and from the fishing-ground every day. Their crews are less exposed to the weather and to the perils of the deep; and their fish are subjected to more careful treatment than those caught by the small boats. The French carry on a very large fishery from smacks round the coast of Iceland, their average catch being considerably more than the total fishing of the Icelanders; and English, Faroese, and Norwegian smacks also take a large share of the Iceland fishing. It is computed that if the Icelanders used smacks instead of small boats, employing the same number of men as at present, their annual catch would be increased fivefold. Hand-lines alone are used on Icelandic smacks; but if they carried two or three small boats, long lines—to which hundreds of baited hooks are attached—and nets could be used with equal facility when advisable. One advantage which the open boats possess, independently of the small amount of capital sunk in them, is that they can be landed and drawn up on the beach when not in use; while smacks can only be secured in a harbour. But there are a sufficient number of excellent natural harbours round the coasts of Iceland to provide both means of refuge in stormy weather and ports in which to lay up the smacks when not in use.

Altogether, it is evident that by the employment

of small vessels instead of open boats the cod-fishery of Iceland may be enormously and profitably increased and developed. But besides this, there are many other matters connected with the fishery which are capable of vast improvement. Although salt fish will doubtless always remain the chief and most suitable form for export, there seems to be no reason why some of the fish should not be sent fresh to the English markets, either alive in walled vessels, or, what is evidently more practicable, frozen, packed in ice, or in refrigerators. The export of fresh cod and halibut in ice from the Faroes to England has already been commenced; and a similar experiment is likely soon to be tried in Iceland. The latter country has the advantage that there the necessary ice can be obtained on the spot at little cost, while it must be imported to the Faroes at considerable expense; and as Iceland is only three and a half days' direct steaming from the United Kingdom, the distance offers no great obstacle. Something might also be done in the way of smoking and kippers the fish. It is the more desirable that a new market for Iceland fish should be opened up, as the increasing importation of salt cod from France to Spain is somewhat affecting the export from Iceland to the Spanish market.

Besides the fish themselves, the other products of the fishery could be worked up to much greater advantage than is done at present. By more skilful treatment and the use of better apparatus, a purer and more valuable quality of oil, as well as a larger quantity, could be obtained from the livers; while the bones and other refuse might be made into a valuable manure, as they are in Norway, Newfoundland, Shetland, and elsewhere.

Altogether, the Iceland cod-fishery presents a fine opening for foreign enterprise and capital. The natives have neither the means nor the energy necessary for its proper development. As an example of their backwardness in this respect, it may be mentioned that Iceland was practically unrepresented at the Fisheries Exhibition in London. It is from abroad, and preferably from England, that the impulse and the means must come; and if properly applied, they will not fail to yield a rich return to the investors, and at the same time confer a great and lasting benefit on the country.

The herring-fishery on the coasts of Iceland may be said as yet to be only in its infancy; but we do not enter upon the subject here, as we have already had an article dealing with it (Nov. 4, 1882).

Shark-fishing is carried on to a considerable extent, especially on the north and west coasts of Iceland, both docked vessels and open boats being used in this fishery. The species of shark caught is the *Squalus garcharias*, and it is pursued solely for the sake of the oil yielded by the liver, the rest of the carcase being usually thrown away, though sometimes the flesh is preserved for food. The sharks vary much in size, running up to eighteen or twenty feet in length, and four to five feet in diameter through the thickest part of the body, the yield of oil from each liver varying from four or five up to fifty gallons. Rich livers yield two-thirds of their bulk of oil, poor ones only about one-half. The vessels used in shark-fishing are for the most part small schooners of thirty to fifty tons burden, manned by eight or

ten men. The usual fishing season is from January or February till August. During the winter months, the sharks frequent shallower waters, and are found about twenty miles from land, in fifty fathoms of water or thereabouts; in summer, they seek deeper waters, and are caught one hundred miles or so off the coast in a depth of two hundred fathoms. It having been ascertained by sounding that the ship lies in water of a suitable depth, preferably with a sloping soft mud bottom, the vessel is anchored, and fishing commences. The hook used is twelve or eighteen inches long, baited with seal-blubber and horse-flesh, weighted with an eight-pound sinker, and attached by a couple of yards of strong chain to an inch and a half line. The hook is allowed to hang motionless about a couple of fathoms from the bottom. As a rule, the sharks are shy of taking the bait at first, and the fishers may wait long for their first bite; but once the sharks commence to 'take,' they crowd to the spot, and may be hooked in quick succession; they then take the bait greedily and with little caution.

It often happens that a shark which has slipped off the hook after being drawn up to the ship's side and harpooned, takes the bait again after a short interval, and is drawn up with the harpoons sticking in its body. As soon as the shark reaches the surface, harpoons and lances are struck into it and the spinal column cut. Large hooks are fixed into the body, and chains passed round it; and thus secured, it is cut open and the liver removed. Formerly, it was customary, after taking the livers, to fasten the bodies astern of the vessel, thus attracting other sharks to the surface, which were harpooned as they rose to feed on their dead comrades. Now, the bodies are generally cast loose after the liver has been removed; and sinking to the bottom, they attract other sharks to the spot, thus enabling the vessel to lie and fish for a longer time without changing its position. Some fishers, however, say that if the bodies are allowed to sink, the sharks which flock to the spot gorge themselves to such an extent on the carcases that they lie dormant and decline the bait for weeks afterwards. Whether this view be correct or not, it at least commands so much credence, that it has been proposed to forbid by law the slipping of dead sharks at sea, on the ground that doing so tends to spoil the fishing. This enactment, however, has not as yet passed into law, and it would prove very difficult to enforce it.

Though the bodies of sharks caught by the decked vessels are usually thrown away, as it would be impossible to preserve them for the long period during which the ships are at sea, those caught by open boats, which, as a rule, only lie a few hours at sea, are frequently brought on shore and used for food, after being subjected to the following treatment: the entrails and cartilages are removed, the bodies buried in the earth or sand, and carefully covered over, to exclude the air. In this state they lie for a period of not less than twelve months, often considerably more, during which time a partial decomposition takes place, resulting in the dissipation of deleterious matters which render the fresh shark unwholesome, if not poisonous. When this change is

complete, the shark is dug up, sometimes slightly pressed, to get rid of part of the juices, and then cut into long strips, which are hung up in the air, and sheltered from rain, until thoroughly wind-dried. The shark is then fit for use, and is esteemed a great delicacy by connoisseurs. It is not unpalatable, though somewhat highly flavoured; but generally its powerful odour deters the uninitiated from tasting it.

The livers are brought ashore and stored in vats till the solid matters have settled to the bottom; after which the more fluid portion is melted in iron pots over an open fire. The oil thus obtained is more or less dark-coloured, according to the degree of decomposition which the liver has suffered before melting, and the temperature to which it has been subjected. By this process the liver yields about two-thirds its bulk of a coarse and not very savoury oil. A shark-oil refinery can generally be detected by its odour at a considerable distance off. Of late years, refining by steam has come considerably into use, and the liver is taken as fresh as possible. By this means a finer, lighter-coloured, and less odorous oil is obtained, though the yield is less. The bodies, too, always contain a considerable quantity of oil, which could probably be extracted by pressure or other means, and the residual mass made into manure.

The crews of vessels engaged in shark-fishing are paid about fifty-five shillings a month, with a premium of sixpence per barrel of liver. The captain gets two shillings and threepence per barrel on the first hundred barrels of the season's catch, and three shillings and fourpence per barrel on the remainder.

Shark-fishing in the winter months is a somewhat dangerous pursuit, owing to the frequency of storms and the brief daylight. The decked vessels often encounter very rough weather, and have sometimes been lost, while open boats are naturally subjected to much greater risks. Of this we had not long ago a melancholy instance, when three boats engaged in shark-fishing in the Færa Fiord were lost in one day, their crews, amounting in all to thirty men, perishing. The use of open boats is consequently diminishing, and the number of decked vessels increasing as rapidly as the limited means of the Icelanders will permit. Shark-fishing is a decidedly remunerative industry, and may be made still more profitable by the use of better craft and appliances, and by improvements in the method of extraction, and consequently in the quality of the oil.

A TRADITION OF COTTLEY HALL.

CHAPTER I.—COTTLEY HALL AND ITS MASTER.

THE wind is high to-night. An enthusiast in spiritualistic fancies, or a dreamer of dreams, needs but to seat himself by the great fireplace of Cottley Hall and listen to the rumbling noise which resounds in that capacious chimney, and he would forthwith be supplied with food for mental imagination to his heart's content. Into Cottley Hall—where everything is either too small or too large, and inconvenient to the utmost extent which human ingenuity could possibly make it—it would be hard for

the most commonplace individual to enter without experiencing a spice of uncanny romance. If odd corners, twisting stairs, and a wealth of carved panelling could render it a thing of beauty in the eyes of the artist and the romancer, Cottley Hall was a gem of its class, of the first water. A noticeable fact about the large draughty rooms was that the favoured mortals who cowered round the great wood-fires which blazed thereat at winter-time experienced agreeable sensations of extreme chilliness on one side and overpowering heat on the other. All the bedsteads were of a large old-fashioned type, though these gigantic four-posters looked but strange atoms compared with the enormous rooms in which they were located, the approach to them being mostly across a long uneven floor, upon which bygone-shaped articles of furniture appeared few and far between. Across the doors of these apartments were drawn pieces of antiquated tapestry, worked with divers representations of Solomon and the Children of Israel, all habited in a sort of semi-Roman attire. The window-casements were uniformly filled with glass of a ghastly green colour, which when penetrated by the sun's rays, imparted an unwholesome and milkyway character to the countenances of the Wise King and his contemporaries.

The unwary stranger who ventured into the upper regions of Cottley Hall without a guide speedily found himself involved in a labyrinth of passages and turnings which seldom failed to reduce him to great straits before being extricated therefrom. Between the roof and the third floor was a dreary wilderness of attics, seldom entered by the domestic element—not that they believed in the inevitable ghost supposed to haunt these regions, but because the numerous low intersecting beams rendered locomotion somewhat unsafe. In many places the walls were graced with ancient wooden-faced family portraits, which caused not a little discomfort to visitors who found themselves for the first time the object of their dull expressionless gaze.

The strange exaggerated figures of Solomon and the Israelites have caught but little sunshine lately, owing to a long spell of overcast sky, the few fitful rays that have lighted on Cottley Hall being insufficiently strong to penetrate its thick glazed windows. To-night, the tapestry flaps drearily, for a stiff gale is blowing across country, and cold currents of air find their way into the huge deserted rooms. The tall timber trees surrounding the park are creaking and bending to the blast; but the sturdy gables of Cottley Hall stand firm as the day when they were built. Just such a wild night as this closed upon the 6th of September 1651, three days after the sanguinary and decisive battle of Worcester. Hugh Everett was owner of the Hall at that time, a zealous Parliamentary speaker of high reputation. It was not by strength of arm or by mighty deeds of valour that Master Everett had gained unto himself those honours which had procured him the fat and fair manor of Cottley; from his childhood up the Republican had seldom enjoyed good health, his capabilities fitting him rather for a statesman than a soldier, while at the same time his inclinations were more of a civil than of a military character. The 'desperate and cruel Malignant,' Sir John Rossey, from whom this

wealthy patrimonial estate had been alienated since the fatal field of Naseby, closed the long line of his family by getting shot through the head at Rowton Moor; and now Master Everett reigned in his stead, more secure in his position than the hot-headed knight had latterly been, but none the less looked upon by his numerous tenants as a usurper and a pleasure-hating upstart.

Cottley Hall is black and silent, and its chimneys and gables point dully to the sky. The place might well appear deserted, for no light is to be seen in its many windows, and no response is made to show that the inhabitants are aware of that hollow knocking at the front door. Said knocking continues at intervals, but at length grows desultory and faint, though the wind howls unceasingly amongst the great Cottley elms, making noise enough to drown twenty such feeble sounds. Out of sight at the back of the building, partly obscured by overhanging masses of ivy, a single light proceeds from a small multilioned window opening upon the library of the Hall. This is Master Everett's favourite retreat, and here he sits, surrounded by books and pamphlets bearing such interesting titles as *A Plan to plough the Threshing-floor*, and *A Seed sown upon Goodle Grounds*, together with the bitterly malevolent and better-known treatise upon the *Unloveliness of Louc-locks*. Hugh Everett's age does not exceed thirty-five years, but a troubled harassing life has given him the appearance of a man of fifty. Short scattered gray hairs, sharp features, and a thin stooping figure, are his principal characteristics, the extreme plainness of his countenance being fully equalled by that of his dress. The Master of Cottley is poring over a leather-bound collection of sermons, and though apparently engrossed in his occupation, he is nevertheless in an unusually absent frame of mind. He has not altered his position for nearly an hour, neither has he attempted to turn a leaf; there is something in the lonely howling of the wind to-night which reminds him of his half-forgotten school-days. Although his eyes are fixed upon that printed page before him, Hugh Everett's thoughts are far away in the remote past, looking back with a sorrowful yearning towards scenes and faces which were familiar to him long before these troubles came upon the land.

CHAPTER II.—AN UNEEXPECTED VISITOR.

Things had remained in this state, as we have said, for nearly an hour, when, chancing to raise his head, Master Everett's wandering gaze encountered a silent figure standing at the other end of the room. Though but faintly seen by the lamp's dim uncertain light, there was something about the face he seemed to recognise, and he sat spell-bound for a moment before starting from his chair. The spell was broken by a forward movement on the part of the apparition, and Everett raised a fearful cry, which was instantly choked by the application of a palpably human hand to his mouth. Easily mastered in the ensuing scuffle, the Republican sank back and glared fiercely at his detainer, while his breath came thick and short.

'Hugh Everett,' exclaimed the unwelcome intruder who stood over him, 'do you not know me?'

The scattered recollections in Everett's mind slowly pieced themselves together, and he answered after a pause: 'I do now.'

'That's one to my score then,' said the individual with a short laugh. 'What are you afraid of?'

'Nothing, Walter Cunningham, nothing,' answered Everett, controlling his agitation by a great effort. 'Yet you have sought me in a strange fashion.'

'And if I have, friend Hughie,' said the newcomer, 'that counts for nothing, does it? I am in trouble, and have come to you for help. Old friendship should bind us, if nought else; and were I now in your place—though, heaven knows, I don't wish to be—you should have it for the asking.'

'How did you enter the house?' inquired Everett, whose under current of thought would scarcely allow him to follow what the other said.

'My conscience pricked me somewhat as to the matter of creeping in,' quoth Cunningham; 'but when a house keeps bolt and bar so stubbornly as yours does, one must take some liberties in extremity.'

'What trouble are you in? Why do you come here?' asked Everett nervously. 'Have you joined in any fresh brood, to disturb the peace of this unhappy country?'

'Peace! unhappy broils!' ejaculated Cunningham. 'What are you talking about? Can it be possible that you have not heard of Worcester fight?'

The Master passed his slim hand across his forehead and answered in a husky, perturbed voice: 'Many rumours have I heard of late—rumours of war and strange tales of battle, but little did I wot that Walter Cunningham was concerned therein.'

'He was, and he glories in it,' exclaimed his companion with sudden enthusiasm. 'Hast ever heard, Hugh, of any man being possessed with a fighting demon? I was that day. Oh, ye powers! gave me such another before I die, and I shall leave this world content! Down went Hamilton, down went Maurice and Malley, before those lunatics; yet throughout the melody I bore a charmed life. My cloak was riddled with bullets—see that shot-hole in my hat—yet not a wound, not a scratch. Could such a day again fall to my lot, I should well might esteem myself invincible! The Cavalier, who had been conducting wildly throughout the whole of the day, and speech, threw himself back in the chair and set his teeth with a sardonic grin.

Hugh Everett's blood was up; his thin bent frame trembled partly with nervous eagerness and partly with anger while he listened to the fugitive's discourse; but now his powerful voice, which had been so often raised in behalf of his party, broke forth like a deep enraged roar: 'And it is thus thou beatest in thy strength and thy unrighteous cause! What can have prompted thee, thou stirrer-up of strife, to venture hither with thy evil, self-exalting tale; hast thou no fear in thrusting thy head into the very lion's mouth?'

This sudden outburst produced no effect whatever upon Cunningham; he crossed one leg

over the other, looked Everett straight in the face, and answered sturdily: 'Not a jot.'

The Master of Cottley Hall rested his chin on his hand and regarded the Cavalier fixedly. Bold speaker and diplomatist as he might be, the Republican knew that here he had met his match. Contenting passions might urge him to speak harshly, but he felt that to do his old friend a wilful injury was foreign to his nature. No one could be better aware of this than Walter Cunningham, and certainly no one could have turned the opportunity to advantage with greater coolness or sagacity. For a few minutes the Cavalier's glittering eyes watched his companion's measured movements as he paced across the floor; and then leaning back again, he quietly said: 'You have two roads to choose from, my good friend: there is no other alternative; either hide me or give me up; the prospect of capture will not induce me to move another step to-night.'

'To-night,' echoed Everett, stopping short in his walk. 'Are you indeed so hard pressed?'

'My present action will answer that question,' said Cunningham. 'Fleetwood holds Daventry, and his troopers are scouring the country like bloodhounds in search of poor hunted wretches like myself.'

'Have you fasted long?' asked Everett. 'Are you an hungry red?'

'As much as a man may be who has not tasted food since yesterday at mid-day,' replied the fugitive.

Everett opened a corner cupboard and placed a loaf, a leather flask, and drinking glass before the Cavalier. 'Bread and wine I can give you here,' he said. 'To call for better fare might be dangerous. Fortunately it is that none of my household saw you enter.'

'Fortunately, say you?' said Cunningham with a meaning smile, as he uncorked the flask. 'So be it, then, my lad—Here's to King Charles!' he added, extending his hand.

'The Young Man,' exclaimed Everett quickly.

'His Majesty—God bless him!' retorted Cunningham, tossing off a deep draught.

Hugh Everett turned sharply round and walked towards the window. Events had taken a strangely unpleasant turn with him this evening, and his position could scarcely be called a comfortable one. Walter Cunningham, on the other hand, ate and drank in a most unconcerned manner, for, despite his evident distress, there was an air of careless license about the Cavalier which ill became the puritanical atmosphere of Master Everett's study. The meal was soon over; and Cunningham turned towards the motionless figure at the window.

CHAPTER III.—THE 'PRIEST-HOLE.'

'Rouse yourself, Hughie,' said the fugitive. 'Hast got a touch of the meggrims?'

Walter Cunningham, returned Everett, looking up, 'one thing can I esteem myself fortunate in, that I have received this visitation to-night. Left alone to myself for lengthy periods, my morbid imagination feeds upon itself and staggers the very blood within me.'

'Your discourse sounds mighty well, friend Hugh,' said Cunningham, for the first time

showing some impatience; 'but it will not save me from Fleetwood's troopers. Is there no secret hole or corner where I can hide till the pursuit slackens? I have no fancy to be made the mark for a firing-party in your courtyard just yet.'

'Stay, stay!' exclaimed Everett, pressing his hand to his forehead. 'I do remember me now of some such place like unto what you allude.'

'Well,' said Walter, 'so much the better for me. Let us see to this matter at once.'

The Master laid hold upon the lamp with a trembling hand and glanced irresolutely round the room. Cunningham's eyes turned in the same direction until they rested on a mass of carved woodwork situated in one portion of the panelling.

'What is the place you speak of?' asked the uninvited visitor, as his companion crossed over to this spot and appeared to busily examine it by aid of the light which he carried.

'Hold thou the lamp, and I will tell thee,' said Everett, stooping down upon the floor. 'It is said that within this house of Cottley was first built, the luxurious family of Rossey caused certain large kitchens to be constructed underground. Thus it came to pass that when that evil-doer and imaginer of mischief, Sir John, devoted himself to unlawful state-service, his yearly revenues were insufficient to maintain that example of debauchery and gluttony for which he was well known. The approaches to these kitchens were consequently bricked up, smaller substitutes being used as more convenient, and more adapted to the outlay of his limited income. Cottley Hall at length changed hands; and it was during the execution of some needless repairs that a working-man accidentally touched a spring concealed amongst these carvings, letting fall a cunningly contrived panel. An entry being effected, it was found that behind the wall there existed one of the great chimneys rising from the daisied kitchens. Across its aperture extended a single sooty beam, leading to a small recess on the other side. I myself believed this to be a "priest-hole" which had probably been used during the times of the Catholic persecution; but having no desire that this panel should remain open to gratify the curious, I ordered it to be closed up and left *in statu quo*, little thinking that I might one day have occasion to use it. How little can we guess the future!'

'Cannot you remember how the spring worked?' demanded Cunningham.

'Can you remember everything that crossed your eyes six years ago?' returned the other fretfully. 'I trow not.'

The examination continued for some minutes without success, Cunningham meanwhile keeping perfectly silent, listening to the howling of the wind amongst the great Cottley elms without.

Hugh Everett, he said suddenly, starting up and coming to an attitude of rigid attention, 'what is that noise?'

The Master shook his head.

'I need scarcely ask,' continued Cunningham. 'I have been too long a soldier to neglect a single call. If that panel is not opened quickly, there may chance to be some murderous work here this night.'

'What a frightful emergency!' was the exclamation of Everett, who had not ceased to pass his fingers over the mass of carved work adjoined to the panelling. 'You cannot, you dare not offer any resistance.'

'Believe you, Hugh Everett,' said the Cavalier grimly, as he touched the hilt of his rapier. 'Have you lived so long in this world and yet cannot guess what a desperate man dare do?'

Everett's face turned white as chalk; but the smothered moan which broke from his lips was quickly followed by a cry of joy. 'I have found it!' he exclaimed. 'The panel yields.'

Coming to his aid, Cunningham pushed a portion of the wainscoting on one side, discovering a dark cavernous aperture.

'Enter; be not afraid,' said Everett, holding up the lamp and throwing its light upon the blackened walls of the chimney. 'Cross that log of wood which you see, but trust not to it overmuch. On the other side is the "priest-hole."—Stay a moment. Take this other flask with you. I will let you out when the danger is past.'

Cunningham entering, placed one foot upon the thin worm-eaten beam and faltered.

'Quick!' cried Everett, for an unmi-takable sound now smote upon his ears.

Steading himself as he was best able, Cunningham passed over the yawning pit in safety and gained a ledge on the other side. The panel closed hurriedly, and through the thick darkness came a muffled sound of knocking.

'I faith,' thought the hunted man, as he groped his way into the priest-hole, 'I cannot say much for the hiding-places of the Catholics. Admirable as places of concealment they may be; but their accommodation is detectable.'

The priest-hole was a diminutive apartment, or rather recess, contrived in the thickness of the outer wall, and aired by a loophole which admitted an unpleasantly strong draught. A low stone seat occupied one end of the little place, and upon this Cunningham seated himself to wait with praise-worthy patience.

CHAPTER IV.—SUSPICIONS.

'I am mighty glad to think that you are no Malignant harbinger, Master Everett. Never mind a tough test for character, sir; it's terribly dry work while it lasts. With your permission, my men here shall broach a cask of ale or strong waters wherewithal to refresh themselves in the kitchen.'

The speaker, an athletic man of middle stature, was an officer in charge of a small body of Parliamentary troopers who had invaded the sanctity of Cottley Hall at this singularly inopportune time. A more unprepossessing individual than Major Brand—by which name the officer had introduced himself to Everett—it would have been difficult to find; he was a bandy-legged, black-browed enthusiast, with an offensive guttural voice, and a dark rugged mustache. Yet, in spite of his personal disadvantages, the Republican officer commanded a large degree of respect, being an excellent specimen of that energetic class of people who mount by sheer dogged perseverance over their fellow-creatures' shoulders. His deep-set, lynx-like eyes were remarkably piercing; and

Hugh Everett, already much unnerved, felt himself quite unequal to the task of returning his comp-sure while subjected to their scrutiny. Slightly bowing his head, ostensibly in deference to military authority, but in reality to hide his confusion, the Master replied: 'Cottley Hall is at your service, Major Brand. I shall in nowise hinder any steps you may think fit to take. Nevertheless, your men must be content with what they can get, for my visitors are far from being numerous.'

At a word of command the troopers quitted the library, none remaining except a large, powerfully built fellow, whose habiliments bespoke him to be a non-commissioned officer.

'Now, Master Everett,' said the major, 'we can converse together comfortably.'

'But,' argued Everett, naturally anxious to quit the vicinity of his friend's hiding-place, 'your men have no scrupulous regard for property; would it not rather be better that we should first see them properly quartered?'

'No,' answered Brand gruffly, for as he seem by instinct bound to regard the crime as one of their natural enemies, so did this official consider all those who in any way opposed his wishes as being suspicious malecontents, on whom it was expedient to keep a watchful eye.

The surly answer brought a faint flush to Everett's pale cheeks. 'You take strange liberties with me, Major Brand,' he said, for a moment losing all self-control. 'Times must be sorely changed if my bare word is not sufficient to remove such as you from Cottley Hall.'

'Spoken like an upholder of the good cause—eh, Humphries?' remarked Brand to the tall trooper who stood looking on.

'Nay,' replied Humphries, speaking with that Scriptural affectation which Everett only used in his more agitated moods, 'the speech savoured mightily like the ranting of some vainglorious Cavalier. If your worshipful pleasure that he should be arrested still holds, I will proceed to attach his person without delay.'

'Arrest me—attach my person!' exclaimed Everett, starting back. 'Where is your authority to do so?'

'Hold your peace, Humphries,' said the officer quickly. 'You are over-zealous.—We will stick to the matter now in hand, if you please,' he continued, addressing himself to Everett. 'Any questions concerning authority shall be answered by me as a member of that army who placed you in your high seat.'

'What is it you have to say to me, then?' asked the Master, wearily leaning his head upon his hands.

'This much,' replied Brand, with a significant glance toward his inferior. 'We are seeking for, amongst others, a troublesome youth named Walter Cunningham. Report has tracked him here, and an eye-witness testifies to his having entered the gates of Cottley Hall this very evening. Ask yourself, sir, whether a stiff-necked Malignant would tarry at the abode of a well-known adherent to our cause, unless he were likely to find friends within.'

'I will answer no more,' muttered Everett, fairly driven into a corner. 'You have searched my residence; you have doubtless interrogated my servants; and now, finding nought against

me, you put personal restraint upon my actions, and endeavour to convict me from my own lips.'

The Republican officer did not reply at once; he was slightly nonplussed; but his suspicions were not eradicated. A few moments' thought convinced this dogmatical worthy that it would be best to change his tactics and assume a pacific demeanour while still manœuvring for the desired end.

'I am sorry to have pressed such a charge against you, Master Everett,' he said frankly, after running the situation over in his mind; 'but duty, sir, must not be done negligently. It has been a stiff day for the best of us, still enough to try the patience of Job. Is there no wine-flask handy which we can talk over in a friendlier fashion?'

Greatly relieved by this candid declaration, the Master busied himself with placing a jolly-looking flagon on the table, while the Republican officer, who quickly gave some directions in an undertone, dismissed Humphries to join his comrades down-stairs.

SOME RECENT PHASES IN BIBLIOMANIA.

In the past year or two, an unusual degree of interest has been excited among book-collectors, dealers, and the general public by the numerous fine libraries that have been disposed of by auction, and the exceptional prices in many cases procured, being far in advance of anything hitherto recorded in the annals of book-buying, and certainly, we should think, surpassing more than any one else the owners of the books themselves. The campaign seems to have commenced in December 1879, by the sale of a portion of the library of Dr Lang of Edinburgh, chiefly celebrated for works relating to Scottish history and antiquities. Prices throughout ruled exceedingly high, showing the enormous increase in the value of many books within the last half-century. The next important sale was the Sunderland library, belonging to the Duke of Marlborough; which was remarkably succeeded by the Beckford collection, now in Hamilton Palace. That again was followed by the libraries of Mr Comerford, of Sir Richard Colt Hoare, and many others, including the collection of the Earl of Jersey, only recently dispersed. Nearly all of the above were of considerable antiquity, and, as a consequence, rich in early editions of the classics. In spite, however, of the fancy prices which many books realised at these sales, there is no doubt that a great number of scarce editions of the early authors were disposed of at much below their value, as compared with prices procured, often for the same identical copies, at the Roxburghe and other important sales at the beginning of the century; making it evident that the taste of modern collectors is changing. In a recent interview between Mr Quaritch, the well-known London bookseller, and the reporter of the *Pall Mall Gazette*, the former said: 'The fashion has changed nowadays. Collectors go in for first editions of Keats, Shelley, Thackeray, Dickens, and for the engravings of Cruikshank and Phiz. Then sporting literature is greatly in demand.' And we

are sure our other large booksellers both in London and the provinces will amply corroborate this statement. We will therefore proceed to say a few words relating to this class of literature, now so extensively favoured by collectors.

Fifteen years ago, there seems to have been little or no demand for these books as curiosities; for, by examining the 1870 catalogues of a well-known dealer, we find 'Oliver Twist,' first edition, uncut, offered as new at one pound; 'Sketches by Boz,' three volumes, 1837, fifteen shillings; or in one volume, 1839, one pound; and Egan's 'Life in London,' uncut, 1821, at twenty-six shillings. How little do these prices compare with present values. 'Sketches by Boz,' in three volumes, is now worth at least twelve pounds; has been sold as high as eighteen pounds; and even in poor condition, can seldom be procured for less than eight pounds; while for 'Oliver Twist,' we recently saw a copy catalogued at ten pounds; and 'Life in London' at the same price. Dickens' 'Sunday under Three Heads,' 'Great Expectations,' and 'Life of Ginnah,' range in value from ten to six pounds; and 'Pickwick' (in parts) was recently sold in London for twenty-five pounds! The demand which first brought about such prices did not really commence until after the death (in 1878) of George Cruikshank, whose peculiar style of work seems now to be more highly appreciated than ever it was during the lifetime of that versatile artist. Indeed, the desire to possess books containing his original etchings, and the work of other artists of his school, has continued steadily increasing up to the present time.

It is, however, a remarkable fact that collectors are capricious in their special liking for particular works of one author; and we must not neglect to mention as an example of this, that in spite of the large prices demanded for many of Dickens' works, others, such as 'Dombey and Son,' 'Nicholas Nickleby,' 'Bleak House,' &c., may be procured at comparatively cheap rates. This peculiarity is also noticeable in the case of the five Christmas books of Dickens, all of which can be secured for a few shillings each, except the 'Christmas Carol,' which fetches as much as five pounds. These remarks apply equally to Thackeray's works; and it is worth noting with regard to books having no pictorial illustrations, and merely issued in three-volume form, that even they too may acquire an extraordinary value, as in the case of 'Great Expectations,' recently catalogued at ten guineas, and 'Esmond,' worth at least four guineas.

Uniform with the original issues of Dickens and Thackeray come a long series of novels by Lever, Ainsworth, Maxwell, Albert Smith, Trollope, &c., invariably published in parts and illustrated with etchings by Cruikshank, Leech, or Phiz. Certain of these have acquired a fictitious value, such as Ainsworth's 'Tower of London,' and the sporting novels of Robert Scott Surtees, well known as the 'Hindley Cross' series. The list of books illustrated wholly by George Cruikshank is so extensive, that many collectors content themselves with a selection of his most important works, and among those most in demand are 'The Scourge' (1814), 'Ginnah's Fairy Tales' (1823-6)—the Beckford copy of which brought sixty-three pounds—'The Omnibus' and

'Table Book,' and Brough's 'Life of Sir John Falstaff.' Rather less in demand are early editions of Shelley, Keats, Browning, Byron, Leigh Hunt, Tennyson, &c.; but the prices asked for many of them, especially if anything like a complete set has been formed, are sufficiently startling.

It must, however, be remembered that the highest prices are secured only for copies in fine condition and with uncut edges, a fact which is demonstrated by the comparatively small prices obtained for inferior and dirty copies, numbers of which are constantly being thrown upon the market.

To Dickens' collector, we can confidently recommend Mr. Dexter's 'Dickens' Memento' (London: Field and Tuer) as the most complete guide yet published; and we hear of similar works on Thackeray issued by another London publisher. We may remark in conclusion, that the enormous increase in the value of many of our modern works is to a large extent due to the American demand; many valuable libraries in the States, which the writer had recently the opportunity of examining, attesting to the fact.

WILD WILL.

A TEXAN TYPE.

SOME years ago, few names were better known in Texas than that of 'Wild Will.' It is to be presumed that at some time of his life he possessed a surname; if so, it was soon forgotten, for during the greater period of his short but eventful career he was only known by his baptismal, or, to use an Americanism, here probably more appropriate, his *given* name, with the adjectival prefix. In his hot and unregenerate youth, Will had been unpleasantly notorious as the chief of a gang of 'road-agents' (highwaymen) whose depredations had made them the terror of the State. His skill with the pistol was extraordinary both for accuracy and rapidity. On more than one occasion I have seen him with a revolver in each hand at arms-length, simultaneously hit a playing-card on two adjacent telegraph poles, while riding at full gallop across the railway track midway between the poles. Then turning his horse, he would gallop back, repeating the feat, with his arms crossed. A playing-card is a small mark for a pistol-shot standing, at twenty-five yards. On the back of a running horse, the feat is simply wonderful.

It was Will's boast that of all the men he ever killed, none was ever hit save in the head. On one occasion, a band of sixteen United States soldiers, under the command of a non-commissioned officer, were ordered out to arrest him, information as to his hiding-place having been given. They found Will lying in a thicket, and opened fire. He responded with his revolver; and at the close of the action, fifteen of the soldiers lay dead, each with a bullet in his brain, whilst the other two managed to escape. Will himself was severely wounded; but he managed to drag himself to the brink of a little pool, where he lay until night, when he was carried off by some of his gang.

Having recovered, Will after a time began to grow weary of the excitement of man-hunting, when he was the unfortunate 'hunter,' and thought a little sport, with himself at the other end of the chase, might not prove uninteresting. By some means or other, he managed to make his peace with his outraged government—never a very difficult matter in the western States—and got himself appointed a deputy-sheriff of the State of Texas. In this capacity the apprehension of all criminals whose daring rendered their arrest dangerous was intrusted to him, and in Texas he was not often unemployed. On one occasion he was summoned to the sheriff's office and informed that a specially 'tough' job was in store for him.

'Well,' said the sheriff, 'Texas Charlie's wanted.'

'Yes,' said Will.

'We want him alive, if you can; but at any rate, alive or dead.'

'So!' responded Will.

'Will you take?'—

'Don't mind if I do. Whisky for choice.'

'No, no; I didn't mean that exactly. Will you take any men with you?'

'Guess not,' replied Will.

'Well, well; just as you please; but remember we want him, alive or dead.—Now we'll have that drink.'

Will immediately set out on his expedition. He had received information that Charlie, a noted desperado, had been making his headquarters at the little village of N—. Thither he proceeded; and by chance I happened to be in N—, looking up some missing cowboys, on the day of Will's arrival. We had met before on several occasions, and Will greeted me pleasantly, and insisted upon my taking a 'horn' with him, whilst he told me the duty he was engaged on.

After a short chat and further refreshment, Will started for the door with a cheery 'See you again soon, old man! Get through this job pretty slick, I reckon.'

Just as he reached the door, however, a shout of, 'Hold your hands up, Will!' called all the inmates of the saloon to the street.

There stood Will, his hands in the air, calmly whistling a half-melancholy tune, whilst on the other side of the road sat Texas Charlie himself on a fine Eastern horse, accompanied by several of his gang, and with a fourteen-shooting Winchester pointed dead at Will's heart. (I may here state for the benefit of the uninitiated that throwing one's hands up is a sign throughout America that one doesn't intend to draw a pistol and shoot, and that, therefore, the other party should also drop his muzzle.)

'Well, Will,' said Charlie, 'they say yer goin' to take me, alive or dead.'

'Them's my orders, Charlie.'

'What if ye think ov yer chance now?'

Will calmly resumed whistling the unfinished tune.

'Well, Will, guess I've got the better ov yer.'

'That's so, Charlie.'

'Now, look here, old man. I don't want no kinder trouble in this yer town, so I tell yer ye'd better walk backwards out thar to the brush' (pointing to a thicket about half a mile away).

'When ye get thar, I'll shoot ye; but keep yer hands up. Fust motion down yer makes, I shoot.'

Well, it wasn't altogether a lively prospect for

a man to walk backward, for half a mile with his hands over his head, especially with the certainty of being shot at the termination of the journey; but off Will set, still whistling his tune as calmly as if he was going to a lyceum lecture. Two or three of the others and I followed, meditating a rescue; but the levelled rifles of Charlie's gang were anything but comforting to look upon. As for the townspeople, a murder more or less was not a rarity worth tramping half a mile out of town to see.

A portion of the distance was passed, and still Will's clear bird-like whistle rang cheerily out. Charlie's rifle was at his shoulder, covering the deputy-sheriff's heart, and behind the boys, with rifles and pistols ready, warned off the spectators from approaching too closely. The affair grew thrilling, positively fascinating. I can never forget the calm, cheerful look in Will's eyes as he tramped along backwards, or the cruel, determined air of Charlie and his followers.

Suddenly Will stopped. Waving his hands gently in the air, he shouted: 'Don't hit him, boys; he don't know what he's doing!'

Like a flash, Charlie turned in his saddle, fearing treachery, and that some one was about to club or stab him in the back. For a second, the deadly Winchester swung from its line; that second was Will's opportunity, and with the speed of lightning his hands were at his belt, his pistols out and levelled, and before the desperado could turn again in his saddle, he rolled to the ground with two bullet-holes through his brain. His companions were so thunder-struck that they did not attempt to revenge his death, but turned their horses and galloped off; not fast enough, though, for Will's bullet, swifter even than a Texas mustang, stopped two of them. The rest escaped.

'Alive or dead,' was my order, 'since,' said Will, 'I'm sorry it ain't alive; but dead 'll heve to do.'

That was the last time but one that I saw Will alive; on the next occasion he lost his life; but he fell gloriously—for a Texan, that is. The story, however, is too long to give now.

OCCASIONAL NOTES.

CAMELS IN AUSTRALIA.

IN many parts of Australia are large tracts of arid country—deserts, we might call them—over which, especially in times of drought, it is difficult, if not impossible, for any but the aborigines to travel without the assistance of camels as carriers. Owing to the great increase of population at the antipodes, it has become a matter of some importance to have all possible facilities for opening out new districts; and in South Australia, attempts, not altogether unsuccessful, have been made to raise a home-bred stock of camels. At the present time, there are some two thousand or more of those useful animals in that part of Australia alone. These are greatly in demand, and regular market prices are quoted for them, the value of a good pack bull being sixty pounds, and a pack cow sixty-five pounds. Camels for harness are even more

valuable, selling from sixty-five to seventy pounds, according to sex; whilst those used for riding purposes fetch from seventy to seventy-five pounds.

Camels were not imported into South Australia in any number until 1866, when Sir Thomas Elder entered into the enterprise with a determination to establish a herd, and succeeded in landing a hundred and nine, which shortly increased to a hundred and twenty-five. Soon, however, the little herd was attacked by a kind of mange; and the camels suffered so much from this disease, that at the end of six months their number was reduced to sixty-two. In time, however, by the most careful treatment, the disease was stamped out; the herd then thrived well, and has now largely increased.

It was not until about 1883 that the settlers generally began to see the great value of camels in certain districts; and then the demand far exceeded the supply. In that year, Messrs W. R. Cave & Co. made a trial shipment of six; and this venture proved so successful, that in 1884 six hundred and sixty-one camels were imported. In India, great losses have been sustained from foot-and-mouth disease and tuberculosis; it has been therefore deemed necessary, as a protection to what has now become a very important interest in South Australia, that all imported camels should be subjected to a rigorous veterinary examination; and recently, that effect were published in the *Australian* in December last. Those camels which have become acclimated or are home-bred are particularly healthy; but the imported ones, as a rule, suffer greatly at first from skin disease of a highly infectious order (scab), and many have died from this cause. The remedies for the disease are ointments of sulphur and carbolic acid; tar and fat; and indeed any of the usual sleep-dressings of which sulphur is an ingredient.

For purposes of exploring, surveying, and for carrying stores, camels have proved invaluable aids; and in the interior of Australia, they are firmly established as most valuable stock, and are turned to many and varied uses. In that country, there must always be large tracts of land over which it will be difficult to travel; and there can thus be no doubt that the enterprise of the importers and breeders of camels will be rewarded. Should we, some years hence, have the misfortune to be engaged in another Egyptian campaign, we may perhaps be able to procure that absolute essential of desert warfare, a stock of camels, from our colonial friends.

PROTECTING THE SEACOAST.

A correspondent writes: 'The subject of protecting the seacoast is of almost national importance; I therefore send you the following particulars, as I think you will consider them worthy of a notice in your *Journal*. The ordinary means of protecting property along the coast is to erect either timber, concrete, or stone *groynes* or walls between high and low water marks, so that the shingle, &c. which almost invariably travels along the coast may be caught and retained. The increasing value of the property to be protected, and the frequent damage that has been sustained,

have caused many and various kinds of structures to be put up to attain this object. Judging by the experience gained in many places, it is evident that the benefits derived are frequently more than doubtful, and their cost generally very great. The accumulations of shingle which may have taken place during many months are often entirely removed during one or two rough tides.

'To meet these difficulties, Mr A. Dowson, C.E., 3 Great Queen Street, Westminster, has patented a system of *open* groynes, which allow the water to pass through them, at the same time trapping the shingle brought in by the waves. These groynes consist of a series of iron gratings attached to uprights firmly fixed in the beach. The effect has proved to be most satisfactory; for, instead of the waves loaded with shingle being dashed against a solid obstruction, as is the case with ordinary groynes, the water passes freely through the gratings, but leaves the shingle to accumulate until it becomes level with their tops, when it falls over, and travels forward to the next groyne. With this system, it is impossible that a backwash can be produced, as may be said to be the invariable result of the ordinary groynes.

'Other advantages of the open groynes are, that they can be erected in a few days, a matter of great importance when a foreshore is being injured during stormy weather. Their cost is also very much less than the old systems. These open groynes have been in practical and satisfactory operation on the foreshore of St Anne's, near Blackpool, for over two years, where at spring-tides the seawall is exposed to the full force of the waves from the Irish Sea. The Corporation of Brighton have also erected some of these groynes on a portion of their foreshore, where they have been subjected to some of the heaviest seas ever experienced on this very exposed coast. The result has proved the great advantages of the open system compared with the others previously adopted; for, while considerable damage was done to adjoining solid groynes, the open ones remained unimpaired. At the same time, with the solid groynes there was much scouring away of the shingle; whilst the level of the beach protected by the open groynes was not lowered.'

A model, showing the system, may be seen in Group 3 of the Inventions Exhibition, London.

INTERESTING ROMAN AND GREEK DISCOVERIES.

The remains of a large Roman villa fitted with extensive baths have been recently discovered at Eining, near Alvensberg—supposed to be the ancient *Abusina*—a town in Bavaria on the Abens river, near the Danube. The heating apparatus has been found in very perfect condition, together with many curious and interesting architectural details. But what is perhaps of more interest still, the skeleton of a woman has been found, having by her side a jug, a glass urn, and tear-bottles—the last, usual offerings to the dead. In addition to this, there was the apparatus of her toilet, including hair-pins, pearl necklace, and bracelets. Some sculpture was also brought to light, though in a very broken state; but one piece, a woman's head in marble, was very well

executed indeed. A 'votive' stone was also found with an inscription of four lines, dedicated, as an offering, in honour of '*Iena Fortuna Augusta Faustina*.' A large number of Roman weapons, coins, spoons, rings, and fibule, and many other articles, with Roman bricks, tiles, and stamps in considerable numbers, were also discovered amongst the foundations of this interesting villa.

An interesting discovery has recently been made in connection with the Forum at Rome. On cutting into the accumulation of the unexcavated portion of the north-east side, on which stands—between the Temple of Antoninus and Faustina and the church of St Adriano—the row of modern buildings which is ultimately to be removed for the completion of the excavations, a part of the pavement of the ancient street connecting the Forum with the Subura has been uncovered. It lies at a level of some eighteen inches below the flagged area of the Forum, which dates from the seventh century. The street extends along the south-east side of that part of the Curia which is now the church of St Adriano. The pavement is in a fine state of preservation; and on one side of it stands a pedestal, probably of a statue dedicated, as shown by the inscription, to the Emperor Constantine the Second, by Memmius Vitellius Orfitus, who was *prefectus urbis* from 355 to 359. Large masses of marble, such as pedestals of columns, pieces of cornice, and other fragments, were found one upon another under the accumulations but lately removed.

The *Philologische Wochenschrift* of Berlin referring to the recent discoveries of a number of cornice mouldings of porous stone at the Propylæa at Athens, states the curious theory that these belonged to the older Propylæa, but that they were used as building materials when the new structure was erected in the fifth century B.C. These stones are brilliantly coloured blue, red, and gold; they are in good preservation, and therefore may be given as excellent specimens of architectural colour decoration as practised by the Greeks two thousand three hundred years ago, a beautiful art, which of late has been successfully revived in our own country, and, when carried out with care and judgment, must always have a superb and striking effect.

MAY: A SONNET.

Come forth, my Sylvia; we must haste away
From out our city home, for Nature calls;
That we should visit her green woods and hills,
And hold this for a cheerful holiday.
It is her holy honeymoon of May!
The ardent sun, whose benediction fills
The earth with joy, hath decked the leafy bowers
Wherein she sits, crowned all with love and flowers.
There is a witching music in the breeze,
A deep life-stirring tune that fills the heart
With longings wild and free, and bids depart
All mean intrusive cares—the whispering trees,
The sun, the flowers, the streams—all bid us roam,
And claim, to-day, the woodland for our home.

RED RIVER REBELLIONS.

At the present time, when the news of a combined Half-breed and Indian rising in the Canadian North-west is exciting both interest and alarm, it may be appropriate briefly to relate the causes which led to, and the results which were brought about by, the somewhat similar movement, known as the Red River Rebellion, which took place in what is now the province of Manitoba in the years 1869 and 1870.

To help the better understanding of the matter, it may be necessary to remind the reader that Charles II., in the year 1670, gave a charter to a corporation which had then been newly formed under the title of the 'Governor and Company of Adventurers of England trading into Hudson's Bay.' By this charter he granted to that body the exclusive right and privilege of trading over a vast but undefined tract of country which now forms the greater part of the Dominion of Canada. For close upon two centuries the 'Hudson's Bay Company,' as it is still called, enjoyed its huge monopoly, and was able at times to pay very large dividends to its shareholders. The Company's claim to the territory in question was, however, by no means an undisputed one. As early as the year 1749, a Select Committee of the House of Commons inquired into and reported upon the state of the country occupied by the Company and the trade carried on therein. Many high authorities maintained that the Company's charter gave it no actual territorial possession; but, in spite of this, the Company continued, until the last few years, to exercise a sole control over its vast and silent territories, which it governed exactly in the way that pleased it best. But the days of monopolies had largely gone by; and some forty or fifty years ago, complaints began to be heard to the effect that it was scandalous that so enormous an extent of country should be left entirely in the hands of a commercial Company, consisting merely of a few private individuals; that the Company had not in all cases exercised its authority on the side of justice; and that it

was habitually accustomed to do all that lay within its power to prevent the carrying out of projects likely to advance the prosperity of the country, being over-careful of its own interests, and jealous of all competition. The whole question, however, found a solution in the year 1869, when, following upon an exhaustive inquiry which had taken place before another Select Committee in the year 1857, it was mutually agreed that the Company should surrender almost the whole of its territorial rights to the government of the Dominion of Canada in return for a money-payment of three hundred thousand pounds. It was the method adopted for carrying out the conditions of this agreement which, in the first instance, occasioned the Red River Rebellion.

There were at that time (1869) many old servants of the Company and others settled around its chief trading-station, Fort Garry—now Winnipeg—and along the banks of the Red River and the Assiniboine. Many of these were Scotch; others had come up from the eastern provinces of Canada; a few were Americans; but a very large number—some thousands—were Metis, or French Half-breeds—descendants of the earliest servants of the Company, who had come up from the French-speaking province of Quebec, and who, when they had served their time, had married Indian wives and settled down in the country. The children resulting from these unions presented many marked peculiarities of their own. They possessed in some degree the characteristics both of the white and of the red-skinned races; but their general habits, mode of life, and physique were those of the Indian rather than of the white man. They usually dressed in trousers of a dark-blue cloth, with a heavy woollen shirt of the same colour. In this they followed more or less the ways of civilised man; but the Indian love of finery showed itself in the bright brass buttons, the scarlet waist-sash, and the bead-woolen leggings and moccasins with which they adorned themselves. Their wants were few. Rome was their church. The Hudson's Bay Company was their

government. Three-quarters hunter and one-quarter farmer, their sharpened senses and trusty rifles enabled them to procure most of their few necessities; and the forts of the Hudson's Bay Company, where they supplied their remaining wants, afforded them the requisite market for the disposal of their furs. These men naturally heard with alarm that a fresh power, of which they knew nothing, was about to enter in and rule over them. They neither knew nor cared anything about the government of Canada; they merely knew that 'the Company' and themselves had long occupied and possessed the whole region; and what security had they that the new authority, which they heard was coming up to apportion their country off into square farms, would pay any heed to their claims?

The transfer of the territory from the Hudson's Bay Company to the Canadian government was effected about the middle of the year 1869. A number of land-surveyors were at once despatched to commence surveying the country; and a complete government, consisting of governor, ministers, secretaries, and all other functionaries, few of whom had any acquaintance with the freshly-acquired region, was formed in Ottawa, and despatched in a body to take possession of the new territory. This abortive government reached Saint Paul, in the State of Minnesota (four hundred and fifty miles south of Fort Garry), but at that time the nearest point of railway, early in the following October, and there commenced to make preparations for its long journey over the prairies. But news of its advent went on before, and the arrival of the information at Fort Garry fanned into the full blaze of rebellion the smouldering ember of ignorant prejudice and alarm. The Half-breeds held excited meetings, at which it was decided to oppose—by force, if need be—the entrance of the governor, the Honourable Mr MacDougal, into the country. A message to this effect was forwarded to that gentleman, and the track from the United States boundary was barricaded near the La Salle River, some ten miles south of the fort.

At this time there appeared one Louis Riel, a French Half-breed, who is described as being a man of considerably greater intelligence, force of character, and capacity for leadership than the average of the class to which he belonged. This man now assumed the direction of the movement. He does not seem to have conducted himself at first in a way that was particularly improper, but, as the weather grew colder, the Half-breeds found themselves in very poor winter-quarters at the La Salle River, and it was decided to retire upon Fort Garry. This was accordingly done on the 2d of November, Riel and about one hundred of his followers entering the open gates of the fort without the slightest opposition from the governor or other of the Company's officials. Once established in the large stone fort, the rebels found themselves in comfortable circumstances. They occupied a very strong position, the fort being bastioned and defended by a battery of thirteen six-pounders, and containing nearly four hundred English rifles, and an abundance of ammunition, besides large quantities of supplies of all kinds, a well-filled safe, and an overflowing wine-cellar. Moreover, the possession of the fort gave to the

Half-breed leader the command of all the other inhabitants of the settlement, such as the Scotch, English, and Canadians, who had refused to join in the movement. These were accordingly imprisoned and otherwise ill-treated by Dictator Riel, who, like many other small people when placed in situations of authority, began to imagine himself a very important individual indeed, and proceeded to act accordingly. He called together a Convention and styled himself the 'President of the Republic of the North-west.' A 'Bill of Rights'—which, it must be admitted, formed the basis of the 'Manitoba Act' passed by the Dominion Parliament in the following year—was drawn up and passed. In short, the rebels were now complete masters of the situation, there being no force in the settlement capable of checking them.

The state of affairs was "much aggravated by the insane proceedings of a certain Colonel Dennis, who was to have been 'Conservator of the Peace' under the new government. This gentleman entered the country, and, at the end of October, with a proclamation from Governor MacDougal authorizing him to 'assault, fire upon, break into houses, and attack, arrest, detain, and disperse people;' but, finding himself unable to carry out his injunctions, he wisely returned to Saint Paul, where he rejoined Mr MacDougal, who, with the rest of his government, set his face for home again.

Things continued to remain in this state through the whole of the winter. Riel, emboldened by the support of six or seven hundred armed followers, conducted himself in a most arbitrary manner, ruling with a high hand, and imprisoning at will those who would not support him. Both right and reason had, undoubtedly, to some extent been on the side of many of his earlier proceedings; and we might even now have felt some amount of admiration for the energy and ability he showed in carrying on the movement, had he not at last become intoxicated with his own successes, and been thereby led to commit an act by which he once for all abandoned from his cause the sympathy of all law-abiding people. This act was the murder, in cold blood, of one Thomas Scott, a Canadian, who had rendered himself obnoxious to the overbearing Dictator. This unfortunate man was shot in front of the fort on the 18th of March 1870. Riel himself seems to have been ashamed of his deed; for, refusing permission to bury him to two clergymen that had asked to be allowed to do so, he pretended to have the body interred at night within the walls of the fort; but, in the following year, when the coffin was dug up with the intention of giving a proper burial to the remains it was supposed to contain, it was found to be empty.

Thus affairs went on at Fort Garry for over nine months. But energetic preparations had been made in Eastern Canada for the suppression of the revolt; and, soon after the opening of navigation on the Great Lakes, a force consisting of one battalion of regular infantry, two of Canadian militia, a few artillerymen, and some cavalry—about fourteen hundred souls in all—left for Fort Garry. The course to be followed on this expedition lay first by water up Lakes Huron and Superior, to Thunder Bay on the north-west coast of the latter, where now stands

the town of Port Arthur. From this point the little force had to traverse a veritable wilderness of glacier-scraped rocks, rushing rivers, countless lakes, and endless pine-forests, through which there were no roads, for full five hundred miles before it could reach Fort Garry—the easier means of approach, *via* Saint Paul, lying through United States territory, and being closed against an armed force. No supplies could be obtained on the route. Every thing—Arctic canoe, provisions, munition, food, and supplies of all kinds, had to be carried on men's shoulders across the innumerable 'portages.' Only those who like the writer—have been over the line of railway which now traverses the region, can have any true conception of the difficulties of the route, although enough was said of them at the time, and prophecies concerning the total failure of the expedition were based on all hands. But the little force was under the command of a man who looked upon difficulties only in the light of obstacles to be overcome. This man was none other than General Lord (then Colonel) Wolseley. In due time, therefore, the journey was accomplished, and accomplished at a marvellously small expense and without the loss of a man. On the 23d of August the expeditionary force arrived under the walls of Fort Garry, amid extravagant signs of rejoicing from the loyal portion of the inhabitants of the settlement. But the fort was then empty. Relieved with few remaining followers, had rushed off only a few minutes before, and was then making the best of his way to the frontier, in order to seek refuge on American soil. Thus ended the Red River Rebellion of 1869-70.

Looking at the matter in an unbiased light, it cannot be denied that, at the outset, the Half-breeds had a certain amount of reason on their side. It does not appear that they had any greater grievances than the other inhabitants of the settlement who did not rise; but their ignorance led them to believe they had; and it is certain that the greater part of the blame for the whole affair is attributable to the exigencies of the Canadian officials to assume the government of the new territory. Captain Butler, who in his *Great Lone Land* has given us, from personal experience, one of the most readable accounts we have of the rebellion, says: 'The blame for having bungled the whole business belongs collectively to all the great and puissant bodies [concerned]. An ordinary, matter-of-fact, sensible man would have managed the whole affair in a few hours; but so many high and potent powers had to consult together—to pen despatches, to specify, and to lay down the law about it—that the whole affair became hopelessly muddled.' Moreover, it is a fact that, as a result of the rising, the Half-breeds obtained all they asked. A grant of nearly a million and a half acres of land was made to them and to their children, two hundred and forty acres being given to each of the latter. Bimour says that children were lent by one family to another, and were thus counted several times over; consequently, the Commissioners reported unusual multiplying powers as one of the characteristics of the Half-breeds of the North-west! But the advantages obtained from the grant were almost nil. The reckless improvidence of the Half-breeds soon led

them to dispose of their lands, which were sold for merely nominal sums to the keen speculators who were soon in the field. Children of ten or twelve were allowed to go through all the legal farces connected with the sale of their land; on the representation of the parents that they were unable to support their families without immediate help. At the same time, the mixed-blood shanties of the Half-breeds, to the scores along the banks of the Assiniboine and the Red River, then owners, on the advent of the numerous white settlers, of whom they are by no means fond, having moved away to the more remote districts drained by the great Saskatchewan River, where they are now again creating a disturbance at the instigation of their old leader, Louis Riel, who, after ten years of banishment, returned to Winnipeg in the year 1883, while the writer was also on a visit to the city.*

With regard to the movement now going on, it is difficult to give any reliable information. It is almost impossible to say what grievances—real or supposed—have occasioned it, or what it may lead to. It is certain, however, that so long as it is confined to the Half-breeds, it is not likely to be very serious. The only real danger lies in a general rising of the Indians throughout the North-west. If this once takes place, it is impossible to say where the matter will end. Thus far, it is true, the Canadian Indians—unlike those across the boundary-line—have always been fairly peaceable, largely because the conditions of their treaties with the government have been honestly observed; but still more because, for two centuries past, they have been in daily contact, for purposes of mutual advantage, with the officers of the Hudson's Bay Company. This latter fact is too often overlooked. But it is probable that even the Canadian Indians, in spite of their quiet and orderly conduct, were never in a worse condition than they are now. Although they are partially led and maintained by government, the buffalo and the other large game-animals, which formerly supplied nearly all their wants, have been now killed off by the white men. This has brought many of the Indians down almost to starvation-point, and they are often compelled to use as food gophers and other small prairie animals. Consequently, it is not altogether surprising that some at least of the Indians should now be ready to join any demonstration of malcontents that may arise.

It may be well to point out that the difficulty of getting troops and supplies to the seat of the present rebellion will be much less than on the last occasion. A continuous line of railway now extends from the Atlantic seaboard to within two hundred miles of the centre of the existing disturbance, and Canada is now better prepared than she was fifteen years ago to suppress anything of the kind that may break out.

Civilisation has now completely overrun the scene of the last rising. A fine city of thirty thousand inhabitants surrounds the site of Fort Garry, the strong stone walls of which have entirely disappeared; and little now remains to mark the spot where it stood except the old-fashioned beam-and-plaster houses, which were formerly used as stores and residences, and a few dismounted guns and rotting gun-carriages which are scattered around. The writer has seen

tram-cars running over the spot on which the ill-fated Thomas Scott met his death.

A considerable amount of needless alarm must have been occasioned in the minds of the parents and other relatives of the many young men who have recently emigrated to Manitoba by the appearance in most of the daily papers of paragraphs headed, 'Revolt in Manitoba.' As a matter of fact, Prince Albert, the point at which the rebellion broke out, is on the North Saskatchewan River, more than two hundred miles from the nearest part of Manitoba and nearly five hundred miles in a direct line from the city of Winnipeg. In any case, whatever development the rising may ultimately reach, the probabilities are that settlers in the province of Manitoba will not be placed in situations of real danger. The near proximity of the capital and of the railway, the comparatively small number of the combined Indians and Half-breeds, and the comparatively large number of whites in Manitoba, render it in every way likely that the movement will be confined to the wilder, more remote, and thinly settled districts lying to the north and west.

A HOUSE DIVIDED AGAINST ITSELF.

CHAPTER XXII.

LADY MARKHAM's story was one which was very well known to Society to which everything is known—though it had remained so long a secret, and was still a mystery to one of her children. Waring had been able to lose himself in distance, and keep his position concealed from every one; but it was clear that his wife could not do so, remaining as she did in the world which was fully acquainted with her, and which required an explanation of everything that happened. Perhaps it is more essential to a woman than to a man that her position should be fully explained, though it is one of the drawbacks of an established place and sphere, which is seldom spoken of, yet is very real, and one of the greatest embarrassments of life. So long as existence is without complications, this matters little; but when these arise, those difficulties which so often distract the career of a family, the inevitable explanations that have to be made to the little interested ring of spectators, is often the worst part of domestic trouble. Waring, whose temperament was what is called sensitive—that is, impatient, self-willed, and unenduring—would not submit to such a necessity. But a woman cannot fly; she must stand in her place, if she has any regard for that place, and for the reputation which it is common to say is more delicate and easily injured than is that of a man—and make her excuse to the world. Perhaps, as, sooner or later, excuses and explanations must be afforded, it is the wiser plan to get over them publicly and at once; for even Waring, as has been seen, though he escaped, and had a dozen years of tranquillity, had at the last to submit himself to the questions of Mr Durant. All that was over for those dozen years with Lady Markham. Everybody knew exactly what her position was. Scandal had never breathed upon

her, either at the moment of the separation or afterwards. It had been a foolish, romantic love-marriage between a woman of Society and a man who was half-rustic, half-scholar. They had found after a time that they could not endure each other—as anybody with a head on his shoulders could have told them from the beginning, Society said. And then he had taken the really sensible though wild and romantic step of banishing himself and leaving her free. There were some who had supposed this a piece of *bonne* generosity, like the man, and some who thought it only a natural return to the kind of life that suited him best.

Lady Markham had, of course, been censured for this, her second marriage; and equally, of course, was censured for this breach of it, for the separation, which, indeed, was none of her doing; for retaining her own place when her husband left her; and, in short, for every step she had taken in the matter from first to last. But that was twelve years ago, which is a long time in all circumstances, and which counts for about a century in Society—and nobody thought of blaming her any longer, or of remarking at all upon the matter. The present lords and ladies of fashionable life had always known her as she was, and there was no further question about her history. When, in the previous season, Miss Waring had made her debut in Society and achieved the success which had been so remarkable, there was indeed a little languid question as to who was her father among those who remembered that Waring was not the name of the Markham family; but this was not interesting enough to cause any excitement. And Frances, still thrilling with the discovery of the other life, of which she had never suspected the existence, and ignorant even now of everything except the mere fact of it, suddenly found herself embraced and swallowed up in a perfectly understood and arranged routine in which there was no mystery at all.

'The first thing you must do is to make acquaintance with your relations,' said Lady Markham next morning at breakfast. 'Fortunately, we have this quiet time before Easter to get over all these preliminaries. Your aunt Cavendish will expect to see you at once.'

Frances was greatly disturbed by this new discovery. She gave a covert glance at Markham, who, though it was not his habit to appear so early, had actually produced himself at breakfast to see how the little one was getting on. Markham looked back again, elevating his eyebrows, and not understanding at first what the question meant.

'And there are all the cousins,' said the mother, with that plaintive tone in her voice. 'My dear, I hope you are not in the way of forming friendships, for there are so many of them! I think the best thing will be to get over all these duty introductions at once. I must ask the Cavendishes—don't you think, Markham?—to dinner, and perhaps the Peytons—quite a family party.'

'Certainly, by all means,' said Markham; 'but first of all, don't you think she wants to be dressed?'

Lady Markham looked at Frances critically from her smooth little head to her neat little shoes. The girl was standing by the fire, with her head reclined against the mantel-piece of

carved oak, which, as a 'reproduction,' was very much thought of in Eaton Square. Frances felt that the blush with which she met her mother's look must be seen, though she turned her head away, through the criticised clothes.

'Her dress is very simple; but there is nothing in bad taste. Don't you think I might take her anywhere as she is? I did not notice her hat,' said Lady Markham with gravity; 'but if that is right— Simplicity is quite the right thing at eighteen'—

'And in Lent,' said Markham.

'It is quite true; in Lent, it is better than the right thing—it is the best thing—My dear, you must have had a very good maid. Foreign women have certainly better taste than the class we get our servants from. What a pity you did not bring her with you. One can always find room for a clever maid!'

'I don't believe she had any mind, it is all out of her own little head,' said Markham. 'I did not let you to let yourself be taken in. She has a deal in her, that little thing.'

Lady Markham smiled, and gave Frances a kiss, enfolding her once more in that soft atmosphere which had been such a revelation to her last night. 'I am sure she is a dear little girl, and is going to be a great comfort to me—You will want to write your letters this morning, my love, which you must do before lunch. And after lunch, we will go and see your aunt. You know that is a matter of what shall we call it, Markham?—conscience—with me.'

'Practically Markham said, coming and standing by them in front of the fire.

'Perhaps a little,' she answered with a smile, 'but conscience too. I would not have her say that I had kept the child from her for a single day.'

'That is how conscience speaks, Fan,' said Markham. 'You will know next time you hear it—And after the Cavendishes?'

'Well, of course, there must be a hundred things the child wants.—We must look at your evening dresses together, darling. Tell Josephine to lay them out and let me see them. We are going to have some people at the Priory for Easter, and when we come back, there will be no time. Yes, I think on our way home from Portland Place, we must just look into a shop or two.'

'Now my mind is relieved,' Markham said.—'I thought you were going to change the course of nature, Fan.'

'The child is quite bewildered by your nonsense, Markham,' the mother said.

And this was quite true. Frances had never been on such terms with her father as would have entitled her to venture to laugh at him. She was confused with this new phase, as well as with her many other discoveries; and it appeared to her that Markham looked just as old as his mother. Lady Markham looked just as old as his mother. Lady Markham was fresh and fair, her complexion as clear as a girl's, and her hair still brown and glossy. If art in any way added to this perfection, Frances had no suspicion of such a possibility. And when she looked from her mother's round and soft contour to the wrinkles of Markham, and his no-colour and indefinite age, and heard him address her with that half-caressing, half-bantering equality, the girl's mind grew more and more hopelessly

confused. She withdrew, as was expected of her, to write her letters, though without knowing how to fulfil that duty. She could write (of course) to her father. It was of course, and so was what she told him. 'We arrived about six o'clock. I was dreadfully confused with the noise and the crowds of people. Maamma was very kind. She bids me send you her love. The house is very fine, and full of furniture, and fires in all the rooms; but one wants that, for it is much colder here. We are going out after luncheon to call on my aunt Cavendish. I wish very much I knew who she was, or who my other relations are; but I suppose I shall find out in time.' This was the scope of Frances' letter. And she did not feel warranted, somehow, in writing to Constance. She knew so little of Constance, and was she not in some respects a supplanter, taking Constance' place? When she had finished her short letter to her father, which was all fact, with very few reflections, Frances paused and looked round her, and felt no further inspiration. Should she write to Mariuccia? But that would require time—there was so much to be said to Mariuccia. Facts were not what she would want at least, it would have to be facts of a different kind; and Frances felt that daylight and all the arrangements of the new life, the necessity to be ready for luncheon and to go out after, were not conditions under which she could begin to pour out her heart to her old nurse, the attendant of her childhood. She must put off till the evening, when she should be alone and undisturbed, with time and leisure to collect all her thoughts and first impressions. She put down her pen, which was not, indeed, an instrument she was much accustomed to wield, and began to think instead, but all her thinking would not tell her who the relatives were to whom she was about to be presented; and she reflected with horror that her ignorance must betray the secret which she had so carefully kept, and expose her father to further and further criticism.

There was only one way of avoiding this danger, and that was through Markham, who alone could help her, who was the only individual in whom she could feel a confidence that he would give her what information he could, and understand why she asked. If she could but find Markham! she went down stairs, timidly flitting along the great staircase through the great drawing-room, which was vacant, and found no trace of him. She lingered, peeping out from between the curtains of the windows upon the leafless gardens outside in the spring sunshine, the passing carriages which she could see through their bare boughs, the broad pavement close at hand with so few passengers, the clatter now and then of a hansom, which amused her even in the midst of her perplexity, or the drawing up of a brougham at some neighbouring door. After a minute's distraction thus, she returned again to make further investigations from the drawing-room door, and peep over the balusters to watch for her brother. At last she had the good-luck to perceive him coming out of one of the rooms on the lower floor. He started down as swift as a bird and touched him on the sleeve. He had his hat in his hand, as if preparing to go out. 'Oh,' she said in a breathless

whisper, 'I want to speak to you; I want to ask you something,' holding up her hand with a warning hush.

'What is it?' returned Markham, chiefly with his eyebrows, with a comic affectation of silence and secrecy which tempted her to laugh in spite of herself. Then he nodded his head, took her hand in his, and led her up-stairs to the drawing-room again. 'What is it you want to ask me? Is it a state secret? The palace is full of spies, and the walls of ears,' said Markham with mock solemnity, 'and I may risk my head by following you. Fair conspirator, what do you want to ask?'

'O Markham, don't laugh at me—it is serious. Please, who is my aunt Cavendish?'

'You little Spartan!' he said; 'you are a plucky little girl, Fan. You won't betray the daddy, come what may. You are quite right, my dear; but he ought to have told you. I don't approve of him, though I approve of you.'

'Papa has a right to do as he pleases,' said Frances steadily; 'that is not what I asked you, please.'

He stood and smiled at her, patting her on the shoulder. 'I wonder if you will stand by me like that, when you hear me get my due?—Who is your aunt Cavendish? She is your father's sister, Fan; I think the only one who is left.'

'Papa's sister! I thought it must be on the other side.'

'My mother,' said Markham, 'has few relations, which is a misfortune that I bear with equanimity. Mrs Cavendish married a lawyer a great many years ago, Fan, when he was poor; and now he is very rich, and they will make him a judge one of these days.'

'A judge,' and Frances. 'Then he must be very good and wise. And my aunt?—'

'My dear, the wife's qualities are not as yet taken into account. She is very good, I don't doubt; but they don't mean to raise her to the Bench—You must remember when you go there, Fan, that they are the *other side*.'

'What do you mean by the other side?' inquired Frances anxiously, fixing her eyes upon the kind, queer, insignificant personage, who yet was so important in the house.

Markham gave forth that little chuckle of a laugh which was his special note of merriment. 'You will soon find it out for yourself,' he replied; 'but the dear old nunny can hold her own.—Is that all? for I'm running out; I have an engagement.'

'Oh, not all—not half. I want you to tell me—I want to know—I don't know where to begin,' said Frances, with her hand on the sleeve of his coat.

'Nor I,' he retorted with a laugh. 'Let me go now; we'll find an opportunity. Keep your eyes, or rather your ears, open; but don't take all you hear for gospel.—Good-bye till to-night. I'm coming here to-night.'

'Don't you live here?' said Frances, accompanying him to the door.

'Not such a fool, thank you,' replied Markham, stopping her gently, and closing the door of the room with care after him as he went away.

Frances was much discouraged by finding

nothing but that closed door in front of her where she had been gazing into his ugly but expressive face. It made a sort of dead stop, an emphatic point at which the end. Why should he say he was a fool as to live at home with his mother? Why should he be so nice and yet so odd? Why had Constance warned her not to put herself in Markham's hands? All this confused the mind of Frances whenever she began to think. And she did not know what to do with herself. She stole to the window and watched through the white curtains, and saw him go away in the hansom which stood waiting at the door. She felt a vacancy in the house after his departure, the loss of a support, an additional silence and sense of solitude; even something like a panic took possession of her soul. The impulse was to rush up-stairs again and shut herself up in her room. She had never yet been alone with her mother except for a moment. She dreaded the (quite unnecessary, to her thinking) deal which was coming at which she must sit down opposite to Lady Markham, with that same old gentleman, dressed like Mr Durant, and that gorgeous theatrical figure of a footman, serving the two ladies. Ah, how different from Domenico poor Domenico, who had called her carina from her childhood, and who wept over her hand as he kissed it, when she was coming away. Oh, when should she see these faithful friends again?

'I want you to be quite at your ease with your aunt Cavendish,' said Lady Markham at luncheon, when the servants had left the room. 'She will naturally want to know all about your father and your way of living. We have not talked very much on that subject, my dear, because, for one thing, we have not had much time; and because—' But she will want to know all the little detail. And, my darling, I want just to tell you, to warn you. Poor Caroline is not very fond of me. Perhaps it is natural. She may say things to you about your mother—'

'O no, nunny,' said Frances, looking up in her mother's face.

'You don't know, my dear. Some people have a great deal of prejudice. Your aunt Caroline, as is quite natural, takes a different view. I wonder if I can make you understand what I mean without using words which I don't want to use?'

'Yes, said Frances; 'you may trust me, nunny; I think I understand.'

Lady Markham rose and came to where her child sat, and kissed her tenderly. 'My dear, I think you will be a great comfort to me,' she said. 'Constance was always hot-headed. She would not make friends, when I wished her to make friends. The Cavendishes are very rich; they have no children, Frances. Naturally, I wish you to stand well with them. Besides that I would not allow her to suppose for a moment that I would keep you from her—that is what I call conscience, and Markham call pride.'

Frances did not know what to reply. She did not understand what the wealth of the Cavendishes had to do with it; everything else she could understand. She was very willing,

may, eager to see her father's sister, yet very determined that no one should say a word to her to the detriment of her mother. So far as that went, in her own mind all was clear.

(To be continued.)

FOUR VEINS OF AMERICAN HUMOUR

AMERICAN HUMOUR is now a well-worn subject, but it is far from exhausted. The time for denying humour to the Americans is past; only the question remains. What is the nature of transatlantic humour? That is a far from easy question to answer. We shall not attempt to do so in this paper, except in so far as it will be answered in the specimens given. Our object is to say something about it, not to define it. In doing this we will point out some of the classes into which it may be divided.

(1) *The Humour of Exaggeration.*—Exaggeration is perhaps the main element in American humour. The Yankees get the credit of being a nation of boasters, and some of the sayings of their wit bear out that reputation. Mr Lowell is an example in point. He tells us about a negro 'so black that charcoal made a white mark on him'; and in another place he describes a wooden shingle 'painted so like marble that it sank in the water'. He has many followers in working this particular vein. One writer gravely assumes his readers that he knew 'a tree so tall that it took two men and a boy to see to the top of it.' The same trustworthy chronicler met in his travels with a boat which 'drew so little water that it could sail wherever there had been a heavy dew.' Another came in contact with a man 'so heavy that his shadow, falling on a boy, killed him.' The consciousness of guilt to be attached to this abnormal murderer would tax the skill of many a clever jurist. Of course, such sights are not to be seen, and such people are not to be met, out of that highly favoured region known as 'down East.' There are born the men who are bound to 'whip all creation.' They fulfil their destiny in story-telling. Why fortune should be so kind to them is not apparent. Some would have to believe geography has something to do with the matter. The inhabitants of a large country must have large ideas and large modes of expression. In this little island we could hardly expect such happiness. It is told how a Yankee in England was afraid to take his morning walk, lest he should step off the edge of the country. Another was asked if he had crossed the Alps. He guessed he did come over some 'risin' ground.' It is quite in keeping with the wonderful character of these wonderful sons of 'down East' that one of their children should leave home at the tender age of fifteen months because 'he was given to understand his parents intended to call him Calch.' History is silent as to the fate of this prodigy. Doubtless, he will yet become President of the United States, if he has not set off on a tour of investigation to the moon. It may be, he wandered to Kentucky, and introduced the celebrated ointment which has given that State fame. This ointment has great efficacy.

If a dog's tail should by any mischance be cut off, it has only to be rubbed gently on the part where the caudal appendage used to wag, and lo! a new tail grows. It is quite likely he was the adventurous boy who plucked up an old tail and tried the ointment on it, with the result that it grew into a second dog so like the first that no one could tell which was which. This story reminds us of Josh Billings's testimonial to the efficacy of a certain kind of hair-oil: 'I rubbed a drop or two on the head of my cane, which has been bald for more than five years, and begged me' if I don't have to shave the cane handle every day before I can walk out with it.

These are some specimens of the humour of exaggeration. Many more could be given. We will only give two, both of which we saw lately in an American weekly. A man remarking on the cold weather, said: 'Cold? I should say so. Went home; lit a candle; jumped into bed, tried to blow candle out; couldn't do it; flame frozen, had to break it off.' The other describes a remarkable physical phenomenon: 'A man of our acquaintance—in fact, he was a cousin of Colonel McKimney drank so much chalybeate water for his health that once when in jail for stealing a cow, he opened a vein in his arm and extracted enough iron from the blood to make a crowbar, with which he broke his way out of prison.'

(2) *The Humour of Surprise.*—This is the ludicrous effect of the combination of sense and nonsense, or of absurd statements made with an air of gravity. Artemus Ward furnishes us with an example. He tells of a young man who claimed exemption from conscription 'because he was the only son of a widowed mother who supported him.' The use of incongruous words often gives rise to this kind of humour. Artemus in courting his beloved Betsy informed her that she was a 'gazelle,' which, he remarks, 'I thought was pretty fine.' In the heat of his love he passionately wished 'there were widders to my soul, so that you could see some of my feelings. There's fire enough in here to bile all the corn-beef and turnips in the neighbourhood. Vesuvius and the critter ain't a circumstance to it.' So warm a declaration deserved an equally warm response. Betsy did not fail. She did not beat about the bush. 'You say rite strate out what you are drivin' at. If you mean gettin' hitched, I'm in.' Artemus abounds in this kind of humour. At Richmond, after the siege, he met a 'culled pusion,' and asked him: 'Do you realise how glorious it is to be free? Tell me, my dear brother, does it not seem like some dream, or do you realise the great fact in all its livin' and holy magnitood?' The 'culled pusion' answered he would take some gin.

(3) *The Humour of Philosophy* is what in Scotland we would call pawkiness, dashed with a little wisdom. It accords well with the grave way Americans have of saying commonplaces as if they were some grand discovery; not but that these things are often cleverly put. Occasionally this philosophical humour takes the form of an epigram, as, 'Some people are fond of bragging about their ancestors and their great descent, when in fact their great descent is just what is the matter with them.'

Such people are to be found on both sides of the Atlantic; they are by no means rare in this age of snobs. The touch of cynicism here is repeated in Dod Dilex's well-known sayings: 'It is wicked to cheat on Sunday; the law recognises this fact, and shuts up the shops;' and, 'The symbol of charity should be a circle; it usually ends where it begins at home.' Josh Billings is the best representative of this kind of humour. Some of his witty and wise opinions have a charm peculiar to themselves. They are in a special sense racy of the soil. According to him, 'It is dreadful easy to be a fool; a man can be a fool and not know it.' The vacuous youth and the masher hero of our day may be nothing the worse of reading, learning, and inwardly digesting this truth. 'If I was asked,' writes Josh, 'what was the chief end of man nowadays, I should immediately reply: "Ten per cent." His views on 'female eddikashun' are worthy of notice. 'I haven't any doubt that you could eddikate wummin so muchly that they couldn't know any more about gettin' dinner than some ministers know about preaching; and while they might translate one ov Virgil's Eklags to a spot, they couldn't translate a baby out ov a cradle without it cum apart.' Nobody will quarrel with him for holding that 'there iz 2 things in this life for which we are never fully prepared, and that iz twins.' Nor can any one doubt that 'misfortin and twins brin' brin' cum singly.' From these and other Josh's original deliverances, we might conclude that Josh would agree with Sarah Camp in thinking life a wilderness where joy is quite unknown, did he not take care to warn us against such a mistake. "Man was made to mourn"—this was the private opinion of one Burns, a Scotchman, who was eddikated to poetry from his infancy. I and he differ, which is not uncommon among grate minds. . . . Man weren't made tew mourn; man was made tew laff."

(4.) *The Humour of Spelling.*—Many of the American humorists indulge in eccentricities of style, laughing at the laws of grammar and spelling. It is plain there is not much fun in writing 'hence 4th,' or in putting 'gookin' for joking; yet in some cases there is a good deal of humour hidden behind the bad spelling. In the *Biglow Papers*, the spelling reproduces a characteristic dialect; but usually it is only a mechanical mode of raising a laugh. It is so also with Artemus Ward. Take, for example, the showman's letter to a country editor:

'I shall hav my handbills dum at your offiss. Depend upon it. I want you should git my handbills up in flamm stye. Also git up a tremenious excitement in yer paper 'bout my onparaleld show. We must fetch the publicshunow. We must work on their feelins. Cum the moral on them strong. Ef it's a temperance community, tell 'em I sined the pledge fifteen minits arter Ise born; but on the contrary, ef your peple take their tots, say Mr Ward is as jenal a feller as we ever met, full of conviviality, and the life and sole of the soshul bored. Ef you say anythin 'bout my show, say my snake is as as smart as the new born babe. What a interestin study it is to see a zewological animil like a snake under perfect subjeckshun! My kangaroo is the most lariable little cuss I ever

saw. All for 15 cents. I am anxysus to skewer your infloence. I repeat in regard to them handbills that I shall get 'em struck orf u top your printin offiss. My peritleral sentiments agree with yourn exactly. I know they do, becavz I never saw a man whoos didn't.—Respectfully yures, A. WARD.'

This kind of spelling has become so associated with American humour, that it is now generally regarded as part of it. Some defend it on the ground that it is the writer's only way of rendering the characteristics the actor can represent by his voice and manner.

This is but a brief and incomplete treatment of a large subject. It does not claim to be exhaustive; it only seeks to state something about, and give some specimens of, American humour, in order to induce the interested reader to follow out the subject for himself.

A TRADITION OF COTTLEY HALL.

CHAPTER V.—A DOUBLE SURPRISE.

TWELVE o'clock struck. The flagon was nearly empty, and Major Brand's head and arms reclined upon the table, as if slumber had overtaken him. With Everett it was different. True as steel to the friend who had sought his protection, he still watched, pondering over the probable chances of Cunningham's escape. The wind still blew high; but Hugh Everett heeded it not; he was warily counting the measured tick of the clock, and inwardly hoping that the morning would relieve him of his unwelcome guests. Some unaccountable attraction seemed to fasten his eyes on the secret panel, and his fancy became so powerfully excited that he momentarily expected to see it open and the figure of Cunningham issue forth. This peculiar fascination might have continued until the Master dropped asleep through sheer exhaustion, had not his lethargy been dispelled by a sudden crash coming from behind the wainscoting. Everett rose quickly to his feet and gave a dismayed glance at the recumbent form of Major Brand. The officer's face was hidden, but his position, indicative of profound repose, remained unaltered. The Master hesitated, stopped to listen to the slumberer's low breathing, and then cautiously approached the hiding-place. In a minute, the scene was changed. Suddenly springing to his feet and throwing open the door, the officer shouted for his subordinate.

'Where are the men?' demanded Brand.

'Down-stairs,' answered Humphries, in a voice thoroughly suited to his granite-faced aspect. 'They would not be withheld from the strong drink, and it hath overcome them.'

'How many sentries are there outside?'

'But two, your honour.'

The Republican officer uttered a fierce execration. 'Lock the door, Humphries!' he vociferated. 'We must settle this matter by ourselves.'

'What do you mean to do?' faltered Everett with bloodless lips.

'Bring hither your musket, Humphries. Batter the wall; and if the wood sounds hollow, beat it in.'

The Master sank helplessly into a chair, and vainly endeavoured, by covering his ears, to shut out the distracting sounds which accompanied the fulfilment of this order. Looking up after a short space, he became aware that the work was accomplished, and that a fresh drama was about to be enacted before his very eyes. On the floor lay the trooper's broken gunstock, which, wielded by his powerful arm, had produced a deplorable effect upon the panelling. An opening several feet square was now visible in the fractured oak. A cold tremor crept over Everett's limbs, and seemed to deprive him of the power of motion. He watched the movements of the Republican officer and his followers, silently, listening meanwhile to their voices as one who hears in a dream.

'How is this?' said the major. 'I cannot see the bottom of this Cunningham pit.—Hold out the light, Humphries!'

An exclamation from both parties simultaneously followed.

'Yonder is a doorway!' ejaculated the trooper. 'Praised be the Lord, we have the Amalekite now!'

'Not yet,' quoth Brand. 'A pit yawns before us. How are we to cross it?'

'Beat a hand with that, worthy sir,' said Humphries, pointing to the long table. 'We'll soon make a roadway.'

By the united exertions of the two men the legs were quickly knocked off this useful article of furniture—some of Hugh Everett's particular treasure—which was then forced into the gap and laid across the chimney aperture.

'Take my pistol,' said Brand. 'Show the light on yonder doorway; and if the Malignant attempts to stop me, shoot him dead!'

Everett closed his eyes, and gave Cunningham up for lost, little doubting that a few more minutes would decide his fate. Humphries knelt down, and with the one hand casting the light of the lamp full upon the entrance to the priest-hole, levelled his leader's long pistol with the other, and awaited the result. The Republican officer drew his sword and crossed the improvised bridge without any resistance. Roused to the highest pitch of anxiety for his friend's safety, Everett staggered towards the opening, only to see Major Brand come back begrimed and disappointed. *The priest-hole was empty.*

CHAPTER VI.—THE END OF THE GAME.

It is a favourite axiom with most people that a state of suspense is immeasurably worse than an absolute knowledge of the most dreadful certainty. The anxious time which had elapsed since their first alarm had been felt far more keenly by Cunningham than by even his sorely tried friend. The reckless disposition of the Cavalier was not proof against such emotions, and the faint sounds which occasionally reached

him served only to heighten his suppositions and make him become a prey to distressing doubt. More than once he had had recourse to Everett's leather flask, and the potency of its contents, while sustaining him throughout this ordeal, at length began to have an emboldening effect upon his nerves. Placing the flask in his pocket, he rose, and cautiously advanced until his feet encountered the beam that crossed the chimney. It was here that Cunningham became aware of a narrow streak of light, evidently issuing through a crack in the panel by which he had first entered on the opposite side. Guided solely by the sense of touch, he crept along the beam, and applying his eye to the crevice, saw enough to convince him of the near proximity of danger. Through the limited space afforded him for eyesight, he could just discern a strongly built man in military costume reclining in a position suggestive of his stopping there all night. Facing him was another person, whom Cunningham with little difficulty made out to be Master Hugh Everett. After satisfying himself thus far, the fugitive turned away, and was endeavouring to regain his former quarters, when a slight cracking came from the farther end of the log. In a moment Everett's warning, 'Trust not to it overmuch,' flashed across his mind. He made one desperate effort to reach the ledge, when with a crash the rotten beam gave way, and he was precipitated down the black chasm of the deserted chimney.

A belief had been prevalent amongst Cunningham's friends that this adventurous gentleman was gifted with no fewer than nine lives. His invariable good fortune had not left him, for it was not even now destined that he should leave his bones at the bottom of Cottley chimney. The young royalist's precipitate downfall was sharply arrested by a large beam, across which he fell with a stunning shock—a beam similar to that which had just broken beneath him. Mechanically grasping it, the Cavalier, terribly shaken by his fall, lay for some time as if dead, happily unconscious of the thundering sounds which echoed from the fractured library panels above. At length, however, a few splinters of wood reached the beam upon which Cunningham rested, and these at once awoke his dormant energies. Feebly moving his stiffened limbs, the fugitive strove to restore his blood to some degree of circulation; and being partially successful in his efforts, he crawled a foot or two along the beam until his advance was stopped by the cold bare wall. The noise, together with the fall of rubbish, had now ceased, for a pause had been made in the attack, and Major Brand was preparing to cross. This fact, coupled with the scattered state of his senses, prevented Cunningham from taking the alarm that he would otherwise have done. Turning himself, the Cavalier once more crossed the black gulf, but only with the same result. On neither side was there the slightest projection by which he could effect an ascent. It happened, however, at this moment, as the much-enduring Cavalier was seated astride the beam, pondering moodily over his unpleasant situation, that his legs, which were dangling beneath him, struck against an iron rod, that descended from the log on which he sat into the unknown depths below.

'Good-luck !' quoth Cunningham, whose blood again glowed within him. 'There are two ends to a stick ; down or up is all the same to me.'

Letting himself drop from his resting-place, the fugitive began his descent, and in a second or two his feet touched the ground, and Cunningham stood helplessly in the darkness, uncertain whether to advance, for fear of being precipitated into some invisible pit. Suddenly, as if by magic, a little speck of white moonlight gleamed from a rack of clouds, and casting a solitary gleam through an opening in the face of the wall. Taking heart, Cunningham stepped forward, and with out-tretched arms, slowly traversed the long unseen expanse before him. The flags beneath his feet were slippery with fungus, and the close decayed smell which hung about the place aroused a suspicion that the disused kitchens in their present condition could scarcely be conducive towards the good health of Master Everett in the Hall above. Onward, still onward, traveling lightly, yet occasionally stumbling over pieces of rotten lumber, until an abrupt collision with the hard wall warned him that he could go no farther. Nothing daunted, Cunningham placed his hand upon the old stonework, and was about to continue his exploration, when his movements were checked by the appearance of an unexpected phenomenon. Far away in the direction from which he came, the speck of moonlight still spangled the floor; but now there hovered over it in the darkness a red, a ghastly, red like a hand evil star, which seemed to glare out of the moon look. He was not long left in doubt as to the nature of this mysterious apparition, for the light began slowly to approach him, and a heavy step sounded on the stone floor. Cunningham thought of his pursuers, and instinctively clutched at his sword-hilt; but as the light gets nearer, he perceives that his bearer is alone.

'Hugh Everett!' he cries, starting joyfully forward.

'Halt there !' answers a harsh unknown voice
'I know you, Walter Cunningham. Down with
your weapon ; surrender yourself !'

'Keep that word for your own crew,' retorted the Cavalier, shrewdly guessing who the speaker was. 'You are a liar; you do not know me. Put down that lamp, and come to knocks first.'

Drawing his sword in a moment, Brand rushed at the royalist, intending to overcome him ere any resistance could be offered. This movement, which had been anticipated, was now as promptly encountered. The Republican's thrust was nimbly avoided, and so severe a blow dealt him in return, that he was brought to his knees. But the victory was not yet won. Instantly recovering himself, Major Brand attacked his opponent with such determined ferocity, that it was only there state of partial darkness that saved the latter from almost certain defeat. Several slight flesh-wounds were both given and taken in the blind fury of the encounter, and Cunningham did not feel confident of coming off best man even while he brandished the trusty blade which had borne him company so long, when, as it suddenly snapped off close to his hand, there seemed but little doubt that they had come to the end of the

game. As a last chance, he threw aside the useless hut, and flinging himself on his stalwart adversary, strove to beat him to the ground. Although a perfect match for his opponent in a general way, the serious disadvantages under which the Cavalier laboured forbade this present unequal combat being protracted to any length. Many severe privations and no little amount of fasting had reduced his strength to an unusually low ebb. Not so Major Brand; the Parliamentary building was well fed and as powerful as a lion, and the desperate grapple must have ended by his eventually overcoming the obstinate resistance of Cunningham, had not an accident occurred which brought the duel to a sharp termination. As they wrestled and caught at each other, the Republican made a false step, slipped, and fell backwards, striking his head with terrific force upon the stone flags. The struggle was over.

Having satisfied himself that the vanquished man was not likely to make a poorly received Cunningham took the lamp and proceeded to the dimly lighted chimney by which he had descended. On surveying the spot, he found that he must have unwittingly alighted in the centre of a huge fireplace, which had no doubt been used for cooking many mighty armies of beef in the days of 'Good Queen Bess.' His late antagonist had evidently come down by other means, for the end of a ladder let down by a couple of ropes was visible. It was the appliances which helped the Republican officer to prosecute his search, leaving Humphries meanwhile at a guard on Master Eyreton in the room above. Rightly guessing that assistance would be within hail, though the reason for his adversary's coming alone puzzled Cunningham, not a hint, he promptly decided to leave the place, if possible by a different way from which he came. With the Republican's sword he cut the ropes fastened to the ladder, and exerting all his strength, succeeded in carrying it from inside the chimney, and placing it beneath the opening, which he had noticed in the face of the wall. Returning after this to the still senseless Brand, he effected a partial change of clothing. He then ascended the ladder, and squeezing himself through the opening, which communicated with the level of the ground outside, stood out upon the sodden grass a free man. Turning himself, the fugitive royalist took one look at the old Hall, bathed in silvery moonlight, and with a mental hope that his movement would be unobserved, he trode away beneath the black shadow of the trees, leaving Cutley, as he thought, for ever.

Many years elapsed before Hugh Everett heard any tidings of the nocturnal visitor he received on that eventful night; and in the meantime he suffered greatly from his disinterested kindness. Although actual proof was wanting, suspicion pointed to him as the aider and abettor of the Viceroy Cunningham; and consequently a heavy fine was imposed, which ate up the greater part of the revenues of the manor of Cotleigh. Not until the Restoration, nearly nine years after the events we have recorded, did the two again behold each other; and by this time Walter Cunningham was high in favour with the restored king. Their meeting was one

long to be remembered; and Everett, as he gazed at his friend's face, felt that even those nine years of trouble had not been ill spent in securing his safety; while Cunningham (now Sir Walter), who brought with him an order from the Crown restoring everything that formerly appertained to the property, would have procured twenty such, had he been able, in return for the service rendered him on the night when he made acquaintance with the 'priest-hole' of Cottley.

OCCASIONAL NOTES.

THE FREE STATE OF THE CONGO.

IN connection with the return of Mr H. M. Stanley to this country, and the publication of his book giving a record of his six years' labours on the Congo River, the notes by Mr E. Delmar Morgan, in the *Proceedings of the Royal Geographical Society*, possess considerable interest. We learn there the beginning of the movement which has secured for civilisation and commerce that immense territory in Western Africa called the Free State of the Congo.

Leopold II., king of the Belgians, has all along shown a special interest in the study of geography and for that purpose, and travel, visited, in September 1876, representative geographers to a conference in his royal palace, Brussels, to discuss the question of the exploration and civilisation of Africa by the opening-up of it to commerce and legitimate enterprise, and by the stamping out of the slave-trade. As a result of a three days' conference amongst these representative geographers from six European nations, an International African Association was formed. But as far as England was concerned, international co-operation was of short duration, the Royal Geographical Society preferring to pursue its own path. The result of this was that in the 'African Expedition' of 1879, by means of which Mr Keith Johnston, and his successor Joseph Thomson, were sent out to Africa.

The central committee at Brussels, over which the king of the Belgians presided, likewise organised from time to time seven large expeditions from the east coast towards Lake Tanganyika. The exploration of the Congo by Stanley gave a new direction to these efforts and called attention to the western coast; although this geographical feat cost twelve thousand pounds, besides the depreciation of the loss of one hundred and seventy-three lives.

In 1879, Mr Stanley went to the Congo as commander-in-chief of the International Association, with a view of opening up that river. It became necessary, as the undertaking developed, to obtain from the power, the recognition of the sovereign rights of the Society acquired by treaties from the native chiefs of the Congo, and these rights had to be defined in legal form. The President of the United States in 1884 was authorised to recognise the Society's flag as that of a friendly government, and France followed with this recognition. In the recent conference on West African Affairs at Berlin, important regulations were laid down for the establishment of freedom of commerce in the basin of the Congo and outlying regions. The Congo State was

formally recognised; and its authority is now supreme over five thousand miles of navigable water. The Congo River is estimated as discharging into the ocean a tribute almost equal to the Nile and Mississippi taken together. There is an annual subsidy of forty thousand pounds in perpetuity from the king of the Belgians, to assist the revenue of the state, which is expected to be raised by rent for land leased to traders and others on the banks of the river, and by export duties. No toll or passage dues are levied, and there will be no import duties for twenty years to come. Natives and white men are placed upon the same footing; all religions are tolerated; while the slave-trade is proscribed. Treaties were at the same time concluded with England and the chief European nationalities to recognise its flag as a friendly state.

Mr Stanley, who has done so much to bring the affair to a successful issue, has been appointed governor, while there is a probability that King Leopold will assume the title of sovereign of the state. When properly developed, Mr Stanley considers that the Congo river, which, previous to the delimitation, was estimated as containing one million three hundred thousand square miles, and a population of about forty million souls—ought to yield a trade of one hundred million pounds. Treaties have been made with four hundred and fifty chiefs, who receive each an annual subsidy of ten pounds, on condition that they place no obstacle in the way of the free navigation of the river, and submit their disputes to arbitration. By the convention with Portugal, this power gets the south or left bank of the Congo for a distance of ninety miles from its mouth. Stations have now been built and established for nearly fifteen hundred miles into the centre of Africa, and in all probable railways will be made for it, further development.

Who can forecast the future of this immense territory? How to gain new markets and what to do with our surplus population, are two problems of the age. The opening-up of regions like the above is one answer to them.

CYCLES.

While France and America have claimed the invention of the bicycle, there is also ground for believing that Scotland has some claim as its birthplace. As early as 1846, Mr Gavin Dalzell, merchant, Leamalgaw, Lanarkshire, a man of great mechanical talent, had a bicycle of his own invention in daily use. It went by the name of the 'Wooden Horse,' was made chiefly of wood, in a strong and substantial manner, the only considerable difference between this machine and an ordinary bicycle being that the steering-wheel was much larger than that in present use. The saddle was so low that the rider had both feet on the ground at starting. Stirrups of iron hung from the forepart of the saddle, which were connected by means of iron rods with the cranked axle of the driving-wheel. Previous to this invention, Dalzell had also constructed a tricycle, which was propelled in a very novel manner, the pedals, called wheels, being moved by a treadle movement, and connected to the pedals by a rod, were in use about 1850.

The immediate predecessor of the bicycle and tricycle in this country was the Dandy or Hobby-horse, in use about the beginning of the century, on which the rider used to sit and paddle himself along with feet on the ground. Through the ridicule of the caricaturists and for other reasons, it speedily fell into disuse. For the practical development of cycling we have to come to comparatively recent times. The crank-action having been introduced into machines made of iron in 1862 by M. Michaux, during the Paris Exhibition of 1867 the use of these machines had become fairly popular. Two Englishmen were one day admiring the evolutions of a velocipedist in the Luxembourg Gardens, when the desire for the possession of a machine occurred to both. One of these gentlemen, Mr Charles Spencer, author of *Bicycles and Tricycles Past and Present*, was then the amateur champion gymnast of England, and to him it is said belongs the honour of introducing the bicycle to London in 1868, where it attracted considerable attention. The successful introduction of the bicycle led to the invention and improvement of the tricycle; and now scarcely a season passes without some improvement in utility and good workmanship in connection with both machines.

While speed is affected a good deal by the state of the road, the style of machine, the absence of a head-wind, and the practice of the rider, an amateur has been known to ride upwards of twenty miles in an hour. A tricyclist has been known to do one mile in three minutes thirty-four and a half seconds. Both the literature and the manufacture of bicycles and tricycles are now most extensive, and more than keep pace with the demand.

There is a Cyclists' Union, to which any rider, amateur or professional, is eligible on payment of one shilling. The Cyclists' Touring Club had increased to more than twelve thousand members in 1883.

The law as to cycling forbids riding upon any footway, pavement, or causeway set apart for foot-passengers; insists upon the carrying of a lamp while riding between sunset and sunrise; the sounding of a bell or whistle in passing carts, carriages, or horses; or in riding through the streets of a town; and the law forbids where any horse is rendered restless and frightened. Two or more bicyclists shall not ride abreast when passing or meeting any vehicle or horseman.

SIR SPENCER WELLS ON CREMATION.

Sir Spencer Wells recently delivered an address at the Parkes Museum of Hygiene, when the chair was taken by Sir Lyon Playfair, M.P. In the course of his address, Sir Spencer said that as to burial within our churches, abbeys, and cathedrals, he asked them to consider for a moment what incalculable advantages cremation would give over the present system of mousing the dead body in lead and oak and leaving it beneath the floor, where priests and people attending public worship were exposed to more or less danger for months or years from the poisonous emanations which must escape so long as more than the dry bones remained. Last Saturday the Lord Mayor was left in the crypt of St Paul's, his body to undergo slow decay,

with what amount of injury to Dean and Chapter or to successive congregations no one could tell. It might be small, it might be great, but dangerous it must be. Supposing that instead of placing the coffin in the crypt, at the same part of the burial service it had been passed into a crematory chamber and the remainder of the service had followed, by the time the funeral oration, or one of those eloquent sermons with which Canon Liddon kept congregations spell-bound for an hour, was over, and the concluding hymn had been sung, or the *Dead March* had been played, the silvery-white pure ash, which, after one short hour, was all that remained of a purified body, perfectly inoffensive to the living, might be left unchanged for centuries in any such cinerary urn as might be seen in the British Museum, beautiful in form, and with inscriptions which, as historical records, were mediocrally more permanent than anything of modern fashion. What might St Paul's and Westminster Abbey be, if, instead of the coffins with their corrupting contents, occupying large space, and a source of danger to the living, we had the ashes only admitted, arranged in the urns along the sides of the cloisters, or in chapel or crypt, or beneath memorial windows, slabs, or brasses. We should have the same change in graveyards and cemeteries from danger and disgust to health and beauty, when the overcrowded cemeteries of to-day were converted into the God's-acre of the future.

ONE DOG SAVED BY ANOTHER.

We have received the following interesting narrative from a correspondent in Greenock, who thus writes: "A remarkable case of life-saving by a dog occurred last summer in Greenock, in a timber pond attached to a sawmill. The strip of land upon which the sawmill is built presents a frontage of about fifty yards to the public street, and extends fully two hundred yards towards the Clyde. Two-thirds of the ground is wet ground—that is, ground entirely covered by water when the tide is in. Three sides of this portion are inclosed by a stout paling, through which inclosure the tide ebb and flows. The fourth side is formed by a perpendicular embankment of four feet deep, which also forms the termination of the dry ground. The inclosure, or "pond" as it is called, is used for storing timber afloat. At high water, the floating timber and dry ground are nearly level. And as at the time of the following incident the pond was closely packed with timber, there seemed at high water to be little apparent difference between dry ground and wet ground.

For several days two dogs of the bull-terrier kind, whose owners were at work in one or other of the adjacent wharves, were enjoying themselves in their mutual absence by chasing each other in play, rushing impetuously hither and thither, sometimes along the street, occasionally making a dart into the yard round about the sawmill, and as suddenly disappearing again out to the street, and up one of the many closes at hand. One of these charges led to a rather sudden and somewhat disastrous termination. It was high water. In at the gate of the sawmill premises rushed the two dogs, the one close at the heels of the other, across the

yard and on to the floating timber. One of them was soon made aware of the instability of its footing, by its slipping into the water between two logs which were floating a few inches apart. The two logs between which the dog fell were floating on their corners, and therefore formed a slope on each side like the letter V, which caused the dog to slip back into the water at every effort to scramble on to the top side of its temporary prison wall. Its more fortunate companion retreated to dry ground; but on seeing the struggles of its friend, it at once returned, and, by intelligent gesture, invited it to *terra firma*. The efforts of the unfortunate dog were of no avail; still it persevered, during which time the other had twice returned from and to dry land. On making the third visit, it seemed to grasp the situation, for with its teeth it at once caught its submerged companion by the back of the neck, and assisted so effectually as to enable it to scramble out of the water and join in another romp, but not within so small premises. They were never afterwards seen within the gate, confining their fun to the streets on all subsequent occasions.

It may be of interest to note that it was a male dog which fell into the water; the other, its rescuer, was of the gentler sex.

CURIOUS PROPERTIES OF COAL-GAS

Mr Thomas Fletcher, Warrington, in speaking of 'Some Curious Properties of Coal-gas,' said that until lately people had been under the impression that gas was merely a means of obtaining light, and even for this purpose it had been, and still was wastefully used. Ordinary-sized sitting-rooms were sometimes lighted by three or four burners, each being enclosed with opal or ground-glass globes, which wasted about half the light. Now, his own sitting-room was very well lighted by one No. 8 Bunsen's burner. People were not generally aware that one large burner, consuming eight feet per hour, gave far more light than two separate burners each consuming four feet per hour; and that one burner without shade was about as good as two with opal or ground-glass globes. A burner if placed at such an angle as to give a flat or saucer-shaped flame, greatly increased the light, but was liable to smoke if turned low. In the case of smoking of ceilings, the gray or brown discoloration was, he thought, caused only by the dust in the air being more or less burnt, caught in the ascending current of hot air, and thrown against the ceiling.

Mr Fletcher evidently prizes what he preaches, and the cooking, heating, and lighting in his own home are done by means of gas. In his house of fourteen rooms, with an average of ten persons, his gas bill in 1883 was twenty-one pounds, at three shillings and fivepence per thousand cubic feet. Of this sum, eight pounds went for lighting; three pounds ten shillings for cooking; one pound for bath-heating; and eight pounds ten shillings for gas-fires. The cooking and heating by gas saved him at least one servant, while his coal-bill averaged twenty-seven shillings for eighteen months. As to quality of cooking and convenience, there could be no possible comparison between gas and any known fuel. But Mr Fletcher admits that if we exclude the ques-

tion of labour and dirt, gas-fires are still more costly than coal; but their convenience, cleanliness, and perfect control over heat will more than outweigh this fact with many people.

THE MONTH:

SCIENCE AND ARTS

It will be remembered that last year Mr Ellis Lever offered a prize of five hundred pounds for the best safety lamp for the use of miners. In the result, no lamp sent in for competition fulfilled the required conditions, so that the prize was not awarded. But we may be quite sure that the offer did much good in turning the attention of inventive brains to a much-wanted help to our poor miners. The same gentleman now offers a similar sum to the discoverer or the inventor of a safe and efficient substitute for gunpowder in mines. Unfortunately, gunpowder is cheap and does its work well; but there is little doubt that to it must be attributed many of those sad explosions by which, during the past twelve months, nearly five hundred lives have been lost in this country and abroad. Unless, therefore, the hoped-for discovery points to some substitute which is cheap as well as effective, we cannot hope that it will be received with any great favour. Some short time ago there were favourable reports published of the behaviour of the lime cartridge, which owes its efficiency to the addition of water instead of fire. This cartridge is of course above suspicion so far as explosion is concerned; but like many other so-called 'innovations,' it has not been generally adopted in our collieries. There are many who urge that the use of gunpowder in our mines should be rendered illegal; and although its abandonment would probably lessen the output, the workers would be relieved of one of the risks attending their unenviable lot.

At a recent meeting of the Royal Geographical Society, Mr Comber gave an interesting account of his travels in the region of the Upper Congo. For the last eight years Mr Comber has been in Western Africa, originally going to the country as a medical missionary of the Baptist Missionary Society. With some of his unselfish brethren he pushed up the river for four hundred miles above Stanley Pool, covering a district never before explored except by Stanley himself. With regard to the health of Europeans in this country, he distinguished between the several sections of the river. In the delta and on the coast near the river there are large numbers of European traders from every country, who seem always well and to possess some charm against fevers. In the central region of the river, between Vivi and Stanley Pool, about two hundred Europeans had found their home during the past six years. Of these, perhaps twenty-five per cent. had died, generally from fever. Thirdly, the Europeans in the Upper Congo, numbering about thirty, have enjoyed good health. It is interesting to note that the steamer in which Mr Comber travelled was built at Messrs Thornycroft's works at Chiswick on the Thames, and was taken out in sections and put together on arrival at Stanley Pool.

According to the *New York Christian Union*, the small coin used in many parts of Mexico is of a somewhat peculiar character. It consists of small tablets of soap stamped with the government mark. These tablets can be used for washing purposes so long as the impression is not rendered illegible.

Another novelty which is common to the Mexican Indians is worthy of notice. These warriors, we are told, make a serviceable shield out of a blanket by wetting it and holding it by its upper edge to screen their bodies. A bullet in striking such an obstacle will not pierce it, but will merely cause it to sway back. The blankets are hand-woven and are very thick. A few experiments would soon determine the efficiency of this curious shield, which, if successful, might be utilised by our own troops.

A great many frauds have recently been perpetrated upon pawnbrokers and others by means of a new alloy made to imitate nine-carat gold. It is composed of copper, tin, and platinum, and will resist the ordinary acid test. When formed into coins it will agree in weight, and ring with genuine gold; and it is believed that a large number of spurious sovereigns are at the present moment in actual circulation, composed of this 'mystery gold,' as it is termed.

The lives of the poor horses upon the street tram-lines are hard and short. A very few years of the work the hardest part of which is the effort necessary in starting the heavy vehicle into motion—renders them unfit for further service. All lovers of animal-welfare therefore rejoice in the rapid adoption of steam in place of horse-power for this purpose. In many of our provincial towns the trams are entirely worked by this new form of iron-horse, which is as silent as its living prototype. Only last month the Wigan Tramway Company sold off its entire stock of horses. During the past three years their tramways have been worked by engines and horse-jointly, and the experience thus gained has shown most conclusively that coal is cheaper than muscle. The Wigan Tramway Company would do well to make note of this, and thus put an end to the cruelty enacted day after day on the steep inclines of our northern capital.

The Exhibition of Amateur Photography in London proved to be so great an attraction that it was kept open for a fortnight longer than at first intended. The great number of pictures sent in for competition—nearly sixteen hundred—shows what a hold this beautiful art has taken upon the public taste. Many of the works shown were of the very highest class. The amateur with means and leisure has far better opportunities of gaining distinction in this art than the busy professional photographer, who must, to secure patronage, run in one groove and remain a fixture in his studio.

Now that it is possible to secure pictures of all kinds of object in motion, from a flash of lightning to the gliding breaker on the sea-shore, appliances to make matters easy for the ubiquitous photographer are constantly being brought forward. One of the most ingenious of these is the Camera Clip, introduced by Messrs Oakley of Bernumsey, London. This is a little

contrivance with a clamp and a universal joint which will fit upon anything from a tricycle wheel (at rest) to the knifeboard rail of an omnibus. To this is readily screwed the photographic camera. The traveller can thus dispense with the cumbersome tripod stand, and can place his handy apparatus wherever he pleases.

A powerful hydraulic press has lately been constructed by Sir Joseph Whitworth & Co. for the purpose of compressing teak and making it hard and close-grained, so that loom shuttles can be constructed from it. The high price of boxwood, formerly used for this purpose, has rendered it necessary that some cheaper material should, if possible, be found which will answer the same end. The press subjects the teak to a pressure of about fourteen tons to the square inch. Under the operation, the wood becomes very dense, and is susceptible of a high finish. It would be interesting to know whether this compressed wood can be rendered serviceable for engraving purposes. Many woods have been experimented upon in this direction, owing to the high price of the boxwood ordinarily used, but with indifferent success. Many are of the opinion that automatically engraved blocks will presently reach such perfection that the art of the engraver will be lost. But those who are best qualified to give an opinion upon the subject are of opinion that much yet remains to be done. The wood-engraver finds his occupation gone.

Sixpenny or rather half-frame tickets are now issued at the Paris post office which entitle the holder to the privilege of five minutes' conversation per telephone with a friend at any other post-office or telephone station at a distance. Our own postal and telephone authorities would do well to make a note of this. Hitherto, they seem to have been at loggerheads with one another, and between the two stools the public interest has fallen to the ground. It is certain that our telephone system is at present far too exclusive, and the Companies will soon find out, as the railway Companies have already done, that in serving the interests of the masses, they will best serve their own.

Some interesting particulars have lately been published relative to the different kinds of leather for bookbinding, based on observations recorded in the Printed-book department of the British Museum. Like most other things in this age of rapid production and cheap manufacture, the quality of English leather has deteriorated during the past hundred years. Processes have been introduced for tanning leather quickly, and the resulting material has suffered. Morocco leather, made from the hides of the sheep, the goat, and the seal, is the most durable. These skins are tanned with smumach, a plant which is common in South America as well as in Southern Europe. Next to morocco comes rosen in point of durability; but it will be a surprise to many to find that the so-called Russian leather is the least lasting of any. Among the curiosities of binding in the Museum are—a book bound in deerskin, dated 1485, still in good condition; one bound in the skin of the kangaroo; and several in tanned pigskin, all of which have lasted well.

A new method of packing materials which

are liable to injury by contact with the air has been published by an American paper. It is there stated that a German firm supplies different chemicals, chloride of lime, for instance, treated in the following manner. The material is wrapped in strong paper and sealed up. The package is then immersed for a moment in a bath of resin which is just warm enough to keep it in the liquid state. Another outside coating of paper completes the operation. It is obvious that many perishable commodities—deliquescent salts and the like, which are now supplied in bottles—could be conveniently treated in the same manner.

The powerful antiseptic action of perchloride of mercury (corrosive sublimate) has of late years attracted much attention. Dr Sternberg has in recent Reports to the American Public Health Association given the results of his observations upon the efficiency of the salt, which confirm previous experiments. He asserts that an aqueous solution of the mercury salt in the proportion of one in ten thousand is strong enough to insure the destruction of microscopic germs in active growth not containing spore; and that if the proportion be increased to one in one thousand, it destroys the spores too, provided that its action is continued for a certain period. The stronger solution is also a reliable agent for the disinfection of bedding, for the washing of floors and walls of infected rooms, for the hands and instruments of surgeons, and for the treatment of wounds, but for continuous application to wounds, the weaker solution is preferable. For the thorough disinfection of offensive fluids, and any fluid material supposed to contain germs, he recommends a solution of one in five hundred, containing the same quantity of potassium permanganate (fandy fluid). In all cases, these mixtures require a certain definite time during which they must be allowed to act, or they will not effect the purpose in view.

Mr Samuel Morley has, recently, in a lecture to villagers, endeavoured to urge upon the labouring class the value and economy of a vegetable diet for children. The *Lancet* in commenting on the lecture indorses Mr Morley's remarks, and points out that a child's body, consisting as it does principally of fluid and fatty components, and, in a healthy state, of moderate degree of active life, requires a nourishment which goes rather more to the building-up of its constituents than to the speedy of their functional expenditure, so that the child requires inert materials, such as bread, vegetables, &c., for the laying-on of substance, far more than meat. It is pointed out, too, that a child's food must be abundant, and thus in poor homes is, of course, far easier of attainment with vegetables than with meat at its present price.

There have been in past times many attempts to acclimatise the tea-plant in Italy; and the French consul at Naples has, in his last Report, given several interesting particulars relative to them. Hitherto these attempts have only resulted in failure, although in some few districts plants have been grown in the open and have thriven for a short time. The government are, however, not discouraged by previous disappointment; and the Italian Minister of Agriculture has sent a large

order to Japan for material wherewith to try fresh experiments. This course has been taken at the instance of Professor Beccari, who has studied the growth of the tea-plant in the countries in which it is indigenous. He is of opinion that previous failures in Italy have been due to errors in culture. For instance, the plants have been reared in the shade; whilst in India and China they are planted on open ground in the full blaze of the sun. The soil, too, in which the plants are grown should contain a large proportion of sand and oxide of iron. Professor Beccari believes if these and other details of culture be attended to, and if the plants to be imported are brought from the coldest provinces of Japan, that Italian growers will meet with success in their next attempts.

In 1877, a circular was issued to the railway Companies by the Board of Trade, pointing out that three-fourths of the railway accidents reported to the Board were traceable to the want of continuous brakes. The Board further pointed out the conditions essential for a good continuous brake—namely, that it should be efficient in stopping trains, instantaneous in action, self-acting in case of accident; that it should be regularly used, made of durable materials, and easily kept in order. A return has just been made by the railway Companies, in accordance with the Act of 1878, respecting the use of continuous brakes on their vehicles. From this we gather that the total amount of rolling-stock fitted with continuous brakes up to the end of last year was seventy-four per cent. of engines and seventy-seven per cent. of vehicles. The entire stock of the Metropolitan district line is fitted with the Westinghouse brake. The G. N. R., the L. N. W., the L. B., and S. C., the N. E., the N. London, the Metropolitan, and various Scotch lines are among the other Companies who deserve honourable mention in compliance with the conditions of the Board of Trade circular.

Mr Matthew William, writing in the *Gentleman's Magazine*, says: "The Report of Dr Sprague on 'marbled beef' assures us that cattle-breeders can manufacture this novelty at the public will purchase it, and speaks of rearranging the distribution of fat and lean as freely as a manufacturer of wall-papers or a calico-printer may rearrange his blocks to bring out new patterns for the forthcoming season. As the *Times* remarks: 'The stockyard has become a sculptor's studio, in which living matter is moulded according to the artist's discretion.' Instead of placing the fat of our prize cattle in huge unmanageable lumps as heretofore, we are to have it regularly interlarded with the muscular fibres and fasciculi, forming marbled, ribbon-patterned, streaky beef; and this is to be effected by scientific feeding and the survival of the fittest; by faithful and vigorous application of Darwinian principles. The *Times* tells us that 'the most splendid marbling is as fleeting as beauty in general, and will not survive discomfords,' that the marbled cattle must not be subjected to the hardships of a sea-voyage, and therefore we must do our marbling at home. This confusion, however, is liable to serious modification, now that the problem of importing slaughtered

meat in prime condition has been practically solved.

A contemporary has recently pointed out a curiosity of commerce in the fact that the major portion of the produce exported from South Africa is used for the adornment of the fair sex, and becomes visible in the form of diamonds and ostrich feathers. These articles of luxury indeed account for five millions out of the sum of seven and a half millions which represents the value of the exports. Twenty years ago the diamond fields of South Africa were unknown. Now Kimberley alone rejoices in a population which takes annually a million sterling in wages, all earned in digging out the precious gems. During the past fifteen years about forty million pounds-worth of diamonds have been won from Mother Earth in these fields; representing, when cut and offered for sale in the jewellers' shops, considerably more than double that vast sum.

There is, at the time we write, every reason to hope that a threatened war between this country and another power has been happily averted. But the rumour of such a calamity, although it paralyses trade and does much harm in other ways, is often productive of good in the shape of valuable suggestions, which otherwise would never have been made. For instance, it has lately been proposed that by international understanding, every fleet or squadron should be accompanied by a 'Red Cross' ship, whose duty it would be to rescue drowning men and to succour the wounded. The rescued ones would be considered prisoners of war, and would eventually be given over to the victorious side. This suggestion needs no comment. In these days of torpedoes, rams, and heavy guns—which between them can sink a fleet in a very short time—such a humane provision becomes a positive necessity.

Another very good suggestion is, that Eddystone lighthouse should be at once placed in telegraphic communication with Plymouth, from which town it is distant some ten miles. By this provision, timely warning could be given of the approach of a hostile fleet. But even in times of peace, a cable between the outlying lighthouse and the shore would be of immense service, and would soon pay the expense of its installation. It seems rather surprising that the wire has not been laid down long ago.

The news that England has added to her vast dominions a coaling station at Port Hamilton, in the island of Quelpart, will cause many people to ask where that place happens to be. The island lies off the eastern shores of Asia, and is sixty miles distant from the southern coast of Corea. It is of volcanic origin; about forty miles in length by seventeen in width at its broadest part. The highest point of the island is six thousand five hundred feet; and the rocks are so white as to have the appearance of being covered with snow. The place is fertile, well populated, and its scenery is most beautiful. The people carry on a flourishing industry in the manufacture of straw-plated hats; but they bear a bad name, chiefly in consequence of the island having been used more than once as a penal settlement by the Corean government. By the posses-

sion of this coaling station, England materially strengthens her hands in the far eastern seas.

In this *Journal* for 11th October occurred an article on Burns and Scalds, recommending Carron oil, a compound of olive oil and lime-water. A correspondent suggests an improvement even upon this well-known recipe. He says, 'My father prepared this oil fifty years ago, but he always used raw linseed oil, with the addition of a small quantity of turpentine, say a teaspoonful to a six-ounce or eight-ounce bottle. I do not think there can be a better remedy for burns and scalds. The turpentine is a marvellous improvement in allaying the pain; and it is very desirable that the remedy should be made known as widely as possible.'

T O N E L L Y

THE rose, alas! shall bloom to fall.

The tree that bore it, pass away.

And Time, who pilfers joys from all,

May stamp those features with decay.

Though age may dim that bright blue eye,

For me its charm will ne'er be lost,

Cares may increase as years roll by,
But I shall never count the cost.

The tree with tottering limbs is left,

Its woes upon the breeze to wail.

The boughs, of all then leave bereft.

Shall cringe before the winter's gale

And years may ridge that marble brow,

And all its clustering locks derange,

You will be lovely then, as now,

For I shall never mark the change.

No, can I e'er forget the day

When, hopes deflated, heart dejected seld,

You charmed the bitter stain away,

And filled my soul with peace and love to

Ah, no! I never can forget

The cheering smile, the welcome word,

The eye that listened when we met,

The voice by sweet compassion stirred

That voice shall yet retain its power

When all its silver tone has fled,

Thy smile shall cheer the dimmest hour,

Though all its former light be sped.

Let every feeble charm depart,

If Fate perchance be so inclined—

While yet remains the kindly heart,

The dearest gift is left behind!

FRANCIS EDENST BRADLEY.

The Conductor of CHAMBERS'S JOURNAL begs to direct the attention of CONTRIBUTORS to the following notice:

1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.

2d. For its return in case of uneligibility, postage stamps should accompany every manuscript.

3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

If the above rules are complied with, the Editor will do his best to ensure the safe return of ineligible papers.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH.

PRICE 1½d.

WHITSTABLE OYSTERS.

For some years the production of oysters has been declining. We by no means desire to convey the impression that they are becoming unobtainable. Huge shelly specimens, hailing from America, Portugal, and the North Sea, make a brave show in metropolitan markets. If the public are not above feasting upon these, fishmongers will long be able to supply the article at something like a reasonable price. But epicures, who will be content with nothing short of a real 'Whitstable native,' must not object to pay a high price for the gratification of their taste. During the season, these delicacies, without leaving any large profits to the fishmonger, are worth three shillings and sixpence per dozen. This practically limits their consumption to the wealthy.

Only sixty years ago, Whitstable oysters sold at nineteen shillings a bushel; and even twenty years since, the prices were so moderate that an oyster-supper in which 'natives' figured was by no means regarded as an unjustifiable extravagance. In those good old times, comparatively few of the bivalves were carried to London other than by boats. A regular fleet of swift, perfectly found, well-manned boats ran between Whitstable and Billingsgate; and captain stories of races adopted by the energetic captains are even now gleefully told by veteran salts who delight to 'fight their battles o'er again.' The trade was then a very different affair from what it has since become. A bushel of oysters was a thing worth buying; for the fish were piled and packed to a perfect cone, high over the rim of the measure. As if this was not enough, half a shovelful more was generally given, as a blessing, into the bargain.

The largest sale of oysters recorded was in the season of 1862-63, when upwards of sixty millions were sent into the market. 'Natives' were then two guineas per London bushel. The same quantity at the present time is worth

seventeen pounds; and we need hardly say that measures are not heaped, nor half-shovelfuls thrown in. Even common oysters are now selling at considerably more than double the prices obtained for 'natives' half a century ago.

Of course we are proud of our oysters. They are veritable molluscan aristocrats. But we endeavour to improve the inferior sorts, and to impart, so far as we can, culture and refinement to shelly candidates from Essex, from France, from the North Sea, and even from Ireland. But these last, perhaps feeling their inferiority, prefer 'home-rule.' Still, it is for their good that they are taken from their rough-and-tumble life in the stormy ocean, and transferred to our rich and quiet estuarine waters. Here, like Jeshurun, they wax fat; but truth compels us to admit that we have never yet seen them kick. Yet, at their best, these can scarcely compare with the 'native,' which, while it thoroughly enjoys life, does as little in the house-building line as it possibly can. Free from all anxiety, and safely sheltered from every storm, it disdains to pile up its shell in huge coarse ridges and layers; and so it fashions a beautiful, perfectly formed, thin covering, the interior of which is of a nacreous iridescence, that in point of splendour treads closely at the heels of its tropical cousin, the pearl-oyster himself.

How is it that oysters are declining? A great 'spat of brood' was deposited in the Whitstable waters in the seasons 1858 and 1859. At that time the men reaped a rich harvest. The spat, or in other words the baby oysters, clustered everywhere, on the rocks, on the sides of the harbour, in the sluice, and in the very back-water itself. *Flussmen* earned pounds—weekly, by collecting it; and the very children, without trouble or danger, obtained considerable sums in the same way. But since that time little 'spat' has been deposited. The causes of this failure are unknown. Notwithstanding all the means employed, the scarcity continues to increase. As yet, the brood cometh in scant measure. Not

a few persons—among them those gentlemen who are popularly supposed to know all about the matter—attribute the failure to 'over-dredging.' But we are assured by old men who have been on the ground upwards of sixty years, that some of the heaviest 'spats' have occurred at times when the fishery has been, comparatively speaking, denuded of stock.

According to popular opinion, an oyster should never be eaten unless the month has an 'r' in its name. The summer months are the unlucky ones. Then the oyster enjoys himself, or ought to do so. His human 'friendly foes' refrain from their onslaughts upon his small but well-nigh adamant home. Why is this? Oysters, as a rule, spawn in May or June; and as the nature of the mollusc then undergoes an important change, its flesh is with reason regarded as unwholesome. The spawn—or 'spat,' as it is usually called—is at first of a cream-like colour and consistence; as it matures it assumes the appearance of slate-dust; and when the parent at length opens its shell and emits the 'spat,' the water becomes pervaded with a misty hue. Freed from their mother's watchful care, these gay young creatures—for such they are—plunge headlong into life, and revel in the poetry of motion. As yet, the dashing young bivalve is very rudimentary; but he possesses a pair of tiny skulls, the very picture in miniature of those which his careless parents boast of; and he sports his own little mantle, to which are attached a number of cilia as minute as they are wonderful. By means of these little paddles, during the first three days of its existence the infant oyster moves freely from place to place, as bees flit from flower to flower. While this condition of freedom lasts, the tiny creature is exposed to the ravages of its many foes. It is, too, an anxious time for the dredgerman. Frequently the freely moving young 'spat' is swept far away from its breeding-grounds by storms, tides, and currents. Then, when it finally settles, and seriously undertakes the establishment of a home, it possibly does so on some deep sea bottom. Thus, while the 'spat' is wholly lost to the cultivators, the colony formed remains undiscovered, and so is practically lost.

Should the young oyster escape infantine perils, and be spared to settle down in the vicinity of its phlegmatic parent, it attaches itself to some suitable quiet resting-place by its under shell. The cilia, no longer either useful or ornamental, disappear; and having no longer anything better to do, the juvenile mollusc begins to grow. Within a fortnight it has enlarged to the size of a pin's head; and within twelve months, supposing it to have escaped the attacks of star-fishes and other enemies of its race, it will be as big as a two-shilling piece. Not, however, until it has attained the mature age of four years, is it considered marketable.

Various indeed are the substances to which

at the time of settlement frivolous young oysters attach themselves. Some of these curious materials, with the shells attached, are in the writer's cabinet; and very peculiar they are. Among them may be specially mentioned a piece of wood bored through and through by the *teredo*, or shipworm. Yet another is a fossil crustacean, washed out of the London clay. A portion of the tusk of *Elephas primigenius*, a mammoth's tooth, and a part of the bone of a rhinoceros, have also afforded foundations for colonies of oysters. A vase of beautiful Samian ware and several fragments of Roman pottery are more or less incrustated with well-grown shells. A large rough Roman roofing-tile, similar to those exhibited in York Museum, the same, too, as those which were anciently used in the construction of soldiers' graves, would appear to have afforded young oysters ample room for the display of their peculiar affections. Old Dutch bottle, tobacco-pipes of strange fashion, and other queer articles too numerous to mention, show that the succulent mollusc is not very particular where he pitches his habitation.

This account would be singularly incomplete if no reference was made to the awards at the Fisheries Exhibition of 1883. That Exhibition will be long remembered for the splendid success which it achieved. At the present time, no writer on fisheries or on pisciculture can any more avoid making reference thereto than Mr Dick could keep the head of King Charles I. out of his manuscript. The Whitstable Oyster Company was well represented at the Exhibition, and its aquarium, specially designed and arranged, attracted the attention of the hundreds of thousands of visitors. In this aquarium were exhibited the various species of oysters in the different stages of their growth; the soil of which the bed of the ground is composed; the dog-whelks, star-fishes, and other foes of the oyster; with algae, zoophytes, sea-anemones, and other specimens of marine animal and vegetable life.

The Seasalter and Ham Oyster-fishery Company is another successful centre of the great Whitstable oyster-trade. Its name stands deservedly high in the metropolitan markets, and its products are held in reputation. It is an old fishery, dating back to an unknown period. Certainly the Seasalter fishery was granted to the Priory of Christchurch, Canterbury, before the time of the Norman Conquest. As long ago as the reign of King Henry VIII, the fishery was settled upon the Dean and Chapter of Canterbury Cathedral. At the present time, the royalty of the fishery, the Seasalter portion of which is situated on a spit of ground called the 'Pollard,' is held by Messrs Austen of Canterbury. It is gratifying to be able to record that this fishery was also admirably represented at the great Fisheries Exhibition; and that the enterprising owners carried off a fair share of the prizes and awards.

At the present time, upwards of thirty millions of young oysters are annually imported from various places in England and elsewhere by the two great Companies. Many of these are brought

from Arcachon and other French breeding-grounds; whilst Essex also furnishes large quantities of 'brood.' As this work of importation has increased, it has necessitated the creation of a considerable carrying fleet; thus altogether there are over one hundred boats employed in the trade in one way and another. Each boat is manned by from three to five hands. It will therefore be readily seen that these oyster-fisheries are the means of affording honest, profitable, and fairly constant employment to a very large number of men and boys, who in more senses than one really live by the sea.

A HOUSE DIVIDED AGAINST ITSELF.

BY MRS OLIPHANT.

CHAPTER XXX.

THE Winterbourns came next day: he to the best room in the house, a temperature carefully kept up to sixty-five degrees, and the daily attentions of the excellent doctor, who, Lady Markham declared, was thrown away upon her healthy household. Mr Winterbourn was a man of fifty, a confirmed invalid, who travelled with a whole paraphernalia of medicaments, and a servant who was a framed nurse, and very skilful in all the lower branches of the medical craft. Mrs Winterbourn, however, was not like this. She was young, pretty, lively, fond of what she called 'fun,' and by no means bound to her husband's sickroom. Everybody said she was very kind to him. She never refused to go to him when he wanted her. Of her own accord, as part of her usual routine, she would go into his room three or even four times a day to see if she could do anything. She sat with him always while Robert's man-nurse had his dinner. What more could a woman do? She had indeed, it was understood, married him against her will; but that is an accident not to be avoided, and she had always been a model of propriety. They were asked everywhere, which, considering how little adapted he was for society, was nothing less than the highest proof of how much she was thought of; and the most unreplicable matrons did not hesitate to invite Lord Markham to meet the Winterbourns. It was a wonderful, quite an ideal friendship, everybody said. And it was such a comfort to both of them! For Markham, considering the devotion he had always shown to his mother, would probably find it very inconvenient to marry, which is the only thing which makes friendship between a man and a woman difficult. A woman does not like her devoted friend to marry: that is the worst of those delicate relationships, and it is the point upon which they generally come to shipwreck in the end. As a matter of course, any other harm of a grosser kind was not so much as thought of by any one who knew them. There were people, however, who asked themselves and each other, as a fine problem, one of those cases of complication which it plagues the human intellect to resolve, what would happen if Winterbourn died?—a thing which he was continually threatening to do. It had been at one time quite a favourite subject of speculation in society. Some said that it would not suit

Markham at all, that he would get out of it somehow; some, that there would be no escape for him; some, that with such a fine jointure as Nelly would have, it would set the little man up, if he could give up his 'ways.' Markham had not a very good reputation, though everybody knew that he was the best soul in the world. He played, it was said, more and otherwise than a man of his position ought to play. He was often amusing, and always nice to women, so that society never in the least broke with him, and he had champions everywhere. But the mere fact that he required champions was a proof that all was not exactly as it ought to be. He was a man with a great many 'ways,' which of course it is natural to suppose would be bad ways, though, except in the matter of play, no one knew very well what they were.

Winterbourn, however, had never been so bad as he was on this occasion, when he was almost lifted out of the carriage and carried to his room, his very host being allowed no speech of him till next morning, after he was supposed to have got over the fatigue of the journey. The doctor, when he was summoned, shook his head and looked very grave; and it may be imagined what talks went on among the guests when no one of the family was present to hear. These talks were sometimes carried on before Frances, who was scarcely realised as the daughter of the house. Even Claude Ramsay forgot his own pressing concerns in consideration of the urgent question of the moment, and Sir Thomas ceased to think of Waring. Frances gleaned from what she heard that they were all preparing for flight. 'Of course, in case anything dreadful happens, dear Lady Markham,' they said, 'will no doubt go too.'

'What a funny thing,' said one of the Miss Montagues, 'if it should happen in this house.'

'Funny, Laura! You mean dreadful,' cried her mother. 'Do choose your words a little better.'

'Oh, you know what I mean, mamma!' cried the young lady.

'You must think it dreadful indeed,' said Mrs Montague, addressing Frances, 'that we should discuss such a sad thing in this way. Of course, we are all very sorry for poor Mr Winterbourn; and if he had been ill and dying in his own house.—But one's mind is occupied at present by the great inconvenience—oh, more than that—the horror and—embarrassment to your dear mother.'

'All that,' said Sir Thomas with a certain solemnity. 'Perhaps it was the air of unusual gravity with which he uttered those two words which raised the smallest momentary titter—no, not so much as a titter—a faintly audible smile, if such an expression may be used—chiefly among the young ladies, who had perhaps a clearer realisation of the kind of embarrassment that was meant than was expected of them. But Frances had no clue whatever to it. She replied warmly:

'My mother will not think of the inconvenience. It is surely those who are in such trouble themselves who are the only people to think about.—Poor Mrs Winterbourn'

'Who is it that is speaking of me in such a kind voice?' said the sick man's wife.

She had just come into the room; and she

was very well aware that she was being discussed by everybody about—herself and her circumstances, and all those contingencies which were, in spite of herself, beginning to stir her own mind, as they had already done the minds of all around. That is one thing which in any crisis people in society may be always sure of, that their circumstances are being fully talked over by their friends.

‘I hope we have all kind voices when we speak of you, my dear Nelly. This one was Frances Waring, our new little friend here.’

‘Ah, that explains,’ said Mrs Winterbourn; and she went on, without saying more, to the conservatory, which opened from the drawing-room in which the party was seated. They were silenced, though they had not been saying anything very bad of her. The sudden appearance of the person discussed always does make a certain impression. The gentlemen of the group dispersed, the ladies began to talk of something else. Frances, very shy, yet burdened with a great desire to say or do something towards the consolation of those who were, as she had said, in such trouble, went after Mrs Winterbourn. She had seated herself where the big palms and other exotic foliage were thickest, out of sight of the drawing-room, close to the open doorway that led to the lawn and the sea. Frances was a little surprised that the wife of a man who was thought to be dying should leave his bedside at all; but she reflected that to prevent breaking down, and thus being no longer of any use to the patient, it was the duty of every nurse to take a certain amount of rest and fresh air. She felt, however, more and more timid as she approached. Mrs Winterbourn had not the air of a nurse. She was dressed in her usual way, with her usual ornaments—not too much, but yet enough to make a finkle; had she been at the side of a sick person, and possibly to have disturbed him. Two or three bracelets on a pretty arm are very pretty things; but they are not very suitable for a sick-nurse. She was sitting with a book in one hand, leaning her head upon the other, evidently not reading, evidently very serious. Frances was encouraged by the downcast face.

‘I hope you will not think me very bold,’ she said, the other starting and turning round at the sound of her voice. ‘I wanted to ask if I could help you in any way. I am very good for keeping awake, and I could get you what you wanted.—Oh, I don’t mean that I am good enough to be trusted as nurse; but if I might sit up with you—in the next room—to get you what you want.’

‘What do you mean, child?’ the young woman said in a quick, startled, half-offended voice. She was not very much older than Frances, but her experiences had been very different. She thought offence was meant. Lady Markham had always been kind to her, which was, she felt, somewhat to Lady Markham’s own advantage, for Nelly knew that Markham would never marry so long as her influence lasted, and this was for his mother’s good. But now it was very possible that Lady Markham was trembling, and had put her little daughter forward to give a sly stroke. Her tone softened, however, as she looked up

in Frances’ face. It was perhaps only that the girl was a little simpleton, and meant what she said. ‘You think I sit up at night,’ she said. ‘O no. I should be of no use. Mr Winterbourn has his own servant, who knows exactly what to do; and the doctor is to send a nurse to let Roberts get a little rest.—It is very good of you. Nursing is quite the sort of thing people go in for now, isn’t it? But, unfortunately, poor Mr Winterbourn can’t bear amateurs, and I should do no good.’

She gave Frances a bright smile as she said this, and turned again towards the scene outside, opening her book at the same time, which was like a dismissal. But at that moment, to the great surprise of Frances, Markham appeared without, strolling towards the open door. He came in when he saw her, nodding to her with a look which stopped her, as she was about to turn away.

‘I am glad you are making friends with my little sister,’ he said.—‘How is Winterbourn now?’

‘I wish everybody would not ask me every two minutes how he is now,’ cried the young wife. ‘He doesn’t change from one half-hour to another.—Oh, impatient; yes, I am impatient. I am half out of my senses, what with one thing and another; and here is your sister—your sister—asking to help me to nurse him! That was all that was wanting, I think, to drive me quite mad!’

‘I am sure little Fan never thought she would produce such a terrible result. Be reasonable, Nelly.’

‘Don’t call me Nelly, sir; and don’t tell me to be reasonable. Don’t you know how they are all talking, those horrible people?—Oh, why, why did I bring him here?’

‘Whatever was the reason, it can’t be undone now,’ said Markham. ‘Come, Nelly! This is nothing but nerves, you know. You can be yourself when you please.’

‘Do you know why he talks to me like that before you?’ said Mrs Winterbourn, suddenly turning upon Frances. ‘It is because he thinks that I am coming to a crisis, and that I shall be complicated. Here the hasty creature came to a pause and stared suddenly round her. ‘Oh, I don’t know what I am saying, Geoff! They are all talking, talking in every corner about you and me.’

‘Run away, Fan,’ said her brother. ‘Mrs Winterbourn, you see, is not well. The best thing for her is to be left in quiet. Run away.’

‘It is you who ought to go away, Markham, and leave her to me.’

‘Oh!’ said Markham, with a gleam of amusement, ‘you set up for that too, Fan! But I know better how to take care of Nelly than you do. Run away.’

The consternation with which Frances obeyed this request it would be difficult to describe. She had not understood the talk in the drawing-room, and she did not understand this. But it gave her ideas a strange shock. A woman whose husband was dying, and who was away from him—who called Markham by his Christian name, and apparently preferred his ministrations to her own. She would not go back as she

came, to afford the ladies in the drawing-room a new subject for their comments, but went out instead by the open door, not thinking that the only path by which she could return indoors led past the window of her mother's room, which opened on the lawn round the angle of the house. Lady Markham was standing there looking out as Frances came in sight. She knocked upon the window to call her daughter's attention, and opening it hurriedly, called her in. 'Have you seen Markham?' she said, almost before Frances could hear.

'I have left him, this moment.'

'You have left him? Is he alone, then? Who is with him? Is Nelly Winterbourn there?'

Frances could not tell why it was that she disliked to answer. She made a little assenting movement of her head.

'It ought not to be,' cried Lady Markham—'not at this moment at any other time, if they like, but not now. Don't you see the difference? Before, nothing was possible. Now—when at any moment, she may be a free woman, and Markham—Don't you see the difference? They should not, they should not, be together now.'

Frances stood before her mother feeling that a claim was made upon her which she did not even understand, and a helplessness which was altogether foreign to her ordinary sensations. She did not understand, nor wish to understand—it was odious to her to think even what it could mean. And what could she do? Lady Markham was agitated and excited—not able to control herself.

'For I have just seen the doctor,' she cried, 'and he says that it is a question not even of days, but of hours. Good heavens, child, only think of it that such a thing should happen here; and that Markham, Markham! should have to manage everything. Oh, it is indecent—there is no other word for it. Go and call him to me. We must get him to go away.'

'Mamma,' said Frances, 'how can I go back? He told me to go and leave them.'

'He is a fool,' cried Lady Markham, stamping her foot. 'He does not see how he is committing himself; he does not mind.—Oh, what does it matter what he said to you? Run at once and bring him to me. Say I have something urgent to tell him. Say oh, say anything! If Constance had been here, she would have known.'

Frances was very sensible to the arrow thus flung at her in haste, without thought. She was so stung by it, that she turned hastily to do her mother's commission at all costs. But before she had taken half-a-dozen steps, Markham himself appeared, coming leisurely, easily, with his usual composure, round the corner. 'What's wrong with you, little un?' he asked. 'You don't mind what I said to you, Fan; I couldn't help it, my dear.'

'It isn't that, Markham. It is—mamma.'

And then Lady Markham, too much excited to wait, came out to join them. 'Do you know the state of affairs, Markham? Does she know? I want you to go off instantly without losing a moment, to Southampton, to fetch Dr Howard. —Quick! There is just time to get the boat.'

'Dr Howard?—What is wrong with the man here?'

'He is afraid of the responsibility—at least I am, Markham. Think—in your house!—O yes, my dear, go without delay.'

Markham paused, and looked at her with his keen little eyes. 'Mother, why don't you say at once you want to get me out of the way.'

'I do. I don't deny it, Markham.—But this too. We ought to have another opinion. Do, for any favour, what I ask you, dear; oh, do it!—O yes, I would rather you sent him here, and did not come back with him. But come back, if you must; only, go, go now.'

'You think he will be—dead before I could get back. I will telegraph for Dr Howard, mother; but I will not go away.'

'You can do no good, Markham—except to make people talk. Oh, for mercy's sake, whatever you may do afterwards, go now.'

'I will go and telegraph—with pleasure,' he said.

Lady Markham turned and took Frances' arm, as he left them. 'I think I must give in now altogether,' she cried. 'All is going wrong with me. First Con, and then my boy. For now I see what will happen. And you don't know, you can't think what Markham has been to me. Oh, he has been everything to me! And now—I know what will happen now.'

'Mamma,' said Frances, trembling. She wanted to say that little as she herself was, she was one who would never forsake her mother. But she was so conscious that Lady Markham's thoughts went over her head and took no note of her, that the words were stilled on her lips. 'He said to me once that he could never leave you,' she said, faltering, though it was not what she meant to say.

'He said to you once—? Then he has been thinking of it, he has been discussing the question?' Lady Markham said with bitterness. 'She leant heavily upon Frances' arm, but not with any tender appreciation of the girl's wistful desire to comfort her. 'That means,' she said, 'that I can never desert him. I must go now and get rid of all this excitement, and put on a composed face, and tell the people that they may go away if they like. It will be the right thing for them to go away. But I can't stay here with death in the house, and take a motherly care of that girl, whom I never trusted—whom Markham— And she will marry him within the year. I know it.'

Frances made a little outcry of horror, being greatly disturbed—'O no, no!' without any meaning, for she indeed knew nothing.

'No! How can you say No?—when you are quite in ignorance. I can't tell you what Markham would wish to be let alone, most likely, if they would let him alone. But she will do it. She always was bold and true; and now she will be rich. Oh, what a future it is altogether—like a thunderbolt out of a clear sky. Who could have imagined, when we came down here so tranquilly, with nothing unusual— If I thought of any change at all, it was perhaps that Claude—whom, by the way, you must not be rude to, Frances—that Claude might, perhaps— And now, here is everything unsettled, and my life turned upside down.'

What did she hope that Claude would have done? Frances' brain was all perplexed. She

had plunged into a sudden sea of troubles, without knowing even what the wild elements were that lashed the placid waters into fury and made the sky dark all around.

VERONA AS IT IS.

THE association of Verona with the name of Shakespeare, always intimate, has been intensified within the past few years by the revival, on a scale of exactness and magnificence never before aimed at, of the two plays of which the scenes are laid in the quaint old Italian city; and yet the English traveller, red-hot with the enthusiasm engendered by witnessing one or other of the representations, fondly expecting that the Montagues and the Capulets, Romeo and Juliet, Launce and Speed, will move with him in the midst of scenes almost unchanged during the lapse of centuries, prepared for the enjoyment of pleasant, romantic day-dreams in a prosaic age, is doomed to bitter disappointment. But the bitterness of the blow from his Shakespearean point of view is immeasurably softened by the other historical charms which surround Verona. Verona has but scant justice done her by the general traveller. A couple of hours are deemed amply sufficient to exhaust her attractions, whereas a week might be fully employed by the conscientious sight-seer who has a higher object in view than the mere cramming of the greatest possible amount of 'doing' into the smallest possible space of time; whilst the artist and the antiquary must make up their minds to an even longer sojourn. And yet, even when we have been prepared for disappointment, the first association of Verona in our minds being with Shakespeare, our first duty is to see for ourselves how far short the real falls of the ideal; and we make our way to the house of the Capulets. There, in the mean, dark, narrow, evil-smelling Via Capello, stands the house, but alas! what a grimy, prosaic reality it is, even when presented to us after a due lowering of our ideal.

The arched bearings—the cap—are still over the archway; but excepting them, there is not the remotest trace to remind us that it was here that the most beautiful love-scene in the world's drama was enacted. The carved balconies, the tracery, the ornamentation, all the outward symbols of a wealthy gentleman's town residence, have been torn away by local 'improvers' or relic-hunters. There was Capulet's orchard is now a filthy stable-yard, much used by countrymen who bring the produce of their lands to the city market. There is nothing romantic about us as we stand in the crowded, gloomy street, but the glimpse of never-changing blue sky above us. The natives, doubtless wondering at what can occasion our curiosity, gaze with us at the sculptured cap, and read the inscription, as if these were new features in the surroundings of their daily life. Rather sad at heart, perhaps half-angry with Mr Irving for entrapping us into so enchanting an ideal, we make for Juliet's tomb. The road to it lies

through some of the least delectable parts of the city; it is evidently a well-beaten road, for at every fifty yards or so we are accosted by an individual who wants to conduct us to the tomb. The invitations we decline; and at length find ourselves in front of a miserable-looking house, of which the plaster is battered and discoloured and the tiles torn away. We ring; and after an interval, the filthy head of a cook or scullery-maid, or some one whose lines in life are cast in unsavoury places, appears. Under a sort of tunnel, we pass, and are in what is now a convent garden, and what was, we are to believe, 'a churchyard; in it a tomb belonging to the Capulets.' Again the ideal is shattered.

After making all allowance for the wear and tear of four hundred years, we have, with reason, we think, brought ourselves to the expectation of being more intimately in the company of Shakespeare here than in the streets of the crowded city. But try as we may, the surroundings are unromantic. Peace be to a calm blue sky above, but nothing more. Imagine the Bermudez market-gardens—themselves the sole remnants of one of the richest religious demesnes in England—shut within four walls, and you have the 'churchyard' of Romeo and Juliet. Imagine a stone coffin tomb, built under the shattered remnant of what might have been once a dainty Gothic building, and you have the 'tomb belonging to the Capulets.' There are many visiting-cards in the cattle-trough; and it is a slight consolation to learn, by a perusal of the names on them, that Englishmen are not the only victims of the worthless sham.

We turn from 'Juliet's Tomb' gladly, and retrace our steps city-wards, in order to visit the 'open place' which is the scene of the commencement of the *Two Gentlemen of Verona*. This is probably the 'Piazza delle Erbe,' which has been identified with the Forum of the ancient Roman city, and is a picturesque spot enough, especially on market-days, when the oblong is crowded from end to end with quantity-dressed vendors of various fruit, of grain, meat, and odds and ends of all sorts, each one under his or her huge white umbrella. The houses around, built upon arcades, and with frescoed walls, still wear an old-world look; and we can without much difficulty surround ourselves with Valentines and Proteuses, Tybalts and Capulets, Lucretias and Julias, in spite of the discordant harangues of energetic hucksters, and the prevalent odour of garlic and tobacco. A solitary column at one end reminds us of old Roman days; and an elevated erection in the centre, garnished still with chains and 'bracelets,' carries us to later days, when the market-place was the veritable centre of every medieval city.

But the glory of modern Verona is its amphitheatre. Man has worked harder, or at least more efficaciously, than Time in despoiling and disfiguring it; still it stands majestic, colossal, stalwart, pretty much as it stood eighteen hundred years ago. Here we may linger away many pleasant hours, either wandering about in the brilliant sunshine beneath the cloudless blue sky, amongst the tiers of white marble seats; ascending of course to the topmost tier, whence a wide panorama is seen

stretched around us of the quaint, red-tiled city with its domes and campaniles, its irregular jumble of towers and walls, far away beyond which glimmers the distant line of the snowy Alps; or we may descend through one of the many admirably arranged *comitatus* to the regions 'behind the scenes,' into a damp, dark city of monster arches, huge columns, and colossal walls, amongst which may still be seen the cages wherein the gladiators rested or equipped themselves, or whence the wild animals were let loose upon the Christians awaiting their doom on the sunlit sand of the arena outside the gates. Many of these cages are used as receptacles for such fragments and remnants of the architectural decoration of the corridors as have been found too bulky to be transferred to the local museum. Others, from the deep accumulation of mud within them, have perhaps never been entered by a human being since the days of imperial Rome.

The arena itself owes much of its perfect and brand-new appearance to the energy and patriotism of successive rulers of Verona, and is still frequently used upon popular festivals for theatrical or gymnastic displays; but the corridors around it have, we are told, never been altered or repaired; and the work in them testifies, perhaps as plainly as any other in Italy, to the thoroughness, grandeur, and solidity of ancient Roman work. Until comparatively lately, the amphitheatre was hemmed in closely on all sides by mean, tumble-down dwellings, which completely hid from view its majestic proportions; but these erections have been swept away, and the grand open space created laid out as a public garden, and christened the Square of Victor Emmanuel. In the main street, called the Corso, are two very interesting Roman remains, consisting of a double-arched gateway by Vitruvius, still imposing, although robbed of much of its old embellishment, and disfigured on one side by a tawdry shrine to the Virgin; and a second, highly decorated archway, once spanning the street, now five feet below its level, and half its height imbedded in the wall of a house.

What the Colonna and Orsini were to Rome, the Medici to Florence, the Grimaldi and Doria to Genoa, the Visconti to Milan, the family Della Scala, or as they are more generally known, the Scaligers, were to Verona. Hence, it is not remarkable that in every nook and corner of the old city we come across their once terrible crest, the ladder. The old Scaliger Palace, or, more properly speaking, the chief of their palaces, still exists, although shorn of much of its original splendour. But more interesting than the family palace is the family burial-ground; here, within a wonderfully wrought iron railing of fourteenth-century work, are the tombs of the most distinguished, and therefore the most wicked and unscrupulous members of the family. There is that of Can Grande the First, which he built for himself at a fabulous cost; of the first Scaliger, a quaint monument in the form of a ladder, surmounted by a grotesque equestrian figure; of two other personages—massive granite sarcophagi sculptured with the most ludicrous caricatures of men and animals; and there is, last but not least, a notice to visitors, printed

in Italian, French, and English, which as a laughter-provoking composition may take rank far above comic literature of a more pretentious sort.

The cathedral is interesting, although for magnificence it does not compare with the church of San Zeno. The entrance in particular is striking, as it consists of a projecting balcony, supported by two curiously twisted pillars, which in turn rest on the backs of two winged monsters, bearing the ancient, mysterious, religious, wheel-symbol upon their flanks. On each side of the door stand the exceedingly quaint figures of Roland and Oliver. The church of Saint Anastasia, under the special protection of the Scala family—it being usual for churches in the great Italian cities to be under the patronage of prominent families, just as many of those in St Petersburg are under the patronage of certain regiments—is remarkable for the two grotesque holy-water basin-bearers known as the Gobbi figures of mouthing beggars the size of life, in variously coloured marble.

But, apart from the usual traveller-sought 'line' of Verona, there is much that is interesting, striking, and typical in the city itself, which retains its ancient characteristics, perhaps, to a greater extent than do most North Italian cities in this age of renovation and restoration. There are one or two modern streets of fair dimensions; but the charm of the place, to the sentimentalist and the antiquary, lies away from them, amidst the dark, tortuous, arched byways, of which no two houses resemble each other; whereinto the sun rarely penetrates, wherein reign unbroken stillness and darkness. Here the old-world illusion is heightened by the appearance of the heavily cloaked, big-hatted figures which glide noiselessly in and out of dark archways and quaintly sculptured doors; by the entire absence of anything appearing to repair or reconstruction; and by the air of decayed look which seems to be impressed everywhere. Here may be seen the palaces of the old Verona nobility, veritable Castles Arabas in their hugeness, sadness, and grandeur, still rich with broad, carved staircases, marble halls, frescoed walls, and gaudy, magnificent apartments; still with their 'pleasaunces' stretching away behind, once brilliant with gay flowers and flashing fountains, now overgrown with tangled weeds, battered and deserted. There are bridges crossing the rapid Adige which were ancient when Britain was a vast forest and morass, one of which, after having stemmed the current for ten centuries, had been swept away by an unusual rise of the river a few days before our arrival. These, and the picturesque water-wheels which dot the course of the river, and the curious jumble of ancient buildings climbing up the hillsides, may alone detain the artist for many a long summer day; whilst he who would seek pure air, rest, and quiet, may wander away through the enlaided Byzantine gates of the city walls, along roads running straight as when they were mapped by the old Romans, and still lined by their milestones, into a country of fresh green pasture, fields of golden grain, and hills purple with the wealth of sweet grapes.

There is one serious drawback in Verona—the lack of a good hotel. But if the visitor does

not object to extortion and third-rate accommodation for a few days, he will be amply repaid for his temporary discomfort by the pleasure and instruction he will have derived from the exploration of that city which its natives still fondly call 'Verona la Degna.'

MR L'ESTRANGE.

A TALE OF AN ATLANTIC LINER.

IN FOUR CHAPTERS.—CHAP. I.

'My native land, good-night !'

I murmured Byron's line almost unconsciously, as the dark mass, that had been sinking into the green-gray waters, seemed suddenly to founder in them and to be replaced by a formless cloud. England had passed into shadow-land ! Should I ever know it again as a real land ? Was it and all that I loved passing into mere reminiscence ? Was I, like millions before me, going into perpetual exile ?

The green died out of the sea, the gray grew darker. It, too, died out ; and the vast space over which my eye ranged became black, save where the waves broke into snowy rifts. A feeling of terrible loneliness came over me, and a strange fear of impending troubles. Everybody had descended from the deck to the saloon, at the sound of the dinner-bell ; and I remained solitary, under the lee of the huge funnels that poured out wild ribbons of smoke. I was in no mood for eating, still less did I desire society.

For a long time I had been in weak health ; and recent family matters had seriously lessened my strength. My father had died suddenly, leaving his affairs so confused that bankruptcy became inevitable. I was recalled from my legal studies in London, being the eldest son. But neither my knowledge of law nor my devotion to the family welfare could prevent the ruin which came upon us. In a few months, our changed social level was reached. A cottage replaced our pleasant country villa, the plainest food our former luxuries. My mother and sisters accepted this painful reverse of fortune with astonishing bravery. At least before me and my younger brother Theodore they appeared cheerful and resigned, and prophesied that we should again rise to the sphere from which we had fallen. Loving and untired, capable and ambitious, we could not remain poor in a world where such traits led to wealth and social success. My career as a barrister was at an end, at least for a time ; I must earn something for the good and gentle and heroic women who regarded me as the head of the family now. I had tried several paths that seemed suited to such talents and acquirements as I possessed ; but I could not get even bread for my single self.

My health faded rapidly ; and at times I feared my own death would be added to the calamities of the family. My brother Theodore had been in my father's office. He was thrown upon the world as helpless as a child. Although twenty years old, he was ignorant of everything that produces income in the lower middle-class grade to which we had fallen. He had played at business,

as at everything else. A universal favourite, handsome as Apollo, courageous to folly, and with more health and high spirits than a dozen like me, Theodore, who *ought* to have jumped into a good position at once, could not get even the humblest clerkship. His belief in his 'luck' seemed to grow in proportion to his failures ; smiling irresistibly in our anxious faces, he would say : ' Cheer up, cheer up, good people ; my ship *will* come in ; and when she does, her cargo will consist of pure gold ; and all our fortunes will be made in one grand *coup*.'

At last matters became desperate. Curtailed to mere necessary food and housing, still our expenditure went on consuming the scanty wreckage of our means. My mother smiled rarely ; my sisters went out on furtive errands, and generally came back looking wan and paled. We all grew taciturn, except Theodore. Nothing damped his glowing heart. His belief in himself never faltered for an instant ; but it had ceased to inspire us.

One day I counted the little sum that I had left — it was just over five pounds. My spirits sank into utter eclipse, and I remained in a state of torpid anguish for some hours. Then light broke upon me. I determined to place our situation before my mother's brother, Edward. A long estrangement had separated us. He disliked my father ; and a dozen years before, a bitter quarrel had arisen between the two families. Though living in the same town, we did not even speak. My uncle was a hard and opinionated man, implacable in his aversion ; and the mere thought of asking a favour from *him* made me grow white to the lips. But some miserable inspiration urged me to go to this man and to tell him how we were situated, and to ask him for help. I did not breathe my intention, when I left the house, to my mother and sisters ; they would have protested that any humiliation would be preferable to begging alms from Uncle Edward.

My miserable inspiration proved to be no illusion. Uncle Edward received me with austere reserve. It melted as I went on telling my painful story ; and at the end of it the hard man of the world was softened, as he had probably never been before. He was also alarmed for the reputation of his sister and her children. My statement that death, the workhouse, or the hospital would be the end for me, if things were not changed, quite disturbed the proud old man. The upshot of our interview was that I and Theodore should go to America, there to *soothe* as farmers in the fruit-growing region of California. By such occupation I should have the best chance to recover my health, and a quick means of earning a livelihood for the family. While the boys were building up a home, Uncle Edward would make the women-folks a comfortable allowance ; and when the home was ready, he would pay the cost of the voyage of my mother and sisters. An indefinite time was allowed for the repayment of the moneys advanced by my uncle. He thought that in five or six years we should be able to square the obligations against us, if Theodore and I were industrious and observant.

Hence it had come to pass that my young brother and myself were passengers on a

famous Atlantic liner, and speeding with many hundreds of fortune-seekers to the land of financial promise. Theodore had passed through the tribulations of parting, with his usual cheerfulness, and so wrought up the hopes of my sisters, that the poor girls were confidently expecting to join us in California in less than a year. Even my mother caught the infection of her gallant boy's assurances, and almost bade us good-bye with a smile. Nor could I resist the splendid audacity of the lad, who declared himself the new Columbus, going to discover a new golden world, and all, all, for his dear ones.

Sitting in the chill sea-air, and depressed by the gigantic gloom rolling over the shrinking horizon, I lost the buoyancy that had sustained me since we had left Liverpool. The first symptoms of *malaise* were upon me, and I began to fear that I should have to pass through that painful ordeal which few escape on a first ocean voyage. The whiffs of kitchen odours that passed across my face from time to time added to the repugnance I felt to go below.

'Ahoy! Charley! All hands to the soup-plates,' cried Theodore's merry voice behind me. 'Come, old fellow; you cannot remain here in the dismal, while fairland is just under your feet. I've just been talking to the doctor about you; he's a splendid fellow, and will make you as sound as a bell before we reach New York. He says you must *eat* and not *think*, when you are at sea. I quite agree with him. Come along; and you'll be obliged to agree too. I'll bet you a new hat, to be settled in New York, that you never saw such a spread as there is in the saloon. Why, man, it beats any restaurant or hotel that I have been in. And such a swell company! Come, my dear Charley, I cannot dine, if you do not sit beside me.'

Theodore had not exaggerated, for once, in his description of the saloon. I was dazzled and bewildered by the glitter of glass and silver, and by the brilliant apparel and jewels of the ladies sitting under the effulgence of the electric light.

Theodore had become quite familiar with some of those sitting round our table, of which the ship's doctor was the president. We were hailed with smiles and nods and kind words. I was constrained to look pleased, and to take the soup recommended by the doctor, who assured me that sea-sickness arose partly from dread of it and partly from fasting.

'You are quite right in your opinion, doctor,' said a loud and emphatic voice opposite; 'sea-sickness arises simply from *thinking* of it.'

I looked at the speaker. He was a large, powerfully built man of forty or forty-five years, most fashionably dressed, and with an air of authority that quite impressed me.

'Do you speak from experience?' I asked, rather deferentially.

'I do.' He replied with emphasis. 'You would scarcely believe it,' he continued with a curious smile, 'but my first voyages were martyrdoms. Why, sir, I have been sick crossing the Hudson in a row-boat! The first six days I spent on the Atlantic nearly killed me. If I could have found a back-door out of the ship, I would have run to my mother's home in Connecticut, I can tell you, although I was

going to heir my uncle's estate in England. But I was only a sickly boy in those days.'

Here the waiter came with a new dish, and my interlocutor suddenly ceased, and helped himself freely. I could not resist an envious sigh, as I watched his big strong hands loading the bilious-looking dainty on his plate. What animal force! what magnificent digestion! and I so womanly weak!

I pushed my half-filled plate away, and addressing him, asked, 'How did you conquer sea-sickness?'

'By will, sir,' he replied, after drinking a full glass of champagne. 'By will. I got up one morning feeling that I was going to feed the fishes, instead of enjoying my uncle's estate; and I looked at the water rolling past the ship, wondering how big a hole I should make in it, when they pitched me overboard. All of a minute, something seemed to say to me: "You're a fool, young man; go and feed *yourself*." I said: "I *will* feed myself." Yes, sir, my mind was made up; my will was going like an engine. In less than five minutes, quite a quantity of food had got inside of me.'

The reminiscence seemed to recall him to present facts; for directly he began to eat again, and was about as usual. I sat thinking of the power of the will in human affairs, confessing that I had little of it, and wishing that I could induce a mysterious monitor to call me a fool, if that would make me similar to this resolute epicure before me.

In the meantime my brother Theodore was eating, drinking, talking, as if he were a maritime veteran; so busy was he that he quite forgot me, save when the new dishes came round; then he would urge me to take some more food, and finding me unwilling, would help himself copiously, saying, with a laugh, that he must do duty for both.

Very soon the poor dyspeptic finds himself 'left' on board ship. His glutted face and brooding fancies scare away the gay, and alarm the too sympathetic with fears on their own account.

Who that has felt the solitude of the banquetting table can forget it!—the clash of knives and forks, the sharp rattling of plates, the clinking and clanking of glasses, the sudden laugh, the gurgling appreciation of a *bon mot*, the odours of meats, drinks, fruits, flowers, compounded and recompounded, until the olfactory sense is paralysed and beyond discrimination; the confidential buzz of waters, the sighs of repletion, the grunts of impatience, the compliments of gallantry, and the light laughter of ladies' voices. I bore with this unsympathetic gaiety as long as I could; and then, in spite of Theodore's reproachful remonstrances, of the doctor's perfunctory behests 'to make myself comfortable,' and of the man of will 'to sit it out,' I left the saloon and its diners and staggered up on deck. As I went to the companion-door, I collided with a gentleman, who begged my pardon in a kindly manner. I apologised also, and looking into his face, recognised one that I had seen at a table near to ours. It was that of a youngish man, with an elderly, thoughtful expression, rather odd, if not peculiar. At sea, ceremony is often

suspended, and a sort of nautical "stability" arises that one never finds ashore. Our collation brought myself and fellow-passenger into conversational touch.

'You are like me, I fear,' began the stranger, 'not able to stand the heat and noise of the saloon.'

'I am indeed driven from it,' I returned. 'I cannot eat and drink as most of our guests seem to do. What astonishes me most, however, is that delicate ladies dare indulge in so many kinds of rich food.'

'They'll all be ill to-morrow, and some of them will not get better before we sight Fire Island.' My companion laughed a quiet, low, introspective sort of laugh, as he uttered these predictions.

'Where is Fire Island?' I asked.

'Haven't you been to America before?' The voice and accent of the gentleman seemed to change abruptly, becoming vulgar and eager.

'No; I am crossing the Atlantic for the first time.'

'Splendid country, America. You'll make your fortune quick over there.'

'I hope I may,' cried I, with a cheerful tone.

'Don't put it that way,' said the other advisingly. 'Say you *will* make your fortune, and you'll make your pile.'

'Why, you are of the same school as a gentleman I spoke with at dinner.'

'What school d'ye mean?' demanded the stranger, with another change of demeanour and in an almost agitated voice, while he scrutinised me narrowly in the faint light proceeding from the saloon window near us.

I was surprised, and remained a moment silent, during which the eyes of the questioner explored me keenly.

'I mean, simply, that the gentleman told me that will-power is a cure for sea-sickness.'

'Ha, ha! Funny philosophy, isn't it?' The laugh was a mixture of artifice and relief. 'So he told you that will-power cures sea-sickness?'

'Yes.'

'Do you believe it?'

'I am going to try it.'

'And you're in the right of it, sir. Will's everything in this world. I say, if you go to America with your mind made up to win, your fortune's made, dead-certain. But if you don't *will* it, then you had better take a ticket home again. That gentleman in the saloon is an American, you bet. What's his name?'

'I cannot tell you,' I replied, getting tired of the conversation, and feeling a growing dislike to the man.

'What sort of a man is he?' demanded he with irritating insistency.

'He is a tall, fine-looking, imposing gentleman.'

'With black moustaches and clam-beard?'

'Yes.'

'I believe he's a New York banker,' said my companion with a hushed respect. 'I heard the stewards talking about him. He's a millionaire. Did he tell you to use your will-power to cure sea-sickness?'

'Yes.'

'Then follow it, sir. When a millionaire gives advice gratis, a man's a fool not to take it.—But,

I say, mister, it's getting cold; suppose we go into the smoke-room. A glass of whisky will do you good; keeps the chills off the stomach, and so keeps off sea-sickness. Do you smoke?'

'No; I do not,' I answered with a shudder.

'Well, then, let me advise you to begin right here. Smoking cured me of sea-sickness, when I was quite a little boy. Come along.'

'No, thank you; I dare not go into the midst of tobacco fumes; and I am almost a teetotaler.'

Something like a muttered oath seemed to pass into my ear; and then followed the words: 'Well, just as *you* like; but I must have a drink and a cigar.'

I had scarcely time to think of the man's queer ways, before Theodore came near me, arm in arm with the gentleman who had advised me to *will* so. If he were a banker, as had been hinted, he was very companionable to a poor fellow like Theodore. Indeed, I was rather displeased at my brother's familiarity with a person so far beyond him in monetary position. They did not see me, in the shadow of the deck chair, and Theodore was saying as they passed: 'Yes, my father built up a big business, and might have made an immense fortune; but he was too timid to strike high.'

'That's just where the English fail,' said the other, coming to a stand and slapping Theodore on the shoulder. 'The Americans will soon have the trade of the world, because they are not afraid of attempting big things. Well, my young friend, you must not follow in your father's footsteps, if you go into business in my country. What are your plans?'

Theodore hesitated, as if ashamed to confess that he was going into the humble occupation of a fruit-farmer. 'We are going to California,' he said at length and in an evasive tone.

'California?' exclaimed the American. 'Then, young man, you must be ready for anything and everything. We are pretty wide awake in New York; but we are asleep compared with those fellows on the Pacific slope. Everybody speculates there. Do you speculate?'

'Well, that is just what I would like to do,' cried my brother enthusiastically; 'but I have had no chance, so far. I want to become rich by a few masterly operations, not by plodding and saving. I want my mother and sisters to live like elegant ladies; and my brother to be a wealthy amateur barrister, for the poor fellow has not strength to follow his profession as a means of winning a livelihood. He will be lost in a Californian orchard.'

'I like your style, young man,' said the American, with what I thought a tone of forced admiration. 'You will prosper amongst us. Plodding, as you English call snoring at business, has no chance in our country. We are wide awake, afraid of nothing, ready to make a causeway with the Rocky Mountains across the Atlantic, and run a railway over it at a hundred miles an hour. I tell you when our will-power gets started, we stop at nothing!—But we will talk more comfortably in the smoke-room, and I want a cigar. Will you join me?'

'With all my heart,' cried Theodore. 'You seem to know everything, and I am sure will be of great advantage to me.'

'If I can put you in for a good thing, I shall have much pleasure in doing it. I know several people in California.'

'Thanks, my dear sir; let us go into the smoke-room;' and Theodore seized the arm of the American, as if he had known him from childhood.

The conversation I had overheard disturbed me—why, I could not say. If Theodore was making a useful friend, he was already doing that for which we had left England. Fortune was our object. The sooner that was attained, the sooner joy would return to our desolated home. What harm could happen to Theodore by associating with a man of wealth, influence, and extensive knowledge? Suppose the ingenuous boy told more of our private affairs than was desirable to a casual acquaintance, what harm could arise? Frank, confiding, enthusiastic as he was, those qualities could do us no injury if unduly indulged. At most, our poverty and our plans would be revealed to a stranger. He might despise us, as the rich often do the unfortunate; or he might prove to be a powerful friend. Thinking my English shyness and reserve must be the cause of my dislike to the intimacy springing up between my brother and the stranger, I strove to remonstrate with myself. But I could not banish the feeling of vague alarm that beset me each time that I passed the smoke-room, on my weary promenade round the deck. I was alone again; the night was cloudy, and drifting showers came on at intervals.

At eight o'clock I had so fatigued myself that I could walk no longer, and as I felt better than I had done since leaving the saloon, I determined to get into bed without delay. I therefore went into the smoke-room to tell Theodore I was going below. I found him in the centre of a group of lively people, telling a humorous story, his blue eyes blazing with excitement, his golden curls gleaming in the smoky air, as if radiant with a nimbus. A glass of steaming brandy was beside him, and he had the appearance of having drunk freely. Now, he was not intemperate, and never had I seen him under the influence of drink; his looks and demeanour therefore alarmed me. I called him aside.

'Don't go to bed yet, Charley,' he pleaded. 'Come and enjoy yourself with us for half an hour, and then we will go together. You cannot imagine what a lot of nice fellows are with us; gentlemen of first-rate positions, and who have seen such wonderful things all over the world. Do stay, Charley.'

The smoke began to make me ill. I backed to the door, saying: 'I cannot stand this place, Theodore. Come to bed soon, and do not take any more drink. Are you forgetting yourself?'

'Don't be alarmed, old boy,' he returned with a saucy laugh; 'I am merely taking a glass of grog for the propitiation of Neptune. If you would only do likewise, you would feel jolly as I do. Upon my life, Charley, I never was so comfortably comfortable before. I believe I'm a born sailor; and if we don't make our pile in California, I'll take to the sea. My mind is made up, anyhow. I'll never fall back into our English humdrum. Why, my dear lad, if

you heard these gentlemen's conversation about poor old Britain, you'd be frightened! That country's going down hill, because we don't speculate and invent and drive along as the Americans do. After all, I believe it was a real good thing that poor old father did make a mess of it. We've been forced out of the old ruts, my boy; and I'll bet you what you like, that in five years we shall be millionaires, not in dollars, Charley—no; in pounds sterling. Oh, trust me, I am picking up a lot of notions, and I'll make your fortune as well as my own. But go to bed, old fellow; you are looking bad again.'

A CHAT ABOUT SOLICITORS.

BY ONE OF THEM.

Very curious notions are sometimes entertained of the junior branch of the legal profession by that part of the public which has seldom or never been brought into contact with it. In the first place, there is very considerable ignorance as to what an English solicitor really is, or in what respect he differs from an English barrister. I have constantly met with persons, otherwise well informed, who entertained a rooted idea that the solicitor occupies a rank in the profession subordinate to that of the barrister—that he is a species of subaltern, and that if he is 'good and clever,' he may some day be promoted to be a barrister. I have found it also to be generally supposed that he is, as a matter of course, the possessor of considerable wealth, acquired by means frequently the reverse of reputable; and as a corollary to this proposition, that he is a creature of diabolical and unscrupulous cunning and ingenuity, which attributes are supplemented by the most powerful and comprehensive of intellects, and an instantaneously ready and entirely infallible knowledge of the law. True, he does not always impart this knowledge without reserve to those who consult him; but this is merely that he may not deter them, by too free a demonstration of the pitfalls and morasses which lie before them, from attempting that undesirable feat of gymnastics called 'running up a lawyer's bill.'

I am afraid that those of my readers who entertain such opinions as the foregoing will hardly be disposed to believe me when I assure them that the calling of a solicitor is quite separate and distinct from that of a barrister; that his duties are of an entirely different character; that a sudden transition from the one status to the other is impossible to him; but that if he be desirous of being called to the bar, he must have himself struck off the roll of solicitors three years previously. Also, that a solicitor who has acquired a large fortune by the practice of his profession is rather a rarity than otherwise; that in his business, as in most others, such fortunes are seldom built up, but by wearily slow degrees, with much patient and painful toil and rigid self-denial, and often by

the successive labours of several generations. There are, alas! many very poor and miserable solicitors, both deserving and the reverse; and the excellent charitable societies which have been founded for the relief of the former class and those dependent on them find plenty of employment for their funds. Lastly, the solicitor, taken on the average, is neither better nor worse, neither cleverer nor more stupid, than his neighbours; his one advantage being, that whereas other business men are for the most part experienced only in their own special grooves, and their knowledge of life confined to that class of society in which they move, his experience takes a far wider range; for he is daily brought into contact with all sorts and conditions of men, and is forced by the nature of his work to acquire some acquaintance with almost every trade, profession, and occupation under the sun. Even his legal knowledge, though sometimes wide, is generally superficial as regards theory and principles.

The difference between the solicitor and barrister may be illustrated by comparing them to the two ends of a speaking-tube, the solicitor being the end spoken into, and the barrister that from which the voice issues. Into the one end the aggrieved client pours his wrongs; from the other his wrongs issue in the words of the barrister, to whom Justice, often bored, but ever patient, inclines her ear. To speak without a parable, let me endeavour to make my meaning clear by a rough sketch of the course of an ordinary action at law.

We will suppose, then, reader, that you have suffered grievous wrong and injury at the hands of your malignant and evil-minded neighbour, Smith. It may be that by the negligent driving of Smith or his servants you have been overthrown, with loss of dignity and cuticle, in the public streets, and have thereby suffered wounds and internal injuries which incapacitate you from following your very lucrative calling, to your loss and damage. Or, that the savage and ferocious dog of Smith, not being under proper control, has come upon your lands, and there set upon and worried and done to death your magnificent prize Manx cat, valued (by yourself) at fifty guineas. Then it is that you, suffering under the weight of your grievance, seek the consoling presence of your solicitor, being firmly impressed with the conviction that Smith is altogether in your power, and that he has not a leg to stand upon. Your solicitor listens with irritating impassiveness to your tale of woe; and when he has heard you to the end, proceeds, by means of a few rapid and searching questions, to extract the real story from the confused and probably one-sided statement of facts which you have put before him; for, with the usual fatuity of human nature, you will have enlarged upon and exaggerated all such circumstances as you consider to be in your favour, while carefully suppressing everything which may tell against you.

The next thing your solicitor does is to write a formal letter to Smith, setting forth the complaint, demanding immediate compensation, and threatening legal proceedings in default; which composition is technically called 'the letter before action'; and under the vague generalisation of 'a lawyer's letter,' is regarded with much dread and abhorrence by the world at large. Smith, proving stubborn, the solicitor proceeds to fill up the Writ of Summons, which is merely a printed notice from 'Victoria, by the grace of God Queen, Defender of the Faith,' summoning the recalcitrant Smith within eight days to enter an appearance at your suit, failing which you may proceed to judgment and execution. This having been duly stamped at the proper office, a copy thereof is served upon Smith. We will assume that Smith by his solicitor causes an appearance to be entered in due season.

It is at this point that the barrister steps in. Your solicitor lays before 'counsel'—as the barrister is called*—a carefully prepared summary of the facts, and instructs him to prepare the Statement of Claim. This is simply a history of the circumstances, compiled with due regard to various technicalities, followed by a claim for a sum of money by way of damages. Counsel having drawn it up from the facts before him, it is printed, and a copy is delivered to Smith's solicitor, who replies with a Statement of Defence, also prepared by counsel. By this time it is to be hoped that the parties have managed between them to define pretty clearly what it is they are fighting about; otherwise, the 'pleadings,' which is the name given to these documents, may be continued indefinitely, until the matters at issue are evident. When such a state of things has been happily arrived at, your solicitor delivers a short 'ponder of issue'—that is, in effect, an allegation that what you say is true, and that what Smith says is the reverse.

Counsel is thereupon instructed to 'advise on evidence'—that is, to say what witnesses, documents, &c. will be necessary to prove your case. The solicitor then sets to work to get this evidence together; and here comes the most difficult and trying part of the whole business. Some witnesses are friendly and willing, and even anxious to do all they can to assist; they will attend with alacrity and punctuality at the solicitor's office, and will answer all his inquiries with the most unreserved fullness. They will not only tell him all they know, but also a great deal that they do not know, exaggerating and inventing as they go along in the most trying manner; not from any wish to deceive, but from sheer partisanship and anxiety that their friend shall not be beaten. They will keep back nothing except—unless sharply looked after—some trifling point of the utmost importance to the case, but which, as it seems to them, 'doesn't matter.' These are the most dangerous kind of witnesses; for unless the evidence which they are really able to give be carefully sifted out of them and driven well home into their minds beforehand, they will, when called upon to undergo the ordeal of the oath, infallibly unsay three-fourths of what they have privately

* In Scotland, the counsel is called an advocate, not a barrister.

stated, and qualify the remainder, thus giving a fatal aspect of weakness and deception to the whole case.

Other witnesses, again, delighted with the temporary importance suddenly conferred upon them, will augment that importance by every means in their power. They will not go to the solicitor—not they. 'If he wants them, let him come to them. They do not know when he can see them; they are very busy; they can make no appointment—he must take his chance.' Consequently, much precious time has to be wasted in repeatedly calling upon them and hunting them from place to place; and when at length brought to bay, they exhibit a maddening amount of hauteur and indifference. They don't remember this; they have but a meagre recollection of that; they don't know that they can swear to the other—in fact, they would much rather not have anything to say in the matter, and will only consent to do so under pressure and as a great favour. Add to all this that they are fond of little liches and are dreadfully thirsty. Then there are the absolutely hostile witnesses, who must be compelled to appear and give evidence by legal process, and who in court must have the truth dragged out of them, and in the telling of it will do all the harm to your case that they conveniently can.

The evidence having been collected, the cause is set down for trial, and the brief is prepared for counsel. This is simply your story of the case, followed by the name of each witness, and a résumé of the evidence he is prepared to give. When the cause is heard in court, the opposing counsel, speaking by their briefs, proceed to argue, examine their own witnesses, and cross-examine those of the other side, until each has done all he possibly can for his client. The jury then find either that you are a much injured man, and Smith the cause of it; or that Smith is a most estimable person, and that you are quite mistaken in supposing yourself aggrieved. Or—what is worst of all—perhaps they find themselves unable to come to any conclusion; in which case they are discharged without a verdict, and all the work has to be done over again—that is to say, provided you have the stomach for it, which will probably not be the case unless you are either very wealthy or very obstinate.

This rough outline of proceedings, far too complicated in their details to be set forth more fully, will sufficiently illustrate the difference between the functions of the solicitor and those of the barrister. It will be seen that the former deals directly with the public; the latter only through the agency of the solicitor; so that, although the stamling of the barrister is considered to be superior to that of the solicitor, it is upon the good-will of solicitors that every barrister must depend for success in his profession.

The popular notion is that every time the solicitor is interviewed by his client, every time he puts pen to paper to indite a letter, indeed whenever he exerts mind or body in the slightest degree, he charges (and is paid) a fee, which is invariably put at six shillings and eightpence. And in support of this idea there is a little anecdote, which relates how a solicitor was walking down the street, when a client, meeting him,

observed that the weather was fine, and inquired if the lawyer thought it would hold up; who replied that he considered there was every probability of its doing so. Some little time after, the client was astounded at receiving a bill as follows: 'Attending you on your consulting me as to the state of the weather—conferring and advising thereon—6s. 8d.' As a fact, the solicitor's fee is sometimes more, sometimes less than the above mystical amount; while in certain cases the law does not allow him to make any charge at all. The competition he has to face is tremendous, and the result of his insisting even on his full legal charges would simply be that he would lose three-fourths of his connection. Not only has he to compete with duly qualified members of his own profession, but he has also, in his efforts to acquire a practice, to run the gantlet of all sorts of unlicensed intruders. There is the accountant, the auctioneer, the 'general agent,' the 'private gentleman of fortune' who advances any sum at a day's notice, and who assures his victims that they will incur 'no legal expenses,' and a hundred others; each and all of whom are ready to transact, however imperfectly and unskillfully, business for which people formerly resorted to their solicitors. Many even dabble in matters which solicitors only are by law permitted to handle—some by boldly evading legal restrictions, others by keeping in their employ some unfortunate man of law who has suffered shipwreck in reputation or in pocket, and who, in consideration of a share, and a very small one, of the profits is content to lend such persons the shelter of his name.

Of these harpies, the public cannot sufficiently beware, being, as most of them are—for accountants and auctioneers of standing are seldom guilty of such practices—mere ephemera, here to-day and gone to-morrow; unlike solicitors, responsible to no court, restrained by no scruples, hampered by no professional etiquette, whose only rule of conduct is to get what they can, and whose sole possessions are a highly varnished but unstable set of second-hand office furniture. They are compelled to undergo no training, they pass no examination, and pay no expensive fees. It is competent to any man with enough ready-money to pay a quarter's rent in advance, to open an office and dub himself 'accountant' or what not; and without knowledge, education, ability, or indeed any business qualifications—except a glossy exterior and a confident address, to apply himself to deceive, swindle, and impoverish whomsoever he may succeed in entrapping.

I have spoken strongly, perhaps, on the wrongs of my profession; but have I not some excuse? Is it not a little hard, after having undergone a training which has occupied from three to five years, and has cost in premium, fees, and maintenance during the time of apprenticeship about two thousand pounds, to find that irresponsible intruders have come in over the wall, and are on all hands plucking and devouring the fruit which he who has entered by the gate has striven so hard to win? We do not ask for sympathy or appreciation; we simply demand justice. Place our rivals under the same restrictions which hamper us, and we will undertake to hold our own against all comers.

But it will readily be imagined from the foregoing remarks that the acquisition of a large fortune is not a mere ABC to the solicitor, even if he were exempt, which he by no means is, from the runs of ill-luck and reverses of fortune which beset the rest of mankind. Moreover, the great road to success which is open to his non-professional rivals and to every other class of business man is closed, and very properly so, to the solicitor. He must not advertise; this the etiquette of his profession strictly forbids. He must depend for the increase of his connection upon the slow and wearisome process of contagion—he must wait while those whom he has succeeded in satisfying communicate to others with whom they come in contact a belief in their solicitor's talent. Like other folks, lawyers are liable to make little mistakes; and they are aware of this, and are forbearing with one another, none knowing when his day may come for need of such forbearance. But let a solicitor advertise, and he at once becomes an Ishmaelite. Every man's hand is against him. He cannot make a slip but instant advantage is taken of it to the fullest possible extent; and he soon finds, that he must either withdraw his advertisements and wait until his fault has been forgotten, or abandon the practice of his profession. But we are generally saved from this by a feeling of what is due to our own dignity.

The honesty of the solicitor has always been more or less called in question; and this, curiously enough, appears to be quite compatible with the entire confidence which almost every man reposes in his lawyer. The common cause for these conflicting phenomena is not far to seek. They spring from the lamentable ignorance of the laws by which they are governed which is conspicuous in the majority of Britons. This ignorance compels them to place confidence, reluctantly but perforce, in the man whom they suppose to know the law, and at the same time disables them from perceiving whether he is imposing upon them or not. But let me assure them for their comfort, if they will take the word of one of the suspected tribe, that solicitors are better by far than they are painted. I could, if I had space, set out instances without number of kindness and self-sacrifice on the part of my brethren. You will be as safe in the hands of a solicitor of standing and repute as in those of any other person of similar position. He will not cheat you himself, neither will he allow others to do so. It would not *pay* such a man to be anything else than honest. Sooner or later his sin would find him out; and the consequences would be of considerably more importance to him than any ill-gotten gains he might have acquired. Or supposing him to have a good chance of escape, the risk would be far too serious. Sorry disclosures, no doubt, occasionally take place in public of the shortcomings of solicitors in point of honour and honesty; but do doctors never appear in the police-courts? are clergymen always immaculate? is the glorious profession of arms free from all stain on its brightness? And has any general distrust of soldiers, clergymen, or physicians arisen in consequence?

My advice, therefore, to the reader is to select your solicitor with a due regard to his business

and social surroundings; always to be candid, frank, and straightforward with him, when you may rest assured he will be equally so with you. Trust him implicitly, and he will give you no cause to regret your confidence.

VINE-GROWING IN THE SOUTH OF FRANCE.

THE disease, as it is not very correctly called, that has destroyed the vineyards in many departments in France, has caused changes in the cultivation of the vine that may be useful to record. The enemy was an insect that burrowed and ate up all the fibrous roots, so that, when they were gone, the vine died from want of nourishment. It has been ascertained by experience that the insect known as *Phylloxera* had generally been at work some two years before the vines showed signs of failing. Then loss of power became apparent; the shoots became feeble and short, and in one or two seasons the plant died. Various chemical remedies were tried, one, of a sulphurous nature, being injected through a tube down to the roots. It was efficacious in killing the insect; but as it was dangerous also to the plant, the practice has been dropped. Very liberal manuring in some cases staved off the evil day, probably stimulating the vines to throw out fresh rootlets, which prolonged life for a time. It was at last recognised as inevitable that the old vines were bound to go; and new plants under different conditions must take their place. Happily, America—the country that sent the disease to France—supplied the remedy in vines, many of them quite wild vines, that are now restoring the vineyards of France.

We will first give a short account of the old system of vine cultivation in the south of France, so as to show in what respects the new practice differs and improves upon it.

The old plan of cultivation was—rows of olive-trees eight to ten yards apart between, and six or seven yards apart in the rows. About a yard on each side of the olive-trees, a row of vines, making as it were double rows of vines, with vacant spaces, six or eight yards wide, between two double rows. These spaces were sown with corn or green crops every year, and the only manure applied to the land was that given to these crops. Now, as olive-trees and vines send their roots very far in search of food, the only hope of keeping such a system going would have been excessive manuring. This was not generally done; and, moreover, the produce in olives and grapes was taken off the land without any return in the shape of refuse to speak of. The vine-shoots, too, are cut off in winter down to two eyes, and the cut portions, when dry, used for lighting fires. This drastic treatment impoverished the soil, and rendered the vines too feeble to resist the attacks of the *Phylloxera*. Most of them succumbed at once. One vineyard proprietor we knew had about two hundred and fifty thousand vines. His cellar, running the whole length of his house, fully

twenty yards long, was filled with wine a few years ago. In two years, all was over, and corn had taken the place of vines.

The replanting of such an extent of land was too much to be undertaken; and except a small acreage planted with American vines for home-use, vine-culture has been abandoned on his property. Many kinds of American vines were imported—some that produced grapes useful for wine, others simply wild vines, only useful as stocks for grafts of the old vines of France. Some of them were non-resistant to the insect; others were disliked for one reason or other; and the favourite now seems to be the *Jaquez*, which produces a fairly good grape itself, and is also a good stock for French grafts. As a wild vine useful only as stock, the *Riparia* is most liked. It is a vine of great vigour, throwing out shoots of five to ten yards long in a season. There are many different modes of planting: some proprietors graft the two sorts together as cuttings, and plant them out; others strike them in a nursery, and when rooted, plant them out. After trying all methods, our own experience favours the plan of planting the American *Riparia* rooted, and in a year or two after, grafting the French vine on to it. From crafts made in March, we have had shoots yards in length, which have borne large bunches of grapes the first year.

The change in the mode of cultivation principally consists in doing away with the olive-trees and corn-crops before mentioned, and confining the plantation to vines alone. This is a great improvement; and as with it manuring is recognised, good results are already apparent. There is, however, we think, a tendency to plant the vines too close. Some are planted only a yard apart each way; while two yards between the rows seems to us little enough space. The expense of replanting has been very great. Of course, after the first year or two the larger proprietors formed their own nurseries, and struck the cuttings themselves. Our own practice was to buy the wild *Riparia* rooted, and the following winter to layer the long shoots on either side—if possible, forming new plants—at least a yard distant from the old one, and grafting as they became ready. All cuttings are carefully planted in the nursery, to be planted out the following year in the gaps where the layers had not fully completed a new row. So every year the vines increase, though, as an acre requires thousands under the new system of cultivation, the process is comparatively slow as regards the extent of land.

Under the old system, one thousand vines planted an acre; now, four to five thousand vines are required. The number seems large; but it must be remembered that they are cut back to one or two eyes, that the shoots run very near the ground, and that each plant does not produce more than one or two quarts of wine. The vines in the south of France are not often staked, as in the central departments. The reasons are probably twofold—the one owing to the occasional violent winds that blow; and the other due to wood suitable for stakes not being plentiful. Thus vines that branch a little upwards and form a kind of curve before the end touches the ground, are preferred. The grape bunches coming chiefly near the stem do not touch the ground,

and are handy for gathering. Vines that have shoots simply running along the ground, and bearing bunches of grapes resting on the soil, are undesirable; they get dirty, and are liable to be destroyed by insects and vermin, as well as to be rotted by rain.

The grape-harvest begins towards the end of August, and goes on through September. There are grapes that ripen in July; but these are for eating rather than for wine. The process of ingathering is very simple. As the grapes are gathered, they are placed in baskets, slung on each side of a mule or pony, and taken off to what we may call the squeezing-house. Here we find something like a large bath, built of masonry, and well cemented. On the top, loose planks are laid, and on them the grapes are placed. Men without shoes or stockings dance upon the grapes, and the juice runs through the cracks between the planks into the receptacle below. Then, from time to time, the skins and stalks are allowed to fall in by moving a plank. Nothing is then done for five days, during which period fermentation goes on. At this period, the wine is drawn off by a tap at the bottom of the *cuvée*, and when the liquid is disposed of, the skins and stalks are taken out and put through a press, to get out all the colour of the grape. This last wine in the case of black grapes, is much darker than the other, and is mixed with it, so that the colour should be uniform. We should remember that the colour comes from the skin; and, paradoxical as it may appear, white wine can be made from black grapes, if the skins are kept out. The stalks contain a certain amount of tannin; and there is, without doubt, in good pure wine, over and above the alcohol, a certain amount of food. The natives of the country live chiefly on bread and wine; and although it is a question whether the amount spent on wine might not with greater advantage be spent on meat, the fact remains that they can work very well on the corn-and-wine, salad-and-oil diet.

After this digression, we return to the wine, which is put into casks, generally of two hundred and twenty-five litres—equal to the twenty-six dozen English bottles—and left for six weeks. The bungs being left out, fermentation continues, and skins and froth are constantly thrown off through the bung-hole. Every two or three days the cask is filled up, and the process continues. When six weeks are completed, the bungs are knocked in, and all is finished.

We are speaking now of small properties. In large vineyards, the casks are of enormous size, built in the cellar. The cellar is not underground, as in England, but is on the north side of the house, on the ground-level. It often takes two stories of the house in height, and has a loft above it. The length is often twenty to thirty yards. The wine is rucked in spring—that is, moved from one cask to another—the object being to get rid of all sediment and deposit and to have a clear bright wine. Then it may be bottled or not as convenient. We are not speaking of choice wines, when we say that this wine may be drunk at six months old, though it is better to keep it eighteen months. Nothing should be done to the wine—neither clearing

substance nor alcohol should be added. In fact, the treatment calls for no more trouble than the making of cider, cleanliness and care being the chief desiderata.

Wine may be kept for various periods; but good ordinary wine is never better than at three or four years old, though it may keep sound for twenty years. It is now very difficult to get pure wine. Water is often added at the time of pressing equal to the quantity of wine, and fermented with it; thus the two become blended, and pure alcohol added gives the strength. People used to pure wine can detect at once any adulteration. Once we added something to our own wine. There had been a very abundant crop of grapes, owing to an unusual amount of rain having fallen when the grapes were swelling. The amount of wine was more than one-third above the average, and though clear and pure, it seemed weak. We thought it could not stand a hot summer, and consulted a local authority, who recommended a bottle of brandy, or maybe two, to be added to each cask of about forty gallons. The advice was followed, and the wine was spoiled—that is to say, the pure taste of wine was gone, although it remained perfectly sound. It was no pleasure to drink it; and we consigned it to the domestics. A small cask that had not been doctored or fortified kept perfectly well, and turned out an excellent wine.

The best wine comes from high ground, but quantity gives way to quality. Stony ground—often old quarries—produces a high quality of wine—bright, light, and wholesome. In the plains below, you have quantity, but coarse and heavy wine. The taste of earth is often discernible, and strong manuring only increases this defect. Hillsides with a southern aspect are the best sites for vineyards.

If things go well, the cultivation of vines is a very pleasant occupation; but, like agriculture generally, the last few years have been disastrous, and hope is only now beginning to revive.

DARKNESS AND LIGHT.

I.

On ' the deathly, dreary world—
Summer 's fled;
Oh ' the cruel heart-despair—
Hopes are dead.
All the world is drowned in tears—
Tears of rain;
Night is o'er me; when will Dawn
O Come again?
Dark without and dark within
Is my life;
When will Death, the crown of all,
End the strife?
Flowers have sadly died away—
Gentle friends;
Piercing wind with ^{helpful} power
Storms and rends.
Little warblers of the grove,
Silent all;
Winter covers heart and home
Like a pall.

Gloom and pain are all around,
Chilling aye;
Night is long, and sad, and drear;
Bright the day.
Not a gleam of light, but all
Gray and cold,
Low'ring clouds with ne'er a warm
Ray of gold.
Music hushed and laughter stilled—
Winter's reign—
Sunshine gone, and leaving only
Litter pain

II.

Summer friends have passed away,
All untrue;
Friendship could not bear the storms
As they grew.
Stand they by you, if you keep
In the sun;
Fortune frowns, then count your friends
One by one.
Let them go ' they are not worth
Calling friend—
Word that means standing by you
Till the end.
Let them go ' Cowards leave a
Sinking ship,
Not a friendship tears of heart,
But of lip
Let them go ' to pastures new,
Bright with gold.
Let them live their sunny life,
Shunning cold
Friendship, like the noxious flowers,
Just for show,
With no strength to brave the storms—
Let them go '!

III.

Heart grows warmer with the thought,
I have one
Who will be a friend for aye,
Shade or sun.
Thought that wakes the dull, dead earth—
Past is night.
Through the eastern gates of morn
Breaks the light
Fled is now the dreary dream;
Day is here,
Songsters' voices trilling out
Sweet and clear.
Flowers awake in beauty fresh
Ope their eyes,
Dawn dispels the midnight grief,
Sorrow dies.
Yes, our Life is worth the living:
Rich are we,
If we count as friend one soul,
Frank and free.
Earth grows lovely as I think,
Such have I,
Who will true and faithful be,
Till I die.

SOME BIG SCHEMES.

IN the development of railway schemes the present age is most prolific. Two of these are of colonial inception and of great magnitude — namely, the Canadian Pacific Railway from sea to sea of North America; and the Australian Trans-continental line, which is intended ultimately to connect Adelaide in the south with Port Darwin in the north. Yet there is nothing startling about these projects, because they are in familiar fields of enterprise and expansion, and because they seem not merely legitimate, but obviously necessary sooner or later.

A much smaller project, indeed, may seem much more extravagant: such, for instance, as Mr Stanley's scheme for a line of railway to unite the Upper with the Lower Congo, and so avoid the interruption to navigation caused by the Falls. This railway will not be very long, but it will be difficult to construct, and necessarily costly, from the distance which material and skilled labour will have to be conveyed. But it is one of the first things which will have to be done, and which doubtless will be done, before the attractive country which Mr Stanley has made known to the civilised world can be brought within the bounds of commerce and civilisation. A railway into Central Africa, indeed, is no new idea, and has been in part realised already by the French, who are engaged in making a line from their settlement on the Senegal to a place called Bamnaku, on the upper reaches of the Niger. This railway will be some six hundred miles in length; and from its interior terminus, it is expected that Timbuctoo can be reached in less than a week by steam-launches. These schemes, then, if not great as engineering feats in comparison with others which we have to mention, are certainly 'big' with potentialities.

Of vast importance to the British empire, again, is the intention to expend some fifty millions in developing the railway system of India. It is known that a very large proportion of the wheat

actually produced in India is wasted, because of the insufficiency of existing means of getting it to market. It is also known, by the careful reports of experts, that vast tracts which are peculiarly adapted to wheat cultivation are now lying useless, and that, although the present production of wheat in the empire is between two hundred and two hundred and forty million bushels annually, it could be almost immediately doubled were communication established. With an adequate development of the railway system, it is probable that India may vie with America as the granary of the world.

Then another thing necessary for the development of India and, through India, for an extension of our trade and influence, is the opening of direct communication with Western China and Tibet. To this end, Mr A. R. Colquhoun planned a line of railway from the coasts of British Burmah through Northern Siam and the Shan States to the south-west frontier of China. The whole line of route has been explored; and the reports of Mr Colquhoun have been confirmed by travellers who have followed him, especially by Mr Carl Bock, regarding the natural wealth of the countries to be traversed by the main line and its proposed feeders. It would bring Rangoon into direct connection with the populous towns of Zimmé, Raheng, and Bangkok, and in fact with the whole population of Siam and the Shan States, variously estimated as between thirty and forty millions. The only difficult part of this railway is said to be where it will have to cross the mountains between British Burmah and Siam; but even there the difficulties are not greater than have been encountered and overcome in many other parts of the world. The cost of construction at this point is estimated by Mr Colquhoun at fifteen thousand pounds per mile; but the main length, he thinks, could be constructed for a little over seven thousand pounds per mile. The total cost from Rangoon to Kiang-hsu, on the banks of the Mekong River, he estimates at a little over three millions sterling. This is certainly not a large

outlay for the advantages which may be expected to result; and, this railway, or something like it, we shall probably see ere many years; but in the meantime Mr Colquhoun has turned his attention to other matters, and the scheme sleeps.

Another project to link our Indian possessions with the East is that of Mr C. H. Lepper, whose idea was to construct a short line of railway—about a hundred and fifty miles—from Makum in Assam to Mairla, on the Irrawadi. This would connect at Makum with the Assam Railway Company's line, whose terminus is to be at that place; and would, it is said, tap the trade of the province of Sze-chu-en, and thereafter that of Tibet and Western China. The western terminus of the Assam Railway is at Dibrugarh, on the Brahmaputra; and between that place and Calcutta the traffic is carried by steamers.

Whether or not these two schemes be carried to fruition, there are strong reasons for prosecuting a connection with Tibet. The chief difficulty heretofore has been the opposition of China, who has guarded with jealousy her rights of suzerainty over the rich and populous country of the Grand Llama. That jealousy has compelled us to employ Nepal as the intermediary in what little trade we do with Tibet. Towards the end of last century, Nepal was also made tributary to China; and as recently as 1816, a Chinese army occupied Khatmandu. Now, while the Chinese are essentially a nation of traders, the Pekin government is one excessively jealous of its own authority and prestige, and hence it is easy to understand the disavowal with which the efforts of Anglo-Indians have been regarded when they took a Tibetan direction. The recent expedition to the Lachen Valley, which was undertaken by Mr Macaulay, and some particulars of which have appeared in the *Times*, was an especial cause of disturbance to the Celestial mind. But now it is reported that the Chinese government has been pacified by the assurance that there is no intention on our part of opening up routes without their consent, and that so far from longer opposing, they are now prepared to facilitate our endeavours to form direct trade-relations with Tibet.

Such a trade-route was one of the dreams of Warren Hastings, who, as Mr Clements Markham tells us, 'opened a correspondence with the rulers of Tibet and Bhutan; succeeded in establishing friendly relations by the despatch of an embassy; by his liberal encouragement of trade, brought down crowds of mountaineers to his fair at Rangpur. He followed up his first mission by a second and third to Bhutan, with the object of cementing the recently formed friendship; and finally sent a fourth embassy to Bhutan, which extended its operations into Tibet.' But with all this excellent beginning, practically no advance has been made since, and Tibet remains to all intents and purposes a sealed land to British traders. It is surprising, in these days of exploring enterprises, how few Europeans have ever penetrated into the heart of Tibet; yet from what is known of the country, it would appear to present a splendid field for trade. It is conceivable that the Tibetans are already in a position to buy from us, and to pay for in kind, as many millions of yards of textile fabrics as

Mr Stanley thinks the Africans may be able to do—some day. For our part, we should hope more from commercial relations with a clever Asiatic people, than with the backward races of the Dark Continent. At anyrate, some practical steps are being taken at last to realise the dreams of Warren Hastings and some of his successors.

The expedition lately sent out under the charge of Mr Macaulay was despatched by the lieutenant-governor of Bombay, in consequence of reports that the Tibetan authorities at Thari had interfered with the export trade. Mr Macaulay's mission was to visit the frontier, ascertain the real state of affairs, obtain the friendship of the independent Maharajah of Sikkim, and endeavour to open up a trade-road through the Lachen Valley. The expedition seems to have been successful in every respect, and to have brought back favourable reports of trade prospects by the Lachen route. This route has the advantage of never being closed by snow for any length of time, and Mr Macaulay has established friendly relations with the Tibetan authorities. It has the further advantage of avoiding the tolls which are levied on the traffic passing through Nepal; and this is a very important item, for the effect of these tolls has been to leave the trade between India and Tibet almost entirely in the hands of Nepalese merchants. In consequence, it has yet attained but small dimensions, being represented by something under three hundred thousand rupees annually of imports from Tibet, and of under one hundred thousand rupees of exports thereto.

It has been pointed out as a remarkable fact, that within a hundred miles of Darjeeling there is a confirmed tea-drinking people which obtains all its supplies of the fragrant herb from the markets of China, more than a thousand miles distant. Darjeeling is the centre of the Indian tea-growing industry, and Darjeeling is now united with the railway system of the empire. The distance between Darjeeling and Kongralama was traversed by Mr Macaulay in nine days; and Shigatze, the capital of the province of Tsang, is but five days' journey further; while to reach Shigatze through Nepal occupies several weeks. Once at Shigatze, the whole of Tibet is open to the trader; and the Tibetans are eager purchasers, when they can get the chance, of English broad-cloths and coloured cottons and of hardware of various sorts. In return, they have to give gold, spices, cattle, and above all, wool of the finest quality and in unlimited quantity. We may look forward to the day, then, when the iron-horse will follow still more expeditiously the route marked out by the recent expedition, and enable us to beat down with the friendly arm of commerce the barriers on the western frontiers of China, even as we have surmounted those on the eastern.

But if we are in the prospect of having railway communication between India and China, is there any hope of the realisation of the dream of railway communication between England and India? Engineers say yes; and there are many others who agree with them. The subject has been receiving a great deal of quiet but close

consideration within the last year or two, not of dreamers, but of hard-headed, clear-sighted men of business.

There are several schemes; but it would take too long to explain them fully, and indeed any explanation must be imperfect without maps. We can but indicate briefly the most favoured projects, which, although they may have been already casually noted in these pages, may be now presented more in detail.

There is, first of all, what is known as the Euphrates Valley scheme. The idea of this project is to carry a railway through Asiatic Turkey to the shores of the Persian Gulf. The objections urged by some experts to this scheme are—(1) that it would be very costly; (2) that it is not by any means proved to be practicable throughout; (3) that it would either have to be carried along the river-side, and so be subject to inundation, or else taken inland through a desert country, which could afford no supporting traffic; (4) that even if constructed to the Persian Gulf, it could hardly be carried further, because the country between the mouth of the river and India is desert, crossed by high ranges of mountains, of intense heat, little water, and a scanty and marauding population; and lastly, it would not in any case afford an unbroken land communication between Europe and India.

Next, there is what is called the Tigris Valley scheme. This comprises a line from Soutari to Bagdad via the valley of the Tigris, and thence to India; while another proposes to run from Soutari through Ismid to Aleppo, thence by the Euphrates Valley to Bassorah, and thence to Kurrachee, on the Indian system. The objections mentioned against the Euphrates Valley scheme are understood to apply more or less to each of these, and especially in respect that not one of them would afford an unbroken land-line.

The scheme which has advanced most in favour is that which Sir Macdonald Stephenson framed upwards of thirty years ago, and has been recently revived. It takes Constantinople as its starting-point on the European system, and goes through Angora, Sivas, Van, Teheran, Meshed, Herat, and Candahar to Sukkur, where it joins the Indian system. The total length of railway under this scheme is three thousand miles, of which one thousand would be in Turkish territory, twelve hundred in Persia, and eight hundred in Afghanistan. That is to say, as regards the main line; but the intention is to throw off branches at various points, to tap intermediate traffic. There would be some passes to cross in Persia, and also between Herat and Candahar; but the engineering difficulties are said to be quite surmountable without extravagant cost. Whatever the cost of an Indo-European line, it may be accepted that the through-traffic will never compensate for it, and that the local traffic must be relied on for interest and profit. That being so, the route proposed by Sir M. Stephenson seems to offer the best prospect of suitable returns. Negotiations, we believe, are actually in progress with the Sublime Porte for the necessary concessions and 'firmans' to enable the preliminary steps to be taken; and some day or other we may see the prospectus issued of the Constantinople and

Sukkur Trans-continental Railway Company. By this route, it is said, one might go from London to Calcutta in a week!

Whether any of us now living shall live to see the day when such a journey is possible, may well be doubted; but it is surely within the range of probability that our children will look upon the Indo-European railway with as much complacency as we do upon the Suez Canal.

But if London to Calcutta by rail seems in the meantime something of a dream, what shall we say of the idea of going from London to New York by rail? At first thought, it seems impossible; but an American scheme suggests the possibility, if not the probability. A certain Major Kent has devised a project for constructing a railway from the United States to Asia—the existing lines of American railway to be brought into conjunction with the western terminus of the Canadian Pacific line at Fort Simpson. Thence a line of five hundred and twenty-five miles would have to be constructed along the coast to Mount St Elias, and thence about one thousand miles across the Alaska Territory to Behring's Straits, which would have to be bridged. The bridging is said to be an easy matter, as the straits are only about thirty miles wide at a point where is a cluster of islands so placed that the widest space to be crossed would be only two miles. From East Cape on the Asiatic side, the railway would follow the coast-line as far as possible, for the sake of the temperature, and would eventually join the Russian system of railways at Vladivostok. When the Russian system is complete, the connection with St Petersburg would be attained; and if with St Petersburg, then with all Europe, and with London via the Channel Tunnel!

There is a boldness about this idea worthy of the transatlantic mind; but for ourselves, we confess to not being prepared yet to grasp it; we can only ponder and wonder.

A HOUSE DIVIDED AGAINST ITSELF.

CHAPTER XXXI.

THE crisis, however, was averted—'mercifully,' as Lady Markham said. Dr Howard from Southampton—whom she had thought of only by chance, on the spur of the moment, as a way of getting rid of Markham—produced some new lights; and in reality was so successful with the invalid, that he rallied, and it became possible to remove him by slow stages to his own house, to die there, which he did in due course, but some time after, and decorously, in the right way and place. Frances felt herself like a spectator at a play during all this strange interval, looking on at the third act of a tragedy, which somehow had got involved in a drawing-room comedy, with scenes alternating, and throwing a kind of wretched reflection of their poor humour upon the tableaux of the darker drama. She thought that she never should forget the countenance of Nelly Winterbourn as she took her seat beside her husband in the invalid carriage in which he was conveyed away, and turned to wave a farewell to the little group which had assembled to watch the departure. Her face

was quivering with a sort of despairing impatience, wretchedness, self-pity, the miserable anticipations of a living creature tied to one who was dead—nerves and temper and every part of her being wrought to a feverish excitement, made half delicious by the prospect, the possibility of escape. A wretched sort of spasmodic smile was upon her lips as she waved her hand to the spectators—those spectators all on the watch to read her countenance, who, she knew, were as well aware of the position as herself. Frances was learning the lesson thus set practically before her with applications of her own. She knew now to a great extent what it all meant, and why Markham disappeared as soon as the carriage drove away; while her mother, with an aspect of intense relief, returned to her guests. 'I feel as if I could breathe again,' Lady Markham said. 'Not that I should have grudged anything I could do for poor dear Nelly; but there is something so terrible in a death in one's house.'

'I quite enter into your feelings, dear—oh, quite!' said Mrs Montague; 'most painful, and most embarrassing besides.'

'Oh, as for that,' said Lady Markham. 'It would have been indeed a great annoyance and vexation to break up our pleasant party, and put out all your plans. But one has to submit in such cases. However, I am most thankful it has not come to that. Poor Mr Winterbourn may last yet—for months, Dr Howard says.'

'Dear me; do you think that is to be desired?' said the other, 'for poor Nelly's sake.'

'Poor Nelly!' said the young ladies. 'Only fancy, months! What a terrible fate!'

'And yet it was supposed to be a great match for her, a penniless girl!'

'It was a great match,' said Lady Markham composedly. 'And dear Nelly has always behaved so well. She is an example to many women that have much less to put up with than she has.—Frances, will you see about the lawn-tennis? I am sure you want to shake off the impression, you poor girls, who have been so good.'

'Oh, dear Lady Markham, you don't suppose we could have gone on laughing and making a noise while there was such anxiety in the house. But we shall like a game, now that there is no impropriety!'

'And we are all so glad,' said the mother, 'that there was no occasion for turning out! for our visits are so dove-tailed, I don't know where we should have gone—and our house in the hands of the workmen. I, for one, am very thankful that poor Mr Winterbourn has a little longer to live.'

Thus, after this singular episode, the ordinary life of the household was resumed; and though the name of poor Nelly recurred at intervals for a day or two, there were many things that were of more importance—a great garden-party, for instance, for which, fortunately, Lady Markham had not cancelled the invitations—a yachting expedition, various other pleasant things. The comments of the company were diverted to Claude, who, finding Frances more easily convinced than the others that draughts were to be carefully avoided, sought her out on most occasions, notwithstanding her plain-speaking about his fancifulness.

'Perhaps you were right,' he said, 'that I think too much about my health. I shouldn't wonder if you were quite right. But I have always been warned that I was very delicate; and perhaps that makes one rather a bore to one's friends.'

'Oh, I hope you will forgive me, Mr Ramsay! I never meant!'

'There is poor Winterbourn, you see,' said Claude, accepting the broken apology, with a benevolent nod of his head and the mild pathos of a smile. 'He was one of your rash people, never paying any attention to what was the matter with him. He was quite a well-preserved sort of man when he married Nelly St John; and now you see what a wreck! By Jove, though, I shouldn't like my wife, if I married, to treat me like Nelly. But I promise you there should be no Markham in my case.'

'I don't know what Markham has to do with it,' said Frances with sudden spirit.

'Oh, you don't know!—Well,' he continued, looking at her, 'perhaps you don't know; and so much the better. Never mind about Markham. I should expect my wife to be with me when I am ill; not to leave me to servants, to give me my—everything I had to take; and to cheer me up, you know. Do you think there is anything unreasonable in that?'

'O no, indeed. Of course, if—if—she was fond of you—which of course she would be, or you would not want to marry her.'

'Yes,' said Claude. 'Go on, please; I like to hear you talk.'

'I mean,' said Frances, stumbling a little, feeling a significance in this encouragement which disturbed her, 'that, of course—there would be no question of reasonableness. She would just do it by nature. One never asks if it is reasonable or not.'

'Ah, you mean you wouldn't. But other girls are different. There is Con, for instance.'

'Mr Ramsay, I don't think you ought to speak to me so about my sister Constance, if she were in such a position, would do what was right.'

'For that matter, I suppose Nelly Winterbourn does what is right—at least, every one says she behaves so well. If that is what you mean by right, I shouldn't wish it at all in my wife.'

Frances said nothing for a minute, and then she asked: 'Are you going to be married, Mr Ramsay?' in a tone which was half indignant, half amused.

At this he started a little, and gave her an inquiring look. 'That is a question that wants thinking of,' he said. 'Yes, I suppose I am, if I can find any one as nice as that. You are always giving me *renseignements*, Miss Waring. If I can find some one who will, as you say, never ask whether it is reasonable!'

'Then,' said Frances, reverting something of the sprightliness which had distinguished her in old days, 'you don't want to marry any one in particular, but just a wife?'

'What else could I marry?' he asked in a peevish tone. Then, with a change of his voice: 'I don't want to conceal anything from you; and there is no doubt you must have heard—I was engaged to your sister Con; but she ran

away from me,' he added with pathos. 'You must have heard that.'

'I do not wonder that you were very fond of her,' cried Frances. 'I see no one so delightful as—she would be if she were here.'

She had meant to make a simple statement, and say, 'No one so delightful as she;' but paused, remembering that the circumstances had not been to Constance's advantage, and that here she would have been in her proper sphere.

As for Claude, he was somewhat embarrassed. He said: 'Fond is perhaps not exactly the word I thought she would have suited me—better than any one I knew.'

'If that was all,' said Frances, 'you would not mind very much; and I do not wonder that she came away; for it would be rather dreadful to be married because a gentleman thought one suited him.'

'Oh, I don't mean that would be so—in every case,' cried Claude with sudden earnestness.

'In any case, I think you should never tell the girl's sister, Mr Ramsay; it is not a very nice thing to do.'

'Mrs Warrin,' Frances said—'I was not thinking of you as any girl's sister; I was thinking of you'—

'I hope not at all; for it would be a great pity to waste any more thoughts on our family,' said Frances. 'I have sometimes been a little vexed that Constance came, for it changed all my life, and took me away from every one I knew. But I am glad you have told me this, for now I understand it quite.' She did not rise from where she was seated and leave him, as he almost hoped she would, making a little quarrel of it, but sat still, with a composure which Claude felt was much less complimentary. 'Now that I know all about it,' she said, after a little interval, with a laugh, 'I think what you want would be very unreasonable—and what no woman could do.'

'You said the very reverse five minutes ago,' he said sulkily.

'Yes—but I didn't know what the—what the wages were,' she said with another laugh. 'It is as you are giving me *mensurancements* now.'

Claude took his complaint next morning to Lady Markham's room. 'She actually chaffed me—chaffed me, I assure you; though she looks as if butter would not melt in her mouth.'

'That is a little vulgar, Claude. If you talk like that to a girl, what can you expect? Some, indeed, may be rather grateful to you, as showing how little you look for; but you know I have always told you what you ought to try to do is to inspire a *grande passion*.'

'That is what I should like above all things to do,' said the young man; 'but—'

'But—it would cost too much trouble?'

'Perhaps; and I am not an impassioned sort of man.—Lady Markham, was ~~a~~ really from me that Constance ran away?'

'I have told you before, Claude, that was not how it should be spoken of. She did not run away. She took into her head a romantic idea of making acquaintance with her father, in which Markham encouraged her. Or perhaps

it was Markham that put it into her head. It is possible—I can't tell you—that Markham had already something else in his own head, and that he had begun to think it would be a good thing to try if other changes could be made.'

'What could Markham have in his head? and what changes?—'

'Oh,' she cried, 'how can you ask me? I know how you have all been talking. You speculate, just as I do.'

'I don't think so, Lady Markham,' said Claude. 'I am sure Markham would find all that sort of thing a great bore. Of course I know what you mean. But I don't think so. I have always told them my opinion. Whatever may happen, Markham will stick to you.'

'Poor Markham!' she said with a quick revulsion of feeling. 'After all, it is a little hard, is it not, that he should have nothing brighter than that to look to in his life?'

'Than you?' said Claude. 'If you ask my opinion, I don't think so. I think he's a lucky fellow. An old mother, I don't deny, might be a bore. An old lady, half blind, never hearing what you say, sitting by the fire—like the mothers in books, or the Mrs Nickleby kind. But you are as young and handsome and bright as any of them—keeping everything right for him, asking nothing. Upon my word, I think he is very well off. I wish I were in his place.'

Lady Markham was pleased. Affectionate flattery of this kind is always sweet to a woman. She laughed, and said he was a gay deceiver. 'But, my dear boy, you will make me think a great deal more of myself than I have any right to think.'

'You ought to think more of yourself.—And so you really do not think that Con—' In many ways, dear Lady Markham, I feel that Con—understood me better than any one else—except you.'

'I think you are right, Claude,' she said with a grave face.

'I am beginning to feel quite sure I am right. When she writes, does she never say anything about me?'

'Of course, she always—asks for you.'

'Is that all? Asking does not mean much.'

'What more could she say? Of course she knows that she has lost her place in your affection by her own rashness.'

'Not lost, Lady Markham. It is not so easy to do that.'

'It is true. Perhaps I should have said, fears that she has forfeited—your respect.'

'After all, she has done nothing wrong,' he said.

'Nothing wrong; but rash, headstrong, foolish. O yes, she has been all that. It is in the Waring blood!'

'I think you are a little hard upon her, Lady Markham.—By the way, don't you think yourself, that with two daughters to marry, and—and all that: it would be a good thing if Mr Waring—for you must have got over all your little tiffs long ago—don't you think that it would be a good thing if he could be persuaded to—come back?'

She had watched him with eyes that gleaned from below her dropped eyelids. She said now,

as she had done to Sir Thomas: 'I should put no difficulties in the way, you may be sure.'

'It would be more respectable,' said Claude. 'If getting old is good for anything, you know, it should make up quarrels; don't you think so? It would be a great deal better in every way. And then Markham'—

'Markham,' she said, 'you think, would then be free?'

'Well—then it wouldn't matter particularly about Markham, what he did,' the young man said.

Lady Markham had borne a great many such assaults in her life as if she felt nothing; but as a matter of fact she did feel them deeply; and when a probable new combination was thus calmly set before her, her usual composure was put to a severe test. She smiled upon Claude, indeed, as long as he remained with her, and allowed him no glimpse of her real feelings; but when he was gone, felt for a moment her heart fail her. She had, even in the misfortunes which had crossed her life, secured always a great share of her own way. Many people do this even when they suffer most. Whether they get it cheerfully or painfully, they yet get it, which is always something. Waring, when, in his fastidious impatience and irritation, because he did not get his, he had flung forth into the unknown, and abandoned her and her life altogether, did still, though at the cost of pain and scandal, help his wife to this triumph, that she departed from none of her requirements, and remained mistress of the battlefield. She had her own way, though he would not yield to it. But as a woman grows older, and becomes less capable of that pertinacity which is the best means of securing her own way, and when the conflicting wills against hers are many instead of being only one, the state of the matter changes. Constance had turned against her, when she was on the eve of an arrangement which would have been so very much for Con's good. And Frances, though so submissive in some points, would not be so, she felt instinctively, on others. And Markham—that was the most fundamental shock of all—Markham might possibly in the future have prospects and hopes independent altogether of his mother's, in antagonism with all her arrangements. This, which she had not anticipated, went to her heart. And when she thought of what had been suggested to her with so much composure—the alteration of her whole life, the substitution of her husband, from whom she had been so long parted, who did not think as she did nor live as she did, for her son, who, with all his faults, which she knew so well, was yet in sympathy with her in all she thought and wished and knew—this suggestion made her sick and faint. It had come, though not with any force, even from Markham himself. It had come from Sir Thomas, who was one of the oldest of her friends; and now Claude set it before her in all the forcible simplicity of commonplace: it would be more respectable! She laughed almost violently when he left her, but it was a laugh which was not far from tears.

'Claude has been complaining of you,' she said to Frances, recovering herself with an instantaneous effort when her daughter came into the room; 'but I don't object, my dear. Unless

you had found that you could like him yourself, which would have been the best thing, perhaps—you were quite right in what you said. So far as Constance is concerned, it is all that I could wish.'

'Mamma,' said Frances, 'you don't want Constance—you would not let her—accept that?'

'Accept what? My love, you must not be so emphatic. Accept a life full of luxury, splendour even, if she likes—and every care forestalled. My dear little girl, you don't know anything about the world.'

Frances pondered for some time before she replied. 'Mamma,' she said again, 'if such a case arose—you said that the best thing for me would have been to have liked—Mr Ramsay. There is no question of that. But if such a case arose:—'

'Yes, my dear!—Lady Markham took her daughter's hand in her own and looked at her with a smile of pleasure—'I hope it will some day. And what then?'

'Would you—think the same about me? Would you consider the life full of luxury, as you said—would you desire for me the same thing as for Constance?'

Lady Markham held the girl's hand clasped in both of hers; the soft caressing atmosphere about her enveloped Frances. 'My dear,' she said, 'this is a very serious question. You are not asking me for curiosity alone?'

'It is a very serious question,' Frances said.

And the mother and daughter looked at each other closely, with more meaning, perhaps, than had as yet been in the eyes of either, notwithstanding the excitement of interest in their conversation. It was some time before another word was said. Frances saw in her mother a woman full of determination, very clear as to what she wanted, very unlikely to be turned from it by softer impulses, although outside she was so tender and soft; and Lady Markham saw in Frances a girl who was entirely submissive, yet immovable, whose dove's eyes had a steady soft gaze, against which the kindled light of her own had no power. It was a mutual revelation. There was no conflict nor appearance of conflict between these two, so like each other, two gentle and soft-voiced women, both full of natural courtesy and inclination to wound or offend; both seeing everything around them very clearly from her own, perhaps limited, point of view; and both feeling that between them nothing but the absolute truth would do.

'You trouble me, Frances,' said Lady Markham at length. 'When such a case arises, it will be time enough. In the abstract, I should of course feel for one as I feel for the other.—Nay, stop a little. I should wish to provide for you, as for Constance, a life of assured comfort. Well, if you will drive me to it, of wealth and all that wealth brings. Assuredly, that is what I should wish.' She gave Frances' hand a pressure which was almost painful, and then dropped it. 'I hope you have no fancy for poverty theoretically, like your patron saint,' she added lightly, trying to escape from the gravity of the question by a laugh.

'Mother,' said Frances, in a voice which was tremulous and yet steady, 'I want to tell you—I think neither of poverty nor of money. I am

more used, perhaps, to the one than the other. I will do what you wish in everything—everything else; but—

'Not in the one thing which would probably be the only thing I asked of you,' said Lady Markham with a smile. She put her hands on Frances's shoulders and gave her a kiss upon her cheek. 'My dear child, you probably think this is quite original,' she said; 'but I assure you it is what almost every daughter one time or other says to her parents: Anything *else*—anything; but— Happily, there is no question between you and me. Let us wait till the occasion arises. It is always time enough to fall out.'

ABOUT IRISH EGGS.

THE Irish export egg-trade is a great industry, of comparatively recent growth. It commenced with the running of cross Channel steamers, before which time it was almost unknown; now, its ramifications extend from Dublin to the most obscure village in the wilds of Kerry, the moors of Connaught, the highlands of Donegal, to every port from which a steamer leaves for England, Scotland, or Wales. Potatoes, pigs, porter, and whisky were formerly among the chief consumable exports from Ireland. As England was the land of roast-beef and plum-pudding, Scotland the land of cakes, Ireland was the land of whisky and potatoes.

Things have changed; the potato has never recovered since its total failure in 1846. The pig, although still a prominent export—tens of thousands being shipped annually, alive and dead—has met a most formidable opponent in its American cousin, the Chicago hog. We might add more on Irish exports in general, but wish to confine our selves to the Irish export egg-trade in particular.

Seeing that some three-fourths of the whole population of Ireland are more or less connected with or engaged in agricultural pursuits, there is probably no question more often asked daily, by at least one million of the population of Ireland, than, 'What is the price of eggs?' From the moment the well-known 'Cluck, cluck' is heard from the hen, announcing the production of an egg, there is a rush made for it, which never ceases until the empty shell is thrown into the ash-bin. That egg is bartered and rebartered, sold and sold again, many times before it is introduced to the breakfast-table. Many lies are told about its age, some about its size, many more about its price. Eggs are bought by the dozen and by the hundred of six score. In some parts of Ireland, notably in Dublin market, the hundred counts one hundred and twenty-four.

The trade is divided mainly into two classes—buyers and shippers or exporters. The former are again subdivided into two other classes—dealers and shopkeepers. Buyers sell direct to the shippers; shippers export direct either to a customer in Scotland, England, or Wales, or to an agent or broker there, who sells for him on commission. The buyer is a man or woman owning, or in many cases hiring, a donkey, mule, or horse, and going from one farmer's house to another buying their eggs for money; or in many

cases, giving goods, such as groceries, needles, thread, and other like useful articles, in barter for eggs. Dealers are a smaller class of buyers. They are mostly old women who have what is called a 'dealin'; that is, a small shop, which from ten to thirty shillings would stock; their husbands or children being of the labouring class. These poor dealers buy up from three to four hundred eggs weekly, mostly obtaining the same by barter. These they usually send in by a donkey-cart in a basket resembling a fish-woman's creel, once a week, to the town where the nearest shipper resides; or sometimes, if needy, will sell for a less price than would be had from the shipper, to a well-to-do buyer. Even in the humblest walks of life there is pride, and the poorest dealers will not sell to any one but a shipper, unless they are very badly off for ready-money.

The egg-trade differs from most others in this particular—the supply of eggs of good quality is limited, the demand unlimited. The grocer, the ironmonger, the druggist, and most other merchants buy in a lot of *score*, 'stocking their shop or store, and then have *padding*, a three-months' supply. The egg-shipper or merchant is quite different; he has orders for twenty, fifty, or one hundred cases weekly. Casual orders may come in for more, so that he must always keep buying; and if his supply fails, he loses his custom and reduces his income. Consequently, the shipper with a good connection requires the most eggs; the more he can buy, the more money he makes; further, the margin of profit is so small after passing through so many hands, it only pays the shipper to export in quantity. It is most essential to the shipper to be able to procure as many eggs as he requires, and this leads to many practices utterly unknown in other businesses. To secure the custom of buyers and dealers who bring in a good sample of eggs, the shipper often advances money without interest in sums varying according to the 'strength' of the borrower, from one pound to twenty. This is lent without receipt, 10*U*, or any formality beyond asking one of the shipper's men to witness the transaction, and the writer has often known that evidence omitted. It is repaid by the borrower at so much a 'trip.'

Borrowers are often offered by opposition shippers threepence to sixpence per hundred over market price, and seldom, if ever, do they yield to this temptation without giving the man who lent them the money the preference; and except in case of death, or some heavy loss falling on the borrower, such as the death of a cow or horse or pigs, do these poor dealers or buyers fail in paying any money advanced them. These buyers and dealers procure these loans, similarly, to advance the money in smaller sums to the wives and daughters of the farmers who rear the fowl, thus guaranteeing to themselves a regular weekly supply. The dealers who receive the eggs from the 'grower' give as little as possible for them, saying they heard the price paid by nearest shipper was only so much per hundred on 'last Saturday'—the principal market day in rural Ireland. The dealer or buyer on reselling to shipper expatiates on the freshness and size of the article; and unless he holds shipper's money, would try every

egg-store in the town for a price, and would go miles out of his way for a penny or twopence per hundred extra. Dealers and buyers are, as a rule, scrupulously honest; but in the matter of truthfulness there is some room for improvement. The same must be said as regards some of the shippers. The bad habit of lying grows on those who are thrown into constant intercourse with those who lie, believing it a legitimate part of their trade. We will illustrate the case in point by a common trade incident.

Brian Finn is a strong 'buyer'; he comes in weekly with a horse-load—six or seven twelve-hundred cases—of eggs from a good district. (Egg-shippers know a good and a bad district of eggs, as a farmer would know good land, or a connoisseur in wines a vintage.) He usually draws up his horse at the shipper's store, or in some cases a few houses o. even a street off—the cause of the latter my story will show—and asks, after the usual remarks about the weather: 'What are ye paying to-day?'

Shipper answers: 'Seven shillings for hens', and eight shillings for ducks.'

Brian replies: 'I have already refused seven-and-two and eight-and-two; and because I thought you would be as good as another. Besides, I have'—and here Brian fumbles in the breast-pocket of his frieze-coat, or in his hat—a letter from the new shipper, the Englishman, telling me not to sell until he sees me.' Whereupon Brian produces a note, soiled with dirt, from the Englishman, offering twopence per hundred more than any other shipper, for fresh, best quality eggs; and to be sure, as Brian said, to give him a call before selling.

Now, though, in all probability Brian's first statement of being offered seven-and-two and eight-and-two is untrue, his letter is authentic; the fact of the new English buyer advertising and sending out circulars being well known; and Brian thinks the written evidence will confirm the spoken.

If the shipper is badly in want of eggs, and the sample good, and he have orders without limit to price for really a first-class article, he will not lose Brian's eggs, and probably replies: 'Well, Brian, the highest I paid this week was six-and-ten, and you are not satisfied with seven shillings. However, I will not let the Englishman or any one else get your eggs when I want them; so I will give you the seven-and-two for the hens, and eight-and-two for the ducks, and a shilling a case allowance to yourself.'

This final offer usually concludes the bargain, unless dealer is pretty sanguine of doing better. If buyer accepts, the eggs actually cost shipper seven-and-three and eight-and-three in store.

The eggs are now removed from Brian's car by the shipper or his men. The eggs are all re-counted, and a good packer will keep two boys counting. Sixty eggs are placed on a flat wicker tray called a 'skip' by ten times taking up three eggs in each hand. Six eggs are called a *hand* (although the full of two hands). Eggs are usually packed in cases holding twelve hundred—eight layers of one-and-a-half hundred each. In other markets, eggs are packed in half-cases, holding each six or eight hundred; others in thirteen, fourteen, and twenty hundred cases; and for still again another market, huge boxes,

weighing when full from five to ten hundred-weight, containing from thirty-eight to forty-four hundred of eggs. All eggs must be packed in the best and finest quality of oaten straw. When Brian's load is counted, packer calls out, the return, say sixty hundred five hands and three eggs.

Rarely is the return of a packer in a respectable house called in question. Sometimes buyer may say he thought he had more; and then packer explains how and where his eggs were placed, which usually satisfies. As a rule, buyers are very accurate in the count they keep of the contents of their boxes, although mostly illiterate men. Packed irregularly, according as bought up, and the contents of no two boxes the same, they will tell almost to an egg what they have, before the shipper's men touch them. In paying, if the account come to twenty pounds and one penny, it is the custom of the trade for the shipper to pay the penny. Another peculiarity about the trade—the shipper makes the price, instead of, as in other trades, the owner of the goods making it. 'Actual growers' of eggs get the lowest price, both from the shipper himself, if they sell direct to him, and when selling through intermediate buyers. A dealer or buyer would refuse selling to a shipper, if he found out that shipper paid a farmer's wife as much as he got.

We have now traced the eggs into the shipper's hands, from whom Scotchmen and Englishmen purchase. He has usually a number of 'standing' orders (that is, regular) for each week, price open, on best terms. These orders he buys to fill. Casual orders drop in, for which casual lots must be bought. Scotch and English provision merchants study their own interests best by giving standing orders to a respectable house which knows its customers' requirements. Some require cheap eggs to compete with foreign, others grade, no price in reason for large fresh eggs. Most shippers have relations, partners or agents, in nearly all the large towns; these latter sell and guarantee the shipper against bad debts—for a commission of one penny per hundred.

Shipper's maximum average margin which he puts on his eggs is from threepence to fourpence per hundred—less than one halfpenny a dozen—out of which he has to pay for labour, straw, and commission. At times, of course, a larger margin is made. When eggs are scarce, and the demand increases, the Irish shipper knows how to 'lay it on.' But here, again, the very great operation from foreign eggs and the ever-increasing number of shippers neutralise an exorbitant margin. Bad debt, loss of 'empties,' claims for excessive waste, are among the great drawbacks to the trade. As regards the last, the shippers, as a rule, sell their eggs at a certain price free on board packet solely at English or Scotch purchasers' risk. If packet sunk at one yard from the quay side, after shipper receiving a clear receipt from agents of steamship Company, the loss falls on 'cross Channel buyers, unless they are insured, which is rarely done.

Bad debts are largely incurred by shippers' reckless trading; speculating by buying largely without orders a perishable article; the market drops, and they must sell. They are then very liable to be tempted to fill orders from men

they know nothing at all about, whose circulars and nicely-got-up memoranda tempt a struggling man with his task daily diminishing in value. Others lose by the circular 'stock-up' of large 'cross Channel speculators in provisions, against whom the markets turn; and to owe a poor struggling or wealthy Irish shipper a few pounds or a few hundreds does not give them a second's thought.

The trade is a heavy one for small capitalists. Dealers, buyers, and shippers must all pay cash, or its equivalent, for every egg they ship. To 'cross Channel buyers, the terms are also cash; but all do not adhere to the rule, to their own loss, because the shipper charges a slow payer more for the eggs. To do a paving egg-trade, you must ship in quantity and get in your money promptly, because the profits are so very small, that many shippers up and down the country are acting like the rural shopkeepers, having a general store to supply their customers with goods, and then shipping the eggs at a mere fraction above cost price.

Events occur daily that influence other things, with which not even a remote connection can be traced. The opening of the Mont Cenis Tunnel has affected the Irish export egg trade; quantities of Italian eggs of very fine quality are now before the English public, taking from and reducing the prices of Irish. Foreign competition in eggs from France, Italy, Germany, Denmark, and Hungary has been keener than ever, the supply never having been larger, of better quality, or lower in price. An old shipper over forty years in the trade declared to the writer that unless things altered, the Irish export egg trade must decline. Labour is so much cheaper on the continent than in Ireland, or the raw material for work is not utilized there as it is done on the continent. Some foreign shippers are able also to allow half a hundred of eggs out of a twelve hundred case—towards waste, and also to remove one of the greatest troubles of the trade by giving their egg-cases free.

The cheapest case that will hold and travel safely with twelve hundred of eggs costs in Ireland from two to three shillings; a matter of at least twopence per hundred on the eggs, to give it free. On having the same returned, it costs shipper at least sixpence; and a large percentage are lost, broken up, or stolen. The competition of the Irish dealers with the foreigners does not end here, for the latter go to the trouble of sorting their eggs according to size.

In the wholesale egg-markets in the large Scotch and English towns, a provision-merchant can buy almost any size, colour, or brand of foreign eggs, knowing what he will get without opening the case; just as in any other shop he orders a speciality regardless of price, and feels confident of getting what he orders, unless fraud is practised. But he cannot buy Irish eggs with the same confidence. This neglect can be remedied, and on this being done rests the only hope and future of the Irish trade. Irish eggs are better every way than foreign; and Scotchmen and Englishmen will do their utmost to see Paddy's empties safely returned; they will still buy his eggs at a certain price

free on board boat; they will forgive him the half hundred of eggs per case; but he must sort his eggs. He must sell small eggs as such, and not be selling them as large ones.

The principal shipping ports for Irish eggs are Sligo, Derry, Belfast, Dundalk, Drogheda, Dublin, Waterford, Cork, and Bandon.

We believe the eggs which fetch the highest price in the Scotch and English markets are those 'grown' in the counties Kilkenny and Wexford and shipped at Waterford. At the same time, eggs of equal quality are and can be shipped from every other port. Eggs from rural districts as remote as possible from large towns, where a resident gentry or large farmers reside, are of the best quality, both in size and colour, the latter qualification being almost as much esteemed as the former. The reason for this is, that educated or well-to-do people improve their stock of fowls by introducing the best breeds, and where there is no town, the shopkeeper is not exposed to the temptation of retaining his best eggs. In poor districts, where new blood has not been introduced, the eggs, though numerous, are small.

Irish eggs are often spoken of disparagingly as 'crate eggs' as a distinction between them and what are called 'new-laid eggs'. Up to the 1st of May, all Irish eggs are veritable new-laid eggs; they are bought on a falling market, and sold on a falling market; and every one connected with the shipping of Irish eggs in spring-time thinks he cannot get rid of them too quickly. To hold them over an unnecessary hour entails loss. The price of eggs is at its minimum about that date, and continues so with slight variations until the first or second week in August, when the price slowly, surely, and steadily advances from five-and-six per hundred till it attains its maximum, twelve-and-six, about the first week in December. The first three months of the year are a time of perplexity and anxiety of mind to the shipper; the price declines in jumps, far more rapidly than it advances; and a shipper is often caught with eggs for which he paid one hundred pounds one day, only worth ninety the next. The writer knew a shipper lose sixty pounds in two weeks in that way. At the end of March, or perhaps a little earlier, ducks' eggs begin to drop in, and then a separate price opens for them, which lasts about three months.

MR L'ESTRANGE.

IN FOUR CHAPTERS.—CHAPTER II.

A good night's rest, calm weather, and the fair scenes of Queenstown harbour had a wonderful effect upon my health and spirits, when I went on deck the next morning. A run on shore, while we waited for the mails, still farther exhilarated me, and I felt quite companionable at the lunch-table. At it sat the American banker, whose name I learned was L'Estrange. He was very sociable, and still emphatically recommended me to conquer my quarrelsome propensities by a strong will. Following his example, I did enjoy many of the good and tempting things set before me. Theodore was delighted,

and promised me a magnificent voyage, since I had begun to eat rationally.

'You know, Charley,' said he, 'that if you are enjoying yourself, it will give me a better chance to pick up ideas from our fellow-passengers. If you are sick and shut up in your cabin, I shall have to wait upon you; and that will be a loss of opportunities that cannot come again; so keep up, old fellow. And you won't mind if I leave you a good deal to yourself, will you? You are fond of reading; I don't want to touch a book while afloat; so keep up, Charley.'

Mr L'Estrange heard all this, though he seemed to be preoccupied with the bill of fare. It was a trumpery and quite personal conversation, yet it was not uninteresting; to our neighbour. His ears almost pricked up like a terrier's when I said: 'Theodore, you are a mere boy, and yet you are assuming to pick up wisdom by the hateful, and on board a ship, of all places in the world! Don't be too self-confident; and don't believe in all you hear, even if it seems truth itself. We may have for fellow-passenger the wisest, best, most philanthropic being in the world, or the contrary. Do not let your rash credulity carry you too far. Certainly, I cannot see what great mischief could befall you by over-gallopity on the voyage; still, my good boy, be wary.'

As I finished, I looked right into the big, bold, hard eyes of Mr L'Estrange, who dropped the bill of fare almost simultaneously with his eyes, and he turned to me as he picked it up, with a factitious smile, saying: 'I see there is some pickled salmon set down here, dare you venture to try it?'

The question was wholly irrelevant, and the tone in which it was asked was forced to a degree. I simply shook my head, and turned to Theodore, who began to defend himself from my oblique reproof. I could feel that Mr L'Estrange was looking and listening intently. Not wishing to prolong our fraternal contention, I suddenly swung round the revolving chair upon which I sat, and faced the man with whom I had conversed on the previous night. I thought I detected in his eyes a correspondence with those of Mr L'Estrange behind me; for again wheeling back, I saw that person looking over my head.

Of course, the fancies of a sick man are often ridiculously wrong; and the suspicions of a cautious man are often vile accusations against innocence. I have been deceived many times by precipitate judgments. But I could no more avoid the feeling of possible mischief floating about me, than I could abdicate my personality. L'Estrange and the other man appeared, to my subtler perceptive faculty, to be bound together in some dangerous manner, and for some end in which my affairs were concerned. I wished that Theodore would drop the intimacy with the banker; I began to fear the man. Yet how monstrously absurd was this fantastic aversion! What could he do to injure us? He was ostensibly rich, superior to us in all that impels men to take advantage of men. Even if he were a plundering wolf in sheep's clothing, he could not despoil

us. All our cash, amounting to some four hundred pounds, was in my keeping, safe in my trunk. Theodore never touched money. I was, and had been always, the financier of the family. I was going to buy the farm about which we had been in treaty while in England, for the owner was known to my uncle. Beyond a sovereign or two, Theodore had no money; therefore, he could not be robbed to any extent worth speaking of. Even had I been infatuated with L'Estrange, he would have had no opportunity to rob me, if I were disposed to enter into any speculations with him. Indeed, all this folly of supposititious robbers was very like madness; and I asked myself as I paced the deck if I were going lunatic. What had I had for the 'conglomeration of chaos' that I was bringing against a gentleman of vast property, of great reputed influence in the money world of America, and who had simply shown a little patronage to my brother, and given me advice rather egotistically? 'My good fellow,' I muttered to myself, 'you are an ass. Beware of committing some folly that will make the voyage a pain to yourself and a misery to Theo.'

I sat down upon my deck-chair, wrapping myself in a long rug, for the wind was chilly. I must have fallen into a sleep, for when I looked around, the ship was in motion; we had left Queenstown. After a while, my thoughts recurred to the subject which had agitated me so much; for I heard Theodore and L'Estrange talking and laughing, though I could not see them. Insensibly, I began to utter my thoughts aloud, a habit which I acquired when at school in France, and by which I attained to so rapid a knowledge of the language of that country, that I spoke it like a native ere my studies were finished. My soliloquy was arrested by a deep sigh. I turned my head, and saw reclining on a long couch the form of a woman, heaped up with furs, and the face covered by a thick veil. Where she had come from, I could not guess; whether she joined us at Queenstown or Liverpool, certainly she was not in her present position when I sat down. She murmured something that I could not catch. I looked more intently. She coughed, that deep exhausting cough which indicates but one cause, and which forebodes a fatal end. I could not avert my eyes from her.

When the coughing fit subsided, she moved her head uneasily, and in a low voice said: 'Etes-vous Français?'

'Non, madame,' I answered, astonished, and half rising from my chair.

'Why, then, do you speak in French?' she demanded, still using that language.

'I am not aware that I have been speaking at all,' I said. 'I am alone, as you see.'

'But you *have* been speaking, saying such sorrowful things of your mother, your sisters, your brother. And you speak French so naturally. Are you a Canadian?'

'No; I am an Englishman; but I was educated in France.—You are French, I perceive, madame.'

'No; I am an American, born at New Orleans. But my parents were French, and I have lived much in Paris and Brussels.'

'I am delighted to have the opportunity of conversing with you, madame,' I said. 'In France, I spent the happiest hours of my life; and I am passionately fond of its literature!'

For half an hour we continued our talk; and in that time I had told the lady the salient points of our family troubles, of my plans and prospects. These confidences were induced from the words I had let drop in my sleep or reverie, whichever condition I had been in. They furnished the subjects upon which the lady questioned me. To this hour, I do not know why I revealed myself to her so frankly; I am naturally reserved, illness had made me *l'écœuré*. But just as I had exposed our misery to Uncle Edward from an impulse that logic failed to justify, so, in telling this stranger lady my commonplace story, I acted from a feeling of trustfulness, that very few people could evoke in me.

Our conversation was interrupted by Theodore and L'Estrange coming up and proposing that I should join them in a game of deck-quoits. I was too much engrossed in the lady to be pleased with the proposal. Theodore continued to press me, using that boyish persuasiveness which made him irresistible and lovable to all he came near.

The lady watched him with eyes that I could see dilate, glisten, and gleam through the meshes of her veil. She did not speak at all; but I knew she was agitated to a degree, for her breast heaved and a convulsive cough seized her while Theodore urged me to the game. L'Estrange stood laughing and took not the slightest notice of the lady. Our dispute ended by the maid of the lady coming up and preparing to assist her back to her cabin. I took my leave of her, hoping to have the pleasure of many conversations during our voyage. She bowed, and walked slowly away.

'Who is that lady?' asked Theodore.

'I do not know,' I answered.

'She is a foreigner, it would seem,' said L'Estrange indifferently, as he tossed one of the rope-quoits dexterously in the air. 'What language did she speak?' I only knew English.

'She spoke French.'

'It is a beautiful language, I am told,' continued L'Estrange; 'but I was always a dunce at school, and never could learn grammar of any kind.—What shall we play for?'

'I never gamble,' I said.

L'Estrange laughed. 'Gamble! What do you mean?'

'That I never play any game for money.'

'O Charley, you are altogether too strait-laced!' exclaimed my brother. 'Let us play for a shilling. There is no fun in playing for love.'

'Not for a cent will I play,' I cried angrily, for Theodore's words and manner irritated me.

L'Estrange laughed sardonically. 'Do not tempt the good young man to violate his principles,' he said with a pitying shrug to my brother. 'He will find few like himself in my country. Americans must have a motive for all they do. I could no more play a game without something on it, than I could keep a cigar in my mouth without putting a light to it.—Well, I am going to the smoke-room,' he added, wheeling round and moving away.

Theodore followed him for half-a-dozen paces; then he turned round, and seeing me looking after him, he came back.

'Are you annoyed with me, Charley?'

'Theodore, I do not like that man. He is a sinister, ill-principled man.'

'Ridiculous, Charley! You are getting into one of your old tantrums again. Mr L'Estrange is a perfect gentleman. Do you think he wanted to win a few mean shillings from you or me? Why, last night he flung twenty-dollar bills away like old rags. I never knew what profusion meant, until I saw him and other Americans spend and play. They must be awfully rich to live in such a style. I wish I could discover their plans for making money. They must coin it, Charley, to lavish it as they do.'

'That is a very equivocal explanation, Theo,' I interjected grimly; 'perhaps we have some corners or forgers with us.'

'Upon my life, Charley, your suspicions are simply infamous,' cried my brother in a temper. 'Because Americans find the secret of making colossal wealth and have the habit of princely extravagance, you condemn them like pickpockets. Such opinions are unworthy of you, and are gross libels upon those who will soon be our fellow-citizens.'

'Hush, boy!' I said quietly. 'Do not talk at random or go beyond the record. I am warning you against an individual, not against a nation. The gentleman may be a paragon of honesty, and I hope he is; but to me he is a Doctor Fell, whom I distrust; why, I cannot tell.'

'If you are going to take such prejudices as that against other Americans, because they are fond of speculations and excitements, we had better return to England again, for all are pretty much like Mr L'Estrange, Charley. The worst of puritans like you is, that they try to impose their notions of things upon everybody. You might as well ask that all animals should be peaceful sheep, as that all men should be strait-laced quakers of your stamp!'

'Have you done, Theo.?' I asked, for he stopped abruptly.

'Yes; it is no use talking; you will not think like a man of the world. Why did you not go in for the church, instead of the law? However, Charley, I am not a puritan; and I cannot go manhandling about the ship with you. I must have some gay society. Whatever you may say or desire, I tell you candidly that I am going to pick up all I can from the gentlemen around me. Do not rate me quite with infants. I can take care of myself; perhaps, of you too. What can damage me on a ship? No one can locus me and run away.'

'You are growing eloquent, Theo,' I said with peevish derision.—'eloquent in your own smartness. Nevertheless, you are only a boy, a provincial English boy, just liberated from mamma's apron-strings. You have the self-confidence of all young, inexperienced things, and are certain to win in the game of life, you think, because of your absolute ignorance of its procedure!'

'Upon my honour, Charley, you are too bad. If I had been proved an utter fool, you could not condemn me more. All for what? Because I wish to make hay while the sun shines! We are going to America to make a living,

a splendid one if possible, for mother and sisters' sake. We cannot do it without coming into contact with men, for I suppose *you* will have to buy and sell like common folks, when you are doing business. The sooner we learn what sort of people the Americans are the better.'

I looked in my brother's glowing eyes, admired his passionate earnestness, his superb assurance. He was indomitable, so strong, and I such a timorous valetudinarian.

'Dear boy,' I said, putting my arm on his shoulder lovingly, proudly, 'I cannot argue with you. All I have said was dictated from my fears that your confiding nature might be the means of leading you into those ambushes that are to be found wherever men meet men. A "something" has environed me like a baleful atmosphere; I have ~~down~~ alarm with every breath. It may be the crisis of my long mental misery that has arrived, and that I shall alter this regin calm.'

Theodore examined me narrowly, then took my hand. 'Poor Charley! You cannot throw off the load of care, go where you may. How I wish you were like me!'

My heart trembled with love for Theo, as he went dancing away from me. How good and chivalrous he was; how shrewd also. Yes, Theo, was right to mix with the crowd, to sift its motives, learn its manoeuvres, discern its tricks, and profit thereby. I was a pedantic old bachelor, fit only for my chambers at Gray's Inn, to ponder upon law, life, and destiny. From that quiet haunt, fortune had driven me forth into the world of action, to meet men in the fierce contention for this world's substantial things.

A good 'think' always pulls me together. The queer nervousness and womanly vapourishness passed away, I got up, had a smart trot round the deck, exchanged some jovial remarks with one or two fellow-passengers whom I passed, and then went to dress for dinner. But all my hilarity and confidence melted as I saw Theodore and L'Estrange come in together. My brother's cheeks were scarlet, his eyes glittered, his very hair seemed to undulate with excitement. When he sat down to table, he appeared to be in an ecstasy of delight.

'What is the matter with you?' I asked anxiously.

'Nothing!—Matter? What do you mean? Do I look ill?'

'Yes, of a delirious fever. I never saw your cheeks so flushed; and your eyes blaze like a basilisk's.'

'What sort 'of a thing is that, Charley? I never saw one. But never mind what I look like; take your soup. It's real turtle; the head-steward told me so; and we don't get alderman's fare every day, even on board of this floating grand hotel. And I say, Charley, put off the quaker for to-night, and for my sake; that's a good brother. Let us have a bottle of champagne.'

'Champagne! Do you forget our empty purses?'

'There you go again! Always in the glums, if I propose to let daylight into your poor limping circulating blood.'

I looked at him in blank amazement. 'Don't stare, Charley; order the "fizz." But don't think I want you to *pay* for it; no; I am going to give the treat.'

'Surely, Theodore, you have not been drinking since you left me an hour ago; I whispered remonstratingly.

'Drinking! Not at all. I have had a glass or two of champagne with some friends over a little pastime.—Here, steward, bring a bottle of Roederer; and look sharp, there's a good fellow.'

A shiver passed through me. I stared at my brother as if he were an apparition.

'Ah! here is the wine.—Now, Charley, I will be as good as a nurse to you; better, for this beats all the nursing in the world. There! you have a bumper!—Why don't you drink?'

A deep sob almost stifled me. I dared not make a scene, for the eyes of many were upon us. Those of L'Estrange, like two fireflies, glittered as I met them. I would have left the table, but I was afraid that Theodore would take more wine than he should, and that some uproar would follow.

'All right, Theo,' I said; 'I will drink your wine. Don't get excited!'

'That's a good fellow. Now I feel like myself again. You look a thousand pounds better already, *mon enfant*. Look here! You shall have some champagne every day. It will pick you up marvellously. You've gone down too low, Charley; you've gone down.' Theodore looked round the table with a proud patronising air, which made me blush for shame.

'Give me some more wine,' I said, to withdraw him from his silly pose.

He obeyed with joyful alacrity. 'Go ahead!' he cried; 'don't spare it; we'll have another bottle, if this is not enough.'

My ears still tingle as I recall that dinner scene. Every minute I feared Theodore would commit some extravagance, that would cover us both with ridicule. But nothing happened; and I was somewhat relieved to find that the judgment of those sitting at table was in approval of the younger's wild jollity. Jokes flew about, fun ran faster than the wine, everybody was in exuberant spirits but me. The heat, the noise, the wine, and the agitation made me ill, and I had to leave Theodore, in spite of my alarm on his behalf.

'Do not distress yourself on my account,' he said soothingly, in answer to my admonitions. 'A cup of coffee will make me all -quite again.'

The weather had changed since I went down to dinner; an uneasy and peculiar roll seemed to undulate the deck, now longitudinally, now laterally. I almost stumbled as I attempted to walk.

'We are going to have a dirty night,' said a gentleman smoking under the lee of a lifeboat. The fume of his tobacco was blown into my throat by a sudden gust; a deplorable sensation came over me, a misery of body and spirit. I hurried to my cabin.

Of the march of time during that night I have no record; of events, only one clings to memory—that of Theodore waving a bundle of bank-notes close to my eyes, and saying: 'See,

Charley; our fortune is being made before we get to America."

"Had I been dying, that astounding incident would have held me a moment longer on the frontier of life. 'What do you mean?'" I cried.

"That that sinister, dangerous *bête noire* of yours, L'Estrange, proves to be a babe at whist. I've won twenty pounds from him. Here they are in greenbacks—one hundred dollars' worth."

SOME HINTS REGARDING CONSUMPTION.

IF, as Dr Koch says, the seriousness of a malady be measured by the number of its victims, then the most dreaded pests which have hitherto ravaged the world—plague and cholera—must fall behind that of consumption. That scientist makes the statement that one-seventh of the deaths of the human race are due to tubercular disease; while fully one-third of those who die in active middle life die of consumption. The same authority, by his recent experiments, has placed it beyond doubt that the disease is communicable. The tubercles, as found in the diseased organs of men or animals, he discovered to be infected with a minute, rod-shaped parasite, which can be transferred and reproduced in other bodies by contagion. There are other authorities, however, who hold that the question of the infectiousness of the disease is still unsettled, and that Koch's theory is insufficient to account for it in all its varied forms.

In 1856, Dr B. W. Richardson, while a physician to the Royal Infirmary for Diseases of the Chest, published an essay 'On the Hygienic Treatment of Pulmonary Consumption,' which did not gain much favour with practitioners and the public. He finds, however, that it agrees so closely with the most practical and enlightened treatment of consumptives at the present time, that he has reprinted the paper, with some revision, in his journal called *The Asclepeiad* (Longman & Co.). In this article, he embodies certain rules which commend themselves as satisfactory to himself after a thirty years' experience.

His first rule is a supply of pure air for respiration. A 'nice cosy room' is the very worst possible thing for a consumptive patient, if there be no draught to carry off invisible impurities. So long as the patient is able to be out of doors, he is in his best and safest home. Even the inclemencies of the weather are no so much to be dreaded as confinement in a house. When indoors, the temperature of the room should be sixty degrees Fahrenheit; if there is a fire, it should be in an open grate, and the freest possible current of air should be kept circulating by the chimney vent. The way to obtain animal heat is not to shut out the air and roast the body, but by stimulating and conserving the natural heat made within the body. Stoves and heated pipes which make the air too dry, are injurious.

When possible, the bedroom should always be separate from the living-room; it should also be large, unencumbered by needless furniture, and thoroughly ventilated. Warmth of body is best secured by woollen bed-clothes; gas should not be burned during the night in the bedroom, and

as few other lights as possible. The consumptive patient should also be the sole occupant of his bed and bedroom. Respirators can be made for the cost of a few pence out of a piece of fine wire-gauze, cut oval so as to cover the mouth and nose, and may be fixed in the centre of a small Shetland shawl, which serves to retain the heat thrown out in the expired air, and gives up this heat to the cold air that enters in inspiration.

Dr Richardson's second rule embodies the principle that 'active exercise is an essential element in the treatment of consumptives.' Walking is the most natural exercise, as leading to brisker circulation and more active nutrition; tricycling, as giving a more perfect change of air and scene, he has found of great benefit to some. If we might be allowed to add, aimless solitary walking, when the thoughts of the consumptive are turned in upon himself, cannot be so good as walking in cheerful companionship. The extent to which exercise can be carried varies with the stage of the disease; in some cases it would be positively injurious. In taking muscular exercise, the consumptive should never encumber himself, nor check the free movements of his body, by strapping, weights, loads of clothes, and the like.

The third rule enjoins a uniform climate as an important element in the treatment of consumptives. The main point to be attained in considering climate is to select such a part of the earth's surface as gives the nearest approach to an equality of temperature. In this country, as a matter of course, spring and the beginning of winter are trying times for the patient, when deaths from consumption are most prevalent. Indoors, the temperature may be so far equalised; in the open air, something can be done by attention to clothing and the use of the respirator. Dr Richardson is of opinion that the model resort for consumptives should be near the seacoast, and sheltered from easterly winds; the soil dry, water pure; the mean temperature about sixty degrees.

Rule four states that the dress of the consumptive patient should be adapted to equalise the temperature of the body, and worn so loosely that it will not interfere in any way with the animal functions. Flannel clothing is always required by the consumptive patient, and it should cover the whole body. It need not be heavy; that of a light and porous texture may be sufficient. He should also sleep in flannel; but not in the dress worn during the day. A waterproof india-rubber coat must never be worn by the patient, as it loads the under-clothes with moisture and causes chill. A corset, a strap, or belt round the waist is equally injurious.

Rules five to nine, amongst other matters, treat of the hours of rest of the consumptive, which should be regulated mainly by the absence of the sun. Profuse nocturnal perspirations may be avoided by this treatment, and the skin will assume a healthier action, owing to abundant exposure to sun and air. Indoor or sedentary occupations should be suspended if possible; but a certain amount of outdoor occupation may be advantageous. Of five hundred and fifteen cases of consumption at the Royal Infirmary, sixty-eight per cent. were persons following indoor

occupations. A case is mentioned in which a patient in the first stage of consumption, against the recommendation of his medical advisers (Dr Richardson among the rest), insisted on coming into town every morning from a considerable distance in the country, to look after his business, and return again in the afternoon. When expostulated with, he replied: 'My brothers and sisters have all died of consumption; they were coddled up, nursed, carried about, confined to bed, and bound in the cords of helplessness by the kindest hands, to the satisfaction of the doctor and all concerned. But they soon died. I inherit the proclivity to the same disease, and I too shall die; I know it. But my course is different, for I have made up my mind to die in harness.' This patient threw off the disease, and is still alive.

Excessive mental exertion should be carefully avoided, as well as all crowded assemblies. Recumbent and singing have been found highly beneficial to some. Cuvier, the great naturalist, attributed his recovery from threatened phthisis to the delivery of some lectures. The amusements of the consumptive should combine, with the pleasure they afford, a moderate and equal degree of muscular exercise. A tepid, cleansing bath every morning will be found helpful, as, in either good health or consumption, moderate action of the skin is a relief to the lungs.

Dr Richardson's tenth and last rule relates to diet. 'The diet of consumptive patients should be ample, and should contain a larger proportion of the respiratory constituents of food than is required in health.' The quantity of food taken by the consumptive person should be small at each meal. Of animal foods, mutton is the best. Fatty and oily foods, which constitute the respiratory class, should predominate, and fresh butter and bread may be taken almost *ad libitum*, so long as it agrees with the stomach. Milk and cream are very suitable, of course, but Dr Richardson has seen no specific virtue in goats' or asses' milk. Tea can be taken in moderation; fresh vegetable diets are useful; and fruits, especially roasted apples, are always admissible. Alcohol he has only prescribed as a medicine, and snuff-taking and tobacco-smoking should be avoided.

FROG VITALITY.

A RECENT communication from America has reopened the old and vexed question of the vitality of the frog. We learn that a huge piece of ice left at a residence in Louisville was split open, and in the centre was a large frog. The animal was a black one, of the species known as the Michigan frog, and weighed two pounds or over. It is further stated that the ice had been in store for over four years, and therefore the frog had been a prisoner all that time in his cold quarters. After its release, it was quite lively, and was maintained for some time in an engine-house near. This case is very similar to one that occurred more than two years ago in Connecticut, where a frog had been imprisoned over seven months, and when found was alive and well.

Notwithstanding all that has been written upon the subject, the possibility of frogs existing

for any length of time under these or similar conditions is still debated. It is well known, however, that not only frogs but other reptiles and insects can exist in a torpid state for months, and even years. The snail which woke up in the British Museum after a sleep of some years, is a case in point. A shell which had been picked up in the Egyptian Desert on March 25, 1846, was gummed on to a piece of cardboard, and sent to the British Museum. But, curiously enough, the shell unexpectedly contained a snail, which had retired to the inmost recesses of the whorls, and was consequently unseen. For nearly four years after this time the snail remained in a state of stupor; but on March 7, 1850, it showed signs of life. It was placed in a tepid bath, and immediately on touching the welcome moisture it showed increased signs of animation, and soon crawled to the top of the basin.

The mud-fish of West Africa—known as the *Lepidosteus*—affords another instance of long-continued existence in a state of torpor. The fish lives in the shallows of the Gambia River, which in the tropical season is quite dried up. By a marvellous instinctive power, it knows when the dry season is approaching, and digs deep in the soft clay at the bottom of the pools, and there lies in a torpid state for months together, although the surrounding mud be hardened into a cake. The natives dig these fish up while in this state, and consider them a great delicacy for the table. The mud-fish does not live without breathing, which is provided for by his leaving a small orifice or pipe open from his cell through the hard mud up to the upper air.

Experiments made in the past have generally demonstrated what is really the common-sense view, that the frog cannot live for any protracted period without air. Yet there cannot be the least doubt of frogs having been found alive under the most astonishing circumstances. In the centre of rocks, generally sandstone, and in the heart of trees, they have frequently been discovered. Ambrose Paré, the great surgeon to Henry III. of France, relates a fact of which he was an eye-witness. At his seat near the village of Meudon he was overlooking a quarryman, whom he had employed to break some hard and large stones. In the middle of one they discovered a 'huge toad,' full of life, although there was no visible aperture by which it could get through. On May 21, 1793, a mason named George Wilson, who was engaged in building a stone wall, came across a toad, which, out of sheer wantonness, he immured in the wall. Sixteen years afterwards, in 1809, it was found still alive. At Windsor, in 1790, a live frog was dug up from a depth of nine feet below the surface. At Castleton, in 1779, many frogs were found from five to six feet below the surface, and when exposed to the air they showed signs of animation, and became active and healthy. In 1788, some labourers in digging a well some twenty-five to thirty feet in depth threw out what appeared to be stones covered with earth. These, however, proved to be frogs, and were so numerous, that many of them were cut through with the spades. Being exposed to the air, they soon revived, but could not survive the direct rays of the sun.

A writer who witnessed this discovery considers they must have been covered up 'many hundreds of years.'

Early in 1862, a man in Tyr Nicholas Colliery, Cwm Tylery, near Newport, found in the mine-bed of coal a live frog. The hole it was found in was not more than three and a half inches in diameter. There was a slight hollow over the coal where it was found; and the frog when released commenced moving about, but seemed larger and more lively next day. This was two hundred yards below the surface. In 1731 a toad was found in the heart of an old oak near Nantz, without any visible entrance to its habitation. Near Caen, in an elm at about four feet above the earth and exactly in the centre of the tree, a live toad of middle size, but lean, was discovered. When an opening was made, it 'settled away hastily.' This tree is also said to have been firm and sound. Some twenty years ago in course of the excavations that were made in connection with the Harlepool waterworks, the workmen found a toad imbedded in a block of magnesium limestone at a depth of twenty-five feet from the surface. The toad's eyes shone with unusual brilliancy, and it was full of vivacity on its liberation. The creature continued for some time in the possession of Mr Spence Horner, the President of the Natural History Society, and for a long period was in as lively a state as when found. Similar instances might be quoted as having occurred at Solksworth near Sunderland, at Kilhamock, at some quarries near Cheltenham, and in other places. Only three years ago there was published a well-authenticated instance of a frog having been discovered in the roof of an oak-tree at least two hundred years old—near Balham, Surrey.

How long it is possible for frogs to live without air and food, has been a matter of experiment many times; but in the face of well-established instances like those quoted, it is difficult to conduct experiments that will be considered as being of a conclusive character. That these creatures should be able to live not for centuries only but for ages, appears contradictory to all reason and common-sense. In some cases, frogs have been found in Cretaceous rocks. The oldest fossil toads and frogs occur in Tertiary rocks. If, therefore, those found in Cretaceous rocks had been there from their formation, it would be equivalent to saying that the live frog could be ages and ages older than its fossil relative. To most people, such a declaration would be the height of absurdity. If thoroughly inquired into, it would probably be discovered that in each case there was a fissure in the rocks or trees in which frogs have been found, large enough for the admission of water and the embryo frog which has developed there. It has been assumed by some that the frog naturally contains an acid, which by chemical action on the stone provides that the space at the frog's disposal shall be as large as its body. A second hypothesis is, that not the egg but the primary frog, scarcely larger than the egg itself, falls into the rock or tree, and continues to grow, deriving air and food in the form of small insects from the water that penetrates to its abode. Certain it is that frogs, when artificially secured in air-tight and water-tight vessels, speedily die.

Experiments made by members of the French Academy a century ago proved this. Milne Edwards early in the present century inclosed frogs in vessels made impervious to air, and the creatures speedily perished. Three frogs were once inclosed in a close box for eighteen months, at the end of which time one was dead, and the remainder in a dying condition. Dr Macartney buried a toad in a vessel covered with a slate about a foot deep in the ground. At the end of a fortnight it seemed well and as plump as before. When, however, he inclosed the same toad in an air-tight vessel and buried it, it soon died, and at the end of a week was much decayed.

Dr Buckland made some experiments which are claimed as conclusive. He placed twelve toads separately in twelve holes cut in blocks of hard flinty sandstone. They were firmly sealed in. The imprisoned animals were buried three feet deep on November 26, 1825. At the same time, four toads were deposited in holes cut in the heart of an apple-tree and the opening securely plugged. Four others were also placed in plaster-of-Paris covered with luting. On December 10, 1826, all the buried toads were examined. All in the hard stone and in the tree, and two in the plaster-of-Paris, were dead. The remainder were dying; but some placed in a softer stone were in tolerably good health, and some were actually fatter than when placed in the holes. From this it would appear that in positions where water can penetrate, frogs may live, and even thrive, although buried at a considerable depth, entirely away from the light and any visible means of subsistence.

A YEAR'S WORK AT THE MINT.

THE recently issued Report of the Deputy-master of the Mint, the Hon. C. W. Fremantle, giving an account of the operations of that department for the year 1884, is a more than usually interesting document. From it we learn that the amount of gold coined during the year exceeded by more than a million the amount coined in 1883, while the silver coinage was but little in excess of the average. The coinage of bronze, however, was larger than in any year since 1875.

The total weight of metal melted down during the twelve months was 470 tons, made up as follows—a certain proportion of alloy being of course included—gold, 67 tons; silver, 198 tons; and bronze, 205 tons. The total number of coins struck out of this metal was 65,295,382, giving an average of more than 1,200,000 pieces per week throughout the year. Out of these, however, 8,932,081 pieces did not come within the limits of the standard legal weight, so that the number of pieces available for issue was reduced to 56,363,301, the value of these good pieces being, real or nominal, £3,157,366, 10s. 1d. Of this amount, £3,070,292, 10s. 5d. (11,093,301 pieces) consisted of imperial coinage, the remaining £87,073, 19s. 8d (15,270,000 pieces) being colonial coinage, for Canada, Jamaica, Hong-kong, &c. All this coinage, both imperial and colonial, has been executed at the Mint, its increased coming-power rendering it unnecessary that any portion of the work of coinage should be intrusted to private firms.

The greatest number of coins struck of any denomination was about 11,700,000, consisting, as will readily be supposed, of pence. Halfpence came next in point of numbers, nearly 7,000,000 of this coin being struck. The number of farthings struck was over 5,700,000, a seemingly large number, considering the present small general circulation of this coin. Of shillings, nearly 4,000,000 were coined; sixpences, over 3,400,000; threepences, over 3,300,000. Sovereigns and half-sovereigns were coined to the number of over 1,700,000 and 1,100,000 respectively. Of colonial coinages, that of bronze half-cents for the Straits Settlements was numerically largest, 4,000,000 of this coin being struck during the year.

The profit, or seigniorage as it is termed, for the year on the coinage of silver amounted to the sum of £91,870, silver bullion being purchased by the Mint for coinage at an average market price of 4s. 2½d. per ounce, and issued in the shape of coin at the rate of 5s. 6d. per ounce, thus leaving a seigniorage of 1s. 3½d. per ounce. The seigniorage on bronze coinage was unusually heavy, amounting to £72,000, the very large amount of bronze coinage executed, and the cheap rate at which bronze bars were bought in the market, both contributing to this result. After disbursements were deducted, the net profit realised on the transactions of the Mint for the year was £97,700, this being the largest amount realised in the last thirteen years, with the exception of 1883, when it was £133,713, the average net annual profit for the thirteen years being £23,000.

In addition to the money coinages, over 10,000 medals of different kinds were struck at the Mint during the year, some 1100 of which, in gold, silver, and bronze, were for the International Health Exhibition.

The year 1884 was an exceptional one in respect to the importation of sovereigns from Australia. From 1875 to 1883 inclusive, the average yearly amount of sovereigns received from that country by the Bank of England was nearly 2,500,000; but last year the number was reduced to 284,040, or little more than a tenth of the usual amount. This is partly owing to the large loans raised in London by the Australian colonies, and the consequent exportation of sovereigns from this country. Another reason is that the reserves in the Australian banks were getting low, and it was found necessary to replenish them with gold from this country.

The number of prosecutions for counterfeit coinage during the year was 258, and the number of prisoners 500; as compared with 236 prosecutions and 460 prisoners in 1883; but the increase is in connection with metropolitan prosecutions only; the country prosecutions showing a decrease.

The number of visitors admitted to view the Mint during the year was 8161.

THE GOLDEN VIOLET.

In the latest dramatic effort of Lord Tennyson, in that fine poem and stirring drama of *Becket*, there occurs in the Prologue a few words spoken by Queen Eleanor of Aquitaine referring to the 'golden violet,' which it may interest our readers to know had its origin with the troubadours of the thirteenth century. They established a

tribunal called the Court of Love at Aix, in Provence, which was composed of ladies and gentlemen of the highest rank, who settled all questions relating to love and marriage with the greatest gravity. Titles were laid down for general observance, to which strict adherence was enforced; and so flourishing was this Society, that similar ones were soon established in the neighbouring provinces. The most remarkable of these in later years was at Toulouse, and numbered amongst its members the Countess de Bauffremont, the Marchioness de Saluce, the beautiful Brunssende, niece of Cardinal Talleyrand, and many other names, illustrious in the history of those times.

Madame de Genlis says that the first literary réunions in France owe their origin to these meetings. Their formation was a singular feature of the time; for at that period Europe was distracted by commotion and civil war, and the clangour of arms was heard everywhere. But women can distract themselves from such things, as they can also from the dominion of pain, and Frenchwomen of the highest rank and beauty contended for the prize of 'The Golden Violet,' which was given by way of encouragement to youthful competitors for the best composition either in poetry or prose. But poetry held the foremost place, nor were charades and enigmas considered unworthy of notice; and however trivial the subjects considered may at first sight appear, it must be remembered that the critical discussions took place between the chivalrous men of the middle ages, and by them the prize was awarded. This will explain the pride with which Eleanor of Aquitaine says: 'I speak after my fancies, for I am a troubadour, you know, and won the violet at Toulouse; but my voice is harsh here, not in tune—a nightingale out of season; for marriage, rose or no rose, has killed the golden violet.'

A PORTRAIT.

DARK eyes, from which a pure, calm soul looks out;
Brown hair, back-branded from a gentle face;
Lips ready eye to smile, but slow to pout;
A speech original, yet full of grace;
A buoyant walk, as if bright health did guide
Her tripping feet; a merry laugh, whose sound
Makes all the clear air ring; and at her side
A faithful worshipping, who with swift bound
Doth haste away, then quick again is found
Close to her side, where with a fond caress
The loving creature nestles to her feet,
Makes living passes at her simple dress,
And follows, flying, all her movements sweet.
Woman and homed, in truth a gladsome sight,
Both beautiful, and things of life and light.

Not is she frivolous this gleesome girl;
Her heart is open to the poor and sad;
And the bright smiles that round her lips do curl,
She uses oft to make the sorrowing glad.
God bless thee, dear! May life be full of charm
To thee, who art so fair; may Sorrow fly
Far from thy steps; and may no rude alarm
Harm thy calm dreams nor wait thy pillow night.
Thy presence gladdens earth; may all things fair
Be thine own handmaids whilst thou dwellest there!

ROUND FLAMBOROUGH HEAD.

'LINE-OF-BATTLE-SHIP, ahoy !'

The lusty hail rouses the skipper of the *Volsung* as he is reclining lazily in the well of the canoe, with his legs dangling picturesquely overboard, and his half-closed eyes dreamily watching the throat of the mainsail, from whose peak the burgee of the Royal Canoe Club flutters bravely; and meditates, as he listens to the music of the waters, upon the utter freedom and perfect gladness of a canoeist's life.

A coble is running free across our bows before a western breeze, and the man at the tiller, with a broad grin on his jolly bronzed face, is nodding a cheery greeting. 'Morning, Bob. How much longer will the tide run ?'

'An hour an' more yet, sir—You'll make the Head easy.'

And on the *Three* rushes through the water, her white sides gleaming in the sun as she heads for the distant harbour of Bridlington, whilst the *Volsung* is stooped for a speck out seawards, which is bobbing on the waves.

'North Smithie buoy,' report the pilot as we draw abreast the great red-and-white ringed cylinder, round which the tide is running like a millrace, as though it would tear it from its moorings twenty-seven feet below.

'Keep her away a couple of points,' is the order.

The rudder moves gently; the sheet is slackened off, and the little craft slips merrily onward towards the cliffs of Flamborough.

The muffled moan of the surf on shore away on the port beam grows louder, and our lookout-man catches now and again a long line of white where the rollers are breaking on the rocks. A toss, a plunge, and splash comes a burst of foaming water over the bows along the deck, and we are in a reach of broken waves; for there is 'an overfall' here—foul ground below, over which the currents eddy and swirl, especially at tide-turn, however calm a day it be. But the skipper has been through this before, and so

goes straight at the crestled surges steadily; and soon we are rocking on smoother waters, where the long swell comes rolling in from the open sea, and can look about at the glorious scene around. How grand the Head looks, towering straight out of ocean, as though it knows what an important point it is upon the seaman's chart, and how he shapes his course by its wave-worn front. A little back from the cliff-line stands the white tower of the lighthouse, shimmering in the rays of the sun, which, catching the glass walls of the lantern-room, flash them into a huge diamond of dazzling brightness. Flamborough Head light is one of the finest in the world, a revolving one, which shines once every half-minute, and can be seen twenty-one miles away.

Two whites to one red
Indicates Flambro' Head,

says the North Sea pilot-book, meaning that it shows two white lights in succession and then a red. It is a dioptric light, having one powerful lamp, round which a circular frame of six faces, composed of great glass prisms, revolves by clock-work; the third and sixth faces having sheets of ruby glass before them to give the red effect to the light. The cost of the lantern only was seven thousand pounds. When the sun has sunk behind the Yorkshire wolds, its work begins; the lamp is lighted, and the clockwork wound. Then the watch pacing steamer's deck, Jack Collier taking his 'trick at the wheel,' and the bluff yawlsman riding to his post far out at sea, will see a tiny point of light grow and grow, until a brilliant beam of brightness flashes across the darkness, and then dies down again and leaves all black awhile. Then a ruby glimmer begins to show, and flashes into a star, which throws a crimson glare upon the waves.

To the right is the 'old lighthouse,' a tower of ancient date, surmounted by a flag-staff, from which a red-and-white striped pennant is flying. Long years ago, tradition says, it was used to burn a beacon, to warn the mariner from the dangerous coast; now, it is a signal-station, so

that the passing ship can send word of her whereabouts to her owners, at the other side of the Atlantic perhaps. To the left, at the edge of the point, is a battery, where, during fogs, a rocket is thrown up every ten minutes, which bursts high up with a loud report; whilst beneath is the opening to a long dark cavern, where the waters gurgie sullenly and lap the rocky walls in blackness invisible. Around us, the wavelets dance joyously in the sunlight, with 'Flamborough divers' and sea-parrots darting into them and out again; whilst steamers are screwing their way along, bound north, smoking bravely, and spouting the water from the engine-room ports, and 'Geordies' (or colliers), dirty schooners, and lumbering brigs, with now and then a smarter brigantine or trim barque, are working their way before the steady land-breeze. Farther out, a splendid four-masted ship, her snowy canvas drawing every stitch—with stunsails aloft and aloft—is gliding majestically southward, piling up a heap of sparkling water under her bows, which foams under her counter and streams away in a broad hissing track behind.

But whilst we have been watching the passing ships, the wind and tide have borne us onward, and we just get a glimpse of Silex Bay, where the sandy beach gives a landing for the coast-guards living in that group of white cottages up there, and whose entrance is guarded by 'Adam and Eve'—two rocks which stand out on either hand; then huge cliffs shut it in, and we sail under a grim wall of chalk towering two hundred feet above us into the sky.

Kittiwakes and gulls sun themselves in the ledges, and the shrill note of the curlew echoes from the land; whilst the warm sun is over all, bathing the glaring cliffs and shining upon green waters, until, far down, can be seen the long seaweeds waving over the sunken rocks, a very picture of peace and quiet. But a terrible place is this when the wild gale is lashing the North Sea into fury, and sending huge seas thundering against these cliffs, and whirling the foam-scud up into the black sky, and driving it far inland in big flakes. Then the ill-fated vessel caught by those breakers is lost, and the harsh scream of the seabird and shrieking storm-blast are the requiem of the doomed crew aboard. The breeze has died away; there here, so we will get the canvas stowed snugly out of the way.

'Stand by! Ready! Hoist away! Belay!' The tiny blocks squeak musically; there is a flutter of white canvas, and then the sprit-mainsail is brailled up close against the mast.

'Out paddle! Easy ahead.'

Now a picturesque little bay breaks the cliff-line with two curious pillar-rocks, rising up some distance from the land amongst the waves, known as the 'King and Queen.' The King has a wide archway piercing his royal person, through which the *Volung* darts; and then, as she slips round

the Queen out into the open sea again, her majesty certainly bears a striking resemblance to a lady in all the glory of a modern 'dress-improver.'

All along the coast are openings in the rocks to tiny cavelets; and many a grim tale can the fisher-folk tell how, after fierce gales when gallant ships have disappeared, they have found crushed mangled bodies jammed in those clefts, or lying tangled in the 'carweed' of the rocks below; and they will point out a cave some forty feet above high-water mark where once a desperate sailor, who had seen his mates sucked down by the greedy breakers, climbed, and was found all gashed and bruised long after by seagull-hunting fisher-lads.

Ten minutes' run brings us to one of the glories of Flamborough, the great 'Five-arch Cave.' A lofty pointed archway leads on from the sea; and paddling steadily under it, we are in a huge vaulted chamber, whose groined roof springs from one massive central column of ragged chalk, and whose floor is far down under the translucent emerald water, sixteen feet below. Two passages lead inward, and in the gloom the water sobb in unseen hollows as the *Volung* cautiously works her way along the larger of the two, until a fear seizes the skipper lest, in the darkness, the tide, which has begun to flow, may lift the tiny craft on to some point of rock, and then surging back, cause her to heel over and roll the crew out into the black deep water; so he shouts the order, 'Go astern!' and she shoots out through the most northerly opening into the bright sunlight again.

Close by is 'Robin Lythe's Hole,' a spacious cavern, named after a famed smuggler, and having a roomy entrance from seawards, with a smaller leading to the right out into a bay round a point. At low water, this cave may be explored on foot from the upper end; but care must be taken not to be caught by the tide, for it fills at high water. Rounding the point, we get a fine view of the 'North Sea Landing,' a little cove bounded on either hand by bluff cliffs, and having a strip of sand and shingle for a beach, and then a steep slope leading up inland to the village. On this incline are drawn up long lines of gaily painted boats, the famed cobbles which brave the rough North Sea.

The lifeboat house stands half-way up the cliff, doors open, showing the *Gertrude* on its 'skids' within; and under the lee of it, basking in the warm sunshine, are three or four old men, clad in reddish canvas trousers, blue guernseys, and battered sou'-westers; whilst not far off, half-a-dozen sturdy women in short blue serge petticoats and linen bonnets are at work on the boats, singing blithely a simple hymn-tune; one and another looking up now and again to cast an eye down to the beach, where a group of bare-legged youngsters are playing at the water's edge,

and helping a bronzed fellow to launch a coble, in which he and his boy in the bows are going to take a party to see the caves. These are fisher-folk of Flamborough—or 'Little Denmark,' as it has been named—members of a community exclusive yet in all its ways; they are still a colony to themselves, direct descendants of the old vikings who landed here when 'Ida the Flamenian' came to conquer wild Northumbria long centuries ago. They speak of all outsiders as 'foreigners' to this day, and marry religiously amongst themselves. Tyburnia and Mayfar are not more exclusive than Flamborough town! There are no more daring or skilful boatmen to be found anywhere than real Flamborough men—big muscular fellows, with clear blue eyes and fair golden hair and beards. Sons following their fathers unquestioningly, take to the sea and the hard calling of a fisherman's life; whilst the daughters learn from their mothers to knit the warm blue guineys, and gather and prepare the shellfish for bait. The hazel-eyed girl listens to the fisher-lad's bluff wooing; and when he has part share in the coble he helps to man, marries him, and shares his lot, paints his boat, mends his nets, and bravely helps him all she can. Many a night she will lie awake to listen to the hoarse howling gale sweeping up from the sea, and pray for a precious boat tossing far out upon the angry waters; and hasten down in early morning to meet the flowing tide, anxious to hear that 'blessed, best sound, the boat's keels grating on the sand.' Like enough, there is a sad dark day in store for her, when the gallant coble comes in no more, and nought is known, until some wreckage floats ashore, or a dead man lies on the wet sands.

There is an old woman, worn and bent now by many a hardship, who will tell a tale as sad as ever told—How one night, years ago, a tempest swept the seas and burst upon the far-off fishing fleet; and in the cold gray dawn, women paced the beach searching with terribly eager eyes amongst the breakers. 'Ah, sir, it was a dowy day for me and mony ither. I got my poor bairn and his father up fra the rocks yau after ither and took 'em right hame athort our donkey's back, the salt water dripping sairly all the way. My man's face had an all unrestful look; be like he'd thowt o' me, and now I'd greet; but Ned's war all a smile. Ay, Lord! 'twas trouble then.'

They never speak of the lost husband or sweetheart here as drowned, but use an expression pathetically quaint and simple, and say, 'The sea gat him.'

Yet, though loss and sorrow too often are their lot, the Flamborough men are a cheerful, manly race, who do their work fearlessly without foreboding, ready alike to work their nets and lines, help put a crew aboard some disabled vessel, or man the lifeboat.

Crossing the bay, and standing well out to weather a reef of rocks which runs like a submerged pier from the northernmost point, we steer for a narrow lofty cleft in the chalk, where the tide rises and falls some two feet each time the swell rolls in. Watching a favourable chance, the pilot makes a dash between the lifts of the sea, and the canoe

glides into the cool twilight of the 'Kirk Hole.' There is a wonderful echo here; and as our cabin-boy breaks into the chorus, 'Oh, we're three jolly, jolly sailor-boys; the chords fluttering aloft are caught and flung back by the listening crannies in softer strains, until they die away in the distant hollows of the rocky dome overhead. The water swishing amongst the pebbles at the far end of the cave sounds like a song of coy maidens hiding in the purple seaweed; and as we follow the winding waterway out through another entrance, fancy can almost catch glimpses of laughing eyes peeping round the jagged points and edges, until a burst of sunlight glimmers from 'Thornwick Bay' drives the visions of beautiful sea-nymphs back into the dim gloom behind.

A peep into the 'Smuggler's Cove,' whose deep sandy beach was of old often scored by the keels of swift boats as they ran their cargoes of contraband goods here from some saucy lugger in the offing, and whose long dry passage inland was a favourite 'hide' for 'dooty-free swag';—and we head northward again, skirting the bay with its golden patch of sand until we round a jagged spur of rock into 'Little Thornwick Bay.' A lonely awesome cove is this, with more gloomy caverns, and a wild chasm called the 'Devil's Washpot,' up which angry seas dash in fury, and then foam madly out through a well-like opening on to the cliff above, in seething spray. From here the ruggedness of the coast is lost, and 'Specton Cliff' show a smooth front of whiteness, which gradually grows darker in colour, until rich brown clay reaches in a great curve to Filey, and its famed Brig showing a line of black upon the water. Away beyond, half lost in purple haze, the old castle of Scarborough looks out from its bold headland over seas, and then the sky and ocean meet in a band of sober gray.

But the afternoon is wearing on, and the weather is looking ditty to windward, and we ought to be leaving a homeward course, or shall lose the best of the tide, which is setting strongly down the coast. Already, raindrops are beginning to plash into the water and hum upon the decks, so don sou'-wester and oilskin, and look alive, pilot!

'About ship.'

A dreary drizzle is wrapping the land and blurring the gliding panorama of cliff and caves as we paddle southward, on past the North Landing and the mist-shrouded 'King and Queen.' The wind is freshening fast, 'white-horses' are showing upon the heaving seas ahead, and the little boat plunges heavier into each following surge, shipping every now and again an awkward combur into the well.

'Look out, helmsman; starboard, hard!'

The paddle dips sharply twice, and she swings round just in time to meet a huge seething roller stem on; the next instant, her bows are buried deep under the hissing water, and then, with a gallant stagger, she shakes herself free, and flinging the glistening spray from off her arched deck, glides down into a hollow of the waves. It is too rough now to keep our course parallel to the coast, and we must stand out to sea and meet the wind-waves; for, to let her get broadside on, the end would be speedy. So the *Volsung*

turns away from the land, and faces the wild waste of tossing waters, struggling bravely ahead, though she quivers at each heavy sea, which dashes her bows under up to the swinging mast. But the constant deluge forward is beginning to tell, and so much water has come aboard, that she rolls uncomfortably, and lifts less readily to meet the waves. The skipper slips off his oilskin jacket and tucks it over the apron, to keep out the falling combers, and takes to baling with his sou'-wester, leaving one hand free to hold the paddle and keep her head up. But do all he can, the water does not lessen in the hold; and for a moment or two he loses heart, and is half-minded to let his ship drift before the waves; it will be very awkward, to say the least, if she fills and goes gunwale under, for though the land is only half a mile away, and a sharp swim might reach it, yet, there is no landing at the face of those cliffs, where the surf is linging the spray high; and besides, the brave boat, companion of many a pleasant voyage, will be lost. A glance seawards shows a big steamer forging past, so close, we can read the name on her bows, and see the faces of the passengers crowding her decks; and the officer on the bridge, who is looking at us through his glass, waves a cheering hand. In a second the skipper is him-self again; the honour of the blue cipher burgee of the Royal Canoe Club is in his hands; and at it the *Volsung* goes again, with a secret feeling of joy that she is not quite alone now amongst the tumbling billows. By the time the *General Harbord* is growing small in the distance, we are off the Lighthouse Bay, determined to run ashore here, bale the canoe out, and leave her with the coast-guard. Turning deftly on a wave-top, the pilot steers her cautiously before the seas; and soon the tired crew tumble out joyfully as she takes the beach on the back of a comber.

By the time she has been pumped dry, the wind has dropped, and the sea will soon go down considerably; spirits pluck up again, and we determine not to forsake the staunch little craft, nor leave her in strange quarters, but make a bold dash round and home to Bridlington Quay; so, through the surf she is launched again, and all hands, drenched but resolute, jump aboard, and out to sea again.

Plunge, plunge, the spray flies high;
Rush, rush, the foam spins by

Yet we manage to round the Head at last, and with a good tide still under us, stand rapidly across Bridlington Bay; and soon the brown piers and red-tiled roofs rise up ahead, a welcome sight. A little later, and the *Volsung* is being carried into the coast-guard's boathouse, and the skipper, who is at the bows, runs his head against a line of garments dripping in the gloom. 'Why, Roberts, what's all this?'

'Drowned men's clothes, sir! A coble has gone down in a squall this afternoon with her three hands, and it's only their kit here was saved.'

A feeling of gratitude to One aloft creeps into the skipper's heart as he thinks how the squall which gave the *Volsung* such a buffeting sent a stout boat to the bottom, and that three poor

souls were fighting vainly for dear life with the pitiless sea, as, carelessly happy, he made his way safely through its tossing waters 'Round Flamborough Head.'

A HOUSE DIVIDED AGAINST ITSELF.

CHAPTER XXXII.

NOTHING happened of any importance before their return to Eaton Square. Markham, hopping about with a queer sidelong motion he had, his little eyes screwed up with humorous meaning, seemed to Frances to recover his spirits after the Winterbourn episode was over, which was the subject—though that, of course, she did not know—of half the voluminous correspondence of all the ladies and gentlemen in the house, whose letters were so important a part of their existence. Before a week was over, all Society was aware of the fact that Ralph Winterbourn had been neatly dying at Markham Priory; that Lady Markham was in 'a state' which baffled description, and Markham himself so changed as to be scarcely recognisable; but that, fortunately, the crisis had been tided over, and everything was still problematical. But the problem was so interesting, that one perfumed epistle after another carried it to curious wits all over the country, and a new light upon the subject was warmly welcomed in a hundred Easter meetings. What would Markham do? What would Nelly do? Would their friendship end in the vulgar way, in a marriage? Would they venture, in face of all prognostications, to keep it up as a friendship, when there was no longer any reason why it should not ripen into love? Or would they, frightened by all the inevitable comments which they would have to encounter, stop short altogether, and fly from each other?

Such a 'case' is a delightful thing to speculate upon. At the Priory, it could only be discussed in secret conclave; and though no doubt the experienced persons chiefly concerned were quite conscious of the subject which occupied their friends' thoughts, there was no further reference made to it between them, and everything went on as it had always done. The night before their return to town, Markham, in the solitude of the house, from which all the guests had just departed, called Frances outside to bear him company while he smoked his cigarette. He was walking up and down on the lawn in the gray stillness of a cloudy warm evening, when there was no light to speak of anywhere, and yet a good deal to be seen through the wavering grayness of sky and sea. A few stars, very mild and indistinct, looked out at the edges of the clouds here and there—the great water-line widened and cleared towards the horizon; and in the far distance, where a deeper grayness showed the mainland, the light of a lighthouse surprised the dark by slow continual revolutions. There was no moon; something softer, more seductive than even the moon, was in this absence of light.

'Well—now they're gone, what do you think of them, Fan? They're very good specimens of the English country-house party—all kinds: the respectable family, the sturdy old fogey, the

rich young man without health, and the muscular young man without money.' There had been, it is needless to say, various other members of the party, who, being quite unimportant to this history, need not be mentioned here. 'What do you think of them, little un? You have your own way of seeing things.'

'I—like them all well enough, Markham,' without enthusiasm Frances replied.

'That is comprehensive at least. So do I, my dear. It would not have occurred to me to say it; but it is just the right thing to say. They pull you to pieces almost before your face; but they are not ill-natured. They tell all sorts of stories about each other.'—

'No, Markham; I don't think that is just.'

'—Without meaning any harm,' he went on. 'Fan, in countries where conversation is cultivated, perhaps people don't talk scandal—I only say perhaps—but here we are forced to take to us for want of anything else to say.—What did your Giovannini and Giacomo talk of in your village out yonder?' Markham pointed towards the clear blue-gray line of the horizon, beyond which lay America, if anything; but he meant distance, and that was enough.

'They talked—about the olives, how they were looking, and if it was going to be a bad or an indifferent year.'

'And then?'

'About the *forestieri*, if many were coming, and whether it would be a good season for the hotels; and about tying up the palms, to make them ready for Easter,' said Frances, resuming, with a smile about her lips. 'And about how old Pietro's son had got such a good appointment in the post-office, and had bought little Nina a pair of earrings as long as your finger; for he was to marry Nina, you know.'

'Oh, was he? Go on. I am very much interested.—Didn't they say Mr Whatever-his-name-is wanted to get out of it, and that there never would have been any engagement, had not Miss Nina's mother?'

'O Markham,' cried Frances in surprise, 'how could you possibly know?'

'I was reasoning from analogy, Fan.—Yes, I suppose they do it all the world over. And it is odd—isn't it?—that, knowing what they are sure to say, we ask them to our houses, and put the keys of all our skeleton cupboards into their hands.'

'Do you think that is true, that dreadful idea about the skeleton? I am sure.'—

'What are you sure of, my little dear?'

'I was going to say, O Markham! that I was sure, at home, we had no skeleton; and then I remembered.'—

'I understand,' he said kindly. 'It was not a skeleton to speak of, Fan. There is nothing particularly bad about it. If you had met it out walking, you would not have known it for a skeleton. Let us say a mystery, which is not such a mouth-filling word.'

'Sir Thomas told me,' said Frances with some timidity; 'but I am not sure that I understood. Markham! what was it really about?'

Her voice was low and diffident, and at first he only shook his head. 'About nothing,' he said; 'about—me. Yes, more than anything else, about me. That is how— No, it isn't,'

he added, correcting himself. 'I always must have cared for my mother more than for any woman. She has always been my greatest friend, ever since I can remember anything. We seem to have been children together, and to have grown up together. I was everything to her for a dozen years, and then—your father came between us. He hated me—and I tormented him.'

'He could not hate you, Markham. Oh, no, no!'

'My little Fan, how can a child like you understand? Neither did I understand, when I was doing all the mischief. Between twelve and eighteen, I was an imp of mischief, a little demon. It was fun to me to bait that thin-skinned man, that jumped at everything. The explosion was fun to me too. I was a little beast. And then I got the mother to myself again.—Don't kill me, my dear. I am scarcely sorry now. We have had very good times since, I with my parent, you with yours—till that day,' he added, flinging away the end of his cigarette, 'when mischief again prompted me to let Con know where he was, which started us all again.'

'Did you always know where we were?' she asked. 'Strangely enough, this story did not give her any angry feeling towards Markham. It was so far off, and the previous relations of her long-separated father and mother were as a fairy tale to her, confusing and almost incredible, which she did not take into account as matter of fact at all. Markham had delivered these confessions slowly, as they turned and re-turned up and down the lawn. There was not light enough for either to see the expression in the other's face, and the veil of the darkness added to the softening effect. The words came out in short sentences, interrupted by that little business of puffing at the cigarette, letting it go out, stopping to strike a fusee and relight it, which so often forms the byplay of an important conversation, and sometimes breaks the force of painful revelations. Frances followed everything with an absorbed but yet half-dreamy attention, as if the red glow of the light, the exclamation of impatience when the cigarette was found to have gone out, the very perfume of the fusee in the air, were part and parcel of it. And the question she asked was almost mechanical, a part of the business too, striking naturally from the last thing he had said as sparks flew from the perfumed light.'

'Not where,' he said. 'But I might have known, had I made any attempt to know. The mother sent her letters through the lawyer, and of course we could have found out. It was thrust upon me at last by one of those meddling fools that go everywhere. And then my old demon got possession of me, and I told Con.' Here he gave a low chuckle, which seemed to escape him in spite of himself. 'I am laughing,' he said.—'pay attention, Fan—at myself. Of course I have learned to be sorry for—some things—the imp has put me up to; but I can't get the better of that little demon—or of this little beggar, if you like it better. It's queer phraseology, I suppose; but I prefer the other form.'

'And what,' said Frances, in the same dreamy way, drawn on, she was not conscious how, by

something in the air, by some current of thought which she was not aware of—what do you mean to do now?

He started from her side as if she had given him a blow. "Do now?" he cried, with something in his voice that shook off the spell of the situation and aroused the girl at once to the reality of things. She had no guidance of his looks, for, as has been said, she could not see them; but there was a curious thrill in his voice of present alarm and consciousness, as if her innocent question struck sharply against some fact of very different solidity and force from those far-off shadowy facts which he had been telling her. "Do now? What makes you think I am going to do anything at all?"

His voice fell away in a sort of quaver at the end of these words.

"I do not think it; I—I—don't think anything, Markham; I—don't—know anything."

"You ask very pat questions all the same, my little Fan. And you have got a pair of very good eyes of your own in that little head. And if you have got any light to throw upon the subject, my dear, produce it; for I'll be bothered if I know."

Just then, a window opened in the gloom. "Children," said Lady Markham's voice, "are you there? I think I see something like you, though it is so dark.—Bring your little sister in, Markham. She must not catch cold on the eve of going back to town."

"Here is the little thing, mammy. Shall I hand her in to you by the window?—It makes me feel very frisky to hear myself addressed as children," he cried with his chuckle of easy laughter.—"Here, Fan; run in, my little dear, and be put to bed."

But he did not go in with her. He kept outside in the quiet cool and freshness of the night, illuminating the dim atmosphere now and then with the momentary glow of another fusee. Frances from her room, to which she had shortly retired, heard the sound, and saw from her windows the sudden ruddy light a great many times before she went to sleep. Markham let his cigar go out oftener than she could reckon. He was too full of thought to remember his cigar.

They arrived in town when everybody was arriving, when even to Frances, in her inexperience, the rising tide was visible in the streets, and the air of a new world beginning, which always marks the commencement of the season. No doubt it is a new world to many virgin souls, though so stale and weary to most of those who tread its endless round. To Frances, everything was new; and a sense of the many wonderful things that awaited her got into the girl's head like ethereal wine, in spite of all the grave matters of which she was conscious, which lay under the surface, and were, if not skeletons in the closet, at least very serious drawbacks to anything bright that life could bring. Her knowledge of these drawbacks had been acquired so suddenly, and was so little dulled by habit, that it dwelt upon her mind much more than family mysteries usually dwell upon a mind of eighteen. But yet in the rush and exhilaration of new thoughts and anticipations, always so much more delicately bright than any reality,

she forgot that all was not as natural, as pleasant, as happy as it seemed. If Lady Markham had any consuming cares, she kept them shut away under that smiling countenance, which was as bright and peaceful as the morning. If Markham, on his side, was perplexed and doubtful, he came out and in with the same little chuckle of fun, the same humorous twinkle in his eyes. When these signs of tranquillity are so apparent, the young and ignorant can easily make up their minds that all is well. And Frances was to be 'presented'—a thought which made her heart beat. She was to be put into a court-train and feathers, she who as yet had never worn anything but the simple frock which she had so pleased herself to think was purely English in its unobtrusiveness and modesty. She was not quite sure that she liked the prospect; but it excited her all the same.

It was early in May, and the train and the court plumes were ready, when, going out one morning upon some small errand of her own, Frances met some one whom she recognised walking slowly along the long line of Eaton Square. She started at the sight of him, though he did not see her. He was going with a strange air of reluctance, yet anxiety, looking up at the houses, no doubt looking for Lady Markham's house, so absorbed that he neither saw Frances nor was disturbed by the startled movement she made, which must have caught a less preoccupied eye. She smiled to herself, after the first start, to see how entirely bent he was upon finding the house, and how little attention he had to spare for anything else. He was even more worn and pale, or rather gray, than he had been when he returned from India, she thought; and there was in him a slackness, a letting-go of himself, a weary look in his step and carriage, which proved, Frances thought, that the Riviera had done George Gaunt little good.

For it was certainly George Gaunt, still in his loose gray habit, looking like a man dropped from another hemisphere, investigating the numbers on the doors as if he but vaguely comprehended the meaning of them. But that there was in him that unmistakable air of soldier which no mud can quite disguise, he might have been the Ancient Mariner in person, looking for the man whose fate it is to leave all the wedding-feasts of the world in order to hear that tale. What tale could young Gaunt have to tell? For a moment it flashed across the mind of Frances that he might be bringing bad news, that 'something might have happened,' that rapid conclusion to which the imagination is so ready to jump. An accident to her father or Constance? so bad, so terrible, that it could not be trusted to a letter, that he had been sent to break the news to them.

She had passed him by this time, being shy, in her surprise, of addressing the stranger all at once; but now she paused, and turned with a momentary intention of running after him and entreating him to tell her the worst. But then Frances recollected that this was impossible; that with the telegraph in active operation, no one would employ this lingering way of conveying news; and went on again, with her heart beating quieter, with a heightened colour, and a restrained impatience and eagerness of which she was half

ashamed. No, she would not turn back before she had done her little business. She did not want either the stranger himself or any one else to divine the flutter of pleasant emotion, the desire she had to see and speak with the son of her old friends. Yes, she said to herself, the son of her old friends—he who was the youngest, whom Mrs Gaunt used to talk of for hours, whose praises she was never weary of singing.

Frances smiled and blushed to herself as she hurried, perceptibly hurried, about her little affairs. Kind Mrs Gaunt had always had a secret longing to bring these two together. Frances would not turn back; but she quickened her pace, almost running, as near running as was decorous in London, to the lace-shop, to give the instructions which she had been charged with. No doubt, she said to herself, she would find him there when she got back. She had forgotten, perhaps, the fact that George Gaunt had given very little of his regard to her when he met her, though she was his mother's favourite, and had no eyes but for Constance. This was not a thing to dwell in the mind of a girl who had no jealousy in her, and who never supposed herself to be half as worthy of anybody's attention as Constance was. But, anyhow, she forgot it altogether, forgot to ask herself what in this respect might have happened in the meantime; and with her heart full of innocent eagerness, pleasure, and excitement, full of the hope of hearing about everybody, of seeing again through his eyes the dear little well-known world, which seemed to her so far behind her, hastened through her errands, and turned quickly home.

To her great surprise, as she came back, turning round the corner into the long line of pavement, she saw young Gaunt once more approaching her. He looked even more listless and languid now, like a man who had tried to do some duty, and failed, and was escaping, glad to be out of the way of it. This was a great deal to read in a man's face; but Frances was highly sympathetic, and divined it, knowing in herself many of those devices of shy people, which shy persons divine. Fortunately, she saw him some way off, and had time to overcome her own shyness and take the initiative. She went up to him fresh as the May morning, blushing and smiling, and put out her hand. 'Captain Gaunt?' she said. 'I knew I could not be mistaken.—Oh, have you just come from Boddigher? I am so glad to see any one from home!'

'Do you call it home, Miss Waring?—Yes, I have just come. I—I—have a number of messages, and some parcels, and— But I thought you might perhaps be out of town, or busy, and that it would be best to send them.'

'Is that why you are turning your back on my mother's house? or did you not know the number? I saw you before, looking—but I did not like to speak.'

'I—thought you might be out of town,' he repeated, taking no notice of her question; 'and that perhaps the post!'

'O no,' cried Frances, whose shyness was of the cordial kind. 'Now you must come back and see mamma. She will want to hear all about Constance.—Are they all well, Captain

Gaunt? Of course you must have seen them constantly—and Constance. Mamma will want to hear everything.'

'Miss Waring is very well,' he said with a blank countenance, from which he had done his best to dismiss all expression.

'And papa? and dear Mrs Gaunt, and the colonel, and everybody?—Oh, there is so much that letters can't tell.—Come back now. My mother will be so glad to see you, and Markham; you know Markham already.'

Young Gaunt made a feeble momentary resistance. He murmured something about an engagement, about his time being very short; but as he did so, turned round languidly and went with her, obeying, as seemed, the eager impulse of Frances, rather than any will of his own.

HOW TO BECOME A PATENTEE.

By an Act passed in 1883, inventors are enabled to obtain letters-patent for their inventions for four years at a cost of four pounds; provided, of course, they take out the patent themselves without employing an agent. Previously to 1883, the fees were very heavy, and many useful but possibly unremunerative articles were, in consequence, left unpatented and unmanufactured. How great a success the Act has been, the following figures show: In the first nine months of 1883, four thousand six hundred and fifty-six applications for letters-patent were made; in the corresponding period for the following year, when the Act was in force, the number was thirteen thousand and twelve. Where the invention is of a very complicated nature, or likely to be of great commercial value, inventors should certainly employ patent agents; but in many cases there is no obstacle in the way of the inventor obtaining letters-patent himself without the intervention of an agent.

Before detailing the simple but necessary procedure connected with the Patent Office, it will be well to consider what inventions are patentable. Bare or abstract philosophical principles are not patentable; the principle must be embodied in a practical form; and the patent is taken out not for the principle, but for the mode of carrying it into effect. It is only the new part of the machine or apparatus which can be patented; and if any material part of the alleged invention should prove either not useful or not novel, the patent is void. Want of novelty is a fatal defect. The invention must be of real value, and must not have been used in public or by the public before the date of the patent. The thing may have been invented before; but letters-patent may be obtained for it, if it has not been used or sold publicly, or a description of it published in a printed book sold—but not necessarily published—in this country. Where the inventor is not quite certain that no patent has been taken out for such an invention previously, he should search through the specifications at the Patent Office, 25 Southampton Buildings, London, W.C. The specifications are classified, so that the search, though tedious, is of no great difficulty. If the inventor is unable to make the search, a patent agent will do so for a moderate fee.

Supposing, now, that our budding patentee has invented something which is novel, useful, and of value, his next step is to obtain through a district post-office or at the Inland Revenue Office, Royal Courts of Justice, Strand, W.C., the following forms: One application for patent; two provisional specifications. Before these forms—for which there is no charge—can be filled up, the title or name of the invention must be determined. The title must indicate generally the subject-matter of the invention. It must not be too large, uncertain, or at variance with the description given in the provisional or complete specifications. Samples of titles are: An Improvement in Locomotive Steam-engines; A Roller Skate; A New Apparatus for Sweeping Chimneys. The application must now be filled in, full instructions for which are given on the form. It must bear a one-pound stamp. At the end of it must be a declaration that the person applying for the patent is the true and first inventor, and this declaration must be made before a justice of the peace, or a person authorised to administer oaths, in any court in the United Kingdom. The fee on making the declaration is usually half-a-crown. The application form being now properly filled in, the inventor should fill in the form of provisional specification, attending carefully to the directions given on the form which do not require explanation. The provisional specification must describe the nature of the invention. Minute details need not be given; a general description is sufficient. The provisional specification is only intended to assume the identity of the invention, to disclose it in its rough state, and protect the inventor until such time as he can perfect its details. At the same time, every part of the invention, except details, must be foreshadowed. The application duly stamped, and the provisional specification, *in duplicate*—drawings must also be sent if the invention cannot be explained without them—should now be delivered or sent by post to The Comptroller, Patent Office, 25 Southampton Buildings, Chancery Lane, who will examine them, and notify the applicant if they are accepted. The applicant is now in this position: for the next nine months, he may publish or publicly use his invention without losing his right of ultimately obtaining letters-patent; but during this time, any one else can manufacture and sell the invention without being in any way liable to the inventor. The only real advantage, therefore, of this provisional protection, as it is called, is, that for a period of nine months before obtaining letters-patent, the inventor is protected from any other person applying for and obtaining letters-patent for the same invention. It is a popular error to suppose that a patent can be obtained for nine months at a cost of one pound.

Now comes the final and most important part of the whole proceedings. Before the end of the nine months, the inventor must obtain from the Inland Revenue Office two complete specification forms, fill them up carefully according to directions, stamp one of them with a three-pound stamp, and send them—with drawings, if required—to the Comptroller at the Patent Office. One will be the counterpart of the other.

In the complete specification the invention must be described clearly and fully, so that others, when the patent has expired, may work the invention if they desire to do so. The nature of the invention must be particularly described and ascertained, and in what manner it is to be performed. The inventor must disclose everything, for if he keeps anything back and does not act in good faith, he runs the risk of having his patent declared void. Care must be taken, in describing a machine part of which is new and part old, to state clearly how much is claimed as new. Every essential part of the invention must be mentioned, and the description must be intelligible to workmen of ordinary skill. In due course, the complete specification—if in order—will be accepted, and the patent sealed. If it so happens that the inventor has completed his invention, and has attained the maximum of simplicity with the minimum of cost, before taking any steps to obtain a patent, he should not trouble to obtain provisional protection at all, but send in at once a complete specification with the application. This is of course the simpler method; and the fees, or rather stamps, are the same, namely, a one-pound stamp on the application and three pounds on one of the complete specification. The inventor now possesses the sole right to deal with his invention for a period of four years. Should his invention prove of such value that he is desirous of extending his patent, he can do so for four years at a yearly cost of ten pounds; and for a still further two years at a yearly cost of fifteen pounds; and for a further four years at a yearly cost of twenty pounds.

It will be useful to inventors to know that the Patents Act of 1883 and the Rules can be obtained from 38 Currier Street, Chancery Lane, W.C.; also that the Patent Office, 25 Southampton Buildings, W.C., is open from ten to four every day except Sundays and public holidays. Complete specifications of existing and old patents are kept on sale there; and an old specification is often useful as a guide to the inventor in drawing up his own. A register of patents is kept at the office, which is open to the public. There is also a library, which is free to the public, where all the publications of the office are to be seen, and also the leading British and foreign scientific journals and textbooks in various departments of science and art.

MR L'ESTRANGE.

IN FOUR CHAPTERS.—CHAP. III.

THE reputation of the Atlantic Ocean has been so utterly lost, that no abuse of it by me can defame it. As the most whimsical, wrathful, spiteful of oceans, it is but too well known. It was my fate to be a victim of its temper for six days, during which I endured all that a poor nervous invalid can suffer. Storms blew all round the compass. I seemed to be rolling night and day unceasingly, now in this direction, now in that. My bed was like a willow, I like a log tumbling over it. The steward who attended to me coolly spoke of the string of tempests as spring gales of rather a gentle sort. I have the impression that I did not sleep during these six

days and nights; but this nobody will credit. I admit that I was often in a state of dull lethargy, incapable of using limbs or senses, yet conscious of what was going on near me.

Theodore was a born sailor; the more Boreas blew, the livelier he became. For the first two days, the kind fellow tended me like a woman; brought the doctor to see me, ministered to my humours, importuned me with the robust man's consolations. I begged him to leave me in peace. The third day he obeyed me almost literally; for on that day I do not remember seeing him, except when he came to bed. His berth was over mine, and he had that night a long struggle to get into it, which put me into a fever to witness. I thought it was the raging waters that made him so clumsy; I now know that he had been drinking champagne. On the fourth day I saw little of him; the fifth, he came into our stateroom several times and hurriedly. He always spoke to me, and appeared to look at me with a peculiar anxiety. Once the steward came to the door and could not open it. Theodore rose from the floor, and in an agitated voice asked what was wanted. He did not open the door, which he had bolted. I was getting a little better, and this incident struck me. Subsequent events no doubt intensified my remembrance. I seemed to know that something furtive was going on, and was uneasy, but too shattered by weakness to bestir myself.

The sixth day, Theodore remained in his berth until the afternoon. I heard him groan over my head several times and toss about uneasily. About four o'clock he got up, after drinking his fourth glass of brandy and soda. The steward eyed him very strangely, I thought; and then the man eyed me quizzingly, as he held the empty glass and talked about the improving weather. After dressing, Theodore sat on the sofa staring at the floor, as though looking right through the ship's bottom. He was pale, shivered from time to time, muttered to himself, but never took his eyes from the floor. I grew alarmed as I watched him. At first I thought he was going to be sea-sick after all; that his reckless indulgence in food, drink, and tobacco had found his point of gastric toleration. But the expression of despair which cut deeper and deeper into his face, making its whiteness more marble-like continually, was not that of a sickening man; or rather, it was the manifestation of a mind diseased.

'What ails you, Theodore?' I asked, in a tone so hoarse that I did not recognise my own voice. Illness had indeed changed me in every way.

He jumped up, as if he had been struck in the back; his eyes ran round the room, then rested on me, as if he did not know me. For a moment we stared in silence.

'How do you feel, Charley?' he said, advancing to me.

'How do you feel, Theodore?'

'Me?' rubbing his head with both hands, energetically—'me, Charley? Why, you know I am always first-class.'

'Don't try to impose upon me, brother; you are ill—worse than I have been.'

'Impose! What on earth do you mean?' His face was scarlet; he shook, and he caught at the side of the berth, as if he were falling.

I got on to my elbow and tried to leave the bed, but the effort was too great; my head swam; I fell back helplessly. I lay still awhile. Theodore returned to his seat on the sofa, and again fixed his eyes on the floor as before. The dinner-bell rang.

'Are you not going to dinner, Theodore?' I asked.

He did not reply. I repeated the question. He looked at me, muttered, and began to move about. Again I asked the question.

'No; I do not want to eat,' he said shortly.

'You have eaten nothing to-day?'

'I am not hungry.—Don't bother me, Charley.'

'Theodore, I insist upon knowing what has produced this extraordinary change in you. Tell me, or I will get up and bring the doctor. What has made you ill?'

'Really and truly, Charley, I am not ill at all; a bit out of sorts.—Lie still; you are as weak as a kitten.—What will you have for dinner?'

'I will not eat again, until you tell me what is preying upon your mind. You frighten me, Theodore. Only something of the most extraordinary nature could have metamorphosed you into the haggard, harassed wretch that you have become. You are a perfect wreck.'

He laughed, a wild, passionate, mocking laugh, and turned his face from me.

The steward knocked at the door, calling to ask if I would have some dinner.

'Do have something, Charley,' said Theodore, who became suddenly collected, 'and I will dine with you—Here, steward, come in.'

The door opened, the steward entered, and with him the doctor. After a few inquiries regarding my health, the latter said to Theodore: 'I want to show you those things I spoke of in my cabin.'

My brother looked at him with intense surprise, then a flash of understanding shot into his eyes, and he said in a quavering voice: 'I will be with you in five minutes; I am not dressed.'

I had not been alone many instants, when the steward entered my room in a stealthy manner, and came close to me, whispering: 'Has your brother told you?'

'Told me! What?'

'Of the row in the smoke-room last night?'

'What do you mean?'

'Why, you see, he was playing cards and lost a lot of money—so it is reported, for of course I was not there; and it ended in him knocking a gentleman down.'

I groaned so deeply, that the man was frightened, and made clumsy excuses for mentioning the matter. I pressed his hand reassuringly, but I could not speak; then I motioned to him to leave me. How can I describe the abyss of despair into which the story hurled me? Theodore gambling, drinking, quarrelling, going to the bad already! Gambling! All at once recurred the scene of the bank-notes he had held before me when I fell ill. I had forgotten it. Then returned the boy's wild behaviour at the dinner-table. L'Estrange—Ah! that evil being had justified my opinion of him. Oh, why had I been ill? My absence had permitted this terrible debasement of my brother.

Hours seemed to pass before Theodore returned. He did not speak, but began to pull off his clothes, as if going to bed. The light was turned down to a glimmer. He thought I was asleep.

'Do not undress, Theodore,' I said, as calmly as I could; 'turn up the light.'

'Do you want something, Charley?'

'Yes, I want to talk to you.'

'Put it off till morning; I'm so tired that I cannot talk.' He sighed wearily.

'No, Theodore; I must talk, however tired you are. Come here, unhappy boy, and tell me what you have been doing. Whom did you strike in the smoke-room?'

He recoiled from me and made for the door. I sprang out of my berth and caught him by the arm.

'Let me go, Charley, for mercy's sake! I cannot remain here; it will kill me.' His looks of horror, his mad efforts to tear my hands from him, his ecstasy of terror, for an instant stunned me. Then an icy quiet came over him. I knew that something supremely serious had happened, to have changed my brother so absolutely.

'Sit down!' I said authoritatively. 'Tell me the whole truth; I can bear it.'

He looked at me as the bird at the rattlesnake, half fearing, half confident.

I turned to increase the light, and he again became restless. 'Now, Theodore, out with it. No good can come from delay, and concealment is impossible; others will tell me. Let me know the extent of my shame from the author of it. What have you done?'

'Don't, don't speak like that, Charley; I can't bear it.'

'I thought you were a man, and afraid of nothing.'

'I was so once, my brother. I am not a man any longer; I am a villain, a fratricide. Oh, heavenly Father, why have I lived to commit such a crime!'

These dreadful words tore my soul as grape-shot ravages the flesh. I stared into the weeping eyes of the miserable boy; I placed my hands upon his head, to draw him nearer to me, looking into the depths of his being. 'Explain yourself. Have you seriously injured L'Estrange?'

'L'Estrange, Charley!' Here he assumed an expression so utterly unlike what I had expected, that I believed he had gone insane.

'Yes, L'Estrange, the man you struck in your gambling quarrel.'

'I do not understand you, Charley,' said Theodore, in something like his ordinary manner.

'Did you not strike him?'

'No.'

'Did you not gamble with him?'

'No; that is, he was my partner.'

I put my head against the wall; the confusion of my mind was unbearable. 'Why are you so agitated, then? Why did you call yourself a fratricide? What is the meaning of all you have been manifesting for the last dozen hours?'

'Really, Charley, I cannot tell you—at least, not just now. In the morning.'

'Do you wish wholly to shatter my mind and

body, Theodore? You have committed some deep wrong. My ignorance of the facts is a thousand times worse than the knowledge. If you refuse to tell me, I shall go to the smoke-room, if it is now occupied, and inquire from the attendant. If he is in bed, I shall waken him.'

'But he will only tell you that the gentleman is all right again. The doctor says I have not hurt him; and we have become good friends again.'

I listened to him as if he were talking in an unknown tongue. After a long silence, I said: 'Then you have been suffering from a fit of temporary insanity, brought on by drinking and gambling?'

He turned away from me, trembled, did not speak.

Again my fears returned. 'You are concealing something hideous from me, Theodore. It is infamous to do so. I ask for the last time, will you tell me what you have done? Answer, or I leave this cabin to return no more. If you have not confidence in me, your brother, your friend, then all is over between us. I shall not go to California, but will find some employment in New York. You must go your own way—we shall henceforth be strangers.'

A deep feeling of solemnity thrilled me as I spoke. Theodore did not answer; but he sobbed hysterically for a few minutes, and then threw himself at my feet, pulling my knees with convulsive anguish. 'I cannot endure my misery; it is too great, Charley. Would that I could atone by dying at your feet! O my broken-hearted mother!—my unhappy sisters!'

'This is the very height of folly or remorse,' I cried in a terrible agitation. 'Theodore, in the name of those dear creatures at home, what have you done, that you act thus?'

'I will confess, Charley,' he whispered, hiding his head in my breast and pulling me tightly. 'Do not forgive me, though; no; God himself cannot forgive me. I have—I have stolen the money from your box—we are beggars!'

The shock was supreme! The calamity was measureless, final! A cry of despair burst from my burning lips. Slowly at first, then quicker and quicker, I realised that I had duties to perform towards the lost creature, trembling at my feet, towards those helpless suffering women, dependent upon me for all things now. Though black ruin was crashing around me on every side, I must not despair; I must fight for them who had no champion but me. The hugeness of the misfortune began to steady me as I thought of it. We should reach New York more abject than the pauper emigrant. What could we do?

'Did you take all the money?' I asked Theodore in a quiet voice.

'All that was in the pocket-book,' he answered whistlingly.

'Have you lost it all?'

'Yes.'

'Who won it?' I demanded, a sudden curiosity arising in me. Up to this point, I had been oblivious of the history of Theodore's gambling transactions; now it seemed that I ought to know how the boy had gone wrong. In the effort to adjust myself to a new and calamitous situation, I must begin at the beginning.

'Who won the money from you?'

'A young man. He is named Barker.'

'Did L'Estrange win anything from you?'

'Not a shilling, Charley.'

'Tell me all about it. I am settling down. Besides, you have told me the worst.'

'O Charley, I do not know how I can expose my infamy to you without you spurning me from you, as the most cruel and infatuated man in the world.'

'Spare all that sort of talk, Theodore. Tell me the bare facts. Who is this man Barker? An acquaintance of L'Estrange?'

'No, no; they are total strangers, I assure you. L'Estrange has lost more than I have.'

'Enough of generalities; come to particulars. Tell me all, and from the beginning.'

'I will, Charley.—Well, I first played with L'Estrange, just we two. I won a lot of money from him, I don't know how. He almost seemed to be giving it to me. We played at whist, double-dummy. You remember how excited I was, and the champagne, and the greenbacks that I showed you. Well, from that I fell into a gambling fever, and I won from L'Estrange quite a hundred pounds. Then others began to play with us, the man Barker, and a young gentleman, the son of an English nobleman. This latter lost a great deal to L'Estrange; but L'Estrange lost it to me, and I lost it to Barker. Then we began to play at American games, that I never had heard of, quick games, over in a few minutes. It went on day by day. I was always in a state of excitement. I once had five hundred pounds in my pocket. I thought I was going to make our fortunes before we got ashore. It was not for the money, Charley—I swear it was not; it was to make us both rich, so that we might send for mother and sisters without delay. I really did think that I was destined to obtain a heap of money, and all at once'—

'Poor simpleton! I interrupted. 'And did you believe that money so got could bring a blessing to us? Do you think that I would have shared in the fruit of "amblying The dore"?''

'Do not interrupt me, Charley; I loathe myself enough; ah! may you never know the awfulness of my remorse! Still, I did wish the money for all our sakes. I was not selfish; at least I am free from that. And you do not know what a fearful thing temptation is, Charley. I cannot tell you how the passion to win grew upon me; I could have sat up day and night playing incessantly. I wanted nothing to eat, drink, stimulating drink, was all I needed. Our stakes grew by degrees, until hundreds of pounds were won and lost in an-hour or two.'

'And was there nobody sufficiently manly or sufficiently moral to protest against such a scandal? I exclaimed indignantly. 'How could gentlemen witness a boy like you playing for hundreds without stopping the game?'

'Nobody knew what the stakes were but ourselves,' said Theodore earnestly. 'We played with counters, and the winnings were paid in the cabins of the players; we settled up three times a day. I was wonderfully lucky at first, and quite surprised at myself; the cards seemed to be charmed in my favour. Sometimes I lost nearly all my gains; but I always had a little left over from my first winnings to begin again,

until yesterday. My luck quite deserted me. The young Englishman had lost all his money; and another gentleman took his place, who had never played with us before. L'Estrange and I were partners; Barker and the stranger against us. Between breakfast and lunch we did pretty well; but in the afternoon, fortune went quite away from me: I rose up at dinner-time having lost two hundred pounds. I was almost frantic, for I did not know what I should do to pay. I spoke to L'Estrange, who asked me all about our affairs.'

'Did he suggest that you should take the money from my portmanteau, Theodore?' I cried, all my suspicions of the man's evil character rushing back upon me.

'No, Charley; but he said that my spell of bad luck would be over perhaps, then, and that I would be sure to win heavily next time. Besides, he said, I was bound to settle up, or he would be disgraced as my partner; so the evil spirit led me to take your money, Charley. I put off the thing as long as I could; I stood looking over the side of the ship, and a trifle would have decided me to jump overboard; and then I thought of you and home, and I grew more desperate than to commit suicide; I determined to try the cards again; so I took the keys from your pocket, finding you asleep, and I hastened back to play. But bad luck went on; I lost and lost, until I was again some hundreds to the worse. I need say no more, Charley; I have ruined you and all of us.'

The miserable boy threw himself on the floor, as if he would annihilate the memory of his sin by dashing out his brains.

I lifted him up, and strove to comfort him. My tenderness made his anguish the more poignant.

'Do not be kind to me; I can bear anything but that,' he groaned.

'Who, then, shall lead you back to better ways but me, Theodore? You have fallen, poor boy; yet you must rise again. It is a frightful decadence at the threshold of life. But we will bear it together, my brother.—And now, tell me of your quarrel. Whom did you strike?'

'Barker. I could not pay the whole of my losses. He said something insulting, and I knocked him under the table.'

'Do you owe him something still?'

'Yes, fifty pounds. But the doctor and some other gentlemen have made things pleasant again. I am sorry I lost my temper. The doctor has assured me that Barker is quite well again. L'Estrange has promised to square my debt; and he says I can pay him ~~any~~ time.'

'I am quite astounded at L'Estrange proving a friend, Theodore; I had the worst feeling against him that I have known in all my experience of men.'

'You have been altogether wrong, Charley; L'Estrange is a good fellow.'

Day had broken over the placid sea before our conversation terminated. Exhausted by so many agitations, and with leaden hearts, we fell into our berths like dying men.

I did not wake till noon. Theodore slept, or feigned to do so. I got up, and looked out of the porthole upon the dazzling waters. The weather was magnificent. I dressed quickly,

and left the cabin. I wanted to be alone, to ponder on the frightful position of our affairs. At the instant of waking, all had burst upon me afresh; but the repose had given my mind both strength and calm. In a few days we should be at New York, penniless, planless; something must be schemed before we were shot upon the quayside like human rubbish. Further, I must preoccupy Theodore's mind with the future, or the wretched boy would do further mischief. I knew how much he would suffer from the unappeasable torments of remorse, from the shattering of all his vain self-confidences, from the shame he had heaped upon himself and me.

The deck was crowded with passengers; for, with fine weather all the invalids had been brought from their cabins and placed on chairs and couches. I paid no attention to any one, but walked slowly, thinking as I had never done before, and resting against the bulwarks from time to time, when I grew faint with useless cogitation. No; I could not imagine any expedient in our case. Friendless, beggared, broken-hearted, dismayed, what *could* I do? I groined in impotent agony, and stared at the glittering sea, though I saw it not.

'Etes-vous malade, encore, monsieur?'

I started and looked down, and saw, lying on a deck-lounge, the figure of a lady. Her veil was wreathed round her face, pale as death; two dark, burning, pitying eyes were fixed upon me.

'Do you not recall me?' asked the lady, still speaking in French.

A moment I was confused, then I remembered her, and replied: 'Pardieu me, madame; I was preoccupied. I hope you are getting better. We have had rough weather.'

'You have suffered much, monsieur,' she rejoined, looking intently at me. 'What a change! Ah! the sea is terrible!'

'It is, indeed, for poor weaklings like me, madame.' A bitter sigh followed my words.

'You are still very ill,' said the lady. 'I hope the weather will be fine until we reach New York; then you will be happy. We soon forget the discomforts of ship-life when we are on shore.'

A mournful smile was my only comment. What had I to expect ashore?

'You do not agree with me?' demanded the lady with surprise.

'I agree that I prefer the land to the sea; yet the land does not always bring happiness!'

'Happiness!' exclaimed she. 'Where do we find happiness? It is a phantom, not a reality. —Were you seeking happiness in America?'

'Yes; like millions, I am going with that intent, or rather I was.' I stopped, for a sudden sob choked me.

'You have been *very* ill, monsieur. You are quite unmaned. I did not think that the strong sex suffered so much.'

The lady's voice was tender and pitying; it affected me in a surprising manner. I bent my head and turned from her in a paroxysm of grief. How long the fit of mental agony lasted, I do not know; I seemed to wake out of a dream, trembling and ashamed of the weakness I had shown. The lady was speaking to her maid. I rose

from the seat I had fallen into quite unconsciously, but I was so weak that I sank down again.

'You are seriously ill,' said the lady; 'allow my maid to bring you something.' She then spoke rapidly to her attendant, who hurried away, and soon reappeared with a glass containing some sort of restorative. I drank it gratefully, and sank into a pleasant lethargy.

The lunch-bell rang; the deck became deserted; the lady and myself were alone. Gradually strength and calm returned, and I was able to thank the kind creature. Little by little our conversation expanded, until I had told her all about my plans being annihilated by my brother's folly. She was even more agitated than myself as I related the story; and at the close she got up from her couch, and begging me to excuse her hurried departure, left me.

MUSICAL INTERLOPERS.

WHEN stationed at —, in India, I was asked to preside at the little church harmonium, and for several years I filled that pleasant post. The first instrument we had was decidedly peculiar, and it required a good deal of physical exertion and no little art to bring forth any sound. As long as the dry weather lasted, we got on pretty well; but as soon as the rains fell and damp affected its mechanism, the result was terrible to sensitive nerves.

On coming into church one day and beginning the voluntary, I discovered that more than half the notes would not come up after being struck. The result, of course, conveyed to the congregation was that I was permanently holding down several octaves of a chromatic scale! My husband was fortunately near me; and with his energetic help—picking up each note as I played it—we got through the service as best we could. Before the next Sunday, it had been repaired a little; but there was always a rather painful uncertainty that a note might not suddenly shriek out unbidden. One day I discovered, to my surprise, that the harmonium was inhabited by a mouse. It is possible that his establishment within, and the effects of his appetite on the felt and linings, may in some measure account for the surprising vagaries of the instrument. I had left my high seat and moved to a more comfortable one during the sermon, when I saw a little head with a pair of beady black eyes peeping out from under the pedals. After looking round and finding all was quiet, he sallied out, took a constitutional in the neighbourhood, and before the end of the sermon, had returned to his home. After this we used to see him nearly every Sunday.

One day, just after we had got to church, in came one of our dogs! She had been tied up when we left our house, which was about a quarter of a mile off; but guessing, probably from the sound of the bell, where we had gone, she followed us directly she was let go. The harmonium was fortunately near the door, so that she saw me the moment she came in, and being a thoroughly well-trained dog, lay perfectly still beside my chair. Of course, I was terribly anxious lest the poor mouse should appear, for Bessie, being a splendid ratter,

would without a doubt have given chase, and caused a scene. However, the little inmate of the harmonium was either 'out,' or displayed marvellous discretion. Not so a squirrel. During the sermon, one of these pretty creatures, so common in India, came in through a gap at the top of the 'chick'—a semi-transparent curtain hung in the outer doorways of all Indian houses, to keep out glare and flying insects—and proceeded to run up and down it within a few feet of us! Of course, Bessie had seen it at once; and there she sat with ears erect and straining eyes, shivering with excitement, watching its every movement. After we had endured several minutes of suspense, the unconscious object of our attention, with a whisk of the tail, jumped out through a hole in the chick, and we breathed freely once more.

About this time the Bishop of Calcutta came up to consecrate a piece of ground to be added to the cemetery—a very old one, where rest the bones of heroes who fell but long before this century. The harmonium had been taken over in a hand-cart, that I might accompany the hymns and chants. During the ceremony, the mouse stole out as usual, unconscious of the solemnity of the occasion. How he managed to get in again so as to be carried back to the church, I do not know; but there he was the following Sunday. Some months later, the new American organ arrived, and the old one, with its inmate no doubt, was sold, and we lost sight of it.

This was a harmless tenant. I heard of another and very dangerous one. A little boy we knew used to amuse himself by playing on an old harmonium. He found one day that the pedals had become very stiff, and he experienced great difficulty in working them. Soon after, a pianotuner who twice a year makes the round of all stations where he can find employment, happened to come to —; and on taking the child's instrument to pieces to examine it, found a large cobra coiled up inside—dead! It is impossible to tell what induced it to seek such a strange and, at times, noisy abode. The explanation may possibly be found in the well-known love of serpents for music.

MR CHUCKLES'S CHICKS.

• A COMEDY IN TWO ACTS.—ACT I

'A BAD one!' angrily exclaimed Mr Christopher Chuckles as he completed the chipping of his first egg at breakfast, at the same moment inhaling an aroma which strongly pointed to the conclusion that the albuminous product had been a very undesirable length of time an absentee from the nest.

'Try another, dear,' was the common-sense suggestion of the gentleman's better-half.

Her lord and master grumbly complied; but almost shouted out in his wrath when he became aware of the unpleasant fact that egg number two was just as ancient a 'shopkeeper' as its predecessor. 'I will stand this sort of thing no longer,' he exclaimed; 'it is only by the

merest chance I ever obtain eggs fit for a Christian to eat!'

'Papa, dear, how dreadful you are to be sure,' pouted pretty Mary Ellen, aged twenty-two, the sole offspring of the Chuckleses.

'Chris-topher,' remonstrated Mrs Chuckles, 'although you may have some slight grounds of complaint, I think it would be more seemly were you to restrain those violent outbursts of ill-temper.'

'Madam,' said Mr Chuckles, in his grimmest manner, 'I will not discuss with the illogical female mind the relative force of language; I had much rather discuss my breakfast—that is, of course, should I be fortunate enough to discover anything that is edible.' And the irate Chuckles proceeded with savage impetuosity to operate on egg number three, which, luckily for the further harmony of the family breakfast-table, turned out fairly satisfactory.

After a few moments had tranquilly sped their soothing course, Mr Chuckles suddenly threw himself back in his capacious chair, a radiant glow of satisfaction spreading over his by no means attenuated features.

'O mamma, dear,' gleefully ejaculated Mary Ellen, 'see how pleased papa looks! I shouldn't wonder if he were going to tell us that he will take us somewhere for a day's outing. I vote for Brighton by the express.'

Mrs Chuckles, though equally pleased with her daughter to see the 'wreathed smiles' on her husband's face, refrained from hazarding an opinion as to the probability of that worthy volunteering to escort his family upon a day's pleasure.

Mr Chuckles remained perfectly oblivious to the idea that he had roused any pleasing anticipations whatever in the minds of his wife and daughter, but, with his eyes fixed upon the ceiling, appeared to be solving a mental arithmetical question. At length he broke the silence by abruptly exclaiming: 'Yes, I'll do it!'

'Do what?' simultaneously and eagerly inquired his anticipatory auditor.

'Lay—my—own—eggs,' deliberately and with emphasis replied Mr Chuckles, the benign smile on his face giving place to an expression of calm authority.

'Really, Chris-topher,' said Mrs Chuckles in a deprecatory tone, 'how can you talk such rubbish?' whilst Mary Ellen stared in a manner that suggested a lurking doubt in that young lady's mind as to her father's sanity.

'Maria, when I announce my determination to produce my own eggs, of course, speak allegorically, and intend to convey to your intelligent mind that I merely meant to adopt such measures as shall insure for our table a regular supply of fresh-laid hens—I mean eggs. In short, my intention is to keep poultry.'

'Indeed,' was the monosyllabic remark of Mrs Chuckles, and that in a tone sufficiently icy to have frozen the cream in the jug.

'O papa,' remonstrated Mary Ellen, 'what will become of my nice flower-beds?'

'I don't know, my dear,' replied her father with callous indifference; 'most probably they will remain where they are.'

'Have you calculated the cost, Christopher

dear, of each egg when laid by one's own fowls?' asked Mrs Chuckles.

'Ah,' returned the intending poultry-farmer, 'I was expecting that question; it is a regular stock one, always trotted out with the intention of crushing the party to whom it is propounded. But I am not going to be crushed by it. You must be aware, Maria, that I have many acquaintances in the grain-trade; therefore, I see no difficulty in being able to procure at the merest trifle of cost, if any at all, the quantity of corn they will be expected to consume. Samples, samples, Maria!' and the wily schemer indulged in a quiet little laugh, and rubbed his hands together with subdued ecstasy. 'And,' he continued, 'when the birds have ceased to furnish the breakfast-table with the nourishing egg, we can make them serve us yet another turn by introducing them into the interior of a pie-dish. Chicken-pie, eh, Maria?'

'Chicken-pie!' exclaimed Mary Ellen, in a tone of voice not altogether devoid of incredulity.

'Ostrich-pie,' suggested Mrs Chuckles, 'would perhaps be a more appropriate name for the dish you have in view.'

'Maria, Mary Ellen, despite your covert sneers,' exclaimed the irritated Chuckles, 'I am fully determined to become a proprietor of cochinchinas!'

At this moment a diversion to the family controversy was caused by the loud ringing of the street-door bell.

'The postman,' confidently predicted Mary Ellen.

'Ah!' said her father, 'I very much suspect you are anticipating the arrival of a letter from that jackanapes Frank Featherwell. But let me tell you this, once and for all, that that individual will not suit me for a son-in-law.'

'O papa, everybody says that Frank—I mean Mr Featherwell, is—a nice young man; and I—I'—'Love him,' we suppose she was going to add, but the poor girl broke down, and sobs stopped her further speech.

'Dear, dear!' sympathisingly exclaimed Mrs Chuckles, 'see how you are distressing the poor child, Christopher; and I am sure you have no occasion to be so imbittered against Mr Featherwell, who, I am quite certain, is a most genteel person.'

'And pray, madam, how much per annum does he make by his gentility?' asked Mr Chuckles, as though he were propounding a conundrum which he well knew would be difficult to answer satisfactorily.

Before Mrs Chuckles could make a reply—that is, assuming she had one ready—Tiddlewinks, the 'buttons' attached to the Chuckleses' household, entered the room with a letter which had just been delivered by the postman. It was for Mr Chuckles; and that worthy, after carelessly glancing at the superscription, laid it conveniently to hand on the table, and then commenced the perusal of his morning paper, which had hitherto remained untouched.

Whilst his master was thus preoccupied, the page, who had been standing all the time with his right hand behind his back, commenced to make rapid signs to the fair Mary Ellen in order to draw her attention; and that quick-witted young lady was by no means slow in guessing

that Tiddlewinks was desirous of opening private communications with her. The youth, after having thus 'caught her eye,' brought, by a well-executed rapid flank movement, his dexter hand into close proximity to the plump little palm of his young mistress, who rapidly transferred the letter held by the strategical Tiddlewinks, into her dress pocket, and by a nod, dismissed the buttoned Mercury.

'Now,' said Mr Chuckles, at length laying down his paper—'now for this letter.' He deliberately cut open the envelope, and then, running his eyes over the pages till he came to the signature, gave a low whistle, which of course at once aroused the curiosity of his wife and daughter.

'Who is it from, pa?' inquired Mary Ellen.

'From?' echoed Mr Chuckles. 'Why, it's from that—that—impudent young Frank Featherwell. Just listen to what he says, or rather, writes. "MY DEAR MR CHUCKLES. Know how fond you are of new-fangled eggs, and of the same time being fully alive to the difficulties which beset your path in procuring them in a fresh state, I have taken the liberty to send you a little present in the shape of a few choice specimens of cochinchina fowls, which will amply repay you for the food and attention bestowed upon them, by supplying you liberally with the requisite edible.—Trusting the hamper of birds will arrive all right and safe, I am, my dear sir, yours faithfully,

FRANK FEATHERWELL."

I am sure it is very kind of the young man,' said Mrs Chuckles approvingly.

'And only to think, papa, he should have sent you the dear chuckies just at the very moment you had made up your mind to have some! What a coincidence!'

'Well,' returned Mr Chuckles, 'I can't say that I am struck all of a heap at this display of generosity on the part of your admirer; I simply regard it as a mere attempt to gain my approval to his paying his addresses to my only daughter, in order that he may receive her hand—ay, and her fortune.'

'I am quite certain, Christopher,' remarked Mrs Chuckles with some degree of warmth, 'that Mr Featherwell is not in any way influenced by considerations of a mercenary nature with regard to dear Mary Ellen. But there, you always were so suspicious of your fellow-creatures.'

'Suspicious, madam! Certainly, because I have found it pay the best in the long-run, never to credit any one with doing anything disinterestedly,' retorted Mr Chuckles oracularly. '—But here's a postscript to the letter. What is it?—"I must beg of you, to be wary of the old one, because, though a splendid bird, he is somewhat given to pecking."—Oh, that's its little peculiarity, is it!' exclaimed Mr Chuckles, folding up his letter. 'I fancy I shall be careful of the ancient biped.'

'But, papa, perhaps the word "pecking" refers to its capacity, for consuming barley,' suggested Mary Ellen.

'Nonsense, my dear,' replied her father. 'Depend upon it, the caution applies to the fowl's predilection for the calves of human legs.'

Here, Tiddlewinks made his reappearance at

the door, his agitated countenance indicating the opposite of a calm state of mind.

'Now, what is the matter?' asked Mr Chuckles.

'Ple-e-se, sir, it ain't my fault, sir,' stammered the hapless youth.

'What is not your fault?'

'Why, sir, please, sir, the cove, the party as has brought the hamper of chickens, sir, he's down-stairs, sir;' and, as though in corroboration of the page's assertion, the shrill crowing of a cockerel penetrated the breakfast parlour with ear-splitting distinctness.

'There he goes, sir,' remarked Tiddlewinks.

'Ah, the cochins—just so,' observed Mr Chuckles briskly.

'How my poor head will suffer in the morning!' said Mrs Chuckles ruefully.

'Take the hamper into the garden, Tiddlewinks,' directed Mr Chuckles.

'Yes, sir; but it ain't my fault that there's seven and sixpence to pay, sir; and the man won't leave the hamper till he's got the money, sir. He's a-setting down on the basket, sir.'

'Seven and sixpence to pay for carriage!' indignantly exclaimed Mr Chuckles. 'I mean to say, when one party sends a present to another party, the cost of conveyance should be defrayed by the sender—Tiddlewinks, proceed; I will follow, and endeavour to obtain a reduction on this demand.'

'Dear me,' said Mrs Chuckles to Mary Ellen, as the door closed upon her husband, 'how violent Christopher is. I am very much afraid he will never give his consent to your marriage with Mr Featherwell.'

'Then I will marry dear Frank without papa's consent,' retorted Mary Ellen spiritedly, 'perhaps sooner than you imagine, ma dear.'

'I really cannot say I am much pleased with Frank for sending those noisy fowl,' remarked Mr Chuckles.

'Maanma, I feel quite certain that dear Frank had some special motive in view, when he sent them,' returned Mary Ellen cheerfully.

'Perhaps he had, my dear; but I think it would have been wiser on his part had he paid the carriage,' replied Mrs Chuckles, rising from her seat and going towards the door.

The moment her mother left the room, Mary Ellen impatiently drew her letter from her pocket, and tore open the envelope with nervous haste, and commenced rapidly to peruse the contents. 'Exactly as I thought!' she murmured, a mischievous look twinkling in her eyes. Thus ran the letter:

'MY OWN DEAREST!—This note will be only a short one, but, I trust, most to the purpose. I have sent your estimable, but, may I say, cantankerous papa a present of a few chickens. You will probably, darling, wonder why I have done so. Of course, I have told him that I send the chickens in order that he may be well supplied with new-laid eggs. Well, I am afraid that is not exactly the sole motive I have in view.—Now for the plot, the conspiracy, the blow-up! Do not scream, and oh, do not faint, or all will be lost! You and me, dearest, will, I hope—according to arrangements which are now completed—be married to-day, and by the aid of the chunky chucks! Now, follow my

instructions carefully, and all will go well. *Let the poultry escape from the hamper into the garden (near the wall). I shall be there at the right moment.*—Yours devotedly and conspiringly,
FRANK FEATHERWELL.

'P.S.—The hamper was off before I remembered that I had omitted to pay the carriage. How very stupid of me!'

'Well, I never!' was the truly feminine exclamation which fell from Mary Ellen's pretty lips, as she came to the conclusion of the epistle. 'It is so like dear Frank to concoct some wild scheme or other, and although I half expected it, it does seem rather sudden.'

At this moment Mr Chuckles entered the room, and Mary Ellen hastily crushed back the letter into her pocket.

'Oh, you're here, are you?' commenced Mr Chuckles. 'Your Mr Frank Featherwell is a pretty specimen of his sex, I must say.'

'I am glad, papa, that you think he is nice-looking,' demurely replied Mary Ellen.

'Don't bandy words with me, miss,' fumed papa. 'I've had to pay the whole seven shillings and sixpence for carriage on these precious fowls!'

'Well, papa, I daresay the pretty little chicks are worth much more than that.'

'Pretty little chicks indeed!' echoed Mr Chuckles sarcastically. 'Why, the old bird who is given to pecking has already entered upon his profligate career by inflicting a severe wound in my trousers' leg; I should like to wring his ancient neck!'

'Where are the poor things now?' asked Mary Ellen.

'In the garden, to be sure,' growled the incipient chicken-famer.

'Then,' said Mary Ellen to herself, 'I can carry out dear Frank's wish very nicely,' and she tripped in the most innocent manner through the glass doors and down the steps leading into the garden, as though the word conspiracy was utterly unknown in her vocabulary.

'That boy Tiddlewinks,' mused Mr Chuckles, 'is sharper than I gave him credit for being. It was very thoughtful of him to suggest that the lid of the hamper ought to be more securely fastened down; because, should the birds succeed in escaping from their confinement before I have got ready a suitable place for their permanent abode, awkward results might follow, especially if the cochins were to invade the well-kept garden of my next-door neighbour, the fiery Major Ironlungs. I think it would be wise on my part were I personally to superintend the tying-down operation.' And Mr Chuckles left the room with the intention of carrying out his idea.

When Mary Ellen reached the bottom of the garden, she was not long in discovering the whereabouts of the hamper of poultry. After carefully assuring herself that she was unobserved, the wicked young lady drew from her pocket a pair of bright, sharp-looking scissors, and deliberately commenced to cut through the cord which secured the lid of the basket. Just at the moment she was giving the finishing touch—or rather cut—to her mischievous work, she heard her name pronounced in a low but very distinct tone, and looking up on the instant, she encountered the gaze of her enamoured one, who

was looking at her over the wall which separated the garden from the back lane.

'O Frank!' exclaimed Mary Ellen, 'how you *did* startle me, to be sure!'

'Was it a frightened little birdie then?' said Frank, in mocking tones. 'But,' he continued more seriously, 'of course you got my letter all right? Come close up to the wall and "lend me thine ears," as the man says in the play.'

Mary Ellen dutifully obeyed her lover, but found the wall a trifle too high to enable her to easily carry out Frank's desire as regards her auricular organs without a good deal of standing on tiptoe and craning her neck upwards, which exercise caused her ruby lips to come so close to those belonging to the adored one at the other side of the prosaic bricks and mortar, that the result was a sound of an unmistakably osculatory character.

'Everything,' whispered Frank, 'is going on swimmingly, so, darling, you must meet me in an hour at the church door. I've got the ring, license, witnesses, old woman, pew-opener, little boys to cheer, and crowd to gaze upon and admire the lovely bride.'

'Do not be absurd, sir,' said Mary Ellen, blushing. 'But do you think it quite safe?' she continued hesitatingly.

'Safe? Safe as—houses, my precious, nervous little goose.' Again came the osculatory sound.

'Oh, dear Frank, how sudden and terrible it does seem!'

'Fearful, is it not?' observed the hardened wretch.

'But—but Frank, dear, you have not yet told me why I am to allow the chickens to escape from the hamper.'

'Simply a piece of strategy, worthy, I think, my dear, of the hero of Tel-el-Kebir. There is the hamper. When the lid has been unfastened, you will raise it, and then—'

'Well, what then, sir?'

'Why, then, if I am not very much mistaken, the sagacious cochins will at once avail themselves of the glorious opportunity presented to secure their freedom; and when their respected owner discovers them taking surveys of his land, he will use his best endeavours to lure back the exploring poultry into their deserted prison-house. Of course, the wise birds will respectfully but firmly decline the invitation, and then—' Don't you see, my pet?'

'I think I do,' responded the pet, with a merry twinkle in her eyes.

'Of course!' ejaculated her lover. 'While the exciting chase is proceeding, and all is glorious confusion, a certain young lady I know will quietly put on her hat and cloak and speed with fairy footsteps to the beautiful ecclesiastical edifice round the corner. No one will miss her; the entire household will be engaged in the praiseworthy (but trying) attempt to induce erratic poultry to travel the way they do not wish. In the meantime, Miss Mary Ellen Chuckles has been transformed into Mrs Frank Featherwell. Only think, dearest!'

On hearing this, the expectant bride could do nothing more becoming than earnestly inspect the points of her tiny boots and blush bewitchingly.

'And now,' said Frank, consulting his watch, 'time flies; so must the chickens. You must do the deed.'

The deed was done; Frank disappeared, and Mary Ellen fled indoors to her own room.

INTERESTING DISCOVERY IN CANTERBURY CATHEDRAL.

A small portion of the crypt of Canterbury Cathedral, set apart by order of Queen Elizabeth, and fitted up as a church for the use of the French Protestants, has been held by them to this day. For the purpose of repair, it recently became necessary to remove a portion of the floor of this little church and make certain excavations. Very soon a large number of pieces of exquisitely carved and moulded stonework were brought to light, which once, without doubt, formed parts of an elaborately executed shrine. They are coloured blue, vermillion, and gold, and are finely wrought in the style of the middle of the fourteenth century. Many of the pieces are carved canopy-work, very delicately executed, clearly showing that there were many such niches surrounding what must have been a splendid work of art. A small piece of a sculptured robe was found belonging to an ecclesiastical figure life-size, and in this a single pearl remains imbedded as one of the ornaments of the robe, showing how rich and elaborate the monument must have been in the days of its glory. From a careful inspection of these fragments, it is believed they agree in character with the remains known as the shrine of St Dunstan, situated on the south side of the choir.

MY LOST LOVE.

WERE we but sure that he who won my Sweet

Would wear her noly as the purest flower

That ever blossomed at his careless feet,

The idle fancy of an idler hour

Had we assurance that the coming years

Would bring no clouding to the bridal sky,

That gentlest eyes would be undimmed by tears,

We would be satisfied, my heart and I.

Will he remember when the roses bloom,

That every morning found them at her door?

The Child perhaps would wonder were the room

Less bright with roses than it was before.

Will he be tender when the autumn leaves

Bring wistful memories that pass him by?

Sad memories for which my dear one grieves,

And only we shall know, my heart and I.

If the dear Christ, in tenderness divine,

And pity for this consecrated pain,

Would cause His sun all blessedly to shine

Upon her pathway—upon mine, the rain:

If by our sorrowing our love might take

Her faintest weariness or softest sigh,

And bear it thankfully for her sweet sake,

We would be well content, my heart and I.

A MODERN ARCADIA.

In the Indian Ocean, some six hundred miles from the coast of Sumatra, there is one of those curious circular lagoon-islands of which one reads in stories of the South Seas. They are called atolls, and they confine a space of clear smooth water, while the surf breaks heavily on the outer or ocean side. In the case of the one to which we now refer, there is, on the northern side of the ring, an opening through which vessels can pass to a secure anchorage within. This ringlet of coral-land is sometimes called the Cocos, and sometimes the Keeling Islands. Little known to travellers and navigators, it is still less known to ordinary readers, even to those tolerably well acquainted with books of travel. But it possesses a history and natural characteristics which render it eminently worth a little attention.

Fifty years ago, Darwin visited the lagoon in the *Beagle*, and was struck with its peculiarity. 'The shallow, clear, and still water of the lagoon,' he wrote, 'resting in its greater part on white sand, is, when illuminated by a vertical sun, of the most vivid green. This brilliant expanse, several miles in width, is on all sides divided, either by a line of snow-white breakers from the dark heaving waters of the ocean, or from the blue vault of heaven by the strips of land, crowned by the level tops of the cocoa-nut trees. As a white cloud here and there affords a pleasing contrast with the azure sky, so in the lagoon, bands of living coral darken the emerald green water. . . . On Direction Island, the strip of dry land is only a few hundred yards in width; on the lagoon side, there is a white calcareous beach; and on the outer coast, a solid broad flat of coral-rock, served to break the violence of the open sea. Excepting near the lagoon, where there is some sand, the land is entirely composed of rounded fragments of coral. In such a loose, dry, stony soil, the climate of the intertropical region alone could produce a vigorous vegetation. On some of the

smaller islets, nothing could be more elegant than the manner in which the young and full-grown cocoa-nut trees, without destroying each other's symmetry, were mingled into one wood. A beach of glittering white sand formed a border to these fairy spots.'

On this veritable fairy-ring, thrown up in mid-ocean, and basking alone in a wilderness of waters, Darwin applied himself to the study of coral formations, and evolved his theory of barrier-reefs. But the Keeling Islands have a deeper human interest, which we propose to evolve with the assistance of Mr H. O. Forbes, who has done so much for the cause of natural science in his wanderings in the Eastern Archipelago, and who is now about to penetrate the mysteries of the dark island of Papua.

It was in 1836 that Darwin visited the Cocos-Keeling Islands; and it was not until 1878 that Mr Forbes found his way thither from Batavia, the capital of Java, where he was botanising. The chance of a passage in a small sailing craft was eagerly seized; and after fourteen days of stormy combat with the monsoon in the Straits of Sunda, and sixteen days of baffling calms on the bosom of the Indian Ocean, the islands were at length reached. In the darkness of the night the little vessel crept cautiously through the narrow entrance into the safe anchorage of the lagoon, lighted only by the phosphorescence of countless shoals of fishes, which darted like rockets below the keel. The dawn revealed the extent of the island-lark, inclosed as by a palisade of palm-trees on a narrow ribbon of land, and the first feeling was one of astonishment that what appeared such a tiny speck in the huge waste of waters, should be able to hold its own against the mighty assaults of the ocean.

In a very short time Mr Forbes was carried off with delight by the monarch of the reef, and installed with honour in his hospitable abode, as the first European since Darwin who had of deliberate purpose visited the spot. And there he learned the strange history of the little community.

Among the many Scottish families wrecked in the Jacobite troubles of the '45' was one named Ross. A descendant of the family 'took to the sea,' and in the happier days in the first quarter of the present century, attained the command of one of the vessels stationed in the Java sea for the protection of British interests. At the close of 1825, this Captain Ross chanced upon the Keeling Islands, and struck with the advantage of their situation for the repair and provisioning of vessels voyaging to and from China, India, and Australia, took possession of the group. He went to England, and returned in 1827, to settle permanently, accompanied by his wife and six children, twelve Englishmen, one Javanese, and one Portuguese. But on landing, he found an interloper in possession of a third part of the group. This was an Englishman, named Alexander Hare, who had once held an official post in Borneo, which he had to leave on the re-instatement of the Dutch. In Borneo, Hare had assumed the state of an independent ruler, and driven from thence, sought some unoccupied spot where he could re-assume the rôle. He pitched on Keeling, and took thither a large harem of diverse nationality, and a great retinue of slaves, whom he browbeat and treated generally in the orthodox oriental manner. He had accumulated a considerable fortune, and Ross found him living an indolent sensuous life in mock-regal style.

From the first, Hare exhibited great hostility to Captain Ross and his party, and the enterprising Scotchman found himself in considerable difficulty. He had drawn together his party on the understanding that the islands were his own, that there would be ample room for all, and that there would be no opposition in the developments of the resources. Finding a usurper in possession of one-third of the promised land, he could only offer to release his followers from their bargain. All but three—two men and a woman—accepted the release, and departed by a gunboat which happened to touch at the islands shortly after. Thus left with but three supporters besides his own family, the Scotchman's position was not enviable; but he did not lose heart. In time, he induced seven or eight persons to come to him from Java; and by-and-by a few Europeans, some being his own relatives, augmented the little settlement. Then he hired coolies in Batavia, and began a steady and lucrative trade in cocoa-nuts with Mauritius, Madras, Bencoolen, and various parts of the archipelago.

In the meantime, he was constantly annoyed and opposed by his neighbour Hare, who even tried to induce the officials at Batavia to come and forcibly annex the place to Holland. This attempt was unsuccessful, as was also that of Ross to induce the authorities at Mauritius to assume its protectorate. After this, Ross made direct application to King William to allow the atoll to be proclaimed British territory; but in this also he was unsuccessful. Finally, the vagabond Hare, tired of the idle life, vacated the place, and went to Singapore, where he died immediately afterwards. Mr Ross, thus left in undisturbed possession, soon became known in the archipelago as the King of the Cocos Islands.

It was while the settlement was in a state of transition, just after Hare had left, and while

Mr Ross was absent on business, that Darwin visited it, and formed a not very favourable opinion of its condition. But since then, a wonderful change has come over it, and when Mr Forbes paid his visit, the colony was prosperous and happy; for, with the assistance of his eldest son, Mr Ross soon brought about a perfect state of organisation. He had two villages built, one for the hired coolies, and the other for the European and other true colonists. He also built and acquired quite a fleet of vessels for the carrying on of the trade. That trade was almost uniformly prosperous, and left a handsome balance over year by year.

The great trouble was with the hired coolies. These had to be brought from Java, and had to be engaged for a term of years, the only ones who could be got being criminals who had served out their time in the chain-gangs of Batavia; that is to say, the worst and most dangerous class one could have anything to do with. As they far outnumbered the colonists, their presence was a constant menace and anxiety; but they could not be done without. A regular system of guard was therefore established, and watches were kept all night with military rigour and precision, the changes being marked at on board ship by the stroke of a bell.

The great dread was of incendiarism; for a fire would have destroyed not only the combustible dwellings, but also the new palm trees themselves, which formed the wealth of the community. The colony was isolated on Home Island, and it was ordained penal for any one to spend the night elsewhere. Every boat was numbered, and had to be hauled into its place an hour before sunset. At nightfall, the roll was called; any absences were at once noted, and a search perfectly made for them. Yet, notwithstanding this, the time-stained coolies would still occasionally manage to escape on to the other islets, and keep the settlement in suspense for weeks; or would run riot through the village and endanger the lives of all. But in time the chain-gang men were all got rid of, and a change in the laws of Batavia enabled the Rosses to select their own coolies. They took care to engage only those of the best character.

The present Monarch of Keeling is the grandson of the original proprietor. He was educated at home, and was, in fact, studying engineering in Glasgow, when the news of a great disaster summoned him to the assistance of his father. A terrible cyclone had broken on the group and completely wrecked the settlement. In the midst of the distress, the father died; and young Ross was left alone to grapple with misfortune and revive the broken spirit of the colony. This was in 1862; and now the place bears evidence of his energy and talent for administration.

He cleared away the unprofitable forest, planted the ground with palms, imported machinery, and set up steam-mills and smithies, and established a school, under the charge of a younger brother, who had been educated at a Scottish university. His wife, who was born in the islands, shared all his ideas and interests; and the two, says Mr Forbes, 'became the parents of the people, rather than their masters and rulers.'

The ordinary work of all is in gathering the nuts and preparing the oil—which are sent to Batavia, and there exchanged for grain and other necessities which the islanders cannot produce for themselves. But besides his ordinary duties, every man has to learn to work in wood, iron, and brass; and every girl has to undergo in Mrs Ross's house an apprenticeship in sewing, cooking, and other domestic arts of the European pattern. It will interest our lady readers to learn that Mr Forbes declares he never met with more perfectly trained servants anywhere.

In this modern Arcadia there is no money to tempt men to jobbery. The satanic glamour of gold is not allowed to sully the purity and tranquillity of the little community; and if silver exists at all, it is but in the shape of a few trifling ornaments. Instead of money, Mr Ross has devised a currency of sheep-skin notes signed by himself. Wages and imports are alike paid for in these notes, which can only be exchanged for Dutch money on presentation to Mr Ross's agent in Batavia. It is obviously useless to steal these notes, because any vessel by which the thief could reach Batavia would also carry instructions to the agent to refuse payment of them.

Each family has a comfortably furnished plank-built house inclosed in a little garden, and each has one or more boats carefully housed in a shed by the water's side. These boats are their pride and delight, and the constant source of a friendly emulation in respect of speed or elegance of shape or superiority of finish. The people are as much at home on the sea as on the land, and thus the boats are almost as important to them as the houses.

The village where the hired coolies live is apart. It is well and neatly kept, the dwellings are comfortable, and the people are treated kindly and liberally. In the event of the death of a head of a family, the children are either sent back to the father's native place, or allowed to remain and become Cocos people, according as the widow may elect.

Midway between the villages—the language spoken in both of which is Malay, although English is understood by most of the Cocos people—is the house of Mr Ross. It is large, comfortable, and surrounded by a high wall, inclosing a large garden, luxuriant with fruit-trees, flowering shrubs, and roses. Here lives the proprietor with his family; and here also are accommodated several of his brothers, associated with him in the management of the community.

The relations between 'The House' and the Cocos village, we are told, are of the most cordial and affectionate character, and constant evidence of it came before the notice of Mr Forbes while residing among them. A death of any member of the colony is felt by all as a family loss. Says Mr Forbes: 'That in their relations one with another there should be perfection, is not to be expected; but a finer and more upright community I have never known, nor a simpler or more guileless people—many of whom have never known and never seen a world wider than their own atoll, which can be surveyed in a single glance of the eye; and I feel more than half confident that the English service for the dead has been said over, and that beneath the coral shingle of

Grave Islet there rest, as blameless lives as perhaps our weak humanity can attain to.'

But it is not free from its share in the troubles which are the lot of humanity, and it has some peculiarly its own. We have spoken of one terrible disaster in the time of Ross the Second. Another occurred during the reign of Ross the Third. Towards the end of January 1876—when the population of the islands numbered some five hundred native-born—an abnormal fall in the barometer indicated some great atmospheric disturbance. On the 28th it fell to twenty-eight inches, and the boats were all hauled up into a place of safety. The same afternoon a dark bank of clouds appeared in the western sky, and before evening the cyclone burst. Every house in both villages was swept away; the storehouses and mills, just completed, were dismantled and gutted; great patches of tree were thrown down or carried away entirely; and a great wave carried a ship bodily on to the spot where Ross's house had stood. The only shelter was to be found in hollows of the ground, and there the people crouched, everything having an elevation of over a foot or two being swept away or blown down.

When the morning broke calm and clear, not a speck of green was to be seen on the whole circle of the islets, and the solid coral was broken into fragments on the beach. Thirty-six hours later, the water of the eastern side of the lagoon began to rise and to show a peculiar dark colour. The inky liquid had the smell of rotten eggs, and it continued to spread for fourteen days, until it had extended almost quite round the lagoon. Many fish in the waters impregnated with this liquid died in a few hours, and so great was the quantity of poisoned fish thrown upon the beach, that it took three weeks of hard work to bury them. Then the densely stream gradually passed away. It is supposed to have issued from some submarine volcano, an eruption of which had caused the frightful tidal wave that submerged the settlement.

In six months, however, tree and shrub were clothed in verdure again; and before the end of three years, fruit was being yielded in as great abundance as before. Such is the recuperative force of nature in these latitudes! When Mr Forbes visited the islands only two years after, the traces of the disaster were rapidly disappearing, and the whole settlement seemed the ideal of a peaceful and happy colony.

Since Mr Darwin's visit half a century ago, not only has the physical configuration altered, but the flora and fauna have multiplied greatly. Mr Forbes gives many interesting notes on these subjects, which, however, are not available for the present article.

Both Darwin and Forbes were struck with the wonderful provision of nature in the case of the *Burgus latro*, or great cocoa-nut crab. This is one of the largest of the species of land-crabs, and it feeds almost exclusively on cocoa-nuts, for which purpose its pincer-claws are developed to extraordinary power, capable of breaking a cocoa-nut shell or a man's limb. Although it climbs the trees, it does not pull the fruit, but feeds upon what falls to the ground. With its great claws, it tears off the husk from the nut, and then selecting the one of the three

eye-spots which is always the more easily pierced, probes it with one of its legs. Inserting the leg, it rotates the nut until the orifice is large enough to permit the insertion of its great claws to break up the shell and extract the contents with comfort. Feeding on such nutritious diet, the *Birgus* accumulates a great deal of rich fat, which yields sometimes as much as two pints of oil. This oil, thickened in the sun, forms an excellent substitute for butter, and is also a most excellent anti-corrosive.

Another interesting denizen of the Keelings is the pure white tern (*Gygis canaliculata*), which is to the settlers as the swallow is to us. Most curious are its domestic arrangements. It builds no nest; but the female will deposit her solitary egg upon the extended leaf of a young coconut palm. There it rests securely amid the twisting and heaving of the leaves in the wind, and while the leaf, as in all palms, droops steadily downward to its fall. The process is often watched with keen attention by the settlers, who will sometimes good-humouredly bet on the probabilities, when they see a tern sitting on a rapidly withering leaf. But we are told that the betting is always in favour of the bird; if the leaf falls in the afternoon, the young bird will have emerged from the egg in the morning!

But we have not space to dwell on all the wonderful varieties of vegetable, animal, and marine life of this remarkable lagoon-island. We have said enough to show that Mr Forbes is right in disputing the universal applicability of Dana's statement, that 'nowhere in the world are all the products and all the attractions of a good land, even in its best condition, it is but a miserable place for human development, physical, mental, or moral.' In the Keeling atoll, on the contrary, we find a healthy, happy, contented, prosperous, and singularly moral people, living a life of continuous industry, untroubled by the turmoil of the outer world, undisturbed by political discussions, and unsullied by avarice. Here, indeed, is a prosperous patriarchal State, an actual Modern Arcadia.

A HOUSE DIVIDED AGAINST ITSELF.

CHAPTER XXXIII.

LADY MARKHAM received young Gaunt with the most gracious kindness: had his mother seen him seated in the drawing-room at Eaton Square, with Frances hovering about him full of pleasure and questions, and her mother insisting that he should stay to luncheon, and Markham's hansom just drawing up at the door, she would have thought her boy on the highway to fortune. The sweetness of the two ladies, the happy eagerness of Frances, and Lady Markham's grace and graciousness, had a soothing effect upon the young man. He had been unwilling to come, as he was unwilling to go anywhere at this crisis of his life; but it soothed him, and filled him with a sort of painful and bitter pleasure to be thus surrounded by all that was most familiar to Constance, by her mother and sister, and all their questions about her. These questions, indeed, it was hard upon him to be obliged to answer; but yet that

pain was the best thing that now remained to him, he said to himself. To hear her name, and all those allusions to her, to be in the rooms where she had spent her life—all this gave food to his longing fancy, and wrung, yet soothed, his heart.

'My dear, you will worry Captain Gaunt with your questions; and I don't know those good people, Tassie and the rest; you must let me have my turn now.—Tell me about my daughter, Captain Gaunt. She is not a very good correspondent. She gives few details of her life; and it must be so very different from life here. Does she seem to enjoy herself? Is she happy and bright? I have longed so much to see some one, impartial, whom I could ask.'

'Impartial! If they only knew! She is always bright,' he said with a suppressed passion, the meaning of which Frances divined suddenly, almost with a cry, with a start and thrill of sudden certainty, which took away her breath. 'But for happy, I cannot tell. It is not good enough for her, out there.'

'No?—Thank you, Captain Gaunt, for appreciating my child. I was afraid it was not much of a sphere for her.—What company has she?—Is there anything going on?—'

'Mamma,' said Frances, 'I told you—there is nothing going on.'

The young soldier shook his head. 'There is no society—except the Durants—and ourselves—who are not interesting,' he said, with a somewhat ghostly smile.

'The Durants are the clergyman's family?—and yourselves. I think she might have been worse off—I am sure Mrs Gaunt has been kind to my wayward girl,' she said, looking him in the face with that charming smile.

'Kind!?' he cried, as if the word were a profanation. 'My mother is too happy to do—anything.—But Miss Waring,' he added with a feeble smile, 'has little need of—any one. She has so many resources—she is so far above!—'

He got marbled here, and stumbled in his speech, growing very red. Frances watched him under her eyelids with a curious sensation of pain. He was very much in earnest, very sad, yet transported out of his languor and misery by Constance's name. Now, Frances had heard of George Gaunt for years, and had unconsciously allowed her thoughts to dwell upon him, as has been mentioned in another part of this history. His arrival, had it not happened in the midst of other excitements which preoccupied her, would have been one of the greatest excitements she had ever known. She remembered now that when it did happen, there had been a faint almost imperceptible touch of disappointment in it, in the fact that his whole attention was given to Constance, and that for herself, Frances, he had no eyes. But in the moment of seeing him again, she had forgotten all that, and had gone back to her previous prepossession in his favour, and his mother's certainty that Frances and her George would be 'great friends.'—Now, she understood with instant divination the whole course of affairs. He had given his heart to Constance, and she had not prized the gift. The discovery gave her an acute yet vague (if that could be) impression

of pain. It was she, not Constance, that had been prepossessed in his favour. Had Constance not been there, no doubt she would have been thrown much into the society of George Gaunt—and—who could tell what might have happened? All this came before her like the sudden opening of a landscape hid by fog and mists. Her eyes swept over it, and then it was gone. And this was what never had been, and never would be.

'Poor Con,' said Lady Markham. 'She never was thrown on her own resources before.—Has she so many of them? It must be a curiously altered life for her, when she has to fall back upon what you call her resources.—But you think she is happy?' she asked with a sigh.

How could he answer? The mere fact that she was Constance, seemed to Gaunt a sort of paradise. If she could make him happy by a look or a word, by permitting him to be near her, how was it possible that being herself, she could be otherwise than blessed? He was well enough aware that there was a flaw in his logic somewhere, but his mind was not strong enough to perceive where that flaw was.

Markham came in in time to save him from the difficulty of an answer. Markham did not recollect the young man, whom he had only seen once; but he hailed him with great friendliness, and began to inquire into his occupations and engagements. 'If you have nothing better to do, you must come and dine with me at my club,' he said in the kindest way, for which Frances was very grateful to her brother. And young Gaunt for his part began to gather himself together a little. The presence of a man roused him. There is something, no doubt, seductive and relaxing in the fact of being surrounded by sympathetic women, ready to divine and to console. He had not braced himself to bear the pain of their questions; but somehow, had felt a certain luxury in letting his despondency, his languor, and dis-pleas-ure with life appear. 'I have to be here,' he had said to them, 'to see people, I believe.' My father thinks it necessary; and I must not stay; that is, my people are leaving Bordighera. It becomes too hot to hold one—they say.'

'But you would not feel that, coming from India?'

'I came to get braced up,' he said with a smile, as of self-ridicule, and made a little pause. 'I have not succeeded very well in that,' he added presently. 'They think England will do me more good. I go back to India in a year; so that, if I can be braced up, I should not lose any time.'

'You should go to Scotland, Captain Gaunt. I don't mean at once, but as soon as you are tired of the season—that is the place to brace you up—or to Switzerland, if you like that better.'

'I do not much care,' he had said with another melancholy smile, 'where I go.'

The ladies tried every way they could think of to console him, to give him a warmer interest in his life. They told him that when he was feeling stronger, his spirits would come back. 'I know how one runs down when one feels out of sorts,' Lady Markham said. 'You must let us try to amuse you a little, Captain Gaunt.'

But when Markham came in, this softness

came to an end. George Gaunt picked himself up, and tried to look like a man of the world. He had to see some one at the Horse Guards; and he had some relations to call upon; but he would be very glad, he said, to dine with Lord Markham. It surprised Frances that her mother did not appear to look with any pleasure on this engagement. She even interposed in a way which was marked. 'Don't you think, Markham, it would be better if Captain Gaunt and you dined with me?' Frances is not half satisfied. She has not asked half her questions. She has the first right to an old friend.'

'Gaunt is not going away to-morrow,' said Markham. 'Besides, if he's out of sorts, he wants amusing, don't you see?'

'And we are not capable of doing that.—Frances, do you hear?'

'Very capable, in your way. But for a man, when he's low, ladies are dangerous—that's my opinion, and I've a good deal of experience.'

'Of low spirits, Markham!'

'No, but of ladies,' he said with a chuckle. 'I shall take him somewhere afterwards; to the play perhaps, or—somewhere amusing; whereas you would talk to him all night, and Pau would ask him questions, and keep him on the same level.'

Lady Markham made a reply which to Frances sounded very strange. She said: 'To the play—perhaps?' in a doubtful tone, looking at her son. Gaunt had been sitting looking on in the embarrassed and helpless way in which a man naturally regards a discussion over his own body as it were, particularly if it is a conflict of kindness, and, glad to be delivered from this friendly duel, turned to Frances with some observation, taking up heed of Lady Markham's remark. But Frances heard it with a confused premonition which she could not understand. She could not understand, and yet— She saw Markham shrug his shoulders in reply; there was a slight colour upon his face, which ordinarily knew none. What did they both mean?

But how elated would Mrs Gaunt have been, how pleased the general, had they seen their son at Lady Markham's luncheon-table in the midst, so to speak, of the first society! Sir Thomas came in to lunch, as he had a way of doing; and so did a gay young Guardsman, who was indeed naturally a little contemptuous of a man in the line, yet civil to Markham's friend. These simple old people would have thought their George on the way to every advancement, and believed even the heart-break which had procured him that honour well compensated. These were far from his own sentiments; yet, to feel himself thus warmly received by 'her people,' the object of so much kindness, which his deluded heart whispered must surely, surely, whatever she might intend, have been suggested at least by something she had said of him, was balm and healing to his wounds. He looked at her mother—and indeed Lady Markham was noted for her graciousness, and for looking as if she meant to be the motherly friend of all who approached her—with a sort of adoration. To be the mother of Constance, and yet to speak to ordinary mortals with that smile, as if she had no more to be proud of than they!

And what could it be that made her so kind? Not anything in him—a poor soldier, a poor soldier's son, knowing nothing but the exotic society of India and its curious ways—surely something which, out of some relenting of the heart, some pity or regret, Constance had said. Frances sat next to him at table, and there was a more subtle satisfaction still in speaking low, aside to Frances, when he got a little confused with the general conversation, that bewildering talk which was all made up of allusions. He told her that he had brought a parcel from the Palazzo, and a box of flowers from the bungalow—that his mother was very anxious to hear from her, that they were going to Switzerland—no, not coming home, this year. 'They have found a cheap place in which my mother delights,' he said with a faint smile. He did not tell her that his coming home a little circumstances their resources, and that the month in town which they were so anxious he should have, which in other circumstances he would have enjoyed so much, but which now he cared nothing for, nor for anything, was the reason why they had stopped half-way on their usual summer journey to England. 'Dear old people, they had done it for him—this was what he thought to himself, though he did not say it—for him, for whom nobody could now do anything! He did not say much, but as he looked in Frances' sympathetic eyes, he felt that without saying a word to her, she must understand it all.

Lady Markham made no remark about their visitor until after they had done their usual afternoon's work; as it was her habit to call it, their round of calls, to which she went in an exact succession, saying lightly as she cut short each visit, that she could stay no longer, as she had so much to do. There was always a shop or two to go to, in addition to the calls, and almost always some benevolent errand—some home to visit, some hospital to call at, something about the work of poor ladies, or the salvation of poor girls—all these were included along with the calls in the afternoon's work. And it was not till they had returned home and were seated together at tea, refreshing themselves after their labours, that she mentioned young Gaunt. She then said, after a minute's silence, suddenly, as if the subject had been long in her mind: 'I wish Markham had let that young man alone; I wish he had left him to you and me.'

Frances started a little, and felt, with great self-ignition and distress, that she blushed—though why, she could not tell. She looked up, wondering, and said: 'Markham! I thought it was so very kind.'

'Yes, my dear; I believe he means to be kind.'

'Oh, I am sure he does; for he could have no interest in George Gaunt, not for himself. I thought it was perhaps for my sake, because he was—because he was the son of—such a friend.'

'Were they so good to you, Frances? And no doubt to Con too.'

'I am sure of it, mamma.'

'Poor people,' said Lady Markham; 'and this is the reward they get. Con has been experi-

menting on that poor boy.—What do I mean by experimenting? You know well enough what I mean, Frances. I suppose he was the only man at hand, and she has been amusing herself. He has been dangle about her constantly, I have no doubt, and she has made him believe that she liked it as well as he did. And then he has made a declaration, and there has been a scene. I am sorry to say I need no evidence in this case: I know all about it.—And now, Markham! Poor people, I say. It would have been well for them if they had never seen one of our race.'

'Mamma!' cried Frances with a little indignation, 'I feel sure you are misjudging Constance. What would she do anything so cruel for? Papa used to say that one must have a motive.'

'He said so! I wonder if he could tell what motives were his when— Forgive me, my dear. We will not discuss your father. As for Con, her motives are clear enough—amusement.—Now, my dear, don't! I know you were going to ask me, with your innocent face, what amusement it could possibly be to break that young man's heart. The greatest sin in the world, my love! We need not name matters before ourselves. There is nothing that diverts Con so much, and many another woman. You think it is terrible; but it is true.'

'I think—you must be mistaken,' said Frances, pale and troubled, with a little gasp as for breath. 'But,' she went on, 'supposing even that you were right about Con, what would Markham do?'

Lady Markham looked at her very gravely. 'He has asked this poor young fellow—to dinner,' she said.

Frances could scarcely restrain a laugh, which was half hysterical. 'That does not seem very tragic,' she said.

'O no, it does not seem very tragic—poor people, poor people!' said Lady Markham, shaking her head.

And there was no more; for a visitor appeared—one of a little circle of ladies who came in and out every day, intimates, who rushed up-stairs and into the room without being announced, always with something to say about the Home or the Hospital or the Reformatory or the Poor Ladies or the endangered girls. There was always a great deal to say about these institutions, which formed an important part of the 'work' which all these ladies had to do. Frances withdrew to a little distance, so as not to embarrass her mother and her friend, who were discussing 'cases' for one of those refuges of suffering humanity, and were more comfortable when she was out of hearing. Frances knitted and thought of home—not this bewildering version of it, but the quiet of the idle village life where there was no 'work,' but where all were neighbours, lending a kindly hand to each other in trouble, and where the tranquil days flew by she knew not how. She thought of this with a momentary, oft-recurring secret protest against this other life, of which, as was natural, she saw the evil more clearly than the good; and then, with a bound, her thoughts returned to the extraordinary question to which her mother had made so extraordinary a reply. What could Markham do? 'He has asked the poor young

fellow to dinner.' Even now, in the midst of the painful confusion of her mind, she almost laughed. Asked him to dinner! How would that harm him? At Markham's club there would be no poisoned dishes—nothing that would slay. What harm could it do to George Gaunt to dine with Markham? She asked herself the question again and again, but could find no reply. When she turned to the other side and thought of Constance, the blood rushed to her head in a feverish angry pain. Was that also true? But in this case, Frances, like her mother, felt that no doubt was possible. In this respect she had been able to understand what her mother said to her. Her heart bled for the poor people, whom Lady Markham compassionated without knowing them, and wondered how Mrs Gaunt would bear the sight of the girl who had been cruel to her son. All that with agitation and trouble she could believe. But Markham! What could Markham do?

She was going to the play with her mother that evening, which was to Frances, fresh to every real enjoyment, one of the greatest of pleasures. But she did not enjoy it that night. Lady Markham paid little attention to the play; she studied the people as they went and came, which was a usual weakness of hers, much wondered at and deplored by Frances, to whom the stage was the centre of attraction. But on this occasion Lady Markham was more distraite than ever, levelling her glass at every new group that appeared at all the moments of the recesses, between the acts, the restless crowd which is always in motion. Her face, when she removed the glass from it, was anxious and almost unhappy. 'Frances,' she said, in one of these pauses, 'your eyes must be sharper than mine, try if you can see Markham anywhere.'

'Here is Markham,' said her son, opening the door of the box.—'What does the mother want with me, Fan?'

'Oh, you are here!' Lady Markham cried, leaning back in her chair with a sigh of relief. 'And Captain Gaunt too.'

'Quite safe, and out of the way of mischief,' said Markham with a chuckle, which brought the colour to his mother's cheek.

TURF-BEDDING.

At what time peat, or peat-moss as it has more generally been called, was first used for the purpose of bedding cattle and horses, it is impossible to say. Doubtless, it has been frequently so used in country places when straw was scarce; but it is only about four years ago that it was introduced to us as an article of commerce, and even then was brought forward by our German cousins. In the last week of March 1881, a firm in Bremen sent over to London two bales of what they termed 'turf-bedding for horses and all other animals.' The bales weighed about two hundredweight each, and were inclosed in rough canvas like wool; a system of baling which was afterwards much improved on. At first, considerable difficulty was experienced in getting the London horse-owners to give the new article

a trial; but gradually their scruples were overcome, and the turf-bedding obtained a footing in the metropolis, and very soon after found its way to other large towns both in England and Scotland.

After the first difficulties of securing the patronage of buyers had been overcome, peat-moss or turf-bedding took rapid strides for a time, as far at least as its importation was concerned. The price, which at first was seventy shillings per ton, fell rapidly to forty shillings per ton, and then, owing to the heavy stocks in the country, to almost whatever buyers chose to offer. Inferior qualities, too, were as a matter of course shipped, and buyers grew dissatisfied. The inferiority consisted in the peat-bog having been cut too deeply, and the hard or fuel-peat used. This weighed more heavily certainly, but was not at all suited to the purpose, as, besides being most uncomfortable for the horses to lie on, was not nearly so absorbent. This, however, has been rectified, and the bedding-proper is now being regularly used by some of the largest consumers in London, Glasgow, and other towns, who find it advantageous in many ways, and speak highly in its favour; while, on the other hand, there are others who will have nothing to do with it; and certainly so long as straw is cheap, there is little inducement to depart from the established order of things in that respect. The manufacture of this litter was tried in 1882 on a peat-bog between Edinburgh and Glasgow, belonging to Mr John Pender, M.P.; but, for some reason or other, the experiment was a failure, and it was soon abandoned.

The first bales to arrive in this country were shipped, as already stated, from Bremen, and were the product of a bog at Zwischenahn, near Oldenburg, which was particularly well adapted for the purpose, the upper strata being of a perfectly spongy character, and almost wholly free from the semi-decomposed wood, &c., so commonly found near the surface of peat-bogs.

The process of preparation being similar at all factories, a slight sketch of that of one will serve for all. The peat is cut, dried in the sun, and stacked in the same way as that used for fuel. It is then put into a cutting-machine, composed of two iron rollers, which revolve in opposite directions, and are fitted with teeth of from three to four inches in length, so placed that the teeth of the one roller pass between those of the other, the space between each being according to the size of pieces required. After passing through this operation the peat is thrown into powerful presses, in which it is compressed into bales of from two and a half to three hundredweight each. Wooden slots of about half an inch in thickness, three inches in breadth, and of the full length of the bale, are placed at the top and bottom, and the whole bound round with wres, *c.* which four or six are generally used for each bale. When the foregoing process is properly carried out, the bales stand the carriage to this country with very little breakage.

From its absorbent and deodorising properties, this peat-moss, or turf, is no doubt well suited for the purpose to which it is applied, and makes a dry and comfortable bed for horses; but whether an economical one or not, depends of

course on its price as compared with that of straw.

When of the proper quality and thoroughly dried, it will absorb about six times its own weight of water; but any one wishing to give this litter a trial, should bed his horses with the same degree of comfort that he has been in the habit of doing with straw, and so test the difference between them for himself.

The peat used is the upper spongy stratum, which, when dried, is of a light-brown colour and of a very absorbent nature, and should be as free as possible from all half-decayed vegetable matter.

MR. L'ESTRANGE.

IN FOUR CHAPTERS.—CONCLUSION.

EXPOSURE to the strong air of the ocean began to make me drowsy; I went down to my cabin to get a little sleep. Theodore had not left his berth. The unhappy boy was very ill, and looked so despondent that he took all thoughts of sleep away from me. I was more grieved by his sufferings than by his folly, and exerted myself to the utmost to comfort him.

After leaving him again, I stood at the port-hole, breathing the soft air. A gentle touch upon the arm roused me from my contemplation. I turned, and saw one of the stewards with a letter in his hand for me. Greatly surprised, I opened the envelope, and found the contents ran thus: 'L'Estrange has your money. He is a professional gambler, working with confederates. Go to him; declare that you know him and his associates; and that if he does not restore your money, you will bring the police to your assistance, when you reach New York. Be firm, and fear not; for though he is a man of desperate courage, he will not dare to harm you *while on this ship*. If you cannot force him to yield by such arguments as suggest themselves to you, use the words "Henry Evans."'

I read this extraordinary missive over a dozen times at least, each repusal adding to my amazement. Who was the writer, and why was I enlightened as to L'Estrange's real character? My suspicions had been right, then—the man was a beast of prey! No time must be lost. I had an unpleasant scene before me, and had better get it over without delay. I went on deck at once, examining all that met my view from the companion-door. L'Estrange was not visible. I went slowly round the decks, into the smoke-room; but did not find him. I descended to the saloon; and at the far end he sat writing at the table set apart for that purpose. Near him were several other gentlemen, one of them the young man I had spoken to at the beginning of the voyage. All were writing or reading. As I stood before L'Estrange, the gentlemen lifted their heads and eyed me inquiringly.

'Can I have five minutes' conversation with you, sir?' I demanded from L'Estrange.

He started, paled for an instant, looked hurriedly round the table, then smiled. 'I should be happy to oblige you, sir,' he answered in a level voice; 'but I am writing just now.'

'Be good enough to suspend it; my business is urgent.'

'What do you want?' he asked, half scowling.

'I cannot tell you here; your cabin is the fittest place for what I have to say.'

L'Estrange looked at me searchingly, while he pretended to smile, as if amused at my queer invitation. 'Can't you wait for half an hour?'

'No; not for half a minute.'

'Well, you are a very curious person, I must say. I will grant your request, though it is inconvenient. I suppose you want to talk about your brother?'

I bowed.

L'Estrange rose up, cast a careless glance upon the people sitting round, and led the way down the saloon. We did not exchange a word until he had got into the cabin, which was amidships; then he said, bolting the door: 'Be quick with your conversation, for I shall not spare more than the five minutes you ask for.' He spoke haughtily, almost threateningly.

'One minute will accomplish my purpose,' I replied, looking at him sternly. 'The length of the conversation will depend upon you, not on me. Give me the four hundred and fifteen pounds you have taken from my brother.'

A cool cynical smile was the response to my demand. 'Are you a fool or a knave, young man?' asked L'Estrange, after a moment. 'I have lost three times as much as your brother; why, then, should I give you money that I have neither won nor stolen?'

'Do not assume such an air with me,' I cried angrily. 'I know you.'

'Indeed! Then, if you know Mr L'Estrange, banker of Wall Street, New York, you should know that he is a gentleman of honour. But the five minutes are nearly at an end.'

'I care not for time; I am here to obtain my money; for it is not my brother's; he stole it from my portmanteau.'

'Look here, young man,' said L'Estrange, coming close to me, and staring hard into my eyes—'look here. I tell you, as a gentleman, that I have not got any money of yours; and, I vow, if you come any of your tricks over me, I will hand you over to the captain as a swindling scoundrel, trying to extort money by threats.—There is the door, sir; leave my cabin.' The manner of the man was so imposing, and the evidence of his nature so truculent, that for a few seconds I was almost intimidated.

L'Estrange perceived his advantage, and put his hand upon my shoulder to thrust me outside. That touch brought back my courage. 'Keep your hands off me!' I cried passionately. 'If you cannot persuade me to leave this room, you will never put me out by force. Again, I demand the money you have stolen, under the semblance of gaming.'

A look of savage hatred grew slowly over L'Estrange's sinister features. He remained awhile thinking, though he pretended to wait my resumption of the conversation. A flash of resolution at length blazed in his dark eyes as he said: 'You may thank my self-command, young man, for not kicking you out of this, as I would a whining hound. For your brother's sake, I will not do you any harm. But if I had you ashore, I would give you a lesson that would teach you to behave like a gentleman. Do not provoke me any more. Leave my cabin.'

'I will never leave it till you have given me the money; or if you go out, I will follow you, and before all the passengers, I will repeat what I have said. I care not for your scowls, for your hatred, for any harm your vile ingenuity can devise against me.'

'Then, as you declare war to the knife, you mad fool, you shall have it,' cried L'Estrange with a burst of imprecations. 'I am known on this ship to many gentlemen and to the captain. I shall claim protection from a scoundrel who seeks to fasten a quarrel upon me, to extort a large sum of money; and when we get into the Hudson, I will put the constables on you. If it costs me a thousand dollars, I will shut you up in jail for the next few years.'

I laughed, a scornful, stinging laugh of contempt.

L'Estrange was nonplussed.

'I accept your war to the knife,' I said. 'Come, let us place the matter before the captain and the saloon passengers. I have only made a formal demand for my money so far. I thought that you would see the wisdom of returning your plunder, when you discovered that I knew you and your profession. I do not want the trouble of prosecuting you when we land at New York. I have urgent business to attend to elsewhere, and I would prefer that other hands than mine put you under the jailer's key. However, since you decide to play the innocent and the respectable, I must join in your comedy. It certainly will be the best for society. You and your confederates on this ship are at my mercy. War to the knife, it shall be.' I turned to unfasten the door.

'Stop!' said L'Estrange uneasily.

'Are you going to restore the money?'

'Sit down, and let us talk the matter over. I have a hasty temper, and your request has made me very angry. Let us be friends. I really am a greater victim than your brother; I have lost quite a heap of money. Why did he think I was a professional gambler? Why has he acted so unjustly towards me? I am no pretender to respectability, I assure you. Here is my card. When you reach New York, you will find in ten minutes that I am what I say I am.'

'Pray, do not continue this sort of fiction. I know all about you, Mr L'Estrange. Neither your bluster nor your hypocrisy will turn me from my point. You have only one argument that can prevail with me—that is, to put four hundred and fifteen pounds in unmistakable currency into my hands.'

He glared at me like a ferocious animal in a trap. Then he assumed an amused smile, saying: 'Well, I have had a pretty fair experience of human nature; but I tell you, sir, you are the toughest opponent I have met so far.'

'I am a desperate man, Mr L'Estrange. You and your gang have ruined me, and blasted my brother's career at the start. If I had thought that an appeal to your pity would have caused a restoration of all we have in the world, that appeal would have been made. But the professional gambler has no heart and no conscience, except that which is roused by the policeman. Yet, why am I bandying words with you? Give me the money.'

'Upon my honour as a gentleman, I am very sorry about this affair. I will see what I can do to get the money from Mr Barker and the others who have cleaned your brother's pockets. I give you my promise.' L'Estrange rose, as if to end the interview, and looked at me with a reassuring smile.

'I do not take promissory notes in such transactions as ours,' I said sternly. 'The money!'

'You shall have it before ten o'clock to-night,' quoth L'Estrange, putting out his hand to ratify the pledged words.

'I will not wait ten seconds. The money!'

'I cannot give it to you; I swear I cannot; I have lost all my ready cash. But since you will not treat me as one gentleman does another, I will give you a draft upon my firm, to be paid upon arrival. I am sick and tired of this absurd row. Go into the saloon; I will write the draft, and follow you.'

'I take no draft from a man of your stamp, Mr L'Estrange; all your subterfuges are useless.'

'If I had you ashore, I would take the tall talk out of you,' exclaimed the man, relapsing into a fury. 'Take my draft, or go out of this.'

'Henry Evans!—your last game is played!'

I uttered the words very quietly. I had exhausted all other means to get back my own, and followed the advice of the writer of the letter in my extremity. They struck the gambler with utter dismay. His face became pale and distorted, and he reeled to and fro, as though a storm had suddenly burst upon the sunny sea.

'Who are you?' he asked in a low voice, after he had somewhat recovered.

'That is my concern. I know who you are.'

L'Estrange looked at me in a puzzled, expectant manner, as waiting for me to do something.

As I simply continued to return his stare, he at length said doggedly: 'What do you mean to do?'

'To take four hundred and fifteen pounds out of this place.'

He fixed his eyes upon me like a rat upon its captor: 'And afterwards?'

'Take care that you do not get hold of it again.' My answer completely confounded him.

Again he looked wonderingly, suspiciously at me. 'Look here,' he said. 'Are you going to hand me over at New York, if I give you the money?'

'No.'

'Will you promise? Will you swear it?'

'I will swear nothing; I will make no compact with a man of your character. I say simply, that if you give me my money, I leave you to be punished by other hands than mine.'

His eyes dropped to the floor, and he sat thinking awhile. Suddenly he rose up, and said half menacingly: 'I accept your terms.' Putting his hand into his breast-pocket, he pulled out a large leather case; from this he took a sheaf of Bank of England notes, and counted four hundred and fifteen pounds upon the sofa beside me.

'Count it for yourself,' he said.—'You may

test them as you like,' he added, as I examined the water-marks and then the 'touch' of the notes. 'They are genuine.'

'Yes, they are not forged, I perceive. Now I take my leave.'

'Before we part,' said L'Estrange with suppressed passion—'before we part, let me say that if you deal fair and square with me until we get ashore, I will let bygones be bygones. Remember this, however, that I have many friends, and that, if you put me to the necessity to find you, I will have you killed, even if I am in the fastest prison in the world. Even if you are the chief detective of England, you will not escape them that will find you.' There was no mistaking the fierce, revengeful nature of the man; evidently, he was capable of plotting the deadliest mischief.

'If you will just suppose that I have no further interest in you, that you are practically non-existent for me, then you will understand that your threats are waste of breath. Allow me to pass out.' With these words I quitted the cabin; and thus terminated the most remarkable interview of my life.

I was hurrying to tell Theodore of the astounding recovery of the money, and to remove the awful misery of the boy, when the thought occurred to me, that such a revelation might not be prudent. Theodore never could keep a secret, and he would, in spite of my cautioning, divulge the character of L'Estrange; and this might lead to unknown troubles and delays when we got to New York. Instead of going to our cabin, I returned to the deck, and walked about for a considerable time, planning a method of telling the story after we had got well on the way to California.

Having settled the matter to my satisfaction, I stood calmly watching the sun, poised over the western waters, for it was now evening. The placid ocean heaved in soft rolls, as if it were changed from water to oil. Upon them the effulgence glowed so marvellously that I held my breath in an ecstasy of delight. The world seemed almost too sublime for humanity, with all its baseness and mean contentions. A prayer of thanks and adoration burst from my lips. It was the first perfect sunset at sea that I had witnessed. In the full fervour of my emotion, a female form passed across the deck before me, and eclipsed the sun. The incident annoyed me. Slowly the form passed, and the glowing orange fires fell dazlingly upon my eyes again. But the charm of the scene was gone. The spell of nature's magic was not to be recovered by wishing. Again the female form eclipsed the sun. I turned to leave the deck. The figure advanced towards me. We had almost met, when I recognised the lady with whom I had formed the only acquaintance out of all the passengers. I was about to address her, when she passed me, as if totally oblivious of my presence. Wondering what I had done to deserve this slight, I turned to look after her, and almost collided with L'Estrange. He was pale as only extreme passion can blanch a man of full habit and sanguineous temperament. I thought he was irritated at meeting me; but beyond a darkling frown, he did not recognise me, and passed on.

Dinner had been served for some time, so that

the deck was almost bare of passengers. Not wishing to be slighted again by the lady, I went to the cabin entrance and sat down. A few minutes afterwards, the lady appeared; she threw an imploring glance upon me from her dark and sunken eyes, and descended the companion-stairs with a swiftness that was extraordinary for one so wasted by disease. Still more amazed by this behaviour than by the other, I stared after the retreating figure, when the burly body of L'Estrange blocked out the light from the doorway; for the fraction of an instant he seemed to hesitate; or, rather, I read the impulse that shot through him as he saw me. But he did not stop; like one following a beckoning hand, he disappeared.

I was astounded at the intensity of the emotion which these simple events caused. What was less uncommon than for an invalid lady to desire to have a few minutes' promenade at a quiet interval? If she 'cut' a very distant and chance acquaintance, surely she had the right to do so. Besides, many people behave eccentrically on board ship. But what did her terrible looks mean? Had her illness produced delirium? As for L'Estrange, nothing was more natural than that he should need a walk upon deck, after his excitement and discomfiture. Yet I could not get rid of the shadowy feeling that slowly grew upon me, that some dark link connected the man and woman who had passed from me, like living ghosts. Against the feeling, however, were the facts that I recalled. Did not L'Estrange say, when he and Theodore had broken in upon my conversation with the lady, that he did not know French? and both he and the lady appeared to be absolute strangers to each other. I continued to ponder over the conflict of our intuitions and the realities, which seem to destroy their significance, until the throng of people ascending from the dining-table ended my metaphysical occupation.

I went to see how Theodore was getting on. It was now dusk, and the lamps were being lit in the corridors. Stewards and other ships' servants were bustling about; passengers were moving towards their cabins and up the stairs. For a little while I could not make my way through the press; while thus fixed, I felt something placed in my hand. In the imperfect light and amid so many people, it was impossible to know who the giver was; and beyond the feeling that the object was a piece of paper, I was ignorant of what I had received. Having got free, I went to my cabin as fast as possible. I had had one mysterious and fateful missive before that day; and my natural cautiousness bade me wait until I was clear of observers, before examining the paper I held.

Theodore was sleeping in that heavy manner which follows great exhaustion of bodily and mental powers. I was greatly relieved. Gradually I raised the flame of the lamp and turned my eyes on the piece of paper. It was crumpled and damp by the hand that had conveyed it to me. The contents were as follows: 'Do not hold any conversation with your fellow-passengers for the rest of the voyage. Stay in your cabin as much as possible. When you reach New York, take the first train for the West. Dangerous men surround you. Keep

your brother under your eyes constantly. Do not reveal what has taken place to-day. Burn this, now that you have read it.'

The last injunction was the most difficult of all. I did not dare to strike a match. I tore the paper in the smallest fragments, and finding the port-hole of the little corridor still open, I threw the scraps away at short intervals.

Who was this strange correspondent that knew my affairs so intimately, and who was so eager to befrend me? I could not fix upon any one on the ship save the lady, with whom I had had two conversations only. If she was playing the part of guardian angel, why? Further, if she had written the two notes—and they were in the same handwriting—she must be connected with the desperadoes she warned me against! Could that poor, suffering, almost dying woman be one of the vilest pests of the human race? The more idea seemed an insult to one so refined, so gentle, so compassionate. Undiscoverable, however, as the correspondent might be, I determined to follow the counsel I had received, and to the letter. In thirty or more hours we should be at New York; and under any circumstances I must keep Theodore constantly under my eye, until we were clear of those who had so many reasons to fear and to hate him, as well as myself.

But the unhappy boy had no wish to leave the cabin, or indeed his berth. Remorse devoured him with relentless tooth. He grew pale and haggard, as if in a rapid consumption. His grief was indeed terrible; and if I had dared, I would have told him all. Only the certainty, that in a few hours I could give relief to the anguish that he deemed hopeless, stayed me from saying: 'Sorrow no more, dear boy; the lost is found.'

At last we reached New York. I shall say nothing of my anxiety regarding Theodore, who had to be carried from the ship to a cab, so prostrate and despairing was he. I will only relate the concluding incident of our most momentous voyage, which cleared up the mystery of my unknown friend. It was a final note, hastily given to me as I took my seat beside my brother on leaving the steamship wharf. It was written in French, and ran thus.

'The language in which I bid you adieu for ever will enlighten you as to who I am. Through you, I have been able to do one good deed before going from this world, in which I have done so many evil ones. I thank heaven for the opportunity. I know that I only reach America to die. But I shall leave behind me one, who, though now lost in sin and devoted to the injury of his fellow-creatures, will yet have to die also. L'Estrange is that one—my husband. Now, I pray you, as I have been good to you, not to take any steps against him; I wish him to be with me in my last moments; perhaps then I may, by God's mercy, induce him to return to honour and honesty. He once was good and kind, though now a desperately wicked man. But, as I still possess some slight influence over him, he has promised me not to harm you. He knows that I revealed his real position to you; for the steward who gave you my first note told him afterwards. L'Estrange will not harm you; he has sworn it, upon what is sacred

to him. Have, therefore, no fears, and proceed to your destination calmly and in peace. If you ever recall my memory, pray for my peace beyond the grave. Adieu.'

It was many months before Theodore recovered from the illness which followed his escape on the Atlantic. Though matters had taken so providential a turn, and though I lavished upon him all my tenderness, he could not forgive himself. The bright, self-confident, self-assertive boy that left England was gone, and a grave, silent, gentle man had taken his place. But he is slowly gaining cheerfulness, as we prosper; and when my mother and sisters join us, I hope he will again be gay, for their dear sakes.

LAW-COURT INCIDENTS.

ANY one interested in the peculiarities of his fellow-man must needs find them strikingly exemplified in courts of justice; and the judge or barrister or any other person of any discrimination who has arrived at an old age in the service of a law-court, must possess a clear insight into the traits and peculiarities of mankind.

Nothing is so much appreciated in a court of justice as fun, and it is precisely this aspect of the question that this paper intends to deal with. The solemnity with which they are generally associated, and the serious issues at stake, render wit or humour the more acceptable, as being a deviation from the beaten path of decorum. There are times, however, when levity is much out of place, although often indulged in; for instance, it is most inappropriate to find a barrister joking while the prisoner at the bar stands charged with murder; and the jokes of a judge who is constantly making fun, if any little opportunity presents itself, in the end fall flat, without leaving any appreciable effect, which is not the case when, now and then, this high functionary emits a remark which does not fail to call forth mirth and laughter.

A ready reply or a cutting sarcasm is sometimes used as a weapon of defence by a witness. Occasionally, even in the most unimportant case, he will be cross-examined by the opposing counsel to such an extent, that unless he be a clear-headed and thinking person, he will be liable to commit himself. This is one of the aims of counsel—to confuse the witnesses, and constantly remind them that they are on oath. Some indulge in the latter practice to an insufferable extent. O'Connell was conspicuous for his powers of examination, and of following up, if possible, any part of the evidence the witness endeavoured to evade. During a Munster circuit, he was engaged in a case where the question was the validity of a will, by which property to some amount was devised, but which the plaintiffs alleged was forged. O'Connell noticed that the subscribing witness during examination swore several times that 'the testator signed the will while life was in him.' Suspecting something, he asked the witness, 'Was it not that a live fly was in the dead man's mouth, while his hand was placed on the will?' The witness, through fear, actually confessed that this was the case.

A barrister named Missing was defending a prisoner charged with stealing a donkey, and was severe in his examination of the witness. The case was that the prosecutor had left the donkey tied to a gate, and on returning, it was gone. 'Do you mean to say, witness,' said Missing, 'the donkey was stolen?'—'I mean to say, sir,' was the reply, 'that the ass was missing.'

A witness may be obstructive, and give a barrister great trouble by refusing to answer questions put to him; but this method of procedure is not so effective as quick, sharp, and ready repartee.

An eminent English architect named Alexander was being examined by counsel, who was using every effort in his power to depreciate the witness's opinion.

'You are a builder, I believe?'

'No, sir; I am not a builder; I am an architect.'

'Ah, well, builder or architect, architect or builder—they are pretty much the same, I suppose?'

'I beg your pardon; they are totally different.'

'Oh, indeed. Perhaps you would state wherein this great difference consists.'

'An architect, sir, conceives the design, prepares the plan, draws out the specification—in short, supplies the mind. The builder is merely the machine; the architect, the power that puts the machine together and sets it going.'

'Oh, very well, Mr. Architect; that will do. A very ingenious distinction, without a difference.—Do you happen to know who was the architect of the Tower of Babel?'

'There was no architect, sir—hence the confusion.'

'Which way did these stairs run?' a witness was once asked; and his reply was, 'That it depended on circumstances. If you were at the bottom, they run up; but if you are on the top, they run down.'

Curran was examining a witness, and failing to get a direct answer, said: 'There is no use in asking you questions, for I see the villain in your face.'

'Do you, sir?' said the man with a smile. 'Faix, I never knew my face was a looking-glass before!'

From the dock have issued at various times witty sayings and pert remarks; and it is not an uncommon occurrence to find prisoners whom pecuniary considerations prevent from employing counsel, exhibit wonderful tact and ingenuity on behalf of their cause. Doubtless, every one has heard of the Irishman, who, in reply to the question, 'Guilty or not guilty?' said, 'He would like to hear the evidence before he would plead.' Another native of the Emerald Isle raised a laugh in court by displaying a scar on his head about the size of the knob of a fire-shovel, which he considered conclusive testimony that he was married.

'Prisoner at the bar,' said a judge, 'is there anything you would wish to say before sentence is passed upon you?' The prisoner looked towards the door, and remarked that he would like to say 'good-evening,' if it was agreeable to the company.

The sayings and doings of the bench generally command more attention than anything which emanates from any other part of the court. Probably it is a kind of policy openly if not inwardly to appreciate the judge's jokes, on account of his high judicial position.

Some judges have been remarkable for their wit in giving decisions and for their eccentricity on the bench; Lords Ellenborough and Mansfield were notable examples. The latter judge once gave encouragement to a young barrister who had forgotten the speech he had probably committed to memory. 'The unfortunate client who appears by me,' he began—'the unfortunate client who appears by me—my lord, my unfortunate client.'—'You can go on, sir,' said the judge, in an encouraging tone; 'so far, the court is entirely with you.'

One of the most noted criminal lawyers in the country, while pleading the innocence of his client, is often overcome by his innocence and wrongs, and is obliged to sit down and recover himself. 'Don't you think,' said a judge to him, 'that the jury have found out your movements by this?'—'Ah, you forget,' said the barrister; 'it is always a new jury before whom I play.'

'If you don't stop that coughing,' said an irritable judge to an old gentleman in court, 'I will fine you one hundred pounds.'—'I will give your lordship two hundred, if you will stop it for me,' was the quick reply.

Such are a few incidents which have occurred in connection with the bright side of law-courts from time to time. But there is another aspect of the question. There are the serious issues at stake to be decided within the precincts of the building, which is so often the medium whence ensue wit, drollery, and fun. It would be wrong to suppose that mirth does not find a place, and that the sublime exists without the ridiculous. The very presence of the latter adds a charm to the former, and often chases away that dull monotony which we are apt to associate with law-courts and their surroundings.

MR CHUCKLES'S CHICKS.

A COMEDY IN TWO ACTS.—ACT II.

As already stated in the previous chapter, Mr Chuckles left the house full of the laudable intention to see for himself that the fowls were properly secured in their receptacle. He arrived alongside the hamper at the same moment as the page Tiddlewinks; but both master and servant were too late—the birds had vacated their lodging.

Mr Chuckles glared at the woe-begone Tiddlewinks in so ferocious a manner as caused that hapless youth to try and remember where he had read that death by strangulation was easy, or otherwise.

'O you hardened young villain!' at length gasped Mr Chuckles; 'what do you mean?' and the enraged man extended his right index finger dramatically towards the deserted hamper.

'Ple-e-se, sir, it ain't my fault, sir, I'm sure sir,' whimpered the quaking page.

'Not your fault? Why weren't you here

sooner? Answer that, you young brimstone.—But hold! I will not listen to your miserable excuses," shouted Mr Chuckles, and at the same time looking around, with the view of discovering, if possible, the whereabouts of his erratic birds. "Ah!" he exclaimed, as his eyes rested upon that side of the garden which was next to the domain of the dreaded Major Ironlungs, "there they are!"

There could not be the slightest possible doubt the coohins were most undesirably near the low fence separating the two gardens. What was the best course to pursue? It would certainly never do to alarm the newly escaped birds unnecessarily, for should they become unduly excited, the chances were that they would at once pay a flying visit to the grounds of the choleric son of Mars. Some such thoughts as these were evidently passing rapidly through the brain of the perplexed Chuckles, as he stood gazing at his chicks, which were serenely unconscious of the perplexing interest that their wayward behaviour had aroused in the breast of their new owner, and energetically continued their congenial occupation of scratching up a recently sown patch of flower-seeds.

At length a ray of light pierced Mr Chuckles's bald cranium. "Tiddlewinks," said he, "go and hide behind a gooseberry bush, as near to the hamper as you can get; and then when you see the birds return and get into it, creep out softly, and bang down the lid as sharp as you can."

"When I see 'em a-gettin' into the 'amper, sir!" exclaimed Tiddlewinks, grinning; "but I don't think as I ever shall see 'em get into it!"

"None of your insolence to me, you clattering magpie; do as I tell you—I am now going into the house; and hark you, if anything peculiar happens, come and inform me instantly, or it will be the worse for you!"

"Yes, sir," meekly replied the youth, who, as soon as he saw the retreating form of his master disappear from view, began to indulge in a species of Zulu war-dance, or exaggerated 'cellar flap,' which calisthenic exercise, although doubtless much appreciated, in festive moments, by his clumps of the distinguished order of 'button,' was not exactly calculated to meet with approval from a number of shy fowls. Therefore, what happened under the circumstances was not a matter for much surprise. The 'old bird' whose peculiarity has been alluded to, by a kind of half-flying, half-jumping movement, succeeded in locating itself on the other side of the fence exactly in the centre of a promising clump of tender annuals; whither it was of course immediately followed by the majority of its fellow-birds.

When Tiddlewinks saw what had happened, he suspended his healthy exercise as suddenly as he had begun it, and stood staring, in a semi-imbecile manner, at the coohins, which had so unceremoniously transferred themselves over the way. "Wot a rare go!" at length gasped out the bewildered youth. "Won't there be a game just, and no mistake! When that there major sees 'em, he'll be on the rampage. Wot's to be done? Oh, I remember. The gov'nor said as how if anything peculiar took place, I was to let him know directly; so, as this is a very rare start, I'll be off and tell him."

Suiting the action to the word, the page began to proceed leisurely towards the house; but had scarcely got twenty yards in that direction, when his foot-steps were arrested by a stentorian voice in his rear calling: "Hi, hi! you boy there—you in buttons, confound you! Come back, I say, and explain the meaning of those abominable fowls being in my garden, or, by Jove, I'll put an ounce of lead into you."

"The major!" gasped Tiddlewinks, instinctively changing his slow march into a stampede.

Mr Chuckles was busily employed upon a plan for a proposed henhouse, when his page burst unceremoniously into the room in a state of breathlessness—the combined result of terror and unwanted exercise. The domestic architect thus rudely disturbed in the midst of his weighty labours, directed towards the intruder a look of stern inquiry.

"The major!" exclaimed the distressed youth in piteous tones.

"Well, what of the major? What is the matter with the major? Has he been seized with an apoplectic fit, through giving way to violent passion?" inquired Mr Chuckles grimly.

"No, sir—not a fit, sir; but the coohin-chiners, sir!"

"Ah, the fowls; what of them? Have they returned into the hamper?"

"O lor, no, sir," responded Tiddlewinks, who had by this time recovered his breath. "I only wishes as they had, sir."

"I left you in charge of those birds," said Mr Chuckles, "and woe betide you, should they have gone a-tray!—Now, tell me instantly, where are they?"

"That's just wot it is, sir," answered the page with desperation.

"I have every desire to be calm and temperate in my language," gravely remarked Mr Chuckles; "but if you do not immediately explain that last remark of yours, I shall most certainly be obliged to behave in a manner more forcible than polite."

"Yes, sir, that's just wot—I mean, sir, that them birds has got into the major's gardening and is a-routin' of it up, sir."

"Then they must be got back again at all risks," said Mr Chuckles in a 'do-or-die' tone of voice.

"Yes, sir, please, sir. But the major knows all about it, sir; he's seen 'em, and said he would put a ounce of lead into me, sir."

"Oh, he used threatening language, did he?" remarked Mr Chuckles with quite a magisterial air.—"H'm, I think you may retire now, while I just think over what is the best to be done under the peculiar circumstances."

The youth required no second bidding, but quitted the room with praiseworthy alacrity, only too pleased to let off so easily.

"Yes, Mr Tiddlewinks, you have accomplished a nice day's work with your present of poultry," soliloquised the rate (Chuckles as he paced up and down the room. "But I will be even with you, sir; I'll 'owe you one,' as the man says in the play."

Could he but have guessed that whilst he was vowing vengeance against the giver of the coohins, that generous individual was being

quietly united in the holy bonds of wedlock to his only daughter!

'I think,' mused Mr Chuckles, 'it will be the wisest course to see the major, and endeavour to induce him to look upon the invasion of his flower-beds as a circumstance that could not be very well avoided, and as such, to treat the matter in a philosophical light.' And he turned to depart upon his mission; but just as he stepped upon the terrace outside, he beheld, to his dismay, the podgy form of Major Ironlungs advancing by rapid strides towards the house. In another minute, the two neighbours stood facing each other.

'Ah, major, you here!' began Mr Chuckles in his blandest manner. 'So unexpected a visit from so distinguished a personage is, you know'—

'Don't try to humbug me, sir,' sharply interrupted the gallant but rude defender of hearths and homes.

'My dear major, I have not the slightest intention of "humbugging" you.'

'I should think not, indeed; it's not to be done, sir.—Look you here now; I am a man of few words; I like to come to the point at once, even if it be the point of the sword.' As the major uttered these words, there came, borne by the breeze, a lively cackling of fowls. 'Do you hear that abominable din, sir?' asked the man-of-war of Mr Chuckles.

That gentleman admitted that he was not entirely indifferent to the sounds referred to, at the same time excusing the conduct of the poultry on the ground that it was the natural vocation of chanteclers to proclaim the morn.

'Proclaim the fiddlestick, sir!' exclaimed the major. 'Rubbish! Cock-crowing time is at this period of the year four A.M.'

'Well, then, luncheon-time, if it will be more agreeable to you, major,' insinuated Mr Chuckles.

'Nothing can be agreeable to me, sir, but satisfaction,' replied the major, frowning fiercely.

'My dear major, you shall have it!'

'That's right, sir. I respect you for speaking out like a man, sir. Let us go immediately to the bottom of the garden.'

'N-n-not in the garden, I think, major; we will have it in the room—this room; just a cold snack on a tray, you know.'

'Cold snack on a tray! Why, do you wish to pretend, sir, that you are unaware of the object of my coming here? What do you think I climbed over those wretched palings for?'

'To say truth, major,' answered Mr Chuckles with the calmness of desperation, 'I cannot comprehend why you should put yourself to such inconvenience all on account of such a humble individual as myself.'

'Do these abominable cochon-chinas now in my garden belong to you, sir?' demanded the irate warrior in measured tones.

'They do. That is, they'—

'Quite sufficient, sir. They are your property; you admit the fact. Then, pray, allow me to inform you that the flowers which just now are being rooted up by your miserable fowls, are cultivated by me at no trifling cost.' And the major 'threw out' his chest and endeavoured to add an inch or two to his stumpy figure.

'My dear major,' said Mr Chuckles, 'I shall be only too glad to'—

'Give me the satisfaction of a gentleman, eh?'

'I will pay anything'—

'Pay, sir! don't talk to me of pay! Insult to Major Ironlungs can only be wiped out in one way, sir, and that is by—' Will you meet me in the—' said the podgy warrior in grandiose tones.

'Major Ironlungs' replied the peacefully inclined Mr Chuckles with a calmness of demeanour which did him infinite credit, 'you are of course well aware that an enlightened age has condemned the *duello*, as you term it; and, however much I might feel inclined'—

'Ah, but you don't feel inclined, I can plainly see,' interrupted the major.

'To,' continued Mr Chuckles, ignoring the interruption—'to accede to your request, I am afraid the opportunity for us to maim or kill each other would not be easily found, though we might, I dare say, take an excursion across the Channel. I'll think the matter over, Major Ironlungs.'

Now, a close observer would have detected a look of disappointed surprise in the eyes of the gallant major; just as though he had received an answer which he neither expected nor desired. The warrior turned to depart, and as he proceeded down the path, cried out: 'I intend to have a shot at the old bird, to get my hand in a bit.' He was evidently desirous of disconcerting the prospective antagonist by an unlooked-for bounce and Brummagem bluster.

Mr Chuckles sought the repose of his easy-chair, and ensconced in its springy depths, freely made use of his pocket-handkerchief in the performance of that operation commonly known as 'mopping' his shining cranium. 'Pshaw! He ejaculated, 'how warm it is, to be sure! What a fool I have been! Only to think that I, Christopher Chuckles, have almost undertaken to fight a sun-urny duel with that brimstone old reprobate next door. It is simply ridiculous, now I come to think of it coolly and calmly. Society is strongly against the barbarous custom; and as I am a respectable and a respected member of it, and a good Christian, how can I countenance a practice which the world, in common with myself, emphatically taboos? The worthy man derived much comfort from these reflections, and thereafter made up his mind that he would not gratify the major by standing before him as a living target, to be 'bulls-eyed' or 'innered,' as the case might be.

'Did I not hear Major Ironlungs in conversation, or rather, I think, altercation, with you, Christopher, dear?' asked Mrs Chuckles as she entered the room.

'Well, Maria, I rather imagine you did.'

'I thought the major was speaking in somewhat elevated tones. What was it all about, dear?'

'Fighting, Maria?'

'Fighting!' echoed Mrs Chuckles. 'Oh, I suppose he was describing to you some of his mighty exploits on the field of battle?'

'No, Maria; he did not allude to his past

sanguinary career.—The fact is, my dear,' continued Mr Chuckles solemnly, 'Major Ironlungs has challenged me to fight a duel.'

'And you?' gasped Mrs Chuckles.

'I, Maria, as a family man, feel it my duty not to oblige that hellcose individual.'

'Ah!' sighed Mrs Chuckles, as she staggered, half fainting, and was only just saved in time by the stalwart arms of her lord and master.

'Hillo, Maria! do hold up. I say!'—Here Mr Chuckles came to a sudden stop as the loud report of a gun smote his ear. The crash of firearms had an instant revivifying effect on the apparently unconscious Mrs Chuckles, for she quickly opened her eyes, and gave every sign of restoration, to the no small relief of her paining husband, who seized the opportunity to deposit his fair (but stout) burden in the easy-chair.

'That noise, Christopher, it—it was like a gun going off,' murmured the poor lady feebly.

'You are right, Maria; it was the report of a gun.'

'Oh, do say you're not shot Christopher, dear—do, for my sake—do say you are not killed; she implored.

Mrs Chuckles was extremely happy in being in a sufficiently live state to inform his sympathising partner that he was not perforated by any deadly missile, and as much for his own sake as for hers.

'Saved, saved!' exclaimed the grateful woman as she rose from her seat, and was about to entwine her arms round her Christopher's neck, when the corporal intention was frustrated by the appearance once more on the scene of Tiddiewinks in a state of wild terror and with something like a lump in his gut.

'Oh, p-p-poor, sir,' cried the scared youth, 'I'm ki-killed—I know I am; send for the 'orspital.'

'What is the matter?' simultaneously asked his master and mistress.

'It's all along o' that Major Ironlungs. He was a aimur' at the old bud, but he missed him; and he's hit me instead, and it's horful!' blurted out the stricken youth in apparent agony.

'Poor boy,' said Mrs Chuckles sympathetically; and her husband, who had a shrewd guess that the pain was more frightful than hurt, observed that substantial consolation for personal injury might possibly be wrung out of the perpetrator of the deed, and with that object in view he should communicate with his solicitor. As the indignant master of the maltreated 'buttons' announced this determination, who should appear on the scene but the major himself, apparently, from the blue-red appearance of his visage, on the point of being seized with apoplexy, and carrying his gun in a manner not at all calculated to inspire any one with unlimited confidence in the bearer's knowledge of the precise use of firearms.

'I've done it!' exclaimed the intruder grimly, bringing down the butt-end of his gun heavily on to the floor and glaring wildly upon those around him.

'Yes,' said Mr Chuckles, with dignified calmness, 'you have done it. Gaze upon that poor boy there, the victim of your inaccurate aim.'

'See here, guv'nor,' whimpered the injured individual alluded to. 'When next you goes for to aim at a co-cochin-chiner, don't you go for to hit a hinnercent cove like me.'

'You wretched offshoot of brimstone,' cried the infuriated major, 'how dare you insinuate that my gun-practice is not—er—what it should be? When I was in the'—

Before the affronted marksman could splutter out the remainder of his speech, the door was quickly opened, and Mr Frank Featherwell entered the room, closely followed by Mary Ellen, who was hanging her pretty little head, and blushing in the most bewitchingly becoming manner, like the conscious culprit she undoubtedly considered herself. The addition to the little party affected the latter in various ways. Mr Chuckles stared and frowned upon Frank; whilst the major looked askance at the donor of untamed poultry. Mrs Chuckles 'caught' her daughter's eye; and nods and wreathed smiles, with other signs, were freely passed between the pair in quick and (evidently) intelligible succession.

'Pray, do not let us interrupt the harmony,' said Frank in a cheerful and airy manner.—'I think, Major Ironlungs,' he went on, 'you were speaking as I opened the door, and, if I am not much mistaken, the words which fell upon my ear were, "when I was in the"'. Proceed, my dear major; do not deprive us of your doubtlessly interesting reminiscences.'

'I was merely going to mention the fact,' said the major, in a considerably subdued manner, 'that when I was in the army'—

'Pardon me, major,' interrupted Frank, smilingly, 'but I'm somewhat of a stickler for accuracy; was it not in that branch of the auxiliary forces known as the militia, where—?'

'Well, sir, and pray, what if it were the militia?' but the sometime member of that excellent but often derided branch of England's brave defenders scowled savagely, and did not seem to be altogether at his ease.

'Only the militia' exclaimed Mrs Chuckles in contemptuous tones; whilst that young imp Tiddiewinks indulged himself by screwing up his face into an assortment of new and improved grimaces.

'A militiaman after all!' observed Mr Chuckles, sticking his thumbs into his waistcoat armbolts in the approved manner, at the same time throwing out his chest. 'Why, I think I'm equal to a soldier of that calibre; so I advise you, Mr Militiaman, to keep that weapon of yours quiet, before accident number two happens.'

'Do you?' sneeringly returned the major.

'Why, cert'nly,' facetiously answered Mr Chuckles, gaining confidence as 'the enemy's' increasing discomfiture became apparent; 'at all events in my house, sir. If you really think that a few extra firing-drills would improve your practice, go and practise on your own domestics.'

'In course,' ventured to remark the now excessively delighted and grinning 'buttons,' whose injuries had been purely imaginary; 'and mind you take better aim—yah!'

The discomfited blusterer divined that if he stayed any longer, he would be pretty certain to hear things said of him which would by no

means conduce to his serenity of mind, so he shouldered his gun, and giving a final glare all round, beat a hasty retreat, followed by the smiles of all.

'And now,' said Mr Chuckles, turning with an air of authority to Frank and the fair runaway, 'pray, what is the meaning of this?'

'O pa, dear, do forgive us!' pleaded the brand-new bride; 'it was all my fault, it was, really.'

'Forgive? Your fault? *What* is your fault?' queried the perplexed Chuckles.

'The fact is,' said Frank, stepping forward to the relief of his bride, and holding out his hand to his newly made father-in-law, 'me—I—that is—and your daughter—dear Mary Ellen—are married!'

'Married!' exclaimed Mr Chuckles. '*How? When? Where?'

'My dear—father—in'the usual way—half an hour ago—at the little church round the corner,' promptly answered Frank, delighted and surprised that the old gentleman took the matter so quietly.

'Without my consent, eh, you young—'

'Well—er—you see, sir—circumstances—'

'What is the state of your exchequer, sir?' interrupted Mr Chuckles, looking more severely than he had as yet done.

Frank, who had naturally anticipated some such question, evidently appeared fully prepared with a satisfactory answer. 'I regret,' said he, 'to inform you that, just before leaving home this morning, I received a telegram which informed me of the demise of a distant cousin, whom I had not seen, or ever heard from, for many years, and who has evidently been so pleased with me for never troubling him, that it appears he has bequeathed to me—no doubt out of pure gratitude—his little fortune—about twelve thousand pounds.'

'Well, my dear boy,' exclaimed Chuckles père with considerable effusion, 'I suppose I must offer my congrats— No; I don't mean that—my sincere sympathy in your bereavement, ahem!'

Then followed a good time all round of hand-shaking and hugging and kissing; 'all over the shop,' as Tiddlewinks afterwards vulgarly expressed himself to the housemaid and cook.

At the termination of this exercise, Mr Chuckles drew his new-found son-in-law on one side, and whispered: 'But I say, Frank, my boy, wasn't the present of poultry—especially the old bird—a dodge, eh?'

'Well—er—you see—' began the young fellow in a hesitating manner.

'Out with it!—don't be afraid,' urged the now benignant father-in-law; 'all is ended happily. The fact is, I was partly prepared—'

'Candidly then, sir, it was a—a—sort of what you might call ruse,' admitted Frank. 'Pray, forgive—'

'Forgive, my dear boy! There is nothing requiring forgiveness; I can but admire your masterly strategy. See what has come out of it! A blustering, bouncing ex-major of militia utterly routed; a good husband gained for my only child; and I have found a sterling son-in-law. What more can we poor mortals expect?'

Frank smiled quietly, and wondered how his 'masterly strategy' would have been appreciated,

had not the unexpected good fortune which had so timely befallen him been put into the scale against Mr Chuckles's Chicks.

TEA AS PREPARED IN THE EAST.

The Hunnias (Himalayan natives) drink tea which comes from China in small packets, made up of the large leaves, small branches, seeds, &c., forming a mass reduced to the smallest possible size by pressure, and rendered sometimes still more compact by a slight addition of sheep's blood. The Hunnias travel great distances, living only on tea and what the Hindus call *suttoo*—that is, flour made from roasted beans or peas. To prepare the tea, they boil the leaves for some hours—all night, in fact, if they are in camp—in a small earthen pot; then they pour out the infusion into a large basin full of hot water, adding some salt and clarified butter (ghee), if they happen to have it. All these naturally make a kind of soup; and the native can live on it several months, and undergo severe fatigue without taking any other nourishment.

The method adopted by the Mongols and other Tartar tribes for the preparation of tea in brick—is, says Johnston, in his *Chemistry of Common Life*, 'it is believed, that which extracts from the leaves the greatest possible amount of nourishment. They scrape the tea into fine powder, and boil it in the alkaline water of the steppes, adding some fat and salt, after which they pour off the liquid, leaving the deposit. They drink twenty, even forty, glasses of this liquor in the day, mixing in it some honey and butter with a little roast meat; but with only a little milk instead of the meat, they can subsist many weeks with this drink for sole sustenance.'

IF I WERE YOU.

Why did he look so grave? she asked.

What might the trouble be?

'My little maid,' he sighing said,

'Suppose that you were me,

And you a wealthy secret owner,

Pray, tell me what you'd do?'

'I think I'd tell it somehowly,'

Said she, 'if I were you!'

But still he sighed and looked askance,

Despite her sympathy.

'Oh, tell me, little maid,' he said

Again, 'if you were me,

And if you loved a pretty lass,

O then, what would you do?'

'I think I'd go and tell her so,'

Said she, 'if I were you!'

'My little maid, 'tis you,' he said,

'Alone are dear to me.'

Ah then, she turned away her head,

And ne'er a word said she.

But what he whispered in her ear,

And what she answered too—

O no, I cannot tell you this;

I'd guess, if I were you!

ARE THE CANADIAN FORESTS BEING EXHAUSTED?

FOR some years past the belief has been gradually forming in the minds of those interested in the welfare of Canada that the forests of that country are being slowly but steadily used up; and the matter being one that has most serious aspects, it has been made the subject of an official inquiry, in order that the nature of the causes which may be at work in bringing about a destruction which is greater than the production of trees, might be ascertained, and remedies for so dangerous a state of things suggested. At the instigation of the Marquis of Lansdowne, the Governor-general of Canada, and with the concurrence of Lord Derby, an official communication was on the 21 of July, 1884, sent to the lieutenant-governors of the various provinces of the Dominion, asking for such information as was obtainable on the reported proximate exhaustion of forests. The replies received throw much light upon the subject.

Let us first deal with the small province of Prince Edward Island. The answer sent to Lord Lansdowne by the lieutenant-governor was brief, but very significant. He said that there were now no forests of any extent in the province, they having disappeared under the axes of the settler and the lumber-man.

From Nova Scotia, two Reports were received—one from the present, and the other from the former, Deputy-commissioner of Crown Lands. The former said that, having made inquiries of several gentlemen engaged in the lumbering business in the province, he had found that all, or nearly all, the timber-lands would have been cut over before the expiration of six years from the date of writing; though it did not follow that the timber-supply would then be exhausted. It was found that by carefully husbanding those trees which were too small for conversion into lumber at the time of the first cutting, a second cutting of nearly equal worth could, after fifteen or twenty years, be obtained

in many localities; and that, consequently, if it were not for forest fires, those lands which were carefully looked after would never become denuded of their trees. It was true, however, that the supply of pine and spruce was rapidly being exhausted, and that the lumbering interests of the province were becoming of less importance every year. There was a considerable quantity of hemlock spruce in the province, but in many sections of the country it was being rapidly destroyed for the purpose of securing the bark, which was extensively used for tanning leather. The province could once boast a large quantity of heavy birch; but of late years much of it had been converted into tan-timber and exported. Recently, too, the necessity had arisen for the somewhat extensive use of a number of portable sawmills. A large proportion of the area of the province was held by agriculturists, who hitherto appeared to have taken but little interest in the preservation of the forests, most of them having stripped more land of its timber than was actually necessary, and had not been so careful of the remainder as they should have been. As was well known, forest fires had done an immense amount of damage in the province, and large tracts of country once covered with a stately growth of pine, spruce, &c., were now almost barren. The Deputy-commissioner concluded by expressing a regret that the lumbering and agricultural portions of the population were not more fully alive to the importance and necessity of preserving the forests of the country; for, had proper care been taken to prevent fires and to guard the growing timber, the forests would be in a much more thriving state than they were at the present time.

The Report of the ex-deputy-commissioner of Crown Lands was of a more lengthy and detailed description. It started with the admission, that the greater part of the continent of North America—which a few generations ago was an unbroken forest from ocean to ocean—was being rapidly depleted of its timber; and the reader

was reminded that many sections of the Old World now sterile were prosperous and fertile before the destruction of their forests. The Report went on to account for the origin of forest fires. It appears that the aborigines, as well as the early French settlers on the continent, were careful never to make fires in the woods in the dry season of summer. In 1783, however, a great number of refugees and discharged soldiers came into the country, and many new settlements were formed. The following year, no rain fell during the latter part of May, the whole of June, and the first ten days of July. Fires were kindled in the clearings by the new settlers, and it was reported that, within a fortnight, two-thirds of the province was burned over. The ex-commissioner stated that, except what was cultivated and what was under water, every part of the peninsula of Nova Scotia would now be covered with trees, were it not for their destruction by fires, which scourged the country more or less every year; and he went on to make a suggestion with which it is impossible not to sympathise. He proposed that active measures should be adopted to put a stop to the ravages of fires, and to prevent the felling of trees of less than a given diameter—to be arrived at after due inquiry and consideration—and he ventured to express the opinion that were this done, Nova Scotia would continue to be a timber-producing and exporting country for all time to come. The necessity for some such restrictions as the ex-commissioner suggests will be quite apparent when we mention that at the present time a man is allowed to cut hew and what he pleases in the forests of Nova Scotia. Sawmills of every form and variety are to be found there wherever there is a stream large enough to turn a wheel, if but for a few months in the year; and trees of seven inches diameter and upwards are cut down; those not large enough to come under the head of small deal, being made into staves, laths, and shingles. The Report concluded with the assertion, that though the yield of timber at the present time in the province was great, it would be gradually diminished unless adequate protection were afforded to trees.

Passing over New Brunswick—with reference to which province there is little information to hand bearing upon the condition of the forests—we come to Quebec. From a 'Memorandum on the Crown Timber Forests of the Province of Quebec and on the subjects submitted to the American Forestry Congress at Montreal, in August 1882, that might be applicable thereto,' many facts and figures are obtainable. The Memorandum states that the district south of the St Lawrence is generally suitable for cultivation, and is largely so employed; while the district on the north side of the river, though about one hundred and seventy-seven thousand eight hundred square miles in extent, does not contain a portion of land fit for cultivation equal to one-fourth of its area. Even that small proportion of land which is fit for cultivation, from coldness of climate in the northern part and from difficulty of access, would long be too far below the ordinary standard of agricultural value to attract settlement or admit of cultivation being profitable, were it not for the produce market

and the employment afforded by the timber trade. To be permanent, this trade, according to the Memorandum, must be carried on with that ever-increasing regard for the preservation of the forests which it is evident the interests of the settlers, the public revenue, and the country generally will in future require. Being fit for nothing else, by far the greatest portion of the vast northern region referred to above must remain a forest for ever, increasing in value as timber becomes more scarce elsewhere. Perhaps, however, it will be capable of maintaining a sparse but hardly population in comparative comfort by the development of the resources of its mines and its forests, if cared for and preserved. It is said that the valuable timber of the forests is being rapidly destroyed by the commercial demand for it and by desolating fires, and it is necessary now distinctly to bear in mind that there are no new fields to fall back upon for the white pine that gives the trade its special value. The increasing scarcity of wood for fencing, building, and especially for fuel, is augmenting the difficulty of living, and consequently diminishing the value of farms even on stations otherwise favourable.

Speaking of the Forestry Association—a body of practical and scientific men—the Memorandum says that the population of the province owes it a debt of gratitude, on account of the great care it shows in dealing with the subjects of forest preservation and cultivation, so specially important to the future prosperity of Quebec. This province is obviously adapted, by its favourable geographical position and the unfitness of much of it for other cultivation, to be a timber-yielding and timber-trading country for ever.

The Memorandum then went on to quote a paper of Dr Hough, the chief of the Forestry Branch of the Department of Agriculture of the United States, advocating the planting of trees along railway lines. It contained information on the great and rapidly increasing consumption of small trees for railway 'ties' in the United States, and stated that the demand for them on the Canadian railroads must continue to increase. From two thousand and two hundred to three thousand five hundred such 'ties' were used to every mile; and there were one hundred thousand miles of railroad in the United States. The average duration of a tie was five to eight years; and thirty to fifty millions would be required for the one hundred thousand miles each year. This would necessitate the annual cutting over of from sixty to one hundred thousand acres of wood; and as the trees would require on an average thirty years to attain the necessary size, there should be from about eighteen to thirty acres of woodland to every mile of the railroad. The Memorandum went on to state that amongst the trees recommended for planting along the sides of railways, the black walnut for many reasons was strongly advocated by several eminent American and Canadian gentlemen. Among the latter could be mentioned the Honourable Mr Joly, who had set a good example by commencing the cultivation of the black walnut on a large scale. It was stated, indeed, that he had recently planted ten thousand such trees in one season. This gentleman

had said, 'both the preservation of our existing forests and the creation of new forests in regions where they do not exist, are absolutely necessary.' Mr Joly had also warmly advocated the institution of an annual 'arbor-day,' or day on which the general planting of trees throughout the province would be encouraged.

The Honourable Mr Loring, the President of the Forestry Association, had formed an estimate of the time it would take to exhaust the timber-grounds in the several States of the Union, and had drawn this conclusion: in the course of one generation, the present forests of the United States would be almost entirely exhausted. This, as the Memorandum pointed out, might be regarded as painfully instructive for the population of Canada, as now bearing to them the exhausting demand which, long before the close of that term, would be made upon their forests to meet the requirements of the American market.

Mr P. White, M.P. for Renfrew, Ontario, in a clear, vigorous, and succinct verbal address on the loss in the province from forest fires, had estimated the value lost annually by them in the Ottawa District at twenty millions of dollars. This estimate, the Memorandum continued, might be thought excessive; though, when one bore in mind that in addition to the value of the marketable timber, the fire destroyed not only the smaller trees—that would in fifteen years yield successive cuts of equal value—but also, in many cases, all the seedlings and seed-cones, it was impossible not to conclude that the case was, if anything, understated. As an appropriate setting off to this statement, the Memorandum said that the thinning-out of the larger trees by the lumber-man hastened the growth of the younger ones which were to succeed them. Speaking of the endeavours of the lumber-men to prevent fires, Mr White had justly remarked that the authority of government was necessary, and he had said that the trade would not object to a special tax to meet the expenses of governmental supervision. He had further suggested that the period during which the burning of brush by settlers be interdicted should be extended to the months of June, September, and October.

At the Forestry Congress held at Montreal in August 1882, a Committee had been appointed, and this Committee, in its Report, had recommended: (1) The reservation of all pine and spruce lands unfit for settlement, for lumbering purposes exclusively; (2) the prohibition of the burning of brush by settlers in the vicinity of fir-trees during the months of May, June, September, and October (July and August burning being already interdicted in the province of Quebec); (3) the division of the timber-country into districts, and the appointment of police under a superintendent with magisterial powers, whose duty it should be to detect and punish offenders and provide for the extinction of fires; (4) and that the cost of the maintenance of this protection-tax might be partially met by the imposition of a moderate tax on the parties owning or leasing timber-lands.

The Reports for the remaining provinces—Ontario, Manitoba, and British Columbia—present little that differs from the Reports to

which we have already referred. The Report from Ontario came from the Clerk of Forest Preservation, who said that there existed no data by which to form an exact idea as to how long it would take, at the present rate of consumption, to exhaust the timber of those lands. He pointed out that of course everything would depend upon the measure of care that was taken in the future for the preservation of the forests. These measures would probably include the regular maintenance of officials charged with the duty of preventing the occurrence of fires. It was the Clerk's opinion that if care was taken of the remaining forests of Canada, a very large portion of them would continue in a perpetually reproductive condition, capable of furnishing an annual yield equal to that of the present year.

The Minister of Agriculture of Manitoba said that, during the rapid construction of the main line of the Canadian Pacific Railway in 1882 and 1883, large quantities of timber were used; but as that line had now reached the Rocky Mountains, the progress of construction was necessarily slower, and much less timber was required. The Department had adopted means to prevent as far as possible the destruction of timber by fire, and was endeavouring to secure the rigid enforcement of the Prevention of Fires Act. Steps had also been taken for the establishment of an annual 'arbor-day.'

From British Columbia came an energetic refutation of the assertion that the forests there were within six years of exhaustion.

The broad inferences which will be unhesitatingly drawn from the facts given above are, that provision must be made by law for the protection of the Canadian forests, both against the devastations of fire and the injudicious operations of the woodman; and it is to be hoped that the action of the government in setting on foot the exhaustive inquiries which have afforded the material for this paper, is an earnest of their intentions to place upon the statute-book whatever measures the necessities of the case may call for.

A HOUSE DIVIDED AGAINST ITSELF.

CHAPTER XXXIV.

AFTER this, for about a fortnight, Captain Gaunt was very often visible in Eaton Square. He dined next evening with Lady Markham and Frances; Sir Thomas, who scarcely counted, he was so often there, being the other *conuive*. Sir Thomas was a man who had a great devotion for Lady Markham, and a very distant link of consanguinity, which, or something in themselves which made that impossible, had silenced any remark of gossip, much less scandal, upon their friendship. He came in to luncheon whenever it pleased him; he dined there—when he was not dining anywhere else. But as both he and Lady Markham had many engagements, this was not too often the case, though there was rarely an evening, if the ladies were at home, when Sir Thomas did not 'look in.' His intimacy was like that of a brother in the cheerful easy house. The cheerful company, the friendliness, the soothing atmosphere of feminine sympathy around him; and underneath all the foolish hope, more sweet

than anything else, that a certain relenting on the part of Constance must be underneath, took away the gloom and dejection, in great part at least, from the young soldier's looks. He exerted himself to please the people who were so kind to him, and his melancholy smile had begun to brighten into something more natural. Frances for her part thought him a very delightful addition to the party. She looked at him across the table almost with the pride which a sister might have felt when he made a good appearance and did himself credit. He seemed to belong to her more or less, to reflect upon her the credit which he gained. It showed that her friends after all were worth thinking of, that they were not unworthy of the admiration she had for them, that they were able to hold their own in what the people here called Society and the world. She raised her little animated face to young Gaunt, was the first to see what he meant, unconsciously interpreted or explained for him when he was hazy, and beamed with delight when Lady Markham was interested and amused. Poor Frances was not always quite clever enough to see, when it happened that the two elders were amused by the man himself, rather than by what he said, and her gratification was great in his success. She herself had never aspired to success in her own person; but it was a great pleasure to her that the little community at Bordighera should be vindicated and put in the best light. 'They will never be able to say to me now that we had no society, that we saw nobody,' Frances said to herself, attributing, however, a far greater brilliancy to poor George than he ever possessed. He fell back into melancholy, however, when the ladies left, and Sir Thomas found him dull. He had very little to say about Waring, on whose behalf the benevolent baronet was so much interested.

'Do you think he shows any inclination towards home?' Sir Thomas asked.

'I am sure,' young Gaunt answered with a solemn face, 'that there is nothing there that can satisfy such a creature as that.'

'He has no society, then?' asked Sir Thomas.

'Oh, society! it is like the poem,' said the young man with a sigh. 'I should think it would be so everywhere. Ye common people of the sky, what are ye when your queen is high?'

Sir Thomas had been much puzzled by the application to Waring, as he supposed, of the phrase, 'such a creature as that'; but now he perceived, with a compassionate shake of his head, what the poor young fellow meant. Con had been at her tricks again! He said with the pitying look which such a question warranted: 'I suppose you are very fond of poetry?'

'No,' said the young soldier, astonished, looking at him suddenly. 'O no.—I am afraid I am very ignorant; but sometimes it expresses what nothing else can express. Don't you think so?'

'I think perhaps it is time to join the ladies,' Sir Thomas said. He was sorry for the boy, though a little contemptuous too; but then he himself had known Con and her tricks from her cradle, and those of many another, and he was hardened. He thought their mothers had been far more attractive women.

Was it the same art which made Frances look up with that bright look of welcome, and almost affectionate interest, when they returned to the drawing-room? Sir Thomas liked her so much, that he hoped it was not one of their tricks, then paused, and said to himself that it would be better if it were so, and not that the girl had really taken a fancy to this young fellow, whose heart and head were both full of another, and who, even without that, would evidently be a very poor thing for Lady Markham's daughter. Sir Thomas was so far unjust to Frances, that he concluded it must be one of her tricks, when he recollected how complacent she had been to Claude Ramsay, finding places for him where he could sit out of the draught. They were all like that, he said to himself; but concluded, that as one nail drives out another, a second 'affair,' if he could be drawn into it, might cure the victim. This rapid *resumé* of all the circumstances present and future is a thing which may well take place, in an experienced mind in the moment of entering a room in which there are materials for the development of a new chapter in the social drama. The conclusion he came to led him to the side of Lady Markham, who was writing the address upon one of her many notes. 'It is to Nelly Winterbourn,' she explained, 'to inquire— You know they have dragged that poor sufferer up to town, to be near the best advice; and he is lying more dead than alive.'

'Perhaps it is not very benevolent, so far as he is concerned; but I hope he'll linger a long time,' said Sir Thomas.

'Oh, so do I! These indoligos may go on for a long time and do nobody any harm. But when a horrible crisis comes, and one feels that they must be cleared up!' It was evident that in this Lady Markham was not specially considering the sufferings of poor Mr Winterbourn.

'What does Markham say?' Sir Thomas asked.

'Say! He does not say anything. He shuffles—you know the way he has. He never could stand still upon both of his feet.'

'And you can't guess what he means to do?'

'I think— But who can tell? even with one whom I know so intimately as Markham. I don't say even in my son, for that does not tell for very much.'

'Nothing at all,' said the social philosopher.

'Oh, a little, sometimes. I believe to a certain extent in a kind of magnetic sympathy. You don't, I know. I think, then, so far as I can make out, that Markham would rather do nothing at all. He likes the *status quo* well enough. But then he is only one; and the other—one cannot tell how she might feel.'

'Nelly is the unknown quantity,' said Sir Thomas; and then Lady Markham sent away, by the hands of the footman, her anxious affectionate little billet 'to inquire.'

Meanwhile, young Gaunt sat down by Frances. On the table near them there was a glorious show of crimson, the great dazzling red anemones, the last of the season, which Mrs Gaunt had sent. It had been very difficult to find them so late on, he told her; they had hunted into the coolest corners where the spring flowers lingered the longest, his mother quite anxious

about it, climbing into the little valleys among the hills. 'For you know what you are to my mother,' he said with a smile, and then a sigh. Mrs. Gaunt had often made disparaging comparisons—comparisons how utterly out of the question! He allowed to himself that this candid countenance, so open and simple, and so full of sympathy, had a charm—more than he could have believed; but yet to make a comparison between this sister and the other! Nevertheless, it was very consolatory, after the effort he had made at dinner, to lay himself back in the soft low chair, with his long limbs stretched out, and talk or be talked to, no longer with any effort, with a softening tenderness towards the mother who loved Frances, but with whom he had had many scenes before he left her, in frantic defence of the woman who had broken his heart.

'Mrs. Gaunt was always so kind to me,' Frances said gratefully, a little moisture starting into her eyes. 'At the Durants, there seemed always a little comparison with Tase; but with your mother, there was no comparison.'

'A comparison with Tase!' He laughed in spite of himself. 'Nothing can be so foolish as these comparisons,' he added, not thinking of Tase.

'Yes, she was older,' said Frances. 'She had a right to be more clever. But it was always delightful at the bungalow.—Does my father go there often now?'

'Did he ever go often?'

'N-no,' said Frances, hesitating; 'but sometimes in the evening. I hope Constance makes him go out. I used to have to worry him, and often get scolded. No, not scolded—that was not his way; but sent off with a sharp word. And then he would relent, and come out.'

'I have not seen very much of Mr. Waring,' Gaunt said.

'Then what does Constance do? Oh, it must be such a change for her! I could not have imagined such a change. I can't help thinking sometimes it is a great pity that I, who was not used to it, nor adapted for it, should have all this—and Constance, who likes it, who suits it, should be—banished; for it must be a sort of banishment for her, don't you think?'

'I—suppose so.—Yes, there could be no surroundings too bright for her,' he said dreamily. He seemed to see her notwithstanding walking with him up into the glades of the olive garden, with her face so bright. Surely she had not felt her banishment then! Or was it only that the amusement of breaking his heart made up for it, for the moment, as his mother said?'

'Fancy,' said Frances; 'I am going to court on Monday!—in a train and feathers. What would they all say? But all the time I am feeling like the daw in the peacock's plumes. They seem to belong to Constance. She would wear them as if she were a queen herself. She would not perhaps object to be stared at; and she would be admired.'

'O yes!'

'She was, they say, when she was presented, so much admired. She might have been a maid of honour; but mamma would not. And I, a poor little brown sparrow, in all the fine

feathers—I feel inclined to call out: "I am only Frances!" But that is not needed, is it? when any one looks at me!—she said with a laugh. She had met with nobody with whom she could be confidential among all her new acquaintances. And George Gaunt was a new acquaintance too, if she had but remembered; but there was in him something which she had been used to, something with which she was familiar, a breath of her former life—and that acquaintance with his name and all about him which makes one feel like an old friend. She had expected for so many years to see him, that it appeared to her imagination as if she had known him all these years—as if there was scarcely any one with whom she was so familiar in the world.

He looked at her attentively as she spoke, a little touched, a little charmed by this instinctive delicate familiarity, in which he at last, having so lately come out of the hands of a true operator, saw, whatever Sir Thomas might think, that it was not one of their tricks. She did not want any compliment from him, even had he been capable of giving it. She was as sincere as the day, as little troubled about her inferiority as she was convinced of it—the laugh with which she spoke had in it a genuine tone of innocent youthful mirth, such as had not been heard in that house for long. The exalting ring of it, so spontaneous, so gay, reached Lady Markham and Sir Thomas in their colloquy, and roused them. Frances herself had never laughed like that before. Her mother gave a glance towards her, smiling. 'The little thing has found her own character in the sight of her old friend,' she said; and then rounded her little epigram with a sigh.

'The young fellow ought to think much of himself to have two of them taking that trouble.'

'Don't talk nonsense,' said Lady Markham. 'Do you think she is taking trouble?' She does not understand what it means.'

'Do any of them not understand what it means?' asked Sir Thomas. He had a large experience in society, and thought he knew. But he had little experience out of society, and so, perhaps, did not. There are some points in which a woman's understanding is the best.

The evening had not been unpleasant to any one, not even, perhaps, to the lovers, when Markham appeared, coming back from his dinner-party, a signal to the other gentlemen that it was time for them to disappear from theirs. He gave his mother the last news of Winterbourn; and he told Sir Thomas that a division was expected, and that he ought to be in the house. 'The poor sufferer' was sinking slowly, Markham said. It was quite impossible now to think of the operation which might perhaps have saved him three months since. His sister was with Nelly, who had neither mother nor sister of her own; and the long-expected event was thus to come off decorously with all the proper accessories. It was a very important matter for two at least of the speakers; but this was how they talked of it, hiding, perhaps, the anxiety within. Then Markham turned to the other group.

'Have you got all the feathers and the fur-below ready?' he said. 'Do you think there

will be any of you visible through them, little Fan?"

'Don't frighten the child, Markham. She will do very well. She can be as steady as a little rock, and in that case it doesn't matter that she is not tall.'

'Oh, tall—as if that were necessary!—You are not tall yourself, our mother; but you are a very majestic person when you are in your war-paint.'

'There's the Queen herself, for that matter,' said Sir Thomas. 'See her in a procession, and she might be six feet. I feel a mouse before her.' He had held once some post about the court, and had a right to speak.

'Let us hope Fan will look majestic too. You should, to carry off the effect I shall produce. In ordinary life,' said Markham, 'I don't flatter myself that I am an Adonis; but you should see me screwed up into a uniform. —No, I'm not in the army, Fan.—What is my uniform, mother, to please her? A Deputy Lieutenant, or something of that sort.—I hope you are a great deal the wiser, Fan.'

'People always look well in uniform,' said Frances, looking at him somewhat doubtfully, on which Markham broke forth into his chuckle. 'Wait till you see me, my little dear. Wait till the little boys see me on the line of route. They are the true tests of personal attraction. —Are you coming, Gaunt? Do you feel inclined to give those fellows their revenge?'

Markham had spoken rather low, and at some distance from his mother; but the word caught her quick ear.

'Revenge? What do you mean by revenge? Who is going to be revenged?' she cried.

'Nobody is going to fight a duel, if that is what you mean,' said Markham, quietly turning round. 'Gaunt has, for as simple as he stands, beaten me at billiards; and I can't stand under the affront.—Didn't you heck me, Gaunt?'

'It was an accident,' said Gaunt. 'If that is all, you are very welcome to your revenge.'

'Listen to his modesty, which, by-the-bye, shows a little want of tact; for am I the man to be beaten by an accident?' said Markham, with his chuckle of self-ridicule. '—Come along, Gaunt.'

Lady Markham detained Sir Thomas with a look as he rose to accompany them. She gave Captain Gaunt her hand, and a gracious, almost anxious smile. 'Markham is noted for bad hours,' she said. 'You are not very strong, and you must not let him beguile you into his evil ways.' She rose too, and took Sir Thomas by the arm as the young man went away. 'Did you hear what he said? Do you think it was only billiards he meant? My heart quakes for that poor boy and the poor people he belongs to. Don't you think you could go after them and see what they are about?'

'I will do anything you please. But what good could I do?' said Sir Thomas. 'Markham would not put up with any interference from me; nor the other young fellow either, for that matter.'

'But if you were there, if they saw you about, it would restrain them; oh, you have always been such a true friend. If you were but there.'

'There. Where?' There came before the

practical mind of Sir Thomas a vision of himself at his sober age dragged into he knew not what nocturnal haunts, like an elderly spectre, jeered at by the pleasure-makers. 'I will do anything to please you,' he said helplessly. 'But what can I do? It would be of no use. You know yourself that interference never does any good.'

Frances stood by aghast, listening to this conversation. What did it mean? Of what was her mother afraid? Presently, Lady Markham took her seat again with a return to her usual smiling calm. 'You are right, and I am wrong,' she said. 'Of course, we can do nothing. Perhaps, as you say, there is no real reason for anxiety.' (Frances observed, however, that Sir Thomas had not said this.) 'It is because the boy is not well off, and his people are not well off—old soldiers, with their pensions and their savings.—That is what makes me fear.'

'Oh, if that is the case, you need have the less alarm. Where there's not much to lose, the risks are lessened,' Sir Thomas said calmly.

When he too was gone, Frances crept close to her mother. She knelt down beside the chair on which Lady Markham sat, grave and pale, with agitation in her face. 'Mother,' she whispered, 'tell me—' and pressing her cheek against her mother's, '—he is so kind—he never would do poor George any harm.'

'Oh, my dear,' cried Lady Markham, 'how can you tell? Markham is not a man to be read off like a book. He is very kind—which does not hinder him from being cruel too. He means no harm, perhaps; but when the harm is done, what does it matter whether he meant it or not? And as for the risks being lessened because your friend is poor, that only means that he is despatched all the sooner. Markham is like a man with a fever; he has his fits of play, and one of them is on him now.'

'Do you mean gambling?' said Frances, growing pale too. She did not know very well what gambling was, but it was rum, she had always heard.

'Don't let us talk of it,' said Lady Markham. 'We can do no good; and to distress ourselves for what we cannot prevent, is the worst policy in the world, everybody says.—You had better go to bed, dear child; I have some letters to write.'

(To be continued.)

ARTIFICIAL HANDS.

THE loss of a limb may be considered one of the major physical afflictions. It is also, unfortunately, one of the commonest. Were all the people who lack one or more limbs, in England alone, to be brought together, what a melancholy concourse would there be! The causes of such calamities are so various as to be practically innumerable; but we all know, in a round way, that the bulk of them are the result of accidents by road and rail, by machinery, by operations in mining, or by other dangerous occupations. Those accustomed to travel much, must often have been struck by the number of 'winged' men employed at the different railway stations throughout the kingdom in light or menial capacities; men who, having suffered in the discharge

of their duties, have been generously retained in the service of the Company. And again, the observant traveller will remark how much more frequently one-legged or one-armed men are to be met with in the streets of a Yorkshire or Lancashire town than in any town of similar size outside the manufacturing districts.

With a limb, as with an eye—once gone, gone for ever. But science can do much for the patient who is able to pay for her services. The making of artificial limbs has, in fact, become a fine art, and what is more, a by no means inconsiderable industry. Every surgical-instrument maker provides these, if not actually a manufacturer, and all of them retain men for altering or repairing. With the exception, perhaps, of one or two of the largest firms, few have the work entirely done on the premises, the greater portion being done by artists working at their own homes, and receiving their orders from various employers in the 'trade.' The best workmen are said to be found in London. One curious fact is, that this unique handicraft is often hereditary, being handed down from father to son for many generations. It is curious also that, like the toymakers of Switzerland, the whole of the members of a family are often engaged in producing artificial limbs.

Much credit is withal due to the art exhibited in the making of a 'leg,' of the more expensive sort. The craft has derived its knowledge, of course, from the surgery, so that the study of a 'foot' is a study in anatomy. The limbs are turned on statuesque lines; but were that all, the art would scarcely be higher than that of the Italian image-maker. The action of the knee and the movements of the numerous joints in the foot are simulated by the skillful use of finely tempered elastic cords. The movements of the natural joints are reproduced so faithfully, that a very inappreciable halt, indeed, is all that can be observed in the gait of the wearer of a high-class artificial leg.

But our concern at present is rather with artificial arms than with these highly scientific substitutes for nether limbs. Imitation arms are also constructed on the lines laid down by anatomy, and are often very finely executed pieces of work. But strange as it may sound at first, a moment's reflection will show that they are practically valueless—are, in fact, mere dummies, like a false eye. The mechanism of a foot and leg is called upon to perform limited operations, but the operations demanded of the hand are almost infinite; and, however perfectly the wrist and finger joints may be imitated, they remain utterly inert, unless supplied with, and directed by a continuous impulse from without. In short, a hand of the kind cannot perform any useful movement unless under the guidance of a natural hand. Opening and closing the fingers is all that can be effected by simple pressure against another object; and no art can conceal from the observer the fact that the limb is an inanimate counterfeit; whilst most people would prefer the sight of an empty sleeve, as being less ungraceful than so obtrusive a make-believe.

A serviceable substitute for an arm and hand must, therefore, be sought for on other than an anatomical basis. We have seen some very handsome and ingenious contrivances to meet the

case. The finer and more curious the mechanism, however, the less attainable have they been to a moderate purse, and, what is perhaps of as much importance, the less likely have they appeared to stand the every-day tear and wear of free usage. It would serve no purpose to describe them, as the majority of the class we are writing about require an article that is simple in itself, strong, durable, and reasonably priced. The demands of this class are at present met by an apparatus which appears to be the ultimate outcome of the thought and experience of everybody interested in the subject. It consists of a sheath, or 'socket,' as it is technically called, made of layers of canvas and leather, and lined with flannel or other warm fabric, into which the stump of the severed forearm is to be inserted, and the weight of which is distributed by means of straps passing through a band on the upper arm and thence cross-ways, round the chest. A hollow screw, or a catch-spring, is let into the end of this 'socket,' by means of which any one of a number of 'tools' can at will be attached, and with which the owner can subserve the more common purposes of daily life. These tools, like the 'socket' itself, are generally of a stereotyped character—namely, a hook, a knife, a fork, a spoon, a pen, a pencil, and a glass-holder. A set of 'socket' and tools—can be bought for from four guineas upwards, according to the quality of the materials and the class of workmanship.

Let us be thankful for what mechanical skill has thus far done to meet the case. But it is only because we doubt the finality of the resources in this direction, that we venture to point out, first, that the fixing and unfixing of the 'tools' implies the toil use of one natural hand; and, secondly, that any one-handed man can perform almost all the duties allotted to the 'tools' much more readily and deftly without than with their assistance. The hook—for lifting, gathering, or carrying—is the only article of real solid utility to him, if we except, perhaps, the knife or the fork in assisting him at meals. In the case of a person who has lost both hands, the apparatus is, of course, more valuable. But there, again, the inherent weakness of the arrangement crops up; for the patient has to be indebted to a second person every time a 'tool' requires to be attached or withdrawn; the consequence being, that recourse to them is rare, and the all-useful 'hook' is the instrument mainly relied upon by the one-handed man.

Happily, the number of instances of the loss of both hands is comparatively small. It is large enough, however, to warrant more attention than surgical-instrument makers have hitherto given it. The following case, and the apparatus designed for the patient's use, are given, in the modest hope that it may afford more than a hint for the guidance of the benevolent who are interested in any similar case, and some ray of comfort to the objects of their commiseration.

We were recently driving with a friend along one of the fine pieces of road so common in South Lincolnshire, when we passed a number of cattle being driven along by a tidily dressed, active little man by the aid of a stick and a wry little collar. His left sleeve was empty,

and we noticed that he had also lost an eye. We made some remark upon his skill in droving, seeing that he had only the use of one hand and one eye.

'One hand!' said our friend; 'Old Lettie has no hands.'

'No hands! How, then, can he carry a cane and make such clever use of it?'

'Well, I will tell you the history of the case; and, in the course of the day, we may meet the man himself at Long-Sutton. His eye he lost early in life; and one day some five years ago, Lettie was employed feeding a chaff-cutter for one of the farmers about here, when his left arm was drawn in by the knives, and was torn to pieces. Instead of shouting to his mate to stop the machine, he stupidly tried to release the arm with his right hand, and that, too, was completely destroyed before he was released. His mate applied what are called fuzz-balls to the bleeding stumps; got a cart, and drove him to Wisbech hospital, some six miles distant, where the left arm was promptly removed at the shoulder, and the right hand taken out at the wrist. The man is of a cheery nature, has a fine constitution, and pulled through so well, that he was at home again in less than six weeks—but helpless. His friend, the village shoemaker, made him a rough sheath for his stump, and the blacksmith made for him a hook, which he got fixed on to the sheath; and for about eighteen months this primitive arrangement was all Lettie had to depend upon in lieu of his hands. When at home, he had to be fed like a child; and when from home, had to go without. The only work he could do was to drive a few cattle to market for the farmers. This entailed all-day absences, and the only refreshment he could get was from a beer-mug held to his head by some sociable acquaintance or other. His calling was also a very dangerous one for one so situated. Not having the use of a stick, he had to throw himself against the cattle to keep them together and get them forward. Many kind people wished to get him some appliance that might assist him, nor did money stand in the way. But the "trade" could suggest nothing except a sort of sheath for the arm, to which another person might attach a knife or a fork or a spoon when he required its use. This, his friends concluded, would have been sheer waste of money in Lettie's case; and so the subject was dropped by all except one of my neighbours, who had a strong opinion that the trade did not know everything, and that something useful could and should be designed for the poor fellow. My neighbour had no mechanical skill, but was intelligent and in earnest; and after a few days' thought, produced a design so simple and natural, that a good many wondered it had not occurred to them before. Strange to say, though, the surgical-instrument makers pool-pooched it, said it would never answer, and in fine would have nothing to do with it. Not to be beaten, my neighbour took his design to a respectable firm in Liverpool, and talked the chief into setting about having the apparatus constructed. And Lettie has now had the article in daily use for over three years. There is nothing very clever about it or about its inception, but

it has the merit of being a real practical assistant and friend to the poor fellow.'

On the afternoon of the same day, when we and our friend Mr Bateman were seated in the smoke-room of the *Bull* at Long-Sutton, the maimed drover passed the window. Our friend knocked on the window and called him in. He was asked to sit down, which he did, and immediately placed his cane between his knees, pulled it free from his arm, and began to mop his forehead with the sleeve of his coat.

'Will you have something to eat, Lettie?' asked Bateman.

'Thank ye, sir; if ye please.'

A plate of meat and bread was placed before him, and we became curious to see how he would manage. He first pushed back his sleeve against his knee, disclosing a leathern socket covered with a number of electro-plated pieces; and placing the front of the wrist against a small hook fixed in his waistcoat, pulled open a handsome knife-blade, the point of which was pronged like a fork. With this he very adroitly cut and picked up the food before him; having done which, he carefully wiped the blade, and closed it by pressing it against the table, as one would close a clasp-knife. After sundry questions about the market, Bateman laid a shilling before Lettie and asked him to put it in his pocket. Lettie smiled—this had not been the first shilling he had earned by exhibiting the resources of his stump and in the same way that he had opened the knife, opened out what is called a catch-and-hold spring. After a little manoeuvring, he contrived to fix the shilling, slid it into his pocket, and closed this blade as he had done the former. He then pressed the end of his stick into a tube lying along the back of the wrist—and which we learned contained a strong spring—the stick being held as in a vice. Before he left, we asked and obtained a careful view of the appliances, and herewith briefly note the different parts and their uses.

The 'socket' had been made exceptionally strong, and had been fitted on to a plaster-of-Paris cast taken of the man's forearm. The tube with spring is riveted along the outer side of the socket, and is about three-quarters in diameter and five inches long. The man has had a set of light garden tools made, the handles of which fit into this tube in the same way as his stick, and with these he is able to do all his own gardening. The knife, &c. is merely the idea of a many-bladed pocket-knife, applied. It is riveted to the inner side of the wrist, and arrangement has been made so that each blade can be separately opened, as described, without the assistance of a second person. It will occur to any one that the number of blades could be enlarged if required. The large hook is a fixture, and does not protrude from the end of the 'socket,' as is usually the case, but is riveted along the upper edge of the socket, from which it extends only the length of the *heel* of the hook. This arrangement leaves room at the end of the stump for the old-fashioned hollow screw, common to most sockets; and the man can have a pen, spoon, &c. inserted when he requires such at home.

We will only add that from what we saw and heard, Lettie is making a reasonably good living, and declares himself better off now than when he had both hands. We can only hope that it is

so, and that other poor fellows similarly situated may take heart of grace from reading the story of his artificial hand, the workmanship of which is a credit to the makers.*

OBSERVATIONS ON THE SWALLOW.

THE following interesting notes on the swallow were recently communicated by an observer to the *Scotsman* newspaper.

Some years ago I had, to me, an unusual opportunity of observing the behaviour of a pair of swallows during almost the whole of two seasons and the opening of a third; and what follows is a record taken during the course of an acquaintance which I succeeded in establishing with the harmless and timid creatures.

I heard while in my room, one morning about six o'clock, a persistent chattering about the front door. On going to see what was the matter, I found a couple of swallows (the front-door being open) fluttering in and out of a small outer lobby of about eight feet square. I shut the door of the inner lobby, and looked out to ascertain the cause of the evident excitement. I soon saw that the object of interest was the upper crank on the wire of the front-door bell, and that a little mud was fixed here and there on the crank. During the day a portion of a nest was built, and towards evening the birds left. With a view to observation and to insure quiet to the builders, I cut the bell-wire, put the front-door on the chain, and wedged it, leaving a space for entry and exit of some six inches. Next morning I found the birds very busy and their house rising rapidly. I had callers watched, and in a general way did all that I could to secure quiet for the birds.

My house-keeper had at first strong objections to the notion of a nest inside the house. However, her bark being worse than her bite, she was induced to forbear, and soon became quite proud of the whole thing, and a most interested watcher. I now tried to cultivate the acquaintance of my visitors. This I found was a matter of some difficulty. I had been careful from the first not to intrude, as I found that the sight even of my figure, as I looked from within the glazed inner-lobby door, caused alarm. Accordingly, I made my advances with care, and was soon able to pass from the inner to the outer lobby, and to move about or sit as long as I pleased within a few feet of the nest, watching the birds come and go as they built their nest or fed their young.

I would now state some observations I succeeded in making during the two seasons the swallows sojourned with me. And first, as to the nest. While the nest was building, I came to be of opinion that the female only builds the nest, although both male and female select the materials. I was able to distinguish between the birds, and so had a test. The difference in appearance and occupation of the two birds was quite marked. The female was dumper in form and darker in colour than the male. The note, too, of the male bird was strong and cheery;

while that of the female was little heard, and had, even while building, a soothing, hushing sound, as of a mother stilling a child. The male bird, too, was less timorous than the female. Again, both birds, as I have said, went apparently in search of material for building the nest; but one, and always the same bird, left somewhat earlier than the other, and returned a little sooner. The pilot bird, the male, always, on returning from the search for mud, perched on the lintel above the door, and, till his mate began work, sat in silence and with head to the side, listening. Then he struck up a bright, cheering tune, and continued to sing while the work of building went on. By-and-by, when the builder had finished, he stopped singing, listened for a moment, and then flew away in search of more mud; followed by his mate; and so the work went on.

I have mentioned that the male was a less timorous bird than the female. I noticed this fact in the following amusing way: One morning, when the nest was pretty well built, I ventured, in the absence of the birds, to take a seat in the outer lobby, and within seven or eight feet of the nest. I sat perfectly still, waiting the return of the birds. The male came and took his usual place on the lintel. In a few seconds his mate followed, and seeing me as she swept in, turned tail with a cry of terror and flew out. I did not move, and presently she returned, only again to fly away in terror. The male, who had sat silent, and evidently astonished, now joined the female bird; and together they hung about the doorway chattering earnestly. In a short time the male bird left his mate, and, hovering about in ever-narrowing circles, came closer and closer to me in anxious examination. I still sat perfectly quiet. In the end the examination seemed satisfactory, for presently he joined the female and tried to persuade her to return to her work. She would not be persuaded, and advice being of no use, the master of the house proceeded to exercise authority. He flew about, evidently in anger, and tried to drive his mistress within doors. In the long-run he succeeded; and from that day I could move about or sit in the outer lobby as I pleased, without fear of witnessing another domestic scene.

Next, as to the hatching and rearing of the young. Each season saw two broods of three birds each. During the first season, the weather was uniformly genial, and both broods matured and flew early and strong. Of the second season the first brood was hatched under most favourable circumstances, but bad weather delayed the flight of the birds. In consequence, the second incubation began late; the weather, too, was, and continued to be, throughout of a very unfavourable character. Two of the birds were strong and well fed, the third was weak and ill* fed. Every one knows the saying, 'There's a wurdie in ilka nest;†' and I never saw a better illustration of the words than in the case of the weak bird of the fourth brood. The two strong birds, before they were able to fly, took up positions, the one at the hinge corner of the door, the other at the opposite corner, and each, as the parent birds swept in every two or three minutes, caught the food; while the wurdie trotted between the two, got therefore little to eat, was in a constant

* Mr J. W. Wood, 81 Church Street, Liverpool, as an artificial hand maker, may safely be recommended.

fret, and did not grow. Soon the parent birds, for want of house-room, and perhaps for sanitary reasons, began to roost outside. The young birds, however, returned to the nest each evening; and it was amusing to watch the little weakling hobbling to its bed lone and companionless.

The swallows had set their *three*
Young on the rail, and looked over the sea.

The two strong birds began to practise for flight and to hawk, and soon after their parents left, they flew south. I never saw the third bird attempt flight. One morning I missed it from its perch and from the nest, and what became of it I know not.

I may mention that a friend of mine, a devoted student of Gilbert White, and a great friend and observer of the swallow, used to visit my birds almost daily, and was a witness of the things I have stated. He had never seen a nest similarly situated, nor had he met anywhere with facts or a statement such as the above in his experience or on record. During the first season, we frequently thought of marking the bird, in case some of them, old or young, might return. I had hope, from the peculiar and thoroughly sheltered situation of the nest, that some of the birds might come again, and therefore did not care to do anything that might cause terror. I should have liked, no doubt, to ascertain whether old or young, or perhaps both, might return—and any evidence as to the return of the young birds would have been curious—but during neither of the two seasons did I take the birds and mark them. I am sorry I did not do so, as before a third season arrived, an accident happened to the nest that barred future observation. A caller during the winter failing to ring the door-bell in the usual way, jerked the piece of detached wire inside the outer lobby, rung the bell, no doubt, but broke the nest, and a portion came away. I was in hopes that the birds, on their return—for they came a third time—might have thought the shattered nest worth mending. On examining—and most carefully they did it—the fragments, they decided not to repair, and left the scene. Possibly, like other builders, and the general faithless, the mysterious was a law with which they could not deal; or perhaps it was against all swallow lore that a nest so situated should fail. In any case, they took their departure, greatly to my sorrow, and so brought an amusing and most interesting experiment to a thoroughly unscientific conclusion.

THE MONTH: SCIENCE AND ARTS.

THE Report of M. de Lesseps on the present state and prospects of the Panama Canal works, which has lately been issued to the shareholders in that vast undertaking, is full of interesting information. Although the original programme of proceedings has been modified to some extent, its salient features have not been departed from. The canal, it will be remembered, is to consist of an open cutting, nine metres deep, and twenty-two metres wide at the bottom, stretching from Colon, on the Atlantic side of the isthmus, to

Panama, on the Pacific coast—a distance of about forty-five miles. The works include a lock at the Panama end of the canal, to prevent the tide creating too swift a current in the waterway, and an immense dam to intercept the waters of an encroaching river, and to turn them into another course.

With regard to the present position of these works, the Report tells us that 'half the effort necessary for the cutting of the canal has already been made,' and that without doubt the year 1888 will see the completion of the enterprise. The number of cubic yards of soil removed shows a steady increase, from over half a million, in January last, to something like three-quarters of a million cleared in May. The total amount of soil to be moved is estimated at over one hundred million cubic yards. The insurrection which took place in Colon and Panama in May last was not the cause of any loss to the canal Company, although one of the contractors was a sufferer to some extent. By referring to the several contracts with the Company, it will be ascertained that the total cost of constructing the canal will be twenty-eight million of pounds sterling.

The famous Boulak Museum, near Cairo, becomes richer and richer every year with a constantly increasing store of Egyptian antiquities, for its energetic director, Professor Maspero, performs periodical voyages of discovery, and comes back laden with spoils of great value. From such an expedition he has lately returned, and, as usual, it has been a fruitful one. Not only does he turn his attention to the exploration of sites of historical renown, but he penetrates into localities which are comparatively quite unknown. In such a place named Ekhmeen—a vast necropolis was discovered about a year ago, and its tombs are now being daily examined. A limestone cliff forms the heart of this remarkable cemetery, and not only are the sepulchral chambers formed artificially here, but every natural fissure in the rock has its silent tenants. Some of these chambers contain as many as a dozen coffins. But they are not family vaults, for the mummies show that they contain bodies of persons in no way connected by family ties. It is indeed believed that these graves were not private dwellings of the dead, but more like hotels, for accommodation in which surviving relatives paid a rent to the proprietor, possibly a priest. If the dues remained unpaid, the dead were turned out to make room for others, many of these places giving evidence that the mummies have been subjected to continual changes of location. The date of these curious resting-places of the dead seems to extend from the time of the Pyramid builders to the latest Greek epoch. The bodies are covered with some adhesive material, with an overlying coat of stucco. This upper surface is painted with a portrait of the deceased, dressed in festal robes, but without any religious emblems or hieroglyphs. It is unfortunate that the bodies are so perishable that a touch is almost sufficient to cause them to fall into dust, but it is found possible with great care to preserve three or four out of every hundred disinterred.

Fifty years ago, there was discovered in Leicester a Roman tessellated pavement, which

has since become well known to archaeologists. Its position in a dark underground cellar made it difficult of access and examination; it has now been purchased by the town-council, and the beauty of the work is fully displayed to view by removing the buildings which were above it. This pavement is quite a marvel of design and constructive skill, particularly when it is noted that the artist has made use of the most common materials. Different-coloured bricks, slate, and a white composition like limestone, cut into small pieces, form the tesserae of this curious pavement. Its general construction, too, is remarkable. First, there is a foundation of concrete, upon which is laid a bed of pounded brick and lime; above this is a layer of white cement, upon which the tesserae have evidently been stuck, with their rougher sides downwards. The operation seems to have been completed by pouring liquid cement over the ornamental floor, so fill up its interstices, after which the whole has been rubbed down and polished. The pavement is probably eighteen hundred years old.

The success of the Japanese Village in London, before its untimely destruction by fire, has led to the promotion of a somewhat similar scheme in the shape of an Indian Native Village Exhibition, and a Company has been formed to carry out this idea. Extensive premises have been secured in Regent Street, London, and visitors to the metropolis will shortly have the opportunity of there seeing native artificers, such as carpet-weavers, workers in brass, gold and silver smiths, ivory turners, &c., at work as in their shops in India. In addition to this display of native handicrafts, there will be jugglers and snake-charmers. Indian teas, curries, condiments, &c. will be served in a separate apartment by native attendants. Altogether, the Exhibition promises to be a very interesting one, and it should prove useful, too, in bringing us into nearer acquaintance with our fellow subjects in a far-off land.

An artificial cantharone, which is said to resemble vulcanised india-rubber, but to be a better resister of the action of hot water, is described in one of the foreign technical journals. The skins of small animals, such as hares, rabbits, &c., are washed, cleared of hair, and boiled with five per cent. of crude glycerine and a little water in a Papin's digester until the whole mass is quite dissolved. As a result, a thick and tough glue is obtained, which is afterwards treated with potassium dichromate, to make it insoluble.

A new description of steam-plates has been patented by Mr F. W. Hemby, of Newgate Street, London. These plates—the use of which is to deaden noise and protect stairs from the effect of constant traffic—consist of metal gauze attached to a rubber backing. Above this wire-gauze is spread cement, which fills up all the interstices between the wires, and which, after vulcanisation, binds the whole into a compact material. The plates can be bent into shape to follow the contour of the steps to which it may be applied.

Some years ago, there was sold in the streets a little contrivance called the 'Lovers' Telegraph.' It consisted of two boxes, each furnished with a parchment bottom, and communicating with each other by a thread fastened to the middle of each parchment. If this thread were tightly stretched

between the boxes, a speaker into one box was clearly heard at the other box, although the thread might be fifty feet or more in length. The theory of the contrivance is simple enough. The speaker causes the first parchment to be thrown into vibration; these vibrations act as pulls to the thread, so that the distant diaphragm is urged into similar movement, and the original sounds are given forth.

A mechanical telephone on the above principle has lately been invented by two American gentlemen, and has been exhibited in London with much success, the line-wire being five hundred yards long, and stretching from Ludgate Circus to Chancery Lane. The boxes are furnished with diaphragms made of thin slips of willow interlaced together, and varnished as a protection from moisture. A metal plate forms the centre of this vibratile diaphragm, to which the line-wire is attached; and there is a provision for tightening the wire, should it become slack. One of the most ingenious features in this new form of telephone is the manner in which the wire is supported and made to turn round corners. This is accomplished by means of india-rubber corks fixed on wall brackets, attached to which are loops of wire. It will thus be seen that the whole arrangement is strictly mechanical. There is no electric apparatus to get out of order, and the difficulties arising from 'induction' are avoided. Each box acts as transmitter and receiver, and the system has the merit of simplicity.

The signalling balloon invented by Mr Bruce, which is shown at the Inventions Exhibition, has recently been tried for the first time in actual practice. Made of a material as translucent as possible, the balloon contains within its gas-chamber a number of incandescent electric lamps. These glow-lamps are in connection with the earth by means of wires which pass down the cord which holds the balloon captive. The current is put on to the lamps for short or long periods, so as to spell out messages from aloft by the Morse code.

A wonderful instance of the manner in which a scientific discovery can be turned to practical advantage has recently occurred. At the Montreal meeting of the British Association, Professor Lodge gave a lecture on 'Dust,' and pointed out a new observation due to himself and Mr J. W. Clark. These two gentlemen had made the curious discovery that the passage of electric sparks through a dust-laden atmosphere would quickly cause the dust to settle down. During the lecture alluded to, a bell-glass filled with mercurium smoke was subjected to experiment, and the contained air rapidly became clear when the sparks were passed through it. So much for the scientific discovery. Now for its application. The head of a firm of lead-smelters in Wales read a report of this lecture. He knew what difficulty there was in retaining the fume or volatilised lead from the smelting-works, and preventing it escaping from the flues to poison the atmosphere outside, besides robbing the smelter. He determined to see whether the electric spark would not cause the fume to fall in the same way that it acted upon dust. An experimental shaft made of barrels, with windows in it, and an electric machine by which sparks could be sent through the same, soon demonstrated

the fact that the thing could be done. The works are now to be supplied with apparatus for treatment of the fume on a large scale, and the results will be looked forward to with great interest. It will be evident that the principle is applicable to other industries besides lead-smelting, and its adoption will be hailed with satisfaction both by manufacturers and sanitary reformers.

On a broad river near the city of Baltimore, some experiments have lately been carried out by Professor Graham Bell with reference to the prevention of collisions at sea in times of fog. These experiments are based on the well-known property of bodies placed in the path of sound-waves reflecting back those waves as an echo. As a source of sound, a musket with a speaking-trumpet at its muzzle and loaded with blank cartridge was employed. This trumpet not only gave direction to the sound-impulse, but also intensified the audible effect. It was found that ordinary steamboats and vessels with large sails threw back an echo that was most readily observable. Even a boat approaching with its bow towards the source of sound threw back a feeble echo at a distance of a quarter of a mile. A curious effect was noticed when the surface of the river was rippled, each ripple sending back a reflected wave of sound, the whole resembling a distant roll of musketry. It is believed that this new method will be of great value in indicating the position of icebergs. It need hardly be pointed out that the distance of the obstructing body can be readily calculated by observing the lapse of time between the report and the reception of its echo.

Pintel's principle of compressing oil-gas for lamps on railways is now familiar to all travellers. It has for some time been applied to buoys at outlying places, where a light can be kept burning for many weeks or months according to the capacity of the apparatus. Eight such buoys have been in use for many months on the Suez Canal, and now four more have been sent out to the same place. A gas beacon made on this principle is to be erected in August next on the Gantoch rocks in the Clyde. The chief advantage of the system is, that a light can be kept burning without supervision for a very long period.

An outbreak of natural gas in the river Clyde, a few hundred yards below Bothwell Bridge, has lately excited much interest. It seems that the river in that place has for some time bubbled up in a curious manner; but it attracted no attention until an angler, happening to throw a cigar-light into the water, was astonished to see the bubble burst into flame. This flame rises to a height of several feet. Such outbreaks of gas are not unprecedented in Lanarkshire, more than one instance having been recorded in past years. But such displays sink altogether into insignificance when compared with the vast outpourings of natural gas in more distant parts of the world. The town of Pittsburg, Pennsylvania, for instance, is extensively lighted from subterranean sources. The supply at present is about twenty-five million cubic feet each day, and this will, it is anticipated, be increased to forty million feet when a ten-inch main now being laid is completed. The houses supplied number fifty mills and factories, besides numerous private residences.

The attention now being paid to the revival

of Irish industries has no doubt stimulated the promoters of the Irish Artisans' Exhibition, recently opened in Dublin. The object of this Exhibition is to show what can be done by workmen themselves in their spare time. The scheme has in every way proved to be a success.

There is much interest attached to the many schemes which are being introduced to supersede horse-traction by some mechanical mode of propulsion. Steam tractors are now common in many of our Northern and Midland towns, although the metropolis has for the present had nothing to do with them. Electrical tractors have been tried, and apparently found wanting, for they have not come into anything more than experimental use. Two years ago, an air-driven car was tried in North London, and for some months did its daily journeys in competition with the horses. We now learn that these trial trips were so satisfactory in every way that the Company intend to displace the whole of their horse-worked cars on this line by ten compressed air-cars on the McKerski system. The method has for some months been shown in operation on a short line in the grounds of the Inventions Exhibition. Its introduction will be hailed with delight by all who know what killing work the trainways are to the poor horses.

A swarm of bees settling on a man's head in Regent Street, London—a locality from which one must travel a considerable distance in any direction before green fields are reached—is an occurrence of too startling a nature to pass unnoticed. If the most daring novelists had described such an event, he would have been unmercifully ridiculed. But the truth, ever stranger than fiction, still remains, that a gentleman in Regent Street was lately seen covered from crown to waist with a large swarm of bees. After walking up and down for some time in the hope that his strange tenants would leave him, he was assisted to remove his coat and hat. The swarm then took flight, leaving behind them luckily only one or two stings.

Jordan's improved Sunshine Recorder is an instrument of great value to the meteorologist, and of interest to all, when it is considered what an important aid to human welfare in various ways is the presence of actual sunshine. The means of recording the exact amount of this life-light which is received in various districts month after month and week by week, for the sake of comparison with other phenomena, is naturally a thing of great moment. The improved instrument is very simple in construction, and cannot get out of order. It consists of a hollow cylinder, lined with a chart made of paper sensitive to light. The solar rays reach this surface through two small openings, one aperture serving for the sun's entrance during the morning hours, and the other for the afternoon. When once adjusted according to the latitude of the place of observation, the recorder requires no attention beyond a visit to replace the chart by a blank one every evening. The chemical record is rendered permanent by merely soaking the paper in water for a short time.

It is remarkable that the chief precious metals, gold, platinum, and silver, are characterised by a high degree of ductility. Professor S. P. Langley has recently obtained platinum wire

one-fifteen thousandth of an inch in diameter. This, however, is by no means the limit of attainable tenacity, as the metal may be drawn much finer if care be taken to secure perfect freedom from dust particles, which scratch the wire and lead to its rupture. Mr Read of Brooklyn, indeed, has produced a platinum thread which is so fine as to be scarcely visible to the ordinary unassisted eye. The following is his ingenious method of preparing these filaments. He covers ordinary platinum wire with an outer coat or tubing of silver; this bimetallic combination is then drawn like ordinary wire, the process being repeated until an incredible degree of tenacity is attained. When the proper stage has been reached, the silver-covered platinum wire is plunged into a bath of nitric acid, which dissolves off the envelope of silver and leaves bare the fine core-thread of platinum. Mr Read proposes to employ this fine platinum filament, instead of the ordinary glass filament at present in use, for dividing the fields of certain optical instruments.

As it is not everybody who has the good fortune to have sun-blinds affixed to every window in his house, it may be worth while to note that a very effectual and very cheap protection from the sun's rays is within the reach of most people. It consists in simply lowering slightly the upper division of the window-frame, and turning the ordinary linen blind outside instead of inside the window. Thus the window-panes are not only shaded, but a space, through which there is necessarily a draught, is between them and the linen. The effect in cooling a room when the blaze is strong is quickly perceptible, for, as is well known, the oppressive warmth from an unshaded window is due chiefly to the accumulated heat in the glass. While the bright sun is on the blind, there will be plenty of light in the room. Should a wind shake the blind inconveniently, it can be kept still by drawing the cord and tassel into the room and securing it by shutting down the lower division of the window-sash.

At a meeting of the Scottish Meteorological Society, there has just been exhibited an anemometer (wind-measurer) devised by Professor Crum Brown of Edinburgh. Mr Dickson has for some time been making observations with it at the Marine Station, Granton. The instrument has eight cups, instead of the four used in the ordinary Robinson anemometer; and the gusts of wind, turning the shaft in a degree proportioned to their strength, record themselves by pencil on a sheet of paper wrapped round a cylinder which is driven by clock-work—thus giving the time of occurrence of the various gusts. What has yet to be done, it was stated, was to give an arithmetical value to the strength of the gusts as recorded; and it was mentioned that with that view it was intended to obtain permission to affix such an instrument to a train travelling at a known rate of speed.

The hot weather has once more brought to the front the very difficult question of sewage disposal in our large towns and cities, the metropolis and its dirty Thames naturally figuring as the moral to adorn the tale. The metropolitan authorities seem to be quite powerless to mend matters. A recent visitor to the works on the Thames tells

us that nothing whatever is being done beyond a little experimental work with a toy tank. Perhaps the best suggestion for dealing with this bugbear, which becomes more difficult to deal with every year, is that of Mr Page, a Thames ship-owner—namely, that a small fleet of large tank steamers should be built to carry the daily sewage of London far out to sea, and there discharge it in deep water. Such a fleet could be built for the price of one ironclad, and its object would be to save life and not to destroy it. This proposal has, we learn, been already submitted to the Metropolitan Board of Works.

OCCASIONAL NOTES.

SIMPLE PISCICULTURE.

To stock small lakes and rivers with trout is now, owing to recent advances in the knowledge of pisciculture, an easy and by no means expensive matter. By a system of which we are about to give some useful particulars, thirty thousand trout-fry can be turned into a stream at a cost—irrespective of carriage—of less than twenty pounds. To carry out the system, experience is not absolutely necessary, provided there is sufficient intelligence to take its place.

A most difficult part of pisciculture is spawning the fish, and taking care of the ova until they become eyed, that is, until two little dots can be seen in the egg, which indicate that the embryo fish is safely inside, and will soon be ready to emerge. Constant attention, pure water, and other essentials, are necessary to bring the ova up to the eyed stage; but after that, the rest is simple. As has been previously noted in these pages, pisciculturists, and notably Sir James Maitland of Howickton (Stirlingshire), now sell the eggs when they are about a week off hatching, for they then travel well on swan's-down, in boxes, packed between layers of moss. The one essential is to keep them cool by means of ice, otherwise they are apt to hatch out, or die on the journey. The great advantage of purchasing the ova in their eyed state is, that then the chief dangers have been got over; the ova are hardy and not easily injured, and can be hatched out almost without appliances and without difficulty. They have simply to be laid down in the bed of a stream in about six or eight inches of water, covered with fine wire-netting, to keep off water-hurds, rats, and fishy foes; and, provided no heavy flood comes and sweeps them away, they hatch out in a few days, after which the fry—or alevins, as they are called for the first few weeks of their existence—shift for themselves. The foregoing is the most simple method of dealing with the ova, and owing to its simplicity, it often succeeds when more elaborate plans fail. In some streams, the water where only six inches deep, runs a little too rapidly to allow the ova to remain on the bottom. The best plan, then, is to go to some shallow on which there is only one or two inches of water; scoop out a trough half-a-dozen inches deep; strew the bottom with small gravel stones about the size of cobnuts, and on them lay the ova, of course covering with wire-netting, as before. Some judgment is required as to the choice of a shallow, as, if the stream is too strong, it will cover

the eggs with sand and small stones; whereas if no water flows through the trough, few if any of the eggs will hatch. It is a good plan to make the trough rather larger than is wanted, and not to put any eggs within a foot of its head.

The eggs should be laid down without being touched with the hand. When the lid of the box in which they arrive from the fishery is unscrewed, they will be found in layers on swan's-down, and covered with pressed moss. The latter should be *rolled* (not lifted) off them; the swan's-down, held by each side, should be put in the water, and the eggs floated off it into the trough, or 'redd,' to use the proper term. The eggs should not lie in a heap; but it will not matter much if they touch one another. If they lie too thickly, a slight disturbance of the water over them with a feather will cause them to separate. Where the stream is naturally rather muddy, and gives considerable deposit, the eggs should only be laid down about three days before they are due to hatch, otherwise they get covered with sediment, and are thus suffocated.

Late autumn, winter, and early spring are the times during which eyed ova can be obtained. It is well to take advantage of a spell of fine dry weather for the hatching-out, floods being very troublesome and occasionally ruinous to the pisciculturist.

One thing must always be borne in mind—namely, that still water is fatal to trout-eggs. Therefore, it would be futile to sow ova in the bed of a mill-tail, for when the mill stopped work on Sunday, they would all be suffocated, by reason of the non-aeration of the water. Deep water, also, is likely to suffocate them. After the ova hatch, the little fry or alevins will be noticed to have a yellow bag about the size of a pea attached to them. This is called the yolk, or umbilical, sac, and contains the food which nourishes them for the first three or four weeks; when it has nearly disappeared, the little fish come from under the stones where they have been for some time hidden, and begin to seek food for themselves. Not the least advantage of this system of stocking is that the young fry spread over the stream and find their own food; for the greatest losses occur in piscicultural establishments during the fry period, owing to the difficulty of feeding them in any things.

In brooks which are very subject to floods, and therefore unfit for artificial trout-breeding, the following plan can be followed: parallel to the brook, dig a long narrow trench, and make the bottom six inches below the level of the water. Run water into it at one end and out at the other by means of three-inch drain-pipes. The bottom of the trench must be covered with gravel, and in it the ova can be hatched, going, when they feel inclined, into the brook through the outlet pipe. If built properly, floods will not affect this redd, as not more than a certain amount of water can possibly enter through the inlet pipe. A redd of this kind, fourteen inches wide and fifteen feet long, will easily contain a box of fifteen thousand ova.

In stocking a lake or large river, the eyed ova should be sown in some stream connected with it. The ova of Loch Leven trout may with

great advantage be used for lakes, and possibly for very large rivers. Ova of the common brown trout are best for smaller streams. It has quite recently been found out that American brook-trout do well in lakes through which no river runs; but they have not been a success in the rivers of this country.

HALF-BRED SALMON.

An interesting experiment, conducted by Dr Francis Day, at the Howietown Fishery, in Stirlingshire, has come to an untimely end. Not very long ago, learned theorists leaned strongly to the opinion that a hybrid between salmon and trout was an impossibility; but practical men, on the other hand, were inclined to take the contrary view. Among these latter was Sir James Maitland, the owner of the Howietown Fishery, who quickly proved his views on the subject to be correct by fertilising eggs of twenty thousand Loch Leven trout with the milt of a salmon (*Salmo salar*). These hatched on March 9, 1882, just seventy-five days after they were laid down on the 'grilles,' and for probably the first time in the history of pisciculture, a race of half-bred salmon came into existence.

From these hybrids it was hoped that a valuable kind of fish might be bred, possessing many of the excellent qualities of the salmon without its migratory habits; but whether these particular hybrids were capable or not of continuing their species, was a doubtful question, only to be solved by time. In the fry-stage, always the most trying period, there seems to have been a considerable mortality among the little fish, for on November 15, 1882, there were only about a thousand remaining, the finest specimen being four and a half inches long. In March, 1884, the hybrids were reduced to two hundred and twelve in number, but all were apparently in excellent health. They were about this time placed in an octagon pond, having a diameter of twenty feet, and a depth of five and a half feet. The largest specimen then was a little over ten inches in length; but some were not above two and a quarter inches—a remarkable difference in size, when it is remembered that the ages and parents were the same.

During the autumn of 1884 and the early spring of this year, several fish were taken out of the pond; but all were sterile. In May, however, a fish was taken out dead, which proved to be a female with eggs developing, and which, in Dr Day's opinion, would, had it lived, have bred this winter. In July, owing to the great drought, the stream which fed the pond became very low, and the pond was a good deal discoloured. One morning, the keeper, on going to feed the hybrids, saw one dead fish floating, and none rose to the surface to take the food. The water was at once drawn off, and it was discovered that, with one exception, all the fish were dead. The largest was found to be thirteen and a half inches long, and weighed over a pound.

The termination—for we cannot call it failure—of this interesting and important experiment is much to be regretted. This winter, the hybrids would probably have been crossed with themselves, and also with trout and salmon, and a valuable kind of fish might have been the

result. In a detailed account of the experiment, written by Dr Day, it is stated that there are fortunately some more of similar but younger hybrids at Howietoun, which will in due course solve the inquiry.

PROPOSED EARTHQUAKE OBSERVATIONS ON BEN NEVIS.

At a recent meeting of the Scottish Meteorological Society, Professor Ewing, Dundee, described the manner in which he proposes to conduct a series of earthquake observations on Ben Nevis. He was, he said, instigated to take up the work by three of the directors of the Society; and in setting himself to it, he had adopted a wider view of the sense of the word 'earthquake' than was colloquially attached to it. If he accepted the restricted meaning of the word, there would, he supposed, be very little observation possible on Ben Nevis; but recent observations made in various parts of the world had shown that for the earth to be really at rest was an event of the most extreme rarity, if it ever occurred at all. In the wider meaning which he proposed to give to the word 'earthquake,' they must understand at least three tolerably distinct classes of earth-movements. There were, first of all, earthquakes proper; and here he might say that he had served a pretty good apprenticeship in the observation of these, having experienced about three hundred of them during a five years' residence in Japan. Next there came a class of earth-movements of so very delicate a kind as to be totally undistinguishable without some form of instrumental assistance—earth-tremors, he called them; and last of all, there were what might be named changes of the vertical, or those tiltings which the earth's surface seemed to be constantly undergoing. Professor Ewing then described in detail the three instruments which he was having constructed for the purpose of recording earth-movements. What was wanted in the observation of earthquakes proper and of earth-tremors was an approach to neutral equilibrium; and this he had endeavoured to secure by an apparatus which was so adjusted as to combine a pendulum proper with what was in effect an inverted pendulum—the inverted pendulum being below the other, and the 'bobs' of both being connected by what is virtually a ball-and-socket arrangement. In the case of the instrument intended to record the changes from the vertical, a mirror firmly fixed in the rock is so placed in relation to a plate of mercury that when there is no tilting the images of both coincide, and are taken in by a microscope placed in a certain position. When, however, there has been any tilting, the images diverge, and the microscope at once detects the divergence, as well as the extent of it.

ANOTHER GREAT AFRICAN WATERWAY.

Since the discovery of the course of the Congo itself, no more important addition to our knowledge of the hydrography of the region has been made than that from which the Rev. G. Grenfell has recently returned. He has proved that the Mobangi, which enters the right bank of the Congo, forming a great delta, between twenty-six and forty-two minutes south latitude, nearly opposite Equator Station, is probably its greatest

tributary. Certainly, so far as yet known, it offers a much longer waterway than any affluent that has been explored. Mr Grenfell navigated the Mobangi in the little steamer *Peace*, on a mean course of north by east, from the equator to four degrees thirty minutes north latitude, and left it still in an open waterway. At four degrees twenty-three minutes north, just below the second rapids, he found it six hundred and seventy-three yards wide; at no point lower was it less in width. Its mean depth is twenty-five feet, and although there the current runs not more than eighty to one hundred feet per minute, it means an immense volume of water to find running south at a point, as Mr Grenfell puts it, so near the supposed sources of the Bahré, the great affluent of the Niger. Where does it all come from? he asks. The 'trumbashes' of the Chad basin (Schweigenfurth) are common, while they are not known on the Congo. The opinion of Mr Grenfell and of his Congo colleagues is, that the Mobangi is probably the lower part of the Weke, a river whose course is one of the unsolved problems of African geography. A large map, in ten sheets, of the explored part of the river has just been received at the Royal Geographical Society. This map will appear in an early number of the Society's proceedings; and a long narrative of Mr Grenfell's recent work will probably be published in the next number of the *Baptist Missionary Journal*. It is hoped, moreover, that a full narrative of Mr Grenfell's explorations will reach England in time to be read at the Aberdeen meeting of the British Association.

HOW TO PRESERVE CUT FLOWERS.

An important rule, though seldom regarded, says *Popular Science News* (United States, America), is never to cram the vases with flowers. Many will last if only they have a large mass of water in the vase, and not too many stalks to feed on the water and pollute it. Vases that can hold a large quantity of water are to be preferred to the spindle-shaped trumpets that are often used. Flat dishes filled with wet sand are also useful for short-stalked or heavy-headed flowers; even partially withered blooms will revive when placed on this cool moist substance. Moss, though far prettier than sand, is to be avoided, as it so soon smells disagreeably, and always interferes with the scent of the flowers placed in it for preservation. In the case of flowers that grow only in a cool temperature, and suffer when they get into warm and dry air, all that we can do is, to lessen evaporation as much as possible, and when such flowers have hairy stems and leaves, to submerge them for a minute, so that by capillary attraction they may continue to keep themselves moist and cool; but this is dangerous to table-cloths or polished surfaces, unless care be taken that the points of the leaves do not hang down, to prevent dripping. Another means of preventing delicate and sweet-scented flowers from flagging is to cut them with several leaves on the stem, and when the flower-head is placed in water, to allow only this head to remain above the water, while the leaves are entirely submerged. By this means the leaves seem to help to support the flower, which will then last for three days in a fairly

cool room. Frequent cutting of the stem is of great use; but with all flowers, by far the best plan is to put them outside, exposed to dew or rain, during the night, when they will regain strength enough to last for days. All New Holland plants, particularly flowering acacias, are benefited wonderfully by this apparent cruelty, and will even stand a slight frost far better than a hot room at night indoors.

A SAFE BENZOLINE LAMP.

A lamp has been invented on a principle which precludes the possibility of the oil escaping; and thus an explosion is made impossible. Our readers will be acquainted with the 'unsplishable' ink-bottle, in which an inside channel of glass of about two-thirds the height of the vessel descends from its top, having an open and somewhat-narrowed bottom, the arrangement making it impossible, or nearly impossible, for the liquid to escape. The same principle is adopted in Smith's Patent Benzoline Lamp, from which the chances of the oil spilling are even fewer than the chances of the ink spilling. The burner screws immediately over a metal channel which descends into the body of the lamp. At the bottom of this channel there is a good-sized hole, and a little way from the bottom there are a couple of small holes. Through the larger hole a sponge is fixed, the portion in the body of the vessel underneath being greater than the portion which protrudes above. The oil is then poured into the descending channel, and finds its way beneath through the smaller holes. Two fillings of the channel represent an adequate feeding of the lamp. All that now remains to be done is to screw on the burner, the wick descending from which will rest upon the head of the sponge, and will be fed with the oil by the process of absorption. The lamp may now be dropped or otherwise upset without the possibility of the imprisoned oil coming in contact with the flame; and thus perfect immunity from explosion is secured. An advertisement in connection with this newly patented lamp is that it is remarkably economical. The manufacturers—Messrs John Fell & Co., of Wolverhampton—assert that it will burn for fourteen hours at full flame without recharging, at the trifling cost of one halfpenny.

A NEW KETTLE.

A kettle has been invented which is entirely different in construction from the ordinary utensil in which water is boiled; and it is claimed for the novelty that it will perform its function in a considerably shorter space of time than its predecessors. The Victoria Steel Kettle, as the recent invention is called, has several points of difference from other kettles, but it possesses one prominent feature, upon which it mainly lays its claim to distinction. While the kettle is practically similar in shape to the article we are so familiar with, and is surrounded by a circular wall of an unvarying height, it needs but to be inverted for a novelty of construction immediately to manifest itself. One finds that it is seemingly hollowed out, and that the metal plate is shaped so as to form a diagonal flue, which, starting with the same circumference as the kettle itself,

tapers to a small opening at the back of the utensil immediately below the handle. Thus the capacity of the vessel for carrying water is reduced by about one-third, the advantage gained being that the fire, passing through the body of the kettle, causes a quick draught, and the water is raised to the boiling-point in from four to six minutes. The heat, being to a certain extent confined, of course attains considerably more intensity than if, as is usually the case, it merely played upon the bottom of the kettle and passed off on all sides without any restraint. The price of the kettle runs from two shillings and three-pence, and it is made in sizes capable of holding from one pint to a hundred gallons. The sole proprietors of the invention are the Patent Victoria Kettle Company, 7 Westminster Chambers, Victoria Street, S.W.

AT THE GATE.

We stand beside the little gate,
Hand clasping hand, my love and I;
The winds are hushed, the hour is late,
And we have met to say good-bye!
Never a soft cry heard
His wing above the river dips,
As we repeat the saddest word
That ever fell from human lips

'Mid tender sighs, 'tis breathed at last;
I seek to draw my hand away;
But oh, my darling holds it fast,
And love's fond pressure bids me stay.
Dear loving hand! so strong, so brave,
On locks of mine no more to lie,
Oh deck my tresses for the grave,
As I have hoped in days gone by.

Ah, gentle hand, that never more
Shall lead me o'er each rugged rock!
At evening, on our cottage door,
How welcome was your well-known knock.
We cannot smile, my dearest, now,
Our future seems so full of care;
There is a sadness in my brow,
There is a sadness in my hair.

Go, dearest, go, before the weak,
Fond pressure of the breaking heart
Show thee the path of thy dear life,
And bid the tell-tale tear-drops start.
Go, darling, go, my hand release!
'Tis duty pleads—shall we rebel?
Nay, love, be firm, and go in peace;
We part, because we love so well!

The Conductor of CHAMBERS'S JOURNAL begs to direct the attention of CONTRIBUTORS to the following notice:

- 1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.
- 2d. For its return in case of illegibility, postage-stamps should accompany every manuscript.
- 3d. To secure their safe return if illegible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them in FULL.
- 4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

If the above rules are complied with, the Editor will do his best to ensure the safe return of illegible papers.

WILD-FLOWERS OF OLD LONDON.

THE *Great Herball* of Gerarde, and Parkinson's *Theatre of Plants* have an interest apart from their quaint descriptions. They outline in flowers the environs of the London of their times; the fields inter-persing and surrounding it; the rustic lanes traversing some of the now busiest thoroughfares; and the rough solitary ways leading to the scattered villages around. Gerarde addresses his Dedicatorial Epistle to Sir William Cecil, Knight, Baron of Burghley, from his house in Holborn by London—a village ancient even in Elizabeth's time, extending from Holborn Bridge to the Bar, where the stream on whose margins it rose, and from which it had its name—the Oldborne, a branchlet of the Fleet—sprang up. A region of gardens and pasture-lands all the way from St Andrew's Church to Chancery Lane; and on the opposite side, between the village and Turnmill Brook, but separated from it by some fields, stood Hatton House and gardens, which had been extorted from their owner, Bishop Cox, in favour of the Lord-keeper, Sir Christopher Hatton.

In summer-time, the air of Holborn must have been redolent of hayfields and flowers. On the slope of the hill, between what is now Ely Place and what was formerly Fleet River, the neighbourhood of the after notorious Field Lane, Gerarde had one of his physic gardens, with more than a thousand specimens of trees and shrubs and flowering-plants in it; while roses were so abundant in the gardens of Hatton House, that the ill-used bishop had reserved to himself and his successors the right to gather twenty bushels of them yearly. It may be that the originally half-timbered houses, the gabled upper stories of which project over the pavement in front of Staple Inn, made part of the ancient village of Holborn, then, as now, a main thoroughfare to and from the City. It had been paved on both sides of the way in Henry VIII's

time, and lanterns lighted it in winter. Nearly opposite the Bar, Gray's Inn Lane with a little water-course on one side led between hedgerows over Bradford Bridge to Panerus meadows, and farther on to Battle Bridge. West of Holborn stretched the fields about St Giles's, with that most ancient of social institutions, the pound, for straying cattle, at their junction with Tottenham meadows. Beyond were Maribone Fields, with a few cowherds' cottages scattered through them; in the background, the heights of Hampstead, Highgate, and Hornsey, with lesser slopes rising from Battle Bridge to Islington; and in the valley, the Fleet River ran swiftly on between steep, sometimes clifty banks, from its source in the clay, on the southern side of Hampstead Hill, to its outlet at the foot of Snow Hill, to the Thames.*

Whichever way 'the curious and painful searcher after simples' bent his steps, sweet bits of unspoiled nature lay around him. East, west, north, or south, he was still in the neighbourhood of woods and fields and hedgerows; fields from the Charter House to Clerkenwell, with Finsbury and Moorfields stretching beyond the marsh by Ald or Alders-gate to the woods which lost themselves in Epping Forest. Over London Bridge from Southwark to Lambeth Palace, Lambeth marshes, without a habitation. And St George's Fields and Redriff marshes, a district of solitary farmhouses, cottages, and grazing cattle. All of them happy hunting-grounds for the herbalists. But places nearer home were still so unsophisticated that wild-flowers grew in them.

We know how unsullied the air must have been in Chancery Lane, when Gerarde found the earliest blown and most diminutive of our British flora, *Draba verna*, growing on the bricks of a wall there belonging to the Lord Southampton. But then, the common yellow wallflower sprang up between the tiles of the red steep-roofed houses, and the accredited

* Storer and Cronwell's *History of Clerkenwell*.

habitat of the bright flowering stoncrop (*Sedum*) was the 'tops of houses almost everywhere.'

In Holborn meadows by Gray's Inn, Gerarde found the red-flowered clary; and in Gray's Inn Lane itself, mallow and shepherd's purse, 'poor man's permacety'; and on the high bank by the footway going down the lane to Bradford Bridge, the bronzed leaves of the wild lettuce spread themselves. We know nothing of Bradford Bridge; but we can tell from the plants found there how tree-shaded and pretty the lower end of Gray's Inn Lane must have been, especially on the right-hand side of the bridge, with the water-course passing along thereby, where the sweet 'woodrose' nestled, and where the brown blossoms of the wood-rush, the blue-flowered lugle, and Paul's betony grew.

Behind Gray's Inn, in the meadow where Mr Lamb's conduit stood, 'the one with the figure of a lamb on it,' the white saxifrage flourished; and in the next pasture to the conduit head behind Gray's Inn, 'the one which bringeth water to Mr Lamb's conduit in Holborne [Mr Lamb had restored the conduit on Snow Hill], the sad-coloured leaves of the winter-rocket grew plentifully.' The pastures spreading from this to Pancras, where the old church 'stood solitary in the fields,' appear to have been, in the language of Parkinson, a bountiful 'treasury of nature.' Here grew the great red burnet, 'a gallant herb of the sun, the roots of which steeped in wine quickened the spirits, refreshed the heart, and yielded a certain grace in the drinking.'

In the field next the church grew the curious 'strawberry-headed trefoil,' the inflated calyxes of which are so coloured as to resemble the fruit from which it has its trivial name. The lesser hawkweed, yarrow, and all the common meadow flowers had their home here. The cuckoo-pint grew under the shady hedges leading to Kentish-town, a village by London; and in the same neighbourhood, the wild angelica spread its umbels of white flowers tinged with pink, and the yellow gladwyn flourished. On Kentish-town Green—a sadly uncared-for waste, we could imagine—the melancholy musk-thistle, with solitary drooping purple heads and musky odour, grew plentifully, with other species of its tribe; while, by the waysides, the crowfoot grew so commonly, that unless one turned his head into the hedge, he must see it as he walked. It gives one a vivid notion of the rusticity of the City to read that black cresses grew on all the mud-walls about London; that mithridate mustard flourished in the High Street, Pockham; and that white dead-nettle—known in those days as archangel—grew almost everywhere by ditch and roadside, except in the middle of the street. Ditches appear to have been frequent in the thoroughfares, a state of things extremely convenient for the

herbalist, who found what he calls spotted porcecaria (*perscaria*) with spikes of pinkish-white flowers, and large leaves plashed with purple, growing in the great ditch on the right-hand side of the way between Blackman Street and Newington. Enchanter's nightshade grew in a ditch-side against the Earl of Sussex's garden-wall, at his house in Barnaby (Bermundsey Street) by London, 'as you go from the Court which is full of trees unto a farmhouse near unto.' In this same ditch the water-buttercup (*Ranunculus aquatilis*) floated its white flowers; and beds of *cythobium* (willow-herb), and the rigid leaves of the horsetail, covered its banks.

This so-called 'ditch' appears to have been the channel of a little brook, which had its source in higher ground at Cumberwell, and running under the garden-wall of Bermundsey House, made its way by what was then Kentish Street (now Kent Street) to St Thomas's Waterings, the Southwark place of execution, at the junction of Kent St with the Old Kent Road. Here there was a little chapel and holy well, dedicated to St Thomas, where pilgrims to his shrine were wont to offer prayers for the safety of their journey. The ditch or stream at this point appears to have been interesting from the number of aquatic and other plants which grew there; amongst others—fit flowers for such precincts—wild rue, the dwale or nightshade, and that funeral flower of the old Romans, mallow. In the Lock Fields (a hospital for lepers formerly stood there), 'on the left hand of the highway as you go from the place of execution unto Dofford by London,' the large-flowered white saxifrage—a frequent plant in the environs of London in those days—grew plentifully.

By Redriff, on the banks of the Thames, Gerarde found snowflakes—a near relation of the snowdrop—blowing; and in summer, in the same vicinity, the flowering-rush in plenty. Here also the wild anagris flourished; but the whole southern side of the river, Southwark Fields, St George's Fields, Lambeth marshes, and Battersea meadows—these last till quite recent times—appears to have been a very paradise of simplers and botanists. The marshes themselves, and the watery ditches that divided them, abounded with moisture-loving plants, and hence old Gerarde's frequent references to these transpontine places as their local habitat. Here in the still ditches on the banks of Southwark towards St George's Fields, he found the great horsetail growing, and with it arrow-head and burr-reed. In St George's Fields, upon the ditch-sides, tall cat's-tail typha, and the great reed-mace, and yellow water-flag, flourished; and amphibious *perscaria*, with smooth green spreading leaves, and spikes of handsome rose-coloured flowers, shared all the plashy places with water-buttercup and frogbit. By Thames' side near to Lambeth the pretty water-violet abounded. Twenty years after Gerarde noticed it, Johnson, in his enlarged edition of the *Herbals*, tells us that of water-violets he had not found any such plenty in any one place as in the watery ditches adjoining St George's Fields. Willows grew plentifully in these cozy places, and the large-headed cotton-grass spread its

white flocks over wide spaces of the Surrey marshes.

Imagine Thames' side then! A few clumsy barges sluggishly stealing up or down with the tide; a few wherries with a pair of oars or sculls ferrying passengers from one stair to another; or gilded and painted pleasure-barges giving life and animation to its surface; and every little point and bend of the shore fringed with osiers, and beds of tall-stemmed willow-herb flushing wide spaces with its large rose-pink flowers; and yellow *lysmachia*, which Gerardie prettily calls tree primrose; and the 'long purples' of common loosestrife; and here and there an outer jungle of tall reeds or gray-plumed sedges, for ever rustling to the ebbing or flowing tide. The yellow loosestrife grew not only by the river-side, but in the moist meadows as you go from Lambeth to Battersea; and the purple kind lifted its tall spikes of handsome blossoms under the bishop's house-wall at Lambeth near the water of the Thames.

'Ladies' mantle' or 'parsley piert,' grew plentifully 'by the mere-stones by Lambeth which divide the liberties of London from Surrey.' The narrow-leaved rocket (rock-cress), a kind of cousin to the cresses, was found in the clinks and crevices of a stone wall 'as you go from Lambeth Bridge, and under a small bridge that you must pass over hard by the Thames.' It was in a field at Southwark, at the back 'of the theatre by London'-the Globe, Shakespeare's theatre—that Gerardie found, amongst the glazed and golden cups of crowfoot growing there, one with a double flower.

We find, from Tanswell's History of Lambeth, that Lambeth marsh was considered, eighty years ago, a rural retreat. Leading from it were pretty walks, with pollard willows on each side—scenery probably of those that grew there when Gerardie and Parkinson lived. At Battersea, the marshes became meadows, too recently the haunt of modern botanists to be regarded from an antique point of view. We of the present day have no idea of the little streams and rills that ran in and out about Old London and its environs, occasioning the frequent use of bridges. Thus, the lesser cat-tail typha grew by the bridge entering into Chelsea Fields as one goeth from St James's to Little Chelsea. This was probably the field next St James's Wall, where, amongst many other grasses, the little quaking-grass, which 'in Spain is called *amourette*, or the 'lovely grass,' flourished. There also grew that persistent weed clown's woundwort, which set up its square rough stem with narrow dark leaves and spikes of purplish red gaping flowers, speckled with white, in all the fields and pathsides about London.

Beyond the abbey, the Westminster side of the river was a more marshy tract, its margins flowery with water-flags and other aquatic flora, and guarded as it were by tall typhas and sedges, amongst which the water-soldier, and the great burr and mace reed, predominated.

Around Westminster Abbey, Tothill Fields, notwithstanding that the Lords Gray and Dacre had their mansions in the neighbourhood, appear to have been an uncare-for waste, in some places so dry and sandy, that the red spurry and the buck's-horn plantain grew there in plenty;

in others, so wet and marshy, that the red-rattle covered wide spaces with its bright blossoms and chattering seed-vessels; and fleabane, with button-shaped flowers of a glistering gold colour, and the handsome goat's-beard, with grass-like leaves and purple flowers, made it their home. There, standing against the sun, maudlin-wort or great moon-daisy opened its white-rayed flowers; and the pretty speedwell Paul's betony, and prettier eyebright, Milton's euphrasy, found grassy spots in which to grow. There were plashy places also, in which, as lately as Curtis's time, *Polypogon monspeliensis* specially survived, and nowhere else around London.

Even the abbey had its flora, not simply the wall-loving whitlow-grass, sandwort, pellitory, and the inevitable wall-rue—as proper to ancient ecclesiastical edifices in our days, as the wall-flower was in Gerardie's, when he tells us it was in 'the corners of churches everywhere.' The latter herbalist has noted that wall-pennywort 'grew on Westminster Abbey over the door that leadeth from Chaucer's tomb to the old palace.'

A little lower down the Thames' side, right against the Queen's palace of Whitehall, and in many other places, the graceful trailing moneywort, with smooth shining leaves, of a tender green, and large yellow flowers, fringed its margin. Here, the handsome flowering-rush—old Gerardie's 'water ghilole'—a giant in those days, sent up its submerged sword-shaped leaves and stately stalks, from one to six feet high, crowned with corymbs of many rose-coloured flowers.

We have the Watergate of York House, the house in which Sir Francis Bacon was born, still standing at the bottom of Buckingham Street, Strand; but it is pleasant to recall the willows fringing the margin of the river near it, and giving freshness and beauty to it. Very near this site, the sea-starwort (Gerardie's blue daisy) grew; and hercubonts, near to old Hungerford Market, it continued to open its fair lilac-rayed flowers with yellow centres, amongst barks of timber imbedded in the ooze, within the memory of the writer. Still later, the arrowhead maintained its place by Thames' side. But the floating beds of water-ranunculus, and leafy rafts of frogbit (*Morus ranæ*), crowded with pellucid flowers, white, and almost as delicate as snow-crystals—these ceased to beautify the shallow margins of the river about the time when the water-violets and the pond-lilies (beloved of swans) withdrew themselves to its upper reaches.

In the Tower moat, or ditch, as it was called, these Thames' side aquatic plants concentrated themselves. There they might be found, centuries after the Elizabethan herbalists had noticed their existence in it. Although the water in this ditch was said to be the first to freeze in London, the low temperature apparently did not interfere with their thriving.

The yellow charlock brightened the wayside 'going from Houndsditch by Bednall Green to Hackney, a village by London.' Here, between the bushes grew the pretty musk-mallow, which towards evening, in hot weather, emits a faint musky odour. Gerardie knew it as the vervain mallow. Here also, delighting in shade rather than the sunshine, the avens herb *benedictine*,

as it was sometimes called, on account of its remedial qualities, flourished. Faith in these has by no means died out in rustic places, the miners and colliers in what is known as the Black Country eagerly seeking it to make a kind of ale, which is considered excellent in chest affections, and a great purifier of the blood. On either side of the way, in both the wet and dry meadows, ladies' bedstraw, or 'cheeserennet,' abounded. Both avens and the latter plant had their uses in household economy in those days, the one being used for the dairy service its second name suggests; and the root of the other being dried and laid in press amongst linen and garments for the sake of its clove-like scent. In those old times, the cattle pastured in Goodman's and the Spitalfields cropped cowslips with the vernal grasses; and east-end children found the first primroses and violets in the hedges there.

The lesser bugloss was growing on all 'the drie ditch-banks in Pickettills;' and the red dead-nettle continued to survive till Curtis's time on a bank on the right side of the way between Pimlico and Chelsea. Wild roses specially grew 'on the borders of a pasture as you go from a village by London called Knightsbridge unto Fulham, a village thereby.' In the wet, boggy places in the lane going by Tottenham Court towards Hampstead, the rush-grass ripened its brown spikelets of blossoms; and the vervain mallow, with its finely cut leaves and round rose-coloured flowers, 'which growth not everywhere,' grew in the ditch on the left hand of the place of execution at Tyburn. But of all these now curious habitats of wild-flowers mentioned by the old herbalists, one of the most curious is that of the common chickweed, 'which some,' observes (Gerarde, 'call *passamum*, because it refreshes little birds in cages, especially linnets, when they loathe their meat. The moist kind,' he adds, 'is found commonly growing in the gutters of houses'—a place suggestive of the habits of our forefathers, and the absence of sanitary commissioners in Old London.

A HOUSE DIVIDED AGAINST ITSELF.

BY MRS OLIPHANT.

CHAPTER XXXV.

GAUNT did not appear again at Eaton Square for two or three days, not, indeed, till after the great event of Frances's history had taken place—the going to court, which had filled her with so many alarms. After all, when she got there, she was not frightened at all, the sense of humour which was latent in her nature getting the mastery at the last moment, and the spectacle, such as it was, taking all her attention from herself. Lady Markham's good taste had selected for Frances as simple a dress as was possible, and her ornaments were the pearls which her aunt had given her, which she had never been able to look at, save uneasily as spoil. Mrs Cavendish, however, condescended, which was a wonderful stretch of good-nature, to come to Eaton Square to see her dressed, which, as everybody knows, is one of the most agreeable parts of the ceremony. Frances had not a number of

young friends to fill the house with a chorus of admiration and criticism; but the Miss Montagues thought it 'almost a duty' to come, and a number of her mother's friends. These ladies filled the drawing-room, and were much more formidable than even the eyes of Majesty, preoccupied with the sight of many toilets, and probably very tired of them, which would have no more than a passing glance for Frances. The spectators at Eaton Square took her to pieces conscientiously, though they agreed, after each had made her little observation, that the *ensemble* was perfect, and that the power of millinery could no further go. The intelligent reader needs not to be informed that Frances was all white from her feathers to her shoes. Her pretty glow of youthfulness and expectation made the toilet supportable, nay, pretty, even in the glare of day. Markham, who was not afraid to confront all these fair and critical faces, in his uniform, which misbecame, and did not even fit him, and which made his insignificance still more apparent, walked round and round his little sister with the most perfect satisfaction. 'Are you sure you know how to manage that train, little Fan? Do you feel quite up to your elbows?' he said in a whisper with his chuckle of mirth; but there was a very tender look in the little man's eyes. He might wrong others; but to Frances, nobody could be so kind or considerate. Mrs Cavendish, when she saw him, turned upon her heel and walked off into the back drawing-room, where she stood for some minutes sternly contemplating a picture, and ignoring everybody. Markham did not resent this insult. 'She can't abide me, Fan,' he went on. 'Poor lady, I don't wonder. I was a little brat when she knew me. As soon as I go away, she will come back. And I am going presently, my dear. I am going to snatch a morsel in the dining-room, to sustain nature. I hope you had your sandwiches, Fan? It will take a great deal of nourishment to keep you up to that curtesy.' He patted her softly on her white shoulder, with kindness beaming out of his ugly face. 'I call you a most satisfactory production, my dear. Not a beauty, but better—a real nice innocent girl. I should like any fellow to show me a nicer,' he went on with his short laugh. Though he uttered that chuckle, there was something in it that showed Markham's heart was touched. And this was the man whom even his own mother was afraid to trust a young man with! It seemed to Frances that it was impossible such a thing could be true.

Mrs Cavendish, as Markham had predicted, came back as he retired. Her contemplation of the dress of the debutante was very critical. 'Satin is too heavy for you,' she said. 'I wonder your mother did not see that silk would have been far more in keeping; but she always liked to overdo.—As for my Lord Markham, I am glad he will have to look after your mother, and not you, Frances; for the very look of a man like that contaminates a young girl.—Don't say to me that he is your brother, for he is not your brother. Considering my age and yours, I surely ought to know best.—Turn round a little.—There is a perceptible crease across the middle of your shoulder, and I don't quite like the hang of this skirt. But one thing looks very

well, and that is your pearls. They have been in the family I can't tell you how long. My grandmother gave them to me.'

'Mamma insisted I should wear them, and nothing else, aunt Charlotte.'

'Yes, I daresay. You have nothing else good enough to go with them, most likely. And Lady Markham knows a good thing very well, when she sees it.—Have you been put through all that you have to do, Frances? Remember to keep your right hand quite free; and take care your train doesn't get in your way.—Oh, why is it that your poor father is not here to see you, to go with you! It would be a very different thing then.'

'Nothing would make papa go, aunt Charlotte. Do you think he would dress himself up like Markham, to be laughed at?'

'I promise you, nobody would laugh at my brother,' said Mrs Cavendish. 'As for Lord Markham'— But she bit her lip, and forbore. She spoke to none of the other ladies, who swarmed like numerous bees in the room, keeping up a hum in the air. But she made very formal acknowledgments to Lady Markham as she went away. 'I am much obliged to you for letting me come to see Frances dressed. She looks very well on the whole, though, perhaps, I should have adopted a different style, had it been in my hands.'

'My dear Charlotte,' cried Lady Markham, ignoring this ungracious conclusion, 'how can you speak of letting you come? You know we are only too glad to see you whenever you will come.—And I hope you liked the effect of your beautiful pearls. What a charming present to give the child, I thought it so kind of you.'

'So long as Frances understands that they are family ornaments,' said Mrs Cavendish stily, rejecting all acknowledgments.

'There was a little murmur and titter when she went away. 'Is it Medusa in person?' 'It is Mrs Cavendish, the wife of the great Q.C.' 'It is Frances' aunt, and she does not like any remark.'—'It is my dear sister-in-law,' said Lady Markham. 'She does not love me; but she is kind to Frances, which covers a multitude of sins.'—'And very rich,' said another lady, 'which covers a multitude more.' This put a little bitterness into the conversation to Frances standing there in her fine clothes, and not knowing how to interfere; and it was a relief to her when Markham, though she could not blame the whispering girls who called him a guy, came in shuffling and smiling, with a glance and nod of encouragement, to his little sister to take the mother down-stairs to her carriage. After that, all was a moving phantasmagoria of colour and novel life, and nothing clear.

And it was not until after this great day that Captain Gaunt appeared again. The ladies received him with reproaches for his absence. 'I expected to see you yesterday at least,' said Lady Markham. 'You don't care for fine clothes, as we women do; but five o'clock tea, after a Drawing-room, is a fine sight. You have no idea how grand we were, and how much you have lost.'

Captain Gaunt responded with a very grave, indeed melancholy smile. He was even more

dejected than when he made his first appearance. Then his melancholy had been unalloyed, and not without something of that tragic satisfaction in his own sufferings which the victims of the heart so often enjoy. But now there were complications of some kind, not so easily to be understood. He smiled a very serious evanescent smile. 'I shall have to lose still more,' he said, 'for I think I must leave London—sooner than I thought.'

'Oh,' cried Frances, whom this concerned the most; 'leave London! You were to stay a month.'

'Yes; but my month seems to have run away before it has begun,' he said confusedly. Then, finding Lady Markham's eye upon him, he added 'I mean, things are very different from what I expected. My father thought I might do myself good by seeing people who—might push me, he supposed. I am not good at pushing myself,' he said with an abrupt and harsh laugh.

'I understand that. You are too modest. It is a defect, as well as the reverse one of being too bold. And you have not met—the people you hoped?'

'It is not exactly that either. My father's old friends have been kind enough; but London perhaps is not the place for a poor soldier.' He stopped, with again a little quiver of a smile.

'That is quite true,' said Lady Markham gravely. 'I enter into your feelings. You don't see that the game is worth the candle? I have heard so many people say so—even among those who were very well able to push themselves, Captain Gaunt. I have heard them say that any little thing they might have gained was not worth the expenditure and trouble of a season in London—besides all the risks.'

Captain Gaunt listened to this with his discouraged look. He made no reply to Lady Markham, but turned to Frances with a sort of smile. 'Do you remember,' he said, 'I told you my mother had found a cheap place in Switzerland such as she delights in? I think I shall go and join them there.'

'Oh, I am very sorry,' said Frances, with a countenance of unfeigned regret. 'No doubt Mrs Gaunt will be glad to have you; but she will be sorry too. Don't you think she would rather you stayed your full time in London, and enjoyed yourself a little? I feel sure she would like that best.'

'But I don't think I am enjoying myself,' he said, with the air of a man who would like to be persuaded. He had perhaps been a little piqued by Lady Markham's way of taking him at his word.

'But there must be a great deal to enjoy,' said Frances; 'every one says so. They think there is no place like London. You cannot have exhausted everything in less than a week, Captain Gaunt. You have not given it a fair trial. Your mother and the general, they would not like you to run away.'

'Run away, no,' he said with a little start; 'that is what I should not do.'

'But it would be running away,' said Frances, with all the zeal of a partisan. 'You think you are not doing any good, and you forget that they wished you to have a little pleasure too.'

They think a great deal of London. The general used to talk to me, when I thought I should never see it. He used to tell me to wait till I had seen London; everything was there. And it is not often you have the chance, Captain Gaunt. It may be a long time before you come from India again; and think if you told any one out there you had only been a week in London!

He listened to her very devoutly, with an air of giving great weight to those simple arguments. They were more soothing to his pride at least than the way in which her mother took him at his word.

'Frances speaks,' said Lady Markham—and while she spoke, the sound of Markham's hansom was heard dashing up to the door.—'Frances speaks as if she were in the interest of all the people who prey upon visitors in London. I think, on the whole, Captain Gaunt, though I regret your going, that my reason is with you rather than with her.—And, my dear, if Captain Gaunt thinks this is right, it is not for his friends to persuade him against his better judgment.'

'What is Gaunt's better judgment going to do?' said Markham. 'It's always alarming to hear of a man's better judgment. What is it all about?'

Lady Markham looked up in her son's face with great seriousness and meaning. 'Captain Gaunt,' she said, 'is talking of leaving London; which, if he finds his stay unprofitable and of little advantage to him, though I should regret it very much, I should think him wise to do.'

'Gaunt leaving London? O no! He is taking you in. A man who is a ladies' man likes to say that to ladies in order to be coaxed to stay. That's at the bottom of it, I'll be bound. And where was our hero going, if he had his way?'

Frances thought that there were signs in Gaunt of failing temper; so she hastened to explain. 'He was going to Switzerland, Markham, to a place Mrs Gaunt knows of, where she is to be.'

'To Switzerland!' Markham cried—'the dullest place on the face of the earth.—What would you do there, my gallant captain? Climb?—or listen all day long to those who recount their climbings, or those who plan them—all full of insane self-complacency, as if there was the highest morality in climbing mountains.—Were you going in for the mountains, Fan?'

'Frances was pleading for London—a very unusual fancy for her,' said Lady Markham. 'The very young are not afraid of responsibility; but I am, at my age. I could not venture to recommend Captain Gaunt to stay.'

'I only meant—I only thought!—Frances stammered and hung her head a little. Had she been indiscreet? Her abashed look caught young Gaunt's eye. Why should she be abashed?—and on his account? It made his heart stir a little, that heart which had been so crushed and broken, and, he thought, pitched away into a corner; but at that moment he found it again stirring quite warm and vigorous in his breast.

'I always said she was full of sense,' said Markham. 'A little sister is an admirable

institution. And her wisdom is all the more delightful that she doesn't know what sense it is.' He patted Frances on the shoulder as he spoke.—'It wouldn't do, would it, Fan, to have him run away?'

'If there was any question of that,' Gaunt said, 'with something of a defiant air.

'And to Switzerland,' said Markham with a chuckle.—'Shall I tell you my experiences, Gaunt? I was there for my sins once, with the mother here. Among all her admirable qualities, my mamma has that of demanding few sacrifices in this way, so that a man is bound in honour to make one now and then.'

'Markham, when you are going to say what you know I will disapprove, you always put in a little flattery—which silences me.'

He kissed his hand to her with a short laugh. 'The place,' he said, 'was in possession of an athletic band, in rousing spirits and tremendous training, men and women all the same. You could scarcely tell the creatures one from another—all burned red in the faces of them, worn out of all shape and colour in the clothes of them. They clamped along the passages in their big boots from two o'clock till five every morning. They came back, perspiring, in the afternoon—a procession of old clothes, all complacent, as if they had done the finest action in the world. And the rest of us surrounded them with a circle of worshippers, till they clamped up-stairs again, fortunately very early, to bed. Then a faint sort of life began for *vous autres*. We came out and admired the stars and drank our coffee in peace—short-lived peace, for, as everybody had been up at two in the morning, the poor beggars naturally wanted to get to bed.—You are an athletic chap, so you might like it, and perhaps attain canonisation by going up Mont Blanc.'

'My mother—is not in one of those mountain centres,' said Gaunt with a faint smile.

'Worse and worse,' said Markham. 'We went through that experience too. In the non-climbing places the old ladies have it all their own way. You will dine at two, my poor martyr; you will have tea at six with cold meat. The table-cloths and napkins will last a week. There will be honey with flies in it on every table. All about the neighbourhood, mild constitutionals will meet you at every hour in the day. There will be gentle raptures over a new view.—"Have you seen it, Captain Gaunt? Do come with us to-morrow, and let us show it you; quite the finest view"—of Pilatus, or Monte Rosa, or the Jungfrau, or whatever it may happen to be. And meanwhile we shall all be playing our little game comfortably at home. We will give you a thought now and then. Frances will run to the window and say: "I thought that was Captain Gaunt's step;" and the mother will explain to Sir Thomas: "Such a pity our poor young friend found that London did not suit him."'

'Well, Markham!' said his mother with firmness, 'if Captain Gaunt found that London did not suit him, I should think all the more highly of him that he withdrew in time.'

Perhaps the note was too forcibly struck. Gaunt drew himself slightly up. 'There is

nothing so very serious in the matter, after all. London may not suit me; but still I do not suppose it will do me any harm.'

Frances looked on at this triangular duel with eyes that acquired gradually consciousness and knowledge. She saw ere long that there was much more in it than met the eye. At first, her appeal to young Gaunt to remain had been made on the impulse of the moment and without thought. Now she remained silent, only with a faint gesture of protest when Markham brought in her name.

'Let us go to luncheon,' said her mother.—'I am glad to hear you are not really in earnest, Captain Gaunt; for of course we should all be very sorry if you went away. London is a siren to whose wiles we all give in. I am as bad myself as any one can be. I never make any secret of my affection for town; but there are some with whose constitutions it never agrees, who either take it too seriously or with too much passion. We old stagers get very moderate and methodical in our dissipations, and make a little go a long way.'

But there was a chill at table; and Lady Markham was 'not in her usual force.' Sir Thomas said, who came in as usual as they were going down-stairs: 'Anything the matter?—Oh, Captain Gaunt going away. Dear me, so soon!' I am surprised. It takes a great deal of self-control to make a young fellow leave town at this time of the year.'

'It was only a project,' said poor young Gaunt. He was pleased to be persuaded that it was more than could be expected of him. Lady Markham gave Sir Thomas a look which made that devoted friend uncomfortable; but he did not know what he had done to deserve it. And so Captain Gaunt made up his mind to stay.

POPULAR LEGAL FALLACIES.

BY AN EXPERIENCED PRACTITIONER.

LANDLORD AND TENANT.

SEVERAL fallacies may be considered under this heading. The relations of landlords and tenants, with their respective rights and remedies, are somewhat complicated, and the popular mind is prone to twist into a fallacious shape anything which is not most simple; and it will be seen that even extreme simplicity is no safeguard against this twisting process. It may be premised that in what follows, *English law*, not *Scotch*, is mainly spoken of.

1. *The time of day.*—It might be thought that no rule of law or of common life was more simple and universally known than that each day ends at midnight; and yet there is no more widely spread delusion than that which relates to the time when landlords and tenants respectively are required to give notice to quit, or to deliver possession to each other. In many parts of the country, it is almost impossible to make people believe that noon is not the end of the day for these purposes. A notice is served in the afternoon or evening, and the landlord, or tenant as the case may be, refuses to receive it on the ground that it ought to have been served before twelve o'clock; which is true in one sense; but the

necessary twelve o'clock is midnight, not noon. In like manner, a landlord will serve upon his tenant a notice requiring possession to be given up to him before twelve o'clock at noon on the quarter-day, such notice being absolutely bad in law. When a certain act is to be done on a certain day, the law allows the whole of the day in question for doing that act, unless some express statutory direction be given as to the hour at which the requisite act is to be done, as, for example, the publication of notices on a Sunday during the hours of divine service. But as to the termination of tenancies, there is no such enactment, and consequently, the day ends at the usual hour, midnight; and anything which has to be done on a quarter-day may be done at any time on that day.

We do not advise that such things should be deferred until late at night; for in that case they might become impracticable. If a landlord were to delay serving a notice to quit until his tenant had gone to bed, he would lose his opportunity, and this might cause a delay of a year or any shorter period, according to the terms of the tenancy, as will be explained later. On the other hand, if a tenant were to keep the key until too late to find his landlord or any of his family, he would enter upon a new tenancy immediately after midnight, and could not escape from this additional responsibility until that tenancy could be determined by another notice to quit being served by either landlord or tenant. When a legal and valid notice is tendered and refused, the party giving such notice may nevertheless act upon it; and thus litigation is caused, and costs are incurred unnecessarily.

One of our principal objects in writing these simple papers is to prevent people from incurring unnecessary costs, and we have often been surprised at the extent to which litigants voluntarily tax themselves in this way. In the county courts especially, obstinate and litigious persons rush into contention without any reasonable excuse, and in nothing is the more frequently the case than in respect of the fallacy now under consideration. And yet the persons who will stake their money on the conclusion of the day for these purposes being at noon, will not adopt the same theory for any other purpose. We never heard of one of these deluded individuals dating as of Tuesday morning a letter written on Monday afternoon, although they will persist in treating a notice served on Monday afternoon as if it had been given on Tuesday.

2. *Distress for rent, on and off the premises.*—

When rent has got into arrear, the landlord may levy a distress upon the goods which are upon the premises; but here a mistake is often made somewhat similar to that which has been discussed in the previous paragraph. Supposing that the rent is payable quarterly, the tenant is allowed to pay it at any time on quarter-day, and a distress cannot legally be levied before sunrise on the following morning. But some hasty landlords have distrained before sunset on the quarter-day; and though many have done so with impunity, it is well that it should be generally known that this is an act for which the tenant might recover substantial damages. There is no special hour fixed for payment of rent, and therefore any distress levied before the expiration of

the day on which it becomes due is illegal; and as the intrusion without authority upon the occupation of the tenant is contrary to the feelings and instincts of our fellow-countrymen, they are in the habit of marking their sense of the indignity in heavy figures, when a case of illegal distress is brought before them for the purpose of assessing damages. The exceptions to the liability to be distrained upon with respect to articles in actual use—to goods sent to be wrought upon in the way of his trade by the tenant; and to tools of trade if there be sufficient other distress—are generally known, although mistakes are made occasionally even in these respects.

The remedy given to lodgers who have paid their rents, of claiming exemption for their goods, is a more recent statutory creation, and appears to be misunderstood in numerous instances. By the Lodgers' Goods Protection Act, 1871, if any superior landlord causes a distress to be levied in respect of rent due to him, upon the goods of a lodger upon the premises in respect of which the rent is due, such lodger may serve such superior landlord or his bailiff in possession with a declaration in writing that the intermediate tenant has no right to or interest in such goods—specified in an inventory annexed to the declaration—and that such goods are the property of, or in the lawful possession of, the lodger; and also setting forth whether any and what rent is due from the lodger to his immediate landlord. The lodger may pay to the superior landlord or his bailiff the rent due, or so much thereof as may be sufficient to discharge the claim for which the distress has been made; and such payment will be as effectual as if made to the intermediate landlord—the tenant of the house—personally. If the superior landlord should refuse to withdraw or give up possession of the lodger's goods, an application may be made to a magistrate for an order to deliver up the goods in question; and an action for damages may also be brought against the superior landlord, in which action, the truth of the declaration and inventory may be inquired into. (This Act does not extend to Scotland.)

Generally, a landlord can only distrain upon the goods which are actually upon the premises in respect of which the rent distrained for has become due; but there is one important exception to this rule. If a tenant fraudulently or clandestinely removes his goods, in order to prevent his landlord from distraining upon the same for arrears of rent, the landlord may within thirty days after the date of such removal, distrain upon such goods wherever the same may be found, unless in the meantime they shall have *bonâ fide* been sold to some person by the tenant or owner thereof. This appears to be simple enough; but even here, costly mistakes are sometimes made. In order to give the landlord this exceptional remedy, the removal must have been made to avoid a distress for arrears of rent; therefore, if no rent was due at the time of removal, the Act does not apply; neither does it apply when the removal is made at the end of a tenancy, after notice duly given by either party, even though some arrears of rent may then be outstanding. It is not necessary that the removal should be clandestine, though it will generally be so; still, fraud may be inferred

from other circumstances; and it is sufficient to bring a case within the statute that the removal is either fraudulent or clandestine; it need not be both.

3. *Arrears and notice to quit.*—Many landlords refuse to accept a notice to quit from a tenant whose rent is in arrear. This is altogether a mistake; the fact of the rent being in arrear does not affect the right of the tenant to give notice of his intention to give up possession of the premises which he occupies. But it is seldom prudent for a tenant to exercise his right in such circumstances. When a landlord receives notice that a house is going to be thrown on his hands, he generally takes the precaution of distraining, if any arrears of rent are due. He has a legal right to do this, and we cannot blame him for adopting the means provided by the law for the protection of his interests. If he were to remain quiescent and allow the tenant to remove his goods, his only remedy would be an action in the County Court. Everybody knows that this process is much more tedious, costly, and uncertain than the remedy by distress, which is available so long as the goods remain upon the premises.

4. *Double notice to quit.*—Many tenants give their landlord notice of their intention to give up possession, and then refuse to go when the notice has expired, believing that the landlord cannot do anything to expel them until he himself has given them notice to quit. This is a delusion; and we were much surprised when we first had occasion to know how widely spread the belief in the notion had become. It is not confined to any particular locality in England, but extends from Northumberland to Cornwall. And yet there is absolutely no foundation for such a belief. A moment's consideration might show its baselessness. If it were necessary for both parties to give notice in order to determine a tenancy, practically it would be impossible for a tenancy to be put an end to except by mutual consent; the two notices would not be likely to end on the same day; and unless they did, they could not both be operative. The relations of landlord and tenant are revocable by either party, subject to the terms originally arranged between them; and neither party can bind the other longer than is warranted by the terms mutually arranged in the first instance. Besides, it would be unreasonable for a person to be allowed to treat his own notice as a nullity, whatever objections he might make to a notice served upon him by the opposite party.

5. *Holdover after lease.*—It is very commonly the case that after the expiration of a lease for years, the tenancy is continued without any special agreement being come to between the lessor and the lessee. In this case, if the former should accept from the latter any rent which became due after the expiration of the term of years for which the lease was granted, the tenancy becomes a yearly one, subject to such of the terms of the original lease as are not inconsistent with a yearly tenancy. The lessor might have taken proceedings for ejecting the lessee at any time before receiving such subsequently accrued rent; but after he has done so, he has lost that remedy; and if he wishes to obtain possession, he must give half a year's notice to the tenant to quit the premises in the usual course, as if there had

been an express agreement for a yearly tenancy; and the year will be held to have commenced immediately after the expiration of the lease. It must be observed that there may be special terms in the lease which are not applicable to a tenancy from year to year; and these will not apply to the tenancy created by implication rather than by agreement. The circumstances and the terms of leases are so various, that we could not in the space at our disposal distinguish what may or may not be binding upon the tenant; but when there is any uncertainty on the subject, the opinion of a solicitor ought to be taken in each case.

6. *Other yearly tenancies.*—Much uncertainty exists as to what constitutes a yearly tenancy; and as the difference between a yearly and a quarterly tenancy sometimes involves a considerable further responsibility for rent, the question is one of some practical importance. In the first place, a yearly tenancy may be created by express agreement, and even here there is some room for misconception. An agreement in writing—or partly printed—is often for one year, and so on from year to year. It ought to be generally known that such an agreement creates a tenancy of at least two years' duration; for the first year is a term certain, and only the subsequent tenancy is from year to year, and determinable by notice to quit. Again, a tenancy from year to year may be created by a simple letting at a yearly rent, without any stipulation as to the notice to be given. Many persons think that if they agree to pay their rent quarterly, they are quarterly tenants; but this is a mistake. If a house were let at a quarterly rent, the tenancy would be quarterly; but quarterly payment of rent is by no means inconsistent with a yearly tenancy; and as a matter of fact, a large number of yearly tenants of houses pay their rents every quarter. This is a matter of convenience, and has no necessary connection with the terms of tenancy which regulate the notice which is required to put an end to the letting. Again, a yearly tenancy may be created by a void lease for a term of years. A valid lease for a term exceeding three years can only be made by a deed under seal; but an agreement for ten years under hand only, is not wholly void; the tenant having entered into possession of the premises intended to be demised thereby, becomes a tenant from year to year upon such of the conditions specified in the agreement as are not inconsistent with a yearly tenancy. And therefore, if either landlord or tenant should wish to be released from the further performance of the agreement, a notice to quit may be given by the former, or a notice of intention to give up possession by the latter, subject to the same rules and limitations as are binding upon any other yearly tenant. And the same effect will follow upon the entry of a tenant under an agreement for a lease which does not accurately or completely define the terms of the intended lease, so that it cannot be made the ground* for an action for specific performance. A person who obtains possession of a house or land without the consent of the owner thereof may be ejected without previous notice. But if the owner accepts any rent from him, the relation of landlord and tenant is established; and generally he will be a yearly tenant

if the payment is such as might have been made by a tenant from year to year.

7. *Double rent or double value.*—These terms are generally supposed to be synonymous so far as their application to the present subject is concerned; but the fact is that they are two distinct rights, which have separate origins and different incidents and consequences. Double rent is payable where a tenant has given notice of his intention to give up possession, and has failed to deliver possession according to his notice. In any such case, the landlord may serve a notice upon the tenant that he will then forth be required to pay double his former rent, and such double rent is payable from that time to the end of the time during which possession shall be retained. Double rent may be distrained for in the same way as ordinary rent, and may also be made the subject of an action. This applies to all yearly tenancies; and there is some doubt whether it applies to weekly and other short terms. It has been decided that a weekly tenancy is not within the Act of Parliament; but the ground of this decision appears to be doubtful, as the enactment in express terms is made to apply to any tenant without qualification. On the other hand, the statute relating to the right to recover double value of the premises in case of a tenant wilfully holding over after his landlord has served a notice upon him to quit, and demanded possession in writing, is applicable to 'any tenant or tenants for any term of life, lives, or years.' In this case, there is another distinction which is often lost sight of; double value cannot be distrained for, the remedy being by action only. In either of these cases, the right of action would be waived if any single rent were accepted which had accrued due after the expiration of the notice to quit; although rent previously due may be received without giving up the right to the double rent or double value, as the case may be.

8. *Washing the roots of shrubs.*—This fallacy is of Northumbrian origin, and does not appear to have extended beyond the two counties of Northumberland and Durham. It is a part of the mistaken law relating to fixtures, but is sufficiently curious to merit separate notice. It is well known that the landlord becomes entitled to trees and shrubs planted upon his land by a tenant. But in the localities referred to above, there is a belief that this rule of law may be evaded by washing the roots of the shrubs after they have been taken out of the ground, so as not to take away any part of the soil in which they have grown. This is a delusion. The right of the landlord rests upon a different foundation, that is to say—that the trees or shrubs have become incorporated in his estate, and are part thereof. The taking away of the plant is the unlawful act; and it cannot make any material difference whether a large or a small portion of earth adheres to the roots when they are taken away. The shrub is of some value; the value of the earth which would cling to its roots can scarcely be calculated.

9. *Fixtures generally.*—The rule as to fixtures is one which occasions considerable perplexity to many persons, and occasionally causes much unnecessary disputing, leading to heavy costs. The general rule is, that whatever is affixed to the freehold becomes the property of the landlord;

while articles slightly affixed for the purposes of ornament, convenience, and the necessary enjoyment of the premises, are removable by the tenant at any time before the expiration of his tenancy. This rule is well illustrated by reference to gas-fittings: the pipes which are carried through walls and ceilings belong to the landlord; while the pendants, brackets, and other gasaliers, if put up by the tenant, are his property, and may be sold by him to his successor, or removed at his option. In some parts of England, it used to be customary for the tenant to provide fire-grates, ovens, &c., but this has become nearly, if not quite, obsolete. In no case can a tenant be entitled to remove what he has not placed in the property at his own expense, or purchased from his predecessor. For the encouragement of trade, the rule as to fixtures used for business purposes has been much modified; and it is much more favourable to tenants than the law relating to fixtures in private houses and gardens appertaining thereto. The first apparent difference which allows a nurseryman or market-gardener to remove trees or shrubs raised by him for the purpose of sale, is really nothing more than an extension of the rule which permits a tenant of a private garden to take up and carry away the vegetables which have grown in his garden during the term of his tenancy. In both cases, the original intention was that the contact of the roots with the soil should be only temporary. But several fixtures may be removed because they were fixed solely to enable the tenant to carry on his business; although the same or similar articles in a private house would have become the property of the landlord. The following examples must suffice: Green-houses built in the ordinary way; coppers, pipes laid through walls, and all kinds of brewing utensils; steam-engines in collieries, &c. But this would not extend to a substantial building, although the fixtures therein might be within the exception in favour of the tenant.

DUNLEAP TOWER.

A STORY IN FOUR CHAPTERS.—CHAP. I.

HER father said No; her mother said No; the whole family of Chevasse said No, emphatically.

'Circumstances alter cases,' wrote Mr Chevasse to me. 'You cannot in reason expect that I should willingly allow my daughter to wed a man who has not a sovereign in the world to call his own. When you had good expectations, the case was different; but now I have other views for Catherine,' and all communications between you and her must cease from this date.'

I could not give up Catherine so easily. I wrote to her; but my letters were returned unopened. I went in person, determined to see her, if it were possible to do so, and learn my doom from her own lips; but I found that the family had started for the continent on the previous day, and I could learn nothing as to their destination. I was winding up my father's affairs at the time, and found it impossible just then to attempt any pursuit. Three months later I read the following announcement in the *Times*: 'At Paris, on the 20th inst., Catherine, only daughter of Francis Chevasse, Esq., to

Martin, eldest son of Osgood Rudyard, Esq., of Russell Square, London.'

A fortnight more sufficed to complete the business I had in hand; and after all effects had been sold and everything cleared off, I found myself with three hundred pounds in my pocket. I bade adieu to my few friends, went down to the Docks, and booked myself by the best vessel for Australia.

I had plenty of time during the voyage to think over all that had recently occurred. First, the sudden break in my father's fortunes by which the fair prospects of my life seemed blotted out for ever; then my father's death; then the rupture with the Chevasse family, who had smiled on me and petted me in my prosperous days; and lastly, the news of the marriage of her I loved better than life.

I knew well the yielding disposition of Catherine, which suffered her to bend and sway to the will of others; it was one of the traits in her which I had loved best in other days. I knew the stern, cold nature of her father, and how he ruled his household with a rod of iron. I knew her worldly-minded mother. I knew how my darling would be baited and worried by all the family; how she would be shut out from the world, and gradually forced into a hateful marriage, through the unbending will of her father acting on her own passive gentleness, and by the dread of disobeying him, which had grown up with her from childhood, and had now become part of her nature. Still, while pitying her and loving her, I felt bitterly towards her, judging her by my own strength, and knowing what I would have gone through for her sake. Of Martin Rudyard, the man she had married, I had already some knowledge which was not of a pleasant kind. He had spent one session at the same public school where I was being educated. At the end of that time he had been summarily expelled; but even during his short sojourn there he had acquired the reputation of a bully and a black-guard. Catherine's chance of happiness with such a man seemed to me a very remote one indeed. But Rudyard was rich, and in the eyes of Mr Chevasse, that fact sufficed to condone a multitude of shortcomings.

That voyage was a miserable one; but youth is buoyant and I had only just seen my twenty-second birthday. When the Australian shore loomed in sight, half my troubles seemed to take to themselves wings, and I could look forward with a hopeful heart to the free rough life before me. I was as strong as a giant, and not above work of any kind; consequently, I was pretty sure to succeed. And succeed I did—not by any sudden stroke of fortune, but by slow, steady, accumulative labour, month after month and year after year. This is not the place to enter into any details of my life in Australia; it is sufficient to state that at the end of a dozen years I set sail for England, a comparatively wealthy man. The first sharp pain of my loss had been softened by years into a sweet memory that mellowed and ripened my life, and drew my thoughts by the golden links of a lost love to higher objects and different aims than they would perhaps have aspired to, had all gone well with me at first. But my trials were not yet over. We were

blown out of our course and lost our reckoning. Our ship struck on a reef in the night, and foundered in the course of a few hours. I had foolishly carried my savings with me, in specie, and when everything I had went to the bottom, except a few sovereigns which I had stitched into my clothing, I landed in England a poorer man than I had left it a dozen years before.

It was needful that I should find employment of some kind; and at the end of a few weeks, through the influence of an old friend of my father, I succeeded in obtaining an appointment as station-master at Brewwood, on one of the western railways. I wrote a brief note of acknowledgment to my kind friend, and set off thankfully for my new post.

There was but little traffic at Brewwood Station; one porter—Reuben Hart, a tall, grim, taciturn old man—and myself comprised the whole of the staff. The station lay in a valley, and Reuben's house was the only habitation in sight, for the neighbourhood was but thinly populated. Having purchased a few needful articles of furniture, and knocked up a shelf to hold a dozen or two of favourite authors, and having arranged with Reuben's wife to do what cooking and cleaning were required, I felt myself thoroughly at home, having learnt in the bush the art of dispensing with superfluities. But few trains stopped at Brewwood; the majority of them went rushing past it with a thunderous roll, and a wild fury of indifference to the existence of any such insignificant place.

As I soon became initiated into the routine of my duties, I found I had much spare time between trains and of an evening; so I took frequent rambles into the country, and employed myself in jotting down some of my Australian experiences, with a view to their subsequent appearance in print. My monotonous and lonely manner of life was by no means distasteful to me; after so many busy years, an interval of rest and seclusion seemed doubly welcome. Two chapters of my life were already closed; another would open before long—of that I felt sure; meanwhile, I waited quietly. One day, when I had been a week or two at my new occupation, a parcel was left by one of the trains, to be called for by the carrier who went the rounds of the neighbourhood. I took it up to copy the address into my book, as I did that of all parcels, but could scarcely for the moment believe in the reality of what I saw, when I read the direction: 'To Martin Rudyard, Esq., Isterby Manor, via Brewwood Station.'

I called to Reuben, who was cleaning a lamp near at hand. 'How long has Mr Rudyard lived in this neighbourhood?' I asked.

'He bought the Isterby estate nigh upon four years ago, sir, and he has lived here ever since.'

'He is married, is he not?'

'He is, sir; and his wife is as sweet a lady as you'd wish to see. But it's said that they don't live very happily together; and no wonder either, if half that's said about his goings-on is true.'

'The information thus elicited affected me deeply. Although Catherine was the wife of another, I could not forget what she had been to me long years before. To think that I had been living so near her without knowing it—that

she was in trouble, and I could not help her! She was only a few miles away, and yet we were as far apart as when seas rolled between us. I afterwards discovered that the reason of my not being sooner aware of Rudyard's residence in the neighbourhood, was the fact that another station lay more convenient to him; hence, he seldom was heard of at Brewwood.

I longed to see Catherine again, but knew that it must not be—that the sight of me would merely add to the weight of the heavy burden she had to bear already. From cautious inquiries made here and there, I soon gathered sufficient to show me how truly miserable must be the life to which she was doomed.

Martin Rudyard was both a rake and a sot; much of his time was passed in low public-houses among dog-fanciers, prize-fighters, and people of a similar stamp. The reputation of a blackguard followed him wherever he went. It made my blood boil to think of my gentle Catherine being wedded to such a man. Why did she continue to live with him? I often asked myself. Why not leave him for ever, and go back to her friends? I now occasionally spent my leisure time in wandering round Isterby Park, not daring to go near the house, for fear Catherine should see me; longing to free her from her terrible bondage, but discerning no method by which it could be accomplished.

I was awakened one night by the shrill whistling of an engine near at hand. I jumped out of bed and opened the window. 'What's up now, mate?' I shouted to a man below.

'A breakdown on the other side of the tunnel,' he replied. 'Both lines blocked. We've got a gentleman here that's badly hurt.'

Two minutes later, I was down-stairs and had my signals turned on to danger.

The man was lifted carefully out of the carriage and placed on some cushions in the waiting-room, and when the light shone on his face, I saw and recognised it at once as the face of Martin Rudyard. He was evidently much hurt, although none of his limbs appeared to be broken. He groaned heavily now and then, but otherwise seemed unconscious of all that was passing around. I at once despatched Reuben to Isterby Manor for assistance. In a few minutes more the throng and noise had died away, and the wounded man and I were left alone.

I had not seen Martin Rudyard since we were schoolfellows together, and in the coarse, disipated-looking man before me, with his blouted, sensual face, it would have been difficult, but for the peculiar cast of his features, to have recognised him again. It was with strange and mingled feelings that I now looked on him who had robbed me of my dearest treasure—a prize which he knew not how to value. I poured a little brandy down his throat. He gave a deep sigh, opened his eyes, and looked round with a vacant, dazed expression, like a man suddenly awakened from a deep sleep.

'Where am I?' he asked in a low hoarse voice.

'You are in the waiting-room at Brewwood Station. An accident has taken place near the tunnel, and you have been brought here till assistance can be obtained to carry you home.'

'Ay, ay; I remember something about it. Let

me have another swig at that brandy.—So.—It has done me good already. Won't I make that villainous railway Company come down with thundering damages, for injuring a man of my position!—Have you sent to Isterby?

'I have.'

'That's well. I believe one of my confounded legs is broken.' He fell back with a groan, and did not speak again for some time. After a while he dropped into a troubled doze, in which he muttered something about 'sweet Margery,' and more brandy, and the name of a favourite dog. He awoke with a start. 'What are you staring at?' he said, turning savagely on me. 'With those fierce eyes and that big beard, you look more like a wild man than aught else.—Who are you? I never saw you before.'

I would not trust myself to reply, but rose, opened the door, and looked out along the high-road, which the early dawn was just lighting up. In the distance, I could see three or four black specks hastening towards the station.

'Will they never come and take me home?' exclaimed the hurt man with an imprecation.

It was a dreary procession to Isterby Manor that fair spring morning, under charge of the village doctor. Rudyard was unconscious part of the way; but the pain roused him at times, when he would ask how much farther we had yet to go. Just before we reached the house, a lady in sad-coloured garments came stepping slowly and with hesitation down the broad steps to meet us. It was Catherine. She went up to the litter, her face very white, and her hands trembling, and bent over it for a moment. 'Dear Martin, are you very much hurt?'

'Not dead yet,' he smiled. 'No such luck for you.'

She did not reply, but fell back a little way, and let the litter go forward into the house.

Yes, it was Catherine, but how changed! The white drawn face, the sunken cheeks, the thin trembling hands, the look of quiet despair in her eyes; the threads of silver already apparent in the brown silky hair I remembered so well; how different from the vision of fair womanhood that had beamed on me through loving tears when we had parted long years before!

Mr Rudyard was carried up-stairs and laid on a bed. Catherine was standing in the doorway as I turned to leave the room. She had not noticed me hitherto, further than as a stranger who had assisted to bring her husband home; but now there seemed something in my face that caused her to fix her eyes on me with a painful straining gaze, as of one striving to recall some memory half forgotten. I would have avoided her if I could, but that was now impossible; still, I hardly thought she would recognise me through my changed appearance. Her face turned of an ashy paleness as she gazed, her hands clasped each other convulsively; for a moment she closed her eyes, and when she opened them again I felt that I was known. 'O Philip Burton!' she cried with a low sobbing wail, 'what do you do here beneath this unhappy roof?' She fell to the floor like one suddenly stricken. I turned to ring for assistance, and as I did so, I saw Rudyard's eyes fixed on me like those of a savage wolf. Whether he had heard the words or not I could not tell, but his sus-

picious nature was evidently aroused. Catherine's maid came up the next moment, and I fled away without looking behind me—away into the solitary fields, striving to shut out that low wail of agony, which kept ringing in my ears wherever I went.

How the next few months passed away I scarcely know. I returned to my duties at the station, but my heart was no longer in the work; and had I not felt a sort of half conviction that Catherine would one day need my services, I should have thrown up my situation and gone back to Australia. We had news from Isterby that Mr Rudyard was slowly recovering, and, with returning health, was beginning to resume his old mode of life.

Summer passed uneventfully away, and early autumn was come, when I was surprised one evening by a visit from a messenger who drove up to the station in a fly and handed me a note marked 'Private,' and signed 'Anelia Staveley'—a name which I at once recalled as being that of an aunt of Catherine, whom I had seen once or twice when I was quite a young man. The note merely contained a polite but urgent request that I would, as soon as possible, accompany the bearer of it. So, an hour later, after the departure of the last train, I set out. We did not take the road to Isterby, as I had partly expected, but proceeded in a direction nearly opposite; and after driving for about five miles, drew up before a small but handsome villa, and alighted. I was shown into a room; and in a few minutes an elderly lady with white hair entered, whom I at once recognised as Mrs Rudyard's aunt. After a few preliminary observations, she went on as follows:

'You are probably aware, Mr Burton, in common with many other persons, that my niece's marriage with Mr Rudyard has not proved a happy one; that is a point on which I need not dilate more than is absolutely necessary. The breach between them has been widening for years, as was, indeed, quite inevitable, considering Mr Rudyard's mode of life. Catherine has been frequently advised by her friends to leave him entirely and return to them; but her strong sense of duty, and perhaps the hope of being ultimately able to reclaim him to better things, have always restrained her. From the date of his railway accident, Mr Rudyard's treatment of her has been, if possible, worse than before. A sudden fit of senseless and infuriate jealousy seemed to have taken possession of him, one result of which was that he set spies round his wife, who reported to him all that she said and did. One day, in one of his angry moods, he kicked over an old black oak bureau which had not been opened for several years. It fell to pieces, and among other things thus revealed was a bundle of Catherine's letters tied together with a piece of white silk. Mr Rudyard pounced on them, and hurried off to read them alone. I believe, sir, that some old letters of yours were among the number, written to her in "your old courting days, and the existence of which Catherine had probably forgotten; at all events, they had never been opened, nor even looked at, since her marriage. During the two following days, Mr Rudyard was silent and gloomy, scarcely speaking

to any one, and seemed to be brooding over some secret project. On the evening of the third day, he told his wife that he was about to take a long journey, and that she was to prepare to accompany him. Silent, but wondering, she obeyed; made her few preparations, and in half an hour told him she was ready. His gig was brought round to the door; they both got in; and he drove away without saying a word to any one as to when he might be expected back. Eight days later, he returned, but without Catherine. His stay at Isterby was, however, of but short duration. He only remained long enough to dismiss the servants and shut up the house; and leaving word with the man whom he left in charge of the place that he was going abroad for some time, he set off on the road to Radford, a little market-town five miles away. I happened to be driving out that afternoon, and met him just as he was entering the town. I stopped him to ask about Catherine; for I had heard of her sudden departure some days before, and was anxious respecting her. He paused, with a scowl on his face, to think for a moment before answering my inquiry.

"Oh, it's Kitty you're anxious about, is it?" he said at last. "You need not trouble your head about her; she's safe enough, I'll warrant—yes, perfectly safe." He burst into a laugh and whipped up his horse; and as he passed me he turned his head and called out: "So safe that you needn't expect to see her again for a month of Sundays." That is my story, Mr Burton; and as I knew you long ago, under happier circumstances, I have sent for you to ask your advice, and I am sure you will pardon my doing so when I tell you that I have no male relative living in England. I confess that I am unhappy, perhaps without cause; that my mind misgives me as to the fate of poor Catherine. I am wretched, for one thing, because I don't know to what spot she has been taken. Why was she conveyed away in such a mysterious manner? Why did Mr Rudyard refuse to satisfy my natural inquiries respecting her? Safe she may be in one sense—safe in his power, and dying by inches, with not a creature near her to comfort her! The old lady burst into tears, and it was some time before she was sufficiently composed to continue. "There is one other point, Mr Burton, on which I think it necessary to enlighten you. When Catherine was married, a life-interest in the sum of fifteen thousand pounds was settled on her; the principal, after her death, to be divided equally amongst her children, in case she should have any; should there, however, be no issue, she was at liberty to leave the amount according to her own discretion. The marriage has been childless, as you are aware; and I know for a fact, that some time ago, in a moment of weakness, Catherine was induced to sign a document in favour of her husband, bequeathing him the fifteen thousand pounds on her decease. Now, Mr Rudyard has spent the whole of his own fortune, and is in very needy circumstances. I need not say more to you on this point. I may perhaps be wronging him—I sincerely hope I am—in even hinting a suspicion that he would not be sorry if my darling were out of the way for ever and the money in his possession. Anyway, Mr Burton, I cannot rest

till I have some news of her, good or bad, and know to what spot he has taken her."

Long and earnestly did Mrs Staveley and I consult together that night, and it was at length decided that I should start personally in search of Catherine.

STUDIES IN ANIMAL LIFE.

MATERNAL AFFECTION.

THE assertion that 'self-preservation is the first law of nature' is a cruel libel upon a large section of animal creation. To preserve and safeguard their offspring, many, if not most, creatures will risk and even sacrifice their lives. The more powerful animals might naturally be expected to do battle for their young; but it is surprising to find that the weakest and most timorous defy strength and forgo fear on account of their progeny. That beings which flee from man and other despots, when the preservation of self only is concerned, should disregard personal danger, and fight till death when the safety of their helpless offspring is concerned, is, indeed, a marvel of nature. From the fragile bird to the mighty elephant, from the lowly snake to the highly organised chimpanzee, this devoted attachment of the mother for her young is seen to exist. Our citations in proof of the universality of maternal affection shall commence with evidence of its operations among the lower types of animal life, and end with records of its effects among the higher.

The cold-blooded adder would scarcely be selected as an emblem of maternal love, and yet there can be no doubt that it has frequently lost its life whilst seeking to preserve the existence of its young. Mr Garratt, in a recent edition of his interesting *Marvels of Instinct*, gives a very circumstantial account of an instance in which a very large adder was seen on a bank by the roadside basking in the sun. The narrator of the story advanced to assail the creature with his stick. On observing him, she gave a slight hiss, at the same time raising her head a little and opening her mouth. The signal was understood by her four little ones, which instantly glided down her throat. But her thought for her offspring caused the mother's destruction, for the act delayed the adder long enough for him to strike again, and the snake, gorged with young, lay dead at his feet. Mr Garratt then removed her body into the middle of the road, to see what had become of the 'insider.' He opened the snake, and the four young all came out alive. The little animals wriggled about in all manner of forms, as if something strange had happened to them, and as if they knew not where to go or what to do. Mr Garratt, annoyed apparently at the doubt which has been sometimes expressed as to the fact of snakes affording their young a temporary shelter from danger in their own insides, has collected a large number

of well-recorded instances of the fact, and it may be noted that in most of the cases cited, the parent perished in consequence of the delay her regard for her young occasioned.

Coming to a somewhat higher type of animal, the same devotion is to be found, as is exemplified in this story of a rat and cobra fight, narrated in the pages of a contemporary. The spectator of the conflict relates that the two combatants fell from the roof of a hut to within a few feet of where he was standing, and through the open window he was enabled to witness the battle. The rat, he states, was too agile for the heavy movements of the snake, and for a long time escaped unscathed, whilst her enemy was desperately wounded. Ultimately, the cobra succeeded in inflicting a bite, and, as though aware that precaution was now useless, the poor rat rushed into close quarters, and firmly fixing her teeth in the throat of the venomous creature, never let go her grasp again. The snake plunged about furiously, but vainly; its enemy had made a death-gripe on its throat, and both the duellists fell in the fight. Subsequent research proved that the rat had faced the formidable foe for the preservation of her little ones, the nest of young rats being discovered in the roofing.

The late Grantley F. Berkeley being asked how it was that a tame stoat he owned came into his possession, related the following instance of maternal affection and animal cunning. One day he saw an old stoat carrying something in her mouth across a field from one cover to another. She was too far off for a shot; but the sportsman's retriever, a well-known canine hero, had sighted the refugee, and received a signal to kill if he could. The stoat saw the dog coming with his tremendous stride and speed, but she would not quit the little one she carried, even to save her own life. When the dog was close upon her, and escape was impossible, the poor hunted thing tried by a desperate stratagem to preserve her offspring's existence at the expense of her own. She tried to hide the little one, and then, turning back across the field, was put to death. On going to the spot where she had left her little one, short as the grass was, there was nothing to be seen. After some search, the tiny creature was discovered crouched in an old horse-shoe impression into the curve of which he had fitted himself exactly. He lay there as still as death, with his two little black shining eyes fixed upon his captor, who picked him up, and—having slain the mother—adopted and made a parlour pet of the orphan.

The hedgehog, though so shy as rarely to be seen by day, except in some very secluded spot, and usually so timid as only to forage for its subsistence at night, rolling itself up like a ball at the approach of a human being or a dog, has yet been known, upon occasions when its offspring were in danger, to show great courage. In his *Natural History*, Lenz relates that he once set a marmot upon a hedgehog which was suckling her young. The hedgehog instantly raised her bristles,

and at the same time pointing her snout to the ground, approached the marmot. She attacked him front and rear by alternately wounding him with her bristles and biting him with her teeth, at the same time snorting with a noise like the beating of a drum. Occasionally, she would seize hold of her adversary and drag it into another corner of the room; and Lenz soon saw that the only means of saving the marmot's life was to take it out of reach of the infuriated mother.

Anecdotes of the devotedness of birds for their young are innumerable. From the days of White's universally known *Natural History of Selborne* down to the present time, instances have continued to issue from the press. Under the influence of maternal instinct, the most timorous of birds become audacious and pugnacious. 'This affection,' observes White, 'sublimes the passions, quickens the invention, and sharpens the sagacity of the brute creation. Thus, a hen just become a mother is no longer that placid bird she used to be; but, with feathers standing on end, wings distended, and clucking note, she runs about like one possessed. These bird-mothers will throw themselves in the way of the greatest danger in order to avert it from their progeny. Thus, a partridge will tumble along before an intruder in order to draw him away from her helpless cover. In the time of multiplication, the most feeble birds will assault the most rapacious. All the swallows of a village are up in arms at the sight of a hawk, which they will persecute till he leaves that district.'

'It is a well-known fact,' says Mr Swanson, 'that a pair of ravens which dwelt in a cavity of the rock of Gibraltar would never suffer a vulture or eagle to approach the nest, but would drive them away with every appearance of fury.' During the breeding season, the miscal-thrush will fight even the magpie or the jay. The female titmouse will often allow herself to be made prisoner rather than fly from her menaced nest, and if she be driven away, will speedily return, threatening the disturber by hissing like a snake and by pecking and biting him. The American cat-bird is declared to be so sensitive to fear that, out of the breeding season, it will fall from the lofty branches of trees into the snake's mouth, by the power of what is called the latter's 'fascination'; 'but it has happened to me,' writes Wilson, the well-known ornithologist, 'that in all the adventures of this bird that I have personally witnessed, the cat-bird was actually the assailant, and always the successful one. These encounters never take place but during the breeding-time of birds, for whose eggs and young the snake has a particular partiality.' A correspondent of Wilson gives an account of a conflict he once observed between a snake and one of these infuriated songsters. The bird darted upon the snake, snapping at it with its bill, whilst the snake drew itself into a coil ready to give the fatal blow. The bird would cautiously whirl round her opponent at a little distance, now and then darting up to and snapping at him, but always keeping at a sufficient distance to avoid a blow. After some minutes, it became a running-fight, the snake retreating, and at last seeking shelter in an adjacent wall. Of the mocking-bird, Wilson

furnishes an equally suggestive account, recording that 'during the period of incubation, neither cat, dog, animal, nor man can approach the nest without being attacked. The cats in particular are persecuted whenever they make their appearance, till obliged to retreat.'

Probably there is no more wonderful instance on record of the sagacity and reasoning affection of birds than that told by White of the Fly-catchers which every year built in the vine growing on the side of his house. 'A pair of these little birds,' he says, 'had one year inadvertently placed their nest on a naked bough, perhaps in a shady time, not being aware of the inconvenience that followed. But a hot sunny season coming on before the brood was half-fledged, the reflection of the wall became insupportable, and must inevitably have destroyed the tender young, had not affection suggested an expedient, and prompted the parent birds to *holler* over the nest all the hotter hours, while, with wings expanded and mouths gaping for breath, they screened off the heat from their suffering offspring.' This is indeed a curious, but, as has already been seen, not a singular instance of the parent voluntarily suffering inconvenience and pain in order to preserve its young from similar experiences. The lamentations made by birds which have been robbed of their young are most distressing, even to human ears, and many instances are known where the unfortunate mother has succumbed to grief. Some birds will follow or discover where their nestlings have been taken to, and if able to get to them, continue to feed them; this has particularly been noticed of owls, which display an extraordinary attachment to their young. A pair of blackbirds have been known to follow a boy into a house and peck at his head, whilst he was conveying one of their offspring away. Among Jesse's interesting anecdotes is an account of a gallant defence made by a pair of these birds against a cat that sought to get at their young by means of a fence. On seeing the enemy approach, the hen-bird left the nest and flew to meet the cat, placing herself almost within her reach, and uttering the most piteous screams. The cock-bird also showed the greatest distress, uttering loud screams and cries, sometimes settling on the fence just before the cat, which was unable to make a spring because of the narrowness of its footing. After a little while, the cock-bird flew at the cat, settled on her back, and pecked her head so violently that she fell to the ground, followed by the bird, which succeeded in driving her away. A second time a similar scene was enacted; the bird was again victorious, and the cat was so intimidated by the attacks, that she gave up her attempts to get at the little ones.

The stories told on good authority of the attachment shown by storks for their young are so numerous that it is difficult to select from them, but the following incident, related by the *Nachrichten* of Basle, is not likely to be known to our readers. During a storm, a barn in the village of Lowenberg was set on fire by lightning, and a nest in which there were two young storks was threatened by the flames. The parent birds viewed the approaching danger from a distance. After a short deliberation, the mother darted into the nest, and seizing one of her offspring with her beak, carried it off to

a safe spot in an adjacent field. The father flew down to the little one to keep guard over it whilst the mother returned for the other bantling. When she reached the seat of danger, the flames had already enveloped the nest, and as she fluttered round it, the young stork fell through the charred fragments into the burning barn below. Without a moment's hesitation the mother darted through the smoke and fire, and returned bearing her little one in her beak, and, apparently unhurt, flew off with it. But the next day, a wounded stork fell into the marketplace of Trebbin, a neighbouring town. She was unable to stand; and it was discovered that both her legs were badly burned, and that she was indeed the heroic mother which had saved her offspring from the previous day's fire. Those who know what reverential sympathy storks receive abroad, will comprehend with what care the poor bird was removed to the Rathaus, where the burgo-master had a shelter provided for her, and where a physician came to tend her. In the meantime, the male stork discovered his consort's temporary place of refuge, and paid her daily visits, as if to learn how she progressed, and to inform her that their youngsters, for whom he carefully provided, were doing well. The school-children of Trebbin found more food for the patient than she could dispose of; the burgo-master and medical man visited her every day; and in less than a fortnight the devoted mother was well enough to fly away to her husband and children.

Much remains that might be told of the devotion of birds for their young, but it must not be overlooked that this charming and suggestive trait is manifested by other members of the animal world. The patient manner in which cats, dogs, and other quadrupeds will endure any amount of inconvenience and pain for the comfort, or even the amusement, of their offspring is known to all, but how strong the maternal attachment is, is not so generally noticed. Cats, from the homest downwards, are proverbially devoted to their young, and rarely are more intense examples of the feeling witnessed than in the domestic cat. In defence of their offspring, cats are just as daring and courageous as any animals; they have been known to attack and defeat the most ferocious dogs, and put to flight or destroy venomous snakes. In the *Naturalist's Cabinet*, the following typical anecdote is recorded. Whilst a cat was disputing with her kittens about the barnyard, they were espied by a large hawk that was sailing above on the lookout for prey. Instantaneously it darted upon one of the kittens, and was bearing it off, when the mother, seeing the danger, flew at the hawk, and made it drop the prize. A dreadful battle now began between the two; for a while the hawk had the advantage, with his strong wings, sharp talons, and keen beak, beating and lacerating the poor cat, and actually depriving her of one eye. In no way daunted by her painful injuries, the mother continued to exert all her cunning and agility on behalf of her little ones, and at last succeeded in breaking her adversary's wing. The bird was now more within the power of the cat's claws, and although it continued to defend itself vigorously, victory favoured the aggrieved party, and

as she was nearly exhausted, the mother, to the delight of several spectators, laid her opponent motionless beneath her feet, and tore off the head of the vanquished marauder in triumph. Regardless of her own sufferings, she at once ran to her bleeding kitten, and purred contentedly as she licked the wounds the hawk's talons had inflicted on its tender sides.

Dogs are in no way behind other animals in the love and abnegation of self they manifest for their young. So many and so well known are the incidents told of the maternal attachment displayed by the canine species, that it is needless to cite any here. The dog's nearly allied relative, the fox, despite his tricks on other creatures, is a most exemplary parent, and resorts to extraordinary devices to decoy intruders from his family circle. Horses—to pass to another branch of the animal world—display equal affection for their young. We have a wonderful record of how several foals were preserved during an inundation of Krutsand, in the Elbe, by the maternal sagacity and extraordinary reasoning faculty of some old mares. Instead of abandoning their young to their fate, and following the example of the horned cattle, which all swam off to the mainland, these noble creatures stood together, and every two took a foal between them, and by pressing their sides together, kept it wedged in, and lifted up above the surface of the water. For six hours, until the water subsided, did these devoted animals remain immovable in their painful and perilous position, to the surprise and delight of their owners, who beheld from afar the strange manœuvre by which their valuable foals were preserved from what had appeared inevitable destruction.

FRUIT-FARMING IN TASMANIA.

A Scotch gentleman who has embarked a capital of a few hundred pounds in land in Tasmania, writes as follows, for the guidance of a friend who thought of settling there.

'In my opinion,' he says, 'the most successful emigrants are (1) young unmarried men of robust health, able at once to go into any sort of agricultural work or clearing of land, and who are thus likely to get on whether they have capital or not; (2) married men with families able to assist them in farming, and with two or three hundred pounds to start them; (3) professional men or tradesmen also with a small capital. In *Just's Official Handbook to Tasmania*, all questions with regard to free grants of land are fully answered; and further information can be had from the agent for Tasmania in London. I have known many cases of immigrants being so bitterly disappointed—perhaps they expected an Eldorado—that I never take the responsibility of advising any one to come who does not belong to one of the above-named classes. The land is very heavily timbered, and requires the settler either to be a man of iron constitution and bred to the hardest physical exertions, or else to be backed by a pretty solid capital. Where there is a large family of strong sons and daughters, the work, being subdivided, is made comparatively easy.

'On the whole, fruit-growing requires less labour than anything else, as one can plant raspberries and other small fruit amongst the stumps, and

do the clearing gradually afterwards. But for that you must have good soil and easy access to market, which means that you must purchase from private individuals at two to four pounds per acre for best land. In another year or so, I believe there will be plenty of small farms—one hundred to two hundred acres—to be bought in this district for from one hundred and fifty to four hundred pounds, according to the improvements effected on them, quality of soil, and nearness of water-carriage.

'The land I purchased was selected more with the view of having a place ready where I could establish a modest home, if I should wish to do so, than with any view to commercial speculation. I have cleared an acre and a half to plant apple-trees in; these will not be in bearing for five years. The clearing—taking out all stumps and making ready for the plough—has cost twenty-four pounds five shillings per acre; fencing—I supply the timber—three shillings and sixpence a rod, besides expenses of draining, ploughing, and planting. This work could all be done by two strong men, if they had plenty of time to it; and if they planted small fruit and potatoes between the trees, they would begin to get a return next year. Potatoes cost three to five shillings a hundredweight; gooseberry and currant bushes about three to four shillings a dozen; apple-trees (one year old) sixpence each. A hut could be put up with six or eight pounds-worth of timber; ten or twelve acres could be laid down in English grass—six shillings per bushel—and cows kept. A little money might be made until all these things were grown, by splitting palings or jobbing of various sorts. After a year or more—according to one's success, with the potatoes, &c.—of the harvest and most unremitting labour, it would be possible to get a livelihood off thirty acres of fairly good land, supposing it to be bush-land and not extra-heavily timbered. There is no difference between the land sold on credit, and that granted to free immigrants. The smallest quantity of land purchasable is fifteen acres. It is best to bring any good furniture and napery from home, also cutlery and carpenters' tools. Agricultural implements are best bought here. Plenty of clothing should be brought.'

LIFE'S CHIVALRY.

WHERE, in the busy city's care and strife,
Its thirst for riches, and its toil for bread,
Is found that soul of chivalry in life,
Which some are mourning for as truly dead?
Shall we seek for it in the forest-glade;
In hoary dim cathedral, gray with age?
In chancel where the mailed knights are laid
With rusted lance, no further war to wage:
In mould'ring castle, or in ivied tower,
Where pomp and pageantry were wont to be?
Ah, no! But yet the ancient spirit's power
Is with us, and its form, if we would see:
To labour cheerfully from hour to hour,
To do good graciously, is chivalry.

OCEAN AS A HEALTH RESTORER.

THE poets have apostrophised the sea until the power of metaphor and simile could apparently no further go. Now, it is a monarch whose purple diadem is gemmed by the ocean isles; now, a monster whose insatiable maw is filled with wrecked ships and drowned seamen. Again, it is a beauty, whose azure brow is all unwrinkled by the lapse of years; or 'a vast and wandering grave,' into which 'the heavy-shotted hammock-shroud' drops hopelessly.

But the boldest rhymers never thought of addressing the ocean as a healer. Power, grandeur, destruction, deceitful beauty—these were thought to be the natural characteristics of the sea, but the property of restoring health was not dreamt of as claiming inclusion upon the list. Yet, this is the attribute of the sea which now engages the attention and excites the hope of multitudes. A sea-voyage has become a familiar prescription for a variety of ailments, and there is each year a rapid increase in the number of those who can attribute to its agency prolonged life, or complete recovery from almost hopeless disease. The prescription is now as eagerly followed as it is readily given. The ocean has gradually been robbed of its terrors. We know that so far from being constantly storm-tossed, its more usual mood is that of placidity and comparative calm, although storms, shipwrecks, fires, and collisions still sometimes appal us in thick-bodied type in the newspapers; but the hard unanswerable logic of statistics conclusively proves that there is as much risk in travelling by rail from Edinburgh to London as in the voyage by sea from Liverpool to New York, or from Plymouth to Melbourne.

For the health-seeker, the Australian voyage is to be preferred. Its length and variety, the average warmth and calm weather which usually prevail, and the ample provision made for the traveller's comfort on the best ships, are all strong arguments in its favour. He should start on his journey in August or September, thus avoiding

the English winter, and securing the most favourable season for the voyage. He will also be well advised to choose a sailing-ship in preference to one of those fast steamers which now appear almost to annihilate distance and bring the antipodes to our very doors. The invalid does not desire to make 'the quickest run on record;' he has come to sea in order to enjoy as long as possible sea-air, sea-life, and sea-leisure. The longer the voyage, provided it fall short of producing intolerable *ennui*, the greater the gain to health. Again, in the comparatively slow-moving sailing-ship, the changes of temperature are gradual; while the fast steamship, going at a uniform rate of fourteen or fifteen knots per hour, flies through degrees of latitude like a steeple-chaser over his fences, and the invalid is hurried too quickly from the fogs and cold of Britain to the heat of the tropics; and again with equally undue rapidity from the burning equator to the icebergs of the Southern Ocean.

The sailing-ship has other advantages. The passengers are fewer, and there is less crowding and more privacy. The sleeping-cabins are more commodious than those of steamers, and four people are not huddled together in a space six feet by eight in a manner as destructive of comfort as it is prejudicial to health. The sailing-ship also is free from the dust and dirt produced by smoke, from the indescribably nauseous odour of oiled machinery, and from the ceaseless grind of engines and vibration of the screw.* Her motion is smooth and graceful as that of a skilful dancer. Just a little ripple at her prow as the cut-water dashes the blue ocean into foam; just a little gurgle in her wake as the waves close over the rent which her passage makes in their depths; just a slight creaking of the ropes or a faint 'sough' of the sails—all else silence and the majesty of silent motion.

The voyage from England to Australia presents great variety. The traveller traverses about a hundred degrees of latitude, and more than a hundred and fifty degrees of longitude. He encounters every variety of marine climate, sees

ocean in all his moods, and enjoys the sense of traversing half the globe. During the first week, the weather is frequently disagreeable. The Bay of Biscay bars the immediate way, and the voyager too often leaves it behind with unpleasant memories. But soon a change comes: the sun mounts rapidly towards the zenith; the temperature rises; deeper and deeper grow the sapphire of the sea and the azure of the sky; balmy and yet more balmy breezes blow. We are flying south, towards those favoured regions where a kindlier sun charms nature to a fertility unknown in colder lands. The sea at night glows with phosphorescent illumination, and ere long the trade-winds—those ever-welcome allies of the sailor—begin to blow, at first fitfully and with uncertain strength, but soon with a steady powerful blast, before which the vessel spreads all her white wings and hurries ever faster southward. Sailing through trade-wind latitudes is the perfection of voyaging. For days and even weeks together, the vessel urges her way with almost unvarying speed; every stitch of canvas solicits the breeze, which blows so steadily that, with the exception of one motionless figure at the wheel, the sailors enjoy unwonted leisure. The air is deliciously soft and mild, but sufficiently cool to temper the blaze of the tropical sun. All day long the passengers recline in their easy-chairs on deck, and often prolong their siesta far into the night, unwilling to exchange the fresh air and the canopy of heaven for the close quarters and closer atmosphere of their sleeping-cabins.

Soon the vessel runs into the Belt of Colms; every breath of wind dies away, and she lies helplessly drifting, like some stricken bird which the sportsman has wounded and left to float and die. Here strange and magnificent atmospheric phenomena attract observation. The sky is now shrouded in a silver haze, now curtained with dense masses of cloud of the most fantastic shapes, and glowing with every hue of the prism. The sea, unrippled by the faintest breath, reflects, as from some vast mirror, each shade and lineament of the sky. At night, the scene is not less wonderful. Sheet-lightning flashes from end to end of the heavens, and is reflected in unearthly grandeur by the ocean. Each roll of the ship seems to evolve liquid balls of fire from the depths of the sea—the witch's oils of Coleridge's wondrous poem. The heat is prostrating, and the atmosphere, surcharged with moisture, almost stifles respiration. Occasionally, a faint breath of air ripples the smooth surface of the main; the sails are set in eagerness and hope; but soon it dies away, and leaves the ship to drift helplessly as before. Sometimes with startling suddenness, a tornado bursts upon the vessel, rain descends in literal cataracts, and penetrates with irresistible force even to the saloon and the sleeping-cabins.

Some fortunate vessels carry a steady breeze right across this troublesome 'belt,' while others are detained in it a month. Passengers by steamship who cross this region in one or two days see little or nothing of the phenomena which have been described.

But, however slowly, the vessel glides or drifts

surely southward. At length a change comes. The first whisper of the south-east trade-wind comes up from the south; each hour it increases in force; soon it blows a steady breeze, and the vessel, once more under cheery canvas, rushes gaily forwards, like a greyhound released from the leash. The equator is speedily crossed, and perhaps, if ancient usages survive, due sacrifice is offered to Neptune. The cool fresh winds from the south blow still more strongly. In a few days the vessel has left the tropics behind, and soon, having passed the meridian of the Cape, she turns her prow eastward, and heads direct for the great Australian continent. Sailing-vessels usually run as far south as latitude forty-five or forty-eight degrees, in order to catch the 'brave west winds,' which in these regions sweep athwart the globe, varying little, and raising the sea into great foam-crowned billows, which move along in resistless majesty, now pursuing and threatening to engulf each living ship; now passing harmlessly under her stern with a swoosh, as if disappointed at their legitimate prey.

The weather during this portion of the voyage is cool, bracing, and delightful at most seasons of the year; but at times it is as cold as an English winter. Icebergs sometimes abound, and excite a thrill of fearful interest as they raise their gigantic spectral forms out of the sea and glitter in the sun. Sometimes they become sources of imminent peril. In the thickness of a fog, or amid the blinding confusion of a snow-storm, one of these huge ice-mountains may suddenly present itself at close-quarters, and call for all the vigilance and skill of officer and sailor to avoid a disaster.

After a voyage varying from eighty to ninety days, the vessel reaches Australian waters. The weather grows milder, and the lightening green of the sea announces that land is near. At length the low, sandy, scrub-lined coast of Australia is descried; and soon the passengers gladly disembark, and exchange the exile of the sea for a fresh participation in the enjoyments of civilisation.

Life at sea during such a voyage necessarily presents many points of contrast with ordinary life on land. For three months the traveller is shut in upon a floating house, perhaps two hundred and fifty feet long by forty broad. During this period, no intercourse with the outer world is possible, except when some passing vessel chances to stop and exchange greetings. This alone amounts to a revolution in the daily habits of the individual. There is no morning newspaper, no postman's knock, no telegrams, no daily confinement in close offices, courts, or consulting-rooms, no daily duties calling for energy that is so often lacking. The passenger has only to eat, sleep, and live. His most pressing duty is to attend the summons of the dinner-bell, his chief interest to watch the changing humours of sea and sky, or lean over the bulwarks and guess the vessel's speed, or await the daily announcement of the Log. The strain of life is withdrawn. The wheels of existence move easily and with lessened friction. The incessant emulation, the keen anxieties, the worrying cares which beset modern commercial and professional life, are as things that never have been. The busy,

anxious, seething world lies beyond yonder low horizon, and around is the vast silence of the sea. A restfulness, half calm, half melancholy—like that which brooded over the land of the Lotus-eaters—steals upon the voyager. Reclining lazily on deck, his cheek fanned by the soft breath of the trade-wind, his mind like an unstrung bow, he enjoys the perfection of mental and physical repose. It is true the picture has its reverse. Storms will come, and the quiet sea transform itself into a waste of raging waters. At such times, life on shipboard has its hardships; the deck, swept by the waves, becomes unsafe for the landsman; meals are taken with difficulty, if the inclination for them survive. At night, sleep is disturbed by the tempest, the creaking of the rigging, or the erratic movements of the passenger's personal luggage. But such days and nights are almost phenomenally exceptional during the Australian voyage.

This perfection of restfulness is of the first importance to the invalid. On land, cares will assail him, duties press upon him, the travail of the travelling world pursue him even to Alpine heights or Norwegian solitudes. But black Care does not usually go a-voyaging. Things may be getting on very badly on land, and the world may miss us very much. But we are at sea, and each moment bears us farther away. For a little while the world must manage in its own poor way without us. Let us have rest for three months, though at the end the heavens should fall. Let us eat and drink and be merry, and hope that the world will be changed for the better before we return to it again. The veriest victim of worry and anxiety, with whom care is a constant quest, will find it difficult to resist the seductive influences of the tropics. The balmy air lull to sleep like the most perfect opiate; the soft winds whisper rest; the vast expanse of ocean speaks of the littleness of human life, and the folly of worrying about that which will soon be as forgotten as yesterday's storm. The whole scene

Gentler on the spirit lies
Than tired eyelids upon tired eyes.

The traveller, especially if physically weak or mentally exhausted, yields to the soft influences operating upon him. He makes no pretence of activity; he resigns himself to a delicious, because inevitable, idleness; he relinquishes all his resolves of turning the long hours at sea to good account for the purpose of mental culture. His dictionaries remain at the bottom of his trunk; Homer, Virgil, Dante, Goethe, or Shakespeare, as the case may be, slumber undisturbed, and retain the virgin whiteness of their page. Even the last review remains uncut. He lazily turns over the pages of some novel, wishes it were shorter, wonders whence the hero derived so much superfluous energy; or glances at the clock, to see if the log will soon be declared or the dinner-bell speedily ring. He has just sufficient energy to enjoy a leisurely promenade on deck, watching the porpoises at their gambols, or the flying-fish starting from each wave, or the sailors as they swarm aloft to unfurl some sail.

Such luxurious indolence, which at other times and in other places would be contemptible, is

here perfectly right, because perfectly natural. The Neapolitan lazzaroni, the Hindu, the native of Tonga and Tahiti, are constitutionally indolent, because climate and the conditions of life are fatal to energy. The traveller by sea has no motive for activity, and naturally refrains from an expenditure of vigour for which there is no demand.

In the case of the invalid, this restfulness, this intense indisposition for mental or physical exertion, this careless *inassueance*, have a profound explanation. During those long hours and days of calm and inactivity, nature is busily at work, repairing the waste of years of toil, or the ravages of long-continued disease. Unseen hands are silently engaged in building up again the broken cells; unseen fingers are busily rearranging the disordered machinery of life. He will be wisest who will let nature work on, yielding himself to an inaction which he only half comprehends.

Next in importance to the invalid to rest and quiet—to some invalids, indeed, as, for example, consumptives, most important of all—are the pure atmosphere and the long hours of uninterrupted enjoyment of sunshine and fresh air. In the warm latitudes, the passengers live on deck, going only below to eat and sleep, and frequently spend fifteen hours daily in the open air. This is an advantage of the first magnitude. Half the diseases of modern life, and more than half the minor ailments which embitter existence, are due to contamination of the air we breathe. Not the least terrible discovery of modern science is the revelation that this liquid ether, apparently so pure and spotless, which surrounds us on every side, is in reality swarming with invisible forms of life, capable of becoming the ministers of disease and the harbingers of death. We breathe, and fever enters our veins, or consumption sets its fatal seal upon us. Even when free from the germs of actual disease, the atmosphere of large towns is loaded with organic particles and deficient in the vitalising elements. But at sea, the air is the perfection of purity. The ocean is the natural disinfectant which keeps the world wholesome, and the air that sweeps its surface bears no trace of contamination or impurity. Hence, in a large measure is explained the immense advantage of the long sea-voyage to the consumptive, to whom pure air is in the most literal sense the very breath of life.

The extreme equality of the ocean climate is another fact of cardinal importance. The variations of temperature at sea from day to day are trifling, and steadily progressive with the latitude, sudden changes being almost unknown. The winds are all sea-breezes, all laden with moisture, and usually blow from the same point of the compass for many days together. Chill—that word of fearful import on land—has no existence at sea. Sailors rarely suffer from ordinary catarrhs or colds, and even sleep with impunity upon the bare deck. The changes of temperature at sea are gradual, and can be reckoned on, and proper preparation made. January does not surprise us with its mildness, nor does mid-winter suddenly return in May. The east wind has lost its evil name. The touch of the sea has spirited away all its rigour, and invested it with unwonted softness. The voyager

is greatly interested in noting the direction of the wind, owing to its effect upon the vessel's progress, but he forgets to associate peculiarities of temperature with it. If it be fair, he cares not from what quarter it blows.

The saline particles in sea-air, the abundance of oxygen, perhaps some slight impregnation with iodine, have all their salutary effect, and favourably influence the course of disease.

The high average range of the barometer is also a point of importance. Every one knows the profound stillness and calm of a day on which the glass stands unusually high; the air seems wrapped in slumber, and the sun shines with undimmed lustre. The clouds, now like silver fleeces, again like battlements of purest marble, seem to have withdrawn to the remotest heights, and the arch of heaven appears to have lifted itself beyond its wont. Such days are not rare at sea, being especially common on the polar verge of the trade-wind belt, and are grateful to the invalid, but unwelcome to the sailor, because tending to delay the vessel's progress and prolong the voyage.

The disadvantages and discomforts of sea-life are nevertheless real, and cannot be gainsaid. The most real is probably the inevitable monotony of existence—the entire absence of serious occupation. Amusements are greatly restricted. The ever-present ocean presents little variety of scene. Each day is a counterpart of its predecessor, a monotonous round of eating and sleeping, with only such occasional diversions as quarrelling or flirtation. This is at times trying to the man of vigorous health and unimpaired mental and physical activity; but to the invalid the benefit outweighs the tedium. He feels little inclination for employments for which he has no energy, and does not miss amusements which he has no longer the capacity of enjoying. Even the most energetic must yield at times to the prevailing atmosphere of languor and ease. Men of vigorous bodies and active brains find pleasure at sea in trifles which at other times would seem contemptible. A sailor going aloft to shake out some sail becomes an object of interest; a porpoise or a dolphin playing alongside excites the liveliest curiosity. Games which on land would find their proper sphere in the nursery are keenly relished on shipboard by the oldest and the gravest. A chance lurch of the ship, disturbing the conditions of some contest, affords material for abundant merriment and laughter.

But of all the alleviations to the monotony of life at sea, none equals in interest that afforded by the appearance of passing vessels or by the sight of land—perhaps because these remind the travellers of the great world far away which each day finds them more eager to rejoin. Ships are seen in great numbers in the Channel and the Bay of Biscay. They are rarely met in the trade-winds, as, in these latitudes, homeward and outward bound ships are forced to pursue different tracks; but they become very numerous again in the Belt of Calms, where whole fleets lie helplessly drifting, and can exchange sympathetic signals. Down south in the great Southern Ocean, the sight of a ship is an event of rare occurrence, and vessels may pass weeks without catching a glimpse of a companion sail.

Sometimes, as the curtain of night lifts, another vessel is discovered alongside, and a great ocean race ensues, much to the delight of the passengers on the winning ship, which, as it flies ahead, signals sarcastic messages to its defeated competitor.

The sight of land causes still livelier interest and keener excitement. No one who has not taken a long sea-voyage can realise the vivid feeling of pleasure which thrills through a ship's company when, after weeks or months of weary voyaging, of 'ever climbing up the climbing wave,' the cry of 'Land ho!' is heard. Even a desert island or a barren rock is greeted with enthusiasm and eagerly scanned through a hundred telescopes. Every little detail is discussed with interest—the outline of mountain and peak, the presence of tree or grass, the probability of human habitation, the sight of houses or villages, or, most interesting of all, moving figures and human forms. Every observer has his opinion and his group of sympathetic listeners. The passengers feel that now their exact position on the vast wilderness of the Admiralty charts is established beyond cavil; that light streak on the horizon is St Michael or Ascension; those lofty peaks overhanging the fertile Canaries or the barrenness of the Cape Verde. There is no longer any possibility of doubt about the vessel's progress, and the distance already traversed. Henceforth, a new start is made, and the remainder of the voyage counts from the last land sighted. It is pleasant, too, to feel the proximity again of humankind. Even a savage is a man and a brother, and after weeks of isolation, it is something to be near our own species again. Time was when the sight of land aroused very different emotions, when the distant island might be the lair of pirates or the abode of cannibals, when the black flag of the former or the war-canoe of the latter might suddenly burst from some creek or river upon the doomed merchantman. But the sea has almost lost such terrors as these; every flap of England's flag proclaims not only freedom, but protection and safety. On the Australian voyage, land is sighted to a very variable extent. Some ships see no land from the moment that the Lizard fades astern until the first glimpse is obtained of Australia. Others sight land four or five times. Madeira, the Salvages, Teneriffe, San Antonio in the Cape Verde Islands, Tristan d'Acunha, the Crozet Islands, and St Paul's, are the most frequent points sighted. Much depends upon the weather, more upon the captain. The cautious navigator, especially if the weather be wild or cloudy, gives land a wide berth, and holds well out into the open main.

The monotony of a voyage is in a measure alleviated by the opportunity of studying natural living objects; porpoises, sharks, and flying-fish are frequently seen, and even caught. Occasionally, a whale rises in close proximity to the vessel, or, more frequently, may be descried spouting his 'foam-fountains' in the distance. Bird-life, also, is comparatively rare at sea; with the exception of the petrel and its congeners, which follow ships from week to week in patient expectation of occasional booty, few birds are visible in tropical or sub-tropical regions in mid-ocean. A swallow or a dove driven by some

chance gale far out to sea has been known to alight upon some passing ship. Sometimes the lonely frigate-bird may be seen wheeling his apparently ceaseless flight far aloft in the sky; but these are exceptions. In the great Southern Ocean, however, it is otherwise; there the air is frequently filled with a vast cloud of sea-fowl; albatrosses sail around and along, now rising aloft with a flap or two of their huge outstretched wings, now dropping suddenly into the sea to secure their prey. 'Cape pigeons,' 'molly-hawks,' 'mutton-birds,' and numbers of other birds, to which the common parlance of sailors has given equally expressive, if sometimes inelegant epithets, pursue the flying clipper through the long day and the dark night, in gloom and sunshine, storm and calm, and seem neither to sleep nor rest.

A pleasant variety to the monotony of sea-life may be derived from astronomical observations, for which a voyage affords ample opportunities. Each night,

The sentinel stars set their watch in the sky.

The vast expanse of heaven lies open without obstacle or hindrance, and invites our attention. As we speed south, the familiar constellations of English skies—Cassiopeia, the Great and the Little Bear—dip beneath the northern horizon, and new stars—especially the much celebrated but disappointing Southern Cross—arise upon the south. Great Orion, sloping slowly from east to west, is seen through many degrees of latitude, and looks down equally upon the green meadows of England and the parched plains of her great Australian dependency. The Pleiades remind us of the 'sweet influences' which they were once disposed to rain; and their companion stars tell of the time when

Through sea-ming drifts, the rainy Hyades
Cast the dimura.

Belief in astrology was not unnatural in an age before the mariner's compass, when sailors boldly ventured into unknown regions, relying on the guidance of the stars alone.

But the voyager will naturally seek amusement and distraction mainly in the society of his fellow-travellers; and the composition of the passengers' list is a matter of the first interest and importance to him. A ship's company is a microcosm, a photograph in miniature of the great world of action and passion. Each unit makes itself felt in so small a sphere, and the aberrations of one body are sufficient to throw all that little universe out of gear. On shipboard, all the natural characteristics of the individual tend to become exaggerated; the selfish person becomes more than ever self-seeking; the misanthropic person has unwonted opportunities for self-abnegation. The occupations and amusements of one person conflict with those of another, and only by mutual toleration and concession can the general harmony be maintained.

A quarrel—and quarrels are numerous on shipboard—tends to divide the whole company into two hostile camps. Love-affairs—numerous also, but tending, like the voyage, to an early termination—are matters of public interest, curiosity, and comment. No one lives to himself; whether eating, walking, or sleeping, the passenger has

active relations with his environment—as scientific phraseology might express it—and either promotes or disturbs the comfort and happiness of others. A fine school, truly, for the culture of the graces! Oftener, perhaps, it becomes only too perfect a stage for the exhibition of human frailty and human folly. It has been said that the man who passes unscathed through the ordeal of a contested parliamentary election must possess an unblemished reputation. As truly may it be said that the person who has accomplished many sea-voyages and never made an enemy, deserves a monument more enduring than brass.

It remains only to add that there are some who should not tempt the sea. Those far advanced in serious disease from whatever cause, the victim of insomnia, those threatened with melancholia or insanity, should not increase the perils incident to their condition, by seeking to encounter the inevitable hardship and monotony which are serious deductions from the virtues of ocean as a health-restorer.

JAMES A. LINDSAY, M.D.

A HOUSE DIVIDED AGAINST ITSELF.

CHAPTER XXXVI.

'Yes, I wish you had not said anything, Frances; not that it matters very much. I don't suppose he was in earnest, or, at all events, he would have changed his mind before evening. But, my dear, this poor young fellow is not able to follow the same course as Markham's friends do. They are at it all the year round, now in town, now somewhere else. They bet and play, and throw their money about; and at the end of the year they are not very much the worse—or at least that is what he always tells me. One time they lose, but another time they gain. And then they are men who have time, and money more or less. But when a young man with a little money comes among them, he may ruin himself. It is clear he knows.'

'I am very sorry,' said Frances. 'It is difficult to believe that Markham could hurt any one.'

Her mother gave her a grateful look. 'Dear Markham!' she said. 'To think that he should be so good—and yet— It gives me great pleasure, Frances, that you should appreciate your brother. Your father never did so—and all of them, all the Waringss— But it is understood between us, is it not, that we are not to touch upon that subject?'

'Perhaps it would be painful, mamma.—But how am I to understand, unless I am told?'

'You have never been told, then—your father—? But I might have known he would say very little; he always hated explanations.—My dear,' said Lady Markham, with vivid agitation, 'if I were to enter into that story, it would inevitably take the character of a self-defence; and I can't do that to my own child. It is the worst of such unfortunate circumstances as ours that you must judge your parents, and find one or other in the wrong.—O yes; I do not deceive myself on that subject. And you are a partisan in your nature. Con was more or less of a cynic, as people become who are bred up in society, as she was. She could believe we were both wrong, calmly, without

any particular feeling. But you, of your nature, Frances, you would be a partisan.

'I hope not, mamma. I should be the partisan of both sides,' said Frances, almost under her breath.

Lady Markham rose and gave her a kiss. 'Remain so,' she said, 'my dear child. I will say no harm of him to you, as I am sure he has said no harm of me. Now, let us think no more of Markham's faults, nor of poor young Gaunt's danger, nor of'—

'Danger?' said Frances, with an anxious look.

'If it were less than danger, would I have said so much, do you think?'

'But, mamma, pardon me, if it is real danger, ought you not to say more?'

'What! for the sake of another woman's son, betray and forsake my own? How can I say to him in so many words. Take care of Markham; avoid Markham and his friends—I have said it in hints as much as I dare. Yes, Frances, I would do a great deal for another woman's son. It would be the strongest plea. But in this case, how can I do more? Never mind; fate will work itself out quite independent of you and me.—And here are people coming—Claude, probably, to see if you have changed your mind about him, or whether I have heard from Constance. Poor boy; he must have one of you two.'

'I hope not,' said Frances seriously.

'But I am sure of it,' cried her mother with a smile. 'We shall see which of us is the better prophet.—But this is not Claude. I hear the sweep of a woman's train.—Hush!' she said, holding up a finger. She rose as the door opened, and then hastened forward with an astonished exclamation: 'Nelly!' and held out both her hands.

'You did not look for me?' said Mrs Winterbourn with a defiant air.

'No, indeed; I did not look for you. And so fine, and looking so well. He must have taken an unexpected turn for the better, and you have come to tell me.'

'Yes, am I not fine?' said Nelly, looking down upon her beautiful dress with a curious air, half pleasure, half scorn. 'It is almost new; I have never worn it before.'

'Sit down here beside me, my dear, and tell me all about it. When did this happy change occur?'

'Happy? For whom?' she asked with a harsh little laugh. 'No, Lady Markham, there is no change for the better: the other way—they say there is no hope. It will not be very long, they say, before!'

'And Nelly, Nelly! you here, in your fine new dress.'

'Yes, it seems ridiculous, does it not?' she said, laughing again. 'I away—going out to pay visits in my best gown, and my husband—dying. Well! I know that if I had stayed any longer in that dreary house without any air, and with Sarah Winterbourn, I should have died.—Oh, you don't know what it is. To be shut up there, and never hear a step except the doctor's, or Roberts' carrying up the beef-tea. So I burst out of prison, to save my life. You may blame me, if you like, but it was to save my life, neither less nor more.'

'Nelly, my dear,' said Lady Markham, taking her hand, 'there is nothing wonderful in your coming to see so old a friend as I am. It is quite natural. To whom should you go in your trouble, if not to your old friends?'

Upon which Nelly laughed again in an excited hysterical way. 'I have been on quite a round,' she said. 'You always did scold me, Lady Markham; and I know you will do so again. I was determined to show myself once more before—the waters went over my head. I can come out now in my pretty gown. But afterwards, if I did such a thing, everybody would think me mad.—Now you know why I have come, and you can scold me as much as you please. But I have done it, and it can't be undone. It is a kind of farewell visit, you know; she added in her excited tone. 'After this, I shall disappear into—crape and affliction. A widow! What a horrible word. Think of me, Nelly St John; me, a widow! Isn't it horrible, horrible? That is what they will call me, Markham and the other men—the widow. I know how they will speak, as well as if I heard them. Lady Markham, they will call me *that*, and you know what they will mean.'

'Nelly, Nelly, my poor child!' Lady Markham held her hand and patted it softly with her own. 'O Nelly, you are very imprudent, very silly. You will shock everybody, and make them talk. You ought not to have come out now. If you had sent for me, I would have gone to you in a moment.'

'It was not *that* I wanted. I wanted just to be like others for once—before—I don't seem to care what will happen to me—afterwards. What do they do to a woman, Lady Markham, when her husband dies? They would not let her bury herself with him, or burn herself, or any of those sensible things. What do they do, Lady Markham? Brand her somewhere in her flesh with a red-hot iron—with Widow, written upon her flesh?'

'My dear, you must care for poor Mr Winterbourn a great deal more than you were aware, or you would not feel this so bitterly. Nelly'—

'Hush!' she said with a sort of solemnity. 'Don't say that, Lady Markham. Don't talk about what I feel. It is all so miserable, I don't know what I am doing. To think that he should be my husband, and I just boiling with life, and longing to get free, to get free: I that was born to be a good woman, if I could, if you would all have let me, if I had not been made to—Look here! I am going to speak to that little girl. You can say the other thing afterwards. I know you will. You can make it look so right—so right.—Frances, if you get persuaded to marry Claude Ramsay or any other man that you don't care for, remember, you'll just be like me. Look at me, dressed out, paying visits, and my husband dying. Perhaps he may be dead when I get home.' She paused a moment with a nervous shivering and drew her summer cloak closely around her. 'He is going to die, and I am running about the streets. It is horrible, isn't it? He doesn't want me, and I don't want him; and next week I shall be all in crape, and branded on my shoulder or somewhere—where, Lady Markham?—all for a man who—all for a man that'—

'Nelly, Nelly! for heaven's sake—at least respect the child.'

'It is because I respect her that I say anything. —Oh, it is all horrible! And already the men and everybody are discussing. What will Nelly do? The widow, what will she do?'

Then the excited creature suddenly, without warning, broke out into sobbing and tears. 'Oh, don't think it is for grief,' she said, as Frances instinctively came towards her; 'it's only the excitement, the horror of it, the feeling that it is coming so near. I never was in the house with Death, never, that I can remember. And I will be the chief person, don't you know? They will want me to do all sorts of things—What do you do when you are a widow, Lady Markham? Have you to give orders for the funeral, and say what sort of a coffin there is to be, and—all that?'

'Nelly, Nelly! Oh, for God's sake, don't say those dreadful things. You know you will not be troubled about anything, least of all— And my dear, my dear, recollect your husband is still alive. It is dreadful to talk of details such as those for a living man.'

'Most likely,' she said, looking up with a shiver, 'he will be dead when I get home.—Oh, I wish it might all be over, everything, before I go home.—Couldn't you hide me somewhere, Lady Markham? Save me from seeing him and all those—details, as you call them. I cannot bear it, and I have no mother nor any one to come to me—nobody, nobody but Sarah Winterbourn.'

'I will go home with you, Nelly; I will take you back, my dear.—Frances, take care of her till I get my bonnet.—My poor child, compose yourself. Try and be calm. You must be calm, and bear it,' Lady Markham said.

Frances with alarm found herself left alone with this strange being—not much older than herself, and yet thrown amid such tragic elements. She stood by her, not knowing how to approach the subject of her thoughts, or indeed any subject—for to talk to her of common things was impossible. Mrs. Winterbourn, however, did not turn towards Frances. Her sobbing ended suddenly, as it had begun. She sat with her head upon her hands, gazing at the light. After a while, she said, though without looking round. 'You once offered to sit up with me, thinking, or pretending, I don't know which, that I was sitting up with him all night. Would you have done so, if you had been in my place?'

'I think—I don't know,' said Frances, checking herself.

'You would—you are not straightforward enough to say it—I know you would; and in your heart you think I am a bad creature, a woman without a heart.'

'I don't think so,' said Frances. 'You must have a heart, or you would not be so unhappy.'

'Do you know what I am unhappy about? About myself. I am not thinking of him; he married me to please himself, not me; and I am thinking of myself, not him. It is all fair. You would do the same if you married like me.'

Frances made no reply. She looked with awe and pity at this miserable excitement and wretchedness, which was so unlike anything her innocent soul knew.

'You don't answer,' said Nelly. 'You think you never would have married like me. But how can you tell? If you had an offer as good as Mr. Winterbourn, your mother would make you marry him. I made a great match, don't you know? And if you ever have it in your power, Lady Markham will make short work with your objections. You will just do as other people have done. Claude Ramsay is not so rich as Mr. Winterbourn; but I suppose he will be your fate, unless Con comes back and takes him, which is, very likely, what she will do.—Oh, are you ready, Lady Markham? It is a pity you should give yourself so much trouble; for, you see, I am quite composed now, and ready to go home.'

'Come, then, my dear Nelly. It is better you should lose no time.' Lady Markham paused to say: 'I shall probably be back quite soon; but if I don't come, don't be alarmed,' in Frances' ear.

The girl went to the window and watched Nelly sweep out to her carriage as if nothing could ever happen to her. The sight of the servants and of the few passers-by had restored her in a moment to herself. Frances stood and pondered for some time at the window. Nelly's was an agitating figure to burst into her quiet life. She did not need the lesson it taught; but yet it filled her with trouble and awe. This brilliant surface of society, what tragedies lay underneath! She scarcely dared to follow the young wife in imagination to her home; but she felt with her the horror of the approaching death. The dread interval when the event was certain—the tall more dread moment after, when, as if by magic, and trembling in her youth and loneliness, she would live side by side with the dead, whom she had never loved, to whom no faithful bond had united her—It was not till another carriage drew up and some one got out of it, that Frances retreated, not without a very different sort of alarm, from the window—some one coming to call, she did not see whom, one of those wonderful people who came to talk over with her mother other people whom Frances did not know. How was she to find any subject on which to talk to them? Her anxiety was partially relieved by seeing that it was Claude who came in. He explained that Lady Someone had dropped him at the door, having picked him up at some other place where they had both been calling. 'There is a little east in the wind,' he said, pulling up the collar of his coat.

'Was that Nelly Winterbourn I saw driving away from the door? I thought it was Nelly. And when he is dying, with not many hours to live.'

'And why should not she come to mamma?' said Frances. 'She has no mother of her own.' 'Ah,' said Ramsay, looking at her keenly, 'I see what you mean. She has no mother of her own; and therefore she comes to Markham's, which is next best.'

'I said, to my mother,' said Frances indignantly. 'I don't see what Markham has to do with it.'

'All the same, I shouldn't like my wife to be about the streets, going to—any one's mother, when I was dying.'

'It would be right enough,' cried Frances, hot and indignant, 'if you had married a woman who did not care for you.' She forgot, in the heat of her partisanship, that she was admitting too much. But Claude did not remember, any more than she.

'Oh, come,' he said, 'Miss Waring, Frances. (May I call you Frances? It seems unnatural to call you Miss Waring, for, though I only saw you for the first time a little while ago, I have known you all your life.) Do you think it's quite fair to compare me to Winterbourn? He was fifty when he married Nelly, a fellow quite used up. At all events, I am young, and never was fast; and I don't see,' he added pathetically, 'why a woman shouldn't be able to care for me.'

'Oh, I did not mean that,' cried Frances with penitence; 'I only meant'—

'And you shouldn't,' said Claude, shaking his head, 'pay so much attention to what Nelly says. She makes herself out a martyr now; but she was quite willing to marry Winterbourn. She was quite pleased. It was a great match; and now, she is going to get the good of it.'

'If being very unhappy is getting the good of it'—

'Oh, unhappy!' said Claude. It was evident he held Mrs Winterbourn's unhappiness lightly enough. 'I'll tell you what,' he said, 'talking of unhappiness, I saw another friend of yours the other day who was unhappy, if you like—that young soldier-fellow, the Indian man. What do you call him?—Grant? No; that's a Nile man.—Gaunt. Now, if Lady Markham had taken him in hand'—

'Captain Gaunt,' said Frances in alarm; 'what has happened to him, Mr Ramsay? Is he ill? Is he'— Her face flushed with anxiety, and then grew pale.

'I can't say exactly,' said Claude; 'for I am not in his confidence; but I should say he had lost his money, or something of that sort. I don't frequent those sort of places in a general way; but sometimes, if I've been out in the evening, if there's no east in the wind, and no rain or fog, I just look in for a moment. I rather think some of those fellows had been punishing that poor innocent Indian man. When a stranger comes among them, that's a way they have. One feels dreadfully sorry for the man; but what can you do?'

'What can you do? Oh, anything, rather than stand by,' cried Frances excited by sudden fears, 'and see—and see—I don't know what you mean, Mr Ramsay! Is it gambling? Is that what you mean?'

'You should speak to Markham,' he replied. 'Markham's deep in all that sort of thing. If anybody could interfere, it would be Markham. But I don't see how even he could interfere. He is not the fellow's keeper; and what could he say? The other fellows are gentlemen; they don't cheat, or that sort of thing. Only, when a man has not much money, or not the heart to lose it like a man'—

'Mr Ramsay, you don't know anything about Captain Gaunt,' cried Frances, with hot indignation and excitement. 'I don't understand what you mean. He has the heart for—whatever he may have to do. He's not like you people,

who talk about everybody, who know everybody. But he has been in action; he has distinguished himself; he is not a nobody like'—

'You mean me,' said Claude. 'So far as being in action goes, I am a nobody of course. But I hope if I went in for play and that sort of thing, I would bear my losses without looking as ghastly as a skeleton. That is where a man of the world, however little you may think of us, has the better of people out of society.—But that's not the question. I only tell you, so that, if you can do anything to get hold of him, to keep him from going to the bad'—

'To the—bad!' she cried. Her face grew pale, and something appalling, an indistinct vision of horrors dimly appeared before Frances's eyes. She seemed to see not only George Gaunt, but his mother weeping, his father looking on with a startled miserable face. 'Oh,' she cried, trying to throw off the impression, 'you don't know what you are saying. George Gaunt would never do anything that is bad. You are making some dreadful mistake, or— Oh, Mr Ramsay, couldn't you tell him, if you know it is so bad, before—tell him—?'

'What!' cried Claude, horror-struck. 'I tell—a fellow I scarcely know! He would have a right to—kick me, or something—or at least to tell me to mind my own business. No; but you might speak to Markham—Markham is the only man who perhaps might interfere.'

'Oh, Markham! always Markham! Oh, I wish any one would tell me what Markham has to do with it,' cried Frances with a moan.

'That's just one of his ways,' said Ramsay calmly. 'They say it doesn't tell much one way or other, but Markham can't live without play—Don't you think, as Lady Markham does not come in, that you might give me a cup of tea?'

IN ITS RUINS.

ALMOST six hundred years before that Birth at Bethlehem which gives modern time its index—namely, in 582 B.C., the year when the Ishman games were restored—a cast of colonists, swarming out of Gela, not very far off, founded Acragas, which afterwards became, as Pindar wrote, 'the most beautiful city of mortals.' They could not have chosen a finer spot on all the coast of this fair island of Sicily, rich as it everywhere is in loveliness and charm. Broken and accentuated ground gave natural ramparts to the city and the majesty of domination to the temples; while the wide stretch of blue sea in front brought the beauty and burden of ships to the port, which opened its gates to its friends, and shut them like a trap against its foes. Jupiter and Minerva—or, more correctly, Zeus and Athene—were the tutelary deities of the city. The one was Zeus Akabryus, an awful form of Moloch; the other was the wise grave goddess worshipped by the Rhodians at Lindus—from which city came the original colonists of Gela, bringing their familiar deity with them. We have all heard of Phalaris the tyrant of Acragas, with his red-hot brazen bulls, in which he roasted men alive. But we do not all know that this was not only from wanton cruelty; though, as with the Inquisition of later

times, much personal hatred and malice might have been mixed up with it; but that it was also one form of religious superstition of the kind only too common in all faiths. Greek feeling, however, did not tolerate human sacrifices. Milk and honey, fruit and flowers, and poor innocent beasts, which at the worst served afterwards for food, were offered to the gods, to gain favour or ward off punishment. But save in very rare and exceptional instances, of which Iphigenia and her subsequent cult are the most notable, the deities of Hellas were not propitiated by the blood and tears of man. The men of Acragas, therefore, soon rose up in horror and indignation against Phalaris and banished him for his blood-guiltiness; for all that he had greatly embellished the city—always a claim on the gratitude of citizens. Among other things, he built a temple to Jupiter Pœtus, the 'founder of cities,' on the site of which, and in a manner incorporated with while overpowering the older fane, is the Christian church of Sta Maria dei Greci.

Theron, that wise and benevolent despot, whose tomb is still to be seen, was the real star of Acragas. He made that grand Greek luxury, a spacious fishpond; he built the best of the temples, of which the ruins still remain to attract travellers from countries then unknown, but now dominant, while all this majestic past is but a memory and a name; and Pindar celebrated and extolled him, which perhaps is the firmest holding on immortality that he possesses. Among others, he built the temple now called Juno Lacinia; that is, the same Juno as was worshipped at Læurnum; as a modum Catholic might dedicate a church to Sta Maria della Catena, or di Gesù, or della Pietà, &c., always the same goddess, but with specialised attributes. It was for this temple that Zeus painted his famous picture of Juno, taking for his models the five most beautiful virgins of Acragas, and producing a masterpiece such as the world had never seen before. But the forces of nature, like the passions of men, have no respect for works of art, whether in paint or in stone. Earthquakes and storms, winds, frost, and fire did their work of destruction on all these splendid conceptions and perfect achievements of genius; and Saracen and Norman completed the ruin which Carthaginian and Roman had begun. And now we have of Acragas, 'the most beautiful city of mortals,' only the uninteresting little town of Girgenti; and the ruins of the ancient temples.

But what ruins! Out on the edge of the rock stands the beautiful and still perfect skeleton of the Temple of Concord. It needs no great stretch of fancy to reconstruct the past, to repopulate the void, to call back from that dim and misty Hades where the pale ghosts wander mournfully, the forms of those who once filled the temple with love and light and youth and beauty, with music and song and the fervent prayers of pious souls, asking the benign Goddess of Peace to shed her influence over men, and stay both war and slaughter. The beautiful Sicilian girls who were the realisations of the nymphs and younger goddesses, some singing, some playing, others bearing baskets full of fruits and flowers—their soft feet falling in measured tread and the rhythmic swaying of their bodies making visible

music to the eye; the stately matrons, grander and graver, the Junos, the Demeters completed, to whom life had brought its cares as well as its fulfilled joys, its imperative duties as well as its pleading loves; the young men scanning the maidens and falling in love at a glance, as love is kindled into flame by a spark; the husbands and the elder fathers, occupied with things and indifferent to beauty; the poor dumb beasts, garlanded with flowers, and led to the slaughter as offerings to gods slow to save and quick to punish, as even the gentle gods of Greece themselves were:—all file along the paved road and up the marble steps, and range themselves within the columned hall, which then had no Christian arches to block up the space. The cymbals clash and clang; the shrill note of the double pipe sounds far and clear; and the echoes of the sacred songs come back from shaft to wall in a full diapason of joyous melody. Who cannot bring back that scene, as he stands among the asphodels and violets, and forgets time and space in memory?

Farther away is that Temple of Juno Lacinia, already spoken of, where the skeleton is by no means so perfect as this, and where the red hand of fire has left its crimson touch on the old gray stones. Farther still are the ruins of the Temple of Hercules, from which the infamous governor Verres, he who was denounced by Cicero in one of his most eloquent orations, attempted to steal the magnificent bronze statue of the god; sending his slaves at night to prise down the sacred iron; but failing—as the pious of the time said, by the miraculous energy of Hercules himself working through his effigy—until the horrified men of what was then Agrigentum, no longer Acragas, and not yet Girgenti, rushed to the rescue and delivered their deity from harm. And there is the still more undistinguishable chaos of the Temple of Jupiter—ruined before finished—where the great caryatid has prone on the greenward, like one of the old gods despoiled of his glory, dispirited, broken, destroyed, preserving only the dim and roughened outlines, but wanting all that made the life and beauty of the faith. Near to these confused ruins is the beautiful little upright fragment of the Temple of Castor and Pollux, those twin sons of Leda who stand as the emblems of fraternal fidelity.

The air is full of old-world memories, and involuntarily that noble hymn by Theocritus to the Dioscuri comes to us like a living sound wafted by strange singers across the scented bean-fields—'dear work-steeds of the busy bees'—and shaken like perfume from the flushed branches of flowering fruit-trees, and the sweet pale loveliness of almond blossoms. But their day is done. Their Temple is but a hint, precious for architectural grace, and beautiful in spite of its decay; and they themselves, this heroic pair, are as dead as the stone effigy lying prostrate on the grass. 'Farewell, ye sons of Leda'—'Castor of the swift steeds and swift Polydectes,' 'to whom all minstrels were dear,' 'the twin that aid all mortals,' 'the beloved pair,' 'sneakers of man in the very thrill of peril, and of horses maddened in the bloody press of battle, and of ships that, defying the stars that set and rise in heaven, have encountered the perilous breath of storms'—farewell! The present has destroyed the past,

and Judæa has conquered Greece; but what the world has lost in substance it still retains in spirit, and gratitude for beauty may outlive belief in its divinity.

If Theocritus pervades all Sicily, Girgenti is possessed by Empedocles. Clad in his purple robe, crowned with laurel, shod with golden sandals—what was this man? Was he the wise measurer of moral force, the diligent observer and partial conqueror of nature, some affirm him to have been? Was he the self-consecrated seer and mystic, sincere if also self-deceived, who imagined more than he knew, and who obscured his clearer thoughts by phantasies and his perceptions by illusions? Or was he the conscious charlatan who traded on men's credulity and discounted their ignorance? Who can say? He, too, is one of those faces in the clouds for which each observer has a different interpretation, and in which each sees a different form. But whatever he was, he was born and bred at Agræges, the beautiful city where the gods were housed in glory and worshipped with fervour; and it was from there that he set out to seek for immortality in the eternal fires of Etna.

And now, what do we find at the modern town and station of Girgenti? A country barren of trees but fruitful in grain; uplands as green with sprouting corn as English fields are green with summer grass; wide bean-fields scenting the air with perfume almost as rich as that which steals from the jessamine and orange blossoms of the high-walled gardens; uncultivated tracts full of asphodels and violets, of borage and the golden discs of yellow chrysanthemum, of fragrant herbs, and the rarer sorts of our wild-flowers at home—tracts where a botanist may spend his hours in rejoicing. Leaving the country and going into the town, which is set upon the high rock dominating the plain, we find but little beauty. The women no longer 'card the soft wool about their knees,' as in the days of the proud Eunice, who refused to love at all that desperate Simætha who loved too much; but they are said to be the most prolific of all Sicilian women, and for a man to marry a Girgentese is to be sure of heirs and the traditional quiver-full. The chief object of interest in the town is of course the Duomo or cathedral, where they show you superb vestments wrought in gold and silver, with garnets and turquoises mixed in with the embroidery; an engraved ivory staff, and two splendid monstrances—the one of gold and jewels in the form of a sun rayed and banded; the other, of silver flowers, with the Madonna's hair in the centre. The plain white-washed columns dividing nave from aisle agree but ill with the florid ornamentation of the high-altar or the bold carving of the roof; and the echo which seems to run round the wall like an invisible flame was once the cause of more heart-burnings than the architect knew when he struck by chance on that fatal angle of incidence.

If you are at Girgenti at Carnival-time and go to a *veglione* or masked ball in the theatre, you will see a little of Sicilian manners and something of Sicilian feeling. Among the Savages and the Swallows, the gold-horned, red-bodied Fiends, the Sailors and the nondescripts who dance together with more vigour than grace in the *platea*, you will not see one woman. The

Sicilian blood is too hot and Sicilian jealousy too rampant to permit the public and indiscriminate mingling of men and women; and there still exist in these less visited and less continentalised places, strong traces of the Sarcenic seclusion of women. In the boxes, two female masks—the only female masks in the theatre—come down ever and anon, attended by their male companion, to cross the *platea* for such refreshments as are to be found at the back of the stage. No one speaks to them, and they speak to no one. Even that group of Zulus who respect no man, make way for them; as do those half-dozen Swallows who run in and out with short steps and shrill cries, letting fly live birds as a diversion the more. These two bands are evidently well known in the place. They go in and out of certain boxes offering bonbons, which are laughingly accepted, and they dance with less clumsiness and more grace than the rest. Among the spectators in the boxes are two or three exquisite little masks of children. One only I noted, Louis XIV., of perhaps the type age of 11, making frantic efforts to kiss papa with the intervening mask to prevent contact, is handed about from box to box like a big doll. In one it is the centre of attraction and worship to five stalwart men; for Italian men are like women in their love of children, and you will constantly see the father performing what we consider to be essentially womanly offices for a little child, while the mother stands by looking on complacently. There is also a tiny, gold-horned, red-bodied imp, whose delight in his horns is such as one might have expected from a young fawn when he first learned that he could butt that bold kid with his own weapons.

For a last word, Girgenti is now absolutely safe. A few years ago, brigands might have been found lurking behind the fallen columns with the snakes and the lizards, and the long gun handy. Now you have only the lizards. The snakes have been frightened away by the throng of visitors; carabinieri keep evil-disposed men in check; and brigandage, like the old cult, has vanished into the dust and vapour of things past and dead.

DUNLEAP TOWER.

A STORY IN FOUR CHAPTERS.—CHAP. II.

THE first thing I did, after giving Mrs Staveley my promise that I would at once begin my search for Catherine and not rest till I had found her, was to resign my situation under the railway Company. This I did without regret, as I had previously made up my mind to try my fortune once again in one or other of the colonies. As soon as I was relieved from my duties, I began to make cautious inquiries in the neighbourhood of Isterby as to the direction presumably taken by Mr Rudyard on the evening of his departure with his wife. Some time elapsed before I could obtain the slightest clue to the information I was in search of; but when I once held the thread between my fingers, I was careful not to let it go again. It is needless to detail by what means I succeeded in tracing the two people I was in search of, step by step over the road they had gone, nor the labour and difficulty I experienced before

my quest came to an end at a lone house among the fells and moors on the bleak Northumberland coast.

It was evening when I ended my search. I slept that night at a village a couple of miles away, and before noon next day was in a very changed condition on my way to the house.

I doubt whether Catherine herself would have recognised me, had she chanced to encounter me as I left the inn. In my younger and more prosperous days, I had been an adept at amateur theatricals, and my 'make-up' on the present occasion was a study from life. I was a German Jew pedlar, Max Jacoby to wit, as the brass-lettered name on my mahogany box plainly told. My beard and moustache were dyed black and trimmed in a foreign fashion; I had long tangled hair and a tawny complexion; I wore several flashy rings on my fingers; and a square box, well equipped with fancy articles, was suspended over my shoulders by a strap. I spoke good English, but with a foreign accent, and that amount of gesticulation in which foreigners usually indulge. Such was the individual who tramped slowly up to the back entrance of Dunleap Tower and knocked boldly at the door.

It was opened by a rosy-cheeked country lass. 'We don't want any,' she said before I could utter a word.

'Ah, but you must see what I have got, pretty miss,' I answered with a smile and a bow. My box was opened before she could close the door; and when once she caught sight of the contents, she was in no hurry to go. 'I have everything from hair-pins to cameo brooches. Wedding-rings, these, pretty miss. Ah, here is one that would fit you beautifully. Let me just try it on—Ha, ha! what could be nicer? and cheap, dirt cheap. And now, let me fasten this brooch on your dress—real gold—real cameo. I will vow you never looked so charming in your life. Go into the house and see; go and ask your friends; and remember everything is very cheap, most wonderfully cheap.'

Blushing with pleasure, she retired for a moment and then called 'Sally.' Sally came, a buxom, good-tempered, middle-aged woman—the cook, I suppose. 'Heart alive! what pretty things!' she exclaimed, clasping her hands in ecstasy. I was still extolling on the beauty and excellence of my wares, when a door at the back of the kitchen was suddenly opened, and Rudyard entered the room, with his hands in his pockets and a cigar between his lips, followed by a tall, black-haired young woman whom I had never seen before.

'Hallo! what's the row now?' he exclaimed, as the frightened servants fell back. 'A pedlar, eh? Come, my good fellow, you'd better sheer off; we want none of your gimcracks here; and, hark ye! don't let me see your ugly phiz about these premises again, or my mastiff may want to try the flavour of your calves!'

I fell back a few paces and made a little foreign bow, and with a deprecatory smile, held out some brooches towards his companion. 'The gentleman is pleasant this morning,' I said. 'He does not ask the lady whether she would like to glance at my cameos. I have here some very choice ones, direct from Rome.—See! Bacchus and Ariadne, Venus rising from the Sea. All of splendid workmanship, and all wonderfully cheap.'

'Want anything in that line, Margery?' Rudyard asked.

She gave a little scornful shrug and shook her head, but did not reply. She was a tall, well-built young woman, with plenty of red in her cheeks to match the poppies in her hair, with quick-glancing, suspicious eyes, shaded by thick black eyebrows, and with a mouth hard and cruel in all its outlines. She was dressed in thick rustling black silk, and wore a profusion of coarse jewellery lavishly displayed.

'Come now, my hue fellow,' said Rudyard with a grim smile; 'you must make yourself scarce without more palaver.'

I did not stir; but opening a secret drawer at the bottom of my box, I took out of it a couple of Turkish daggers, curiously chased, and having inlaid hafts. I knew that if anything would attract Rudyard, they would. I remembered his weakness for curious pocket-knives when a lad at school, and the bright little dagger he carried about him till the master, hearing of it, took it away. I held up the daggers without a word.

His face lighted up the moment he saw them; he hesitated an instant, as though ashamed of his weakness; but the temptation was too strong, and the next moment he stepped forward irresolutely and took them in his hands to examine.

'Poor, poor,' he said in a deprecatory tone. Then: 'How much for the two?'

'Fifteen guineas.'

'Fifteen thunderbolts!'

'They are worth twenty-five, good sir. They are unique. They were the favourite weapons of the late Ibrahim Pasha, and were manufactured expressly for him.'

'Anyhow, they're not worth the price you ask.'

'The gentleman thinks not? Well, this is what I'll do: I will leave them with you till to-morrow. You can examine them at your leisure, and put them to whatever tests you may think fit. In the morning, I will call again, and then you will count me out fifteen bright new sovereigns and fifteen bright new shillings, and will tell me that you never got such a bargain in your life.'

'You meddly-mouthed rascal, I'll do nothing of the kind!'

It was, however, finally agreed that I should leave the daggers, for having once fingered them, he could not bear to let them go.

Next morning I trudged up to the house again, carrying with me a brace of pistols constructed on a principle which was but just coming into vogue in those days, although common enough now. Rudyard had seen nothing like them before, and was even more delighted than with the daggers. Would I go with him into the shooting-gallery, he asked, and explain that 'new dodge to him?'

Yes; I would go with him willingly, I replied. So into the shooting-gallery we went, which turned out to have been the picture-gallery at one period of the Rudyard lustory; but the walls had been long ago denuded of every picture that would fetch a price, and nothing but a few dingy family portraits remained, with faces which a good scouring would have wonderfully improved. Rudyard was a tolerable shot, but not

equal to me in that respect, for I had had much practice while in the bush, and I beat him without difficulty. When the target was sufficiently riddled, he reached down the portrait of one of his grim old ancestors in ruff and doublet, and set it up to be fired at. I confess that to me it seemed a terrible desecration to make a target of the fine old cavalier; but when I protested, I got nothing for my pains but a declaration that he would treat the whole of the gallery in the same way. By the time the old gentleman's head was all but shot off, luncheon was announced, to which meal Rudyard invited me. After it was over, we had some more shooting; and then we adjourned to the billiard-room, where we played game after game, till a cracked and doleful bell gave notice that dinner would shortly be served. As with the shooting, so with the billiards—Rudyard could not touch me; for I had been a marker in Melbourne in my low-water days, and had there made myself master of the game. But neither with the pistols nor the cue did I do more than just evince my superiority over him, beating his best shot by a mere hairbreadth, and topping his highest score by a couple of points only, urging him forward with the expectation that he only needed a little more practice to beat me easily.

'Come along, Jacoby, and let us have a bit of dinner,' said Rudyard at last, flinging down the cue with an oath.

'But my dress, sir?' pleaded I with an expressive uplifting of my hands.

'Never mind your dress! This is Liberty Hall, man. I'm not going to dress for dinner, why need you? And after dinner, we'll have a bowl of punch and make a night of it; for I mean you to sleep here. One doesn't meet with such a pedlar as you every day.'

We proceeded to the dining-room, a low dingy apartment, poorly furnished; and in a few minutes dinner was brought in, and with it entered the black-haired young woman whom I had seen before, and whom Mr Rudyard, in his off-hand way, now introduced to me as his cousin and housekeeper, Miss Yavill. The dinner was plain and substantial, and proceeded for some time in silence. At length Rudyard looked up.

'Are you out of sorts to-day, Margery? or are you sulky?'

'I am not sulky; I have a headache,' she replied, flashing a dangerous glance at him out of her black orbs.

'That's well in one sense, and bad in another. You had better have a headache than be sulky, Madge. I don't like silky people; and I don't like people who sit like ghosts over their dinner.'

'Really! How humorous you are to-day, and how excessively polite!' rejoined Miss Yavill, with a disdainful smile and a shrug.

Dinner was scarcely over when she rose. 'I'll go now, Martin—that is, if you and this gentleman,' with a special emphasis on the word, 'will kindly excuse me.' She spoke with an unmistakable sneer, this time. It is possible that Miss Yavill was not in the habit of dining with pedlars, and resented my presence accordingly.

'Ain't she a handsome tiger-cat?' asked Rudyard, appealing to me. 'Not without claws,

either.—Go, Margery, go, and my blessing go with you!' winking at me as he drained his glass. 'And now for a bowl of punch. Draw up closer to the fire, Jacoby, and try one of these Cabanas.' There was a rude but hearty hospitality about this man, which seemed to be the sole good quality that had come down to him from a long line of open-handed ancestors.

I did my best to entertain Rudyard that evening, and I succeeded. I related to him scraps of wild adventure that had befallen me during my roving days; I sang to him; above all, I approved myself a good listener when he chose to favour me with some autobiographical reminiscences of a not very creditable character; and I drew him out by insidious questions to talk on those matters with which he was best acquainted. Towards midnight we rose and lighted our candles. 'Jacoby,' said Rudyard, laying a heavy hand on my shoulder and looking in my face with drunken gravity, 'you are a trump! I haven't spent such a jolly day, I don't know when; for it's precious dull work living here, with nobody but Madge to talk to or quarrel with; it becomes monotonous after a time, you know. So I don't mean to let you go in a hurry. You must promise me that you'll stay a fortnight at Dunlop, and not a day less. Speak, Bezonian, what've you got?'

'A fortnight, Mr Rudyard, is a long time; and what would Mr Yavill say to such an arrangement?'

'Diable! I should like to see her object. I'd soon twist her white neck for her! But ain't she handsome, Jacoby? I'd marry her to-morrow, only there happens to be a slight impediment in the way.'

'An impediment, Mr Rudyard?' I thought, from what I have seen of you, that you were a man who would let no impediment stand in the way of a fixed purpose.'

We looked steadily at each other for a second or two; the conversation seemed to have suddenly sobered him.

'King of pedlars!' he exclaimed, 'I wish I knew how far I could trust you. But we will talk of this matter another day. One question, and then good-night. What would you do, Jacoby, if you had a wife who was mad?'

My heart gave a great bound; this was the first allusion to Catherine that had passed his lips. Looking him fixedly in the eyes, I said: 'I suppose I should do as other people do in such cases—shut her up, so that she could do no harm to herself or others.'

'Right you are, Jacoby! That's the thing. Gentle confinement, mild restraint, no harshness, no cruelty. Ay, ay, mad people should always be shut up.' He leered at me out of his drunken eyes, pointed to the door of my room, bade me a rough good-night, and was gone.

My bedroom was on the ground-floor; and that, so far, was fortunate for the purpose I had in view. Its windows looked into the wilderness outside which was dignified with the name of garden. I put out my light, drew back the curtains, and sat down on the low window-seat, and went over again in thought all that I had seen and heard during the day.

Mad! Catherine was no more mad than I was, and Rudyard knew it. I had not forgotten

what Mrs Staveley had told me—that, in the event of Catherine's death, her husband would become possessed of the fifteen thousand pounds which she had bequeathed to him by will. Here was at once a motive which, to such a man as Rudyard, involved in debt as he was, would be almost irresistible for causing him to wish to get rid of her. It was evidently a deep-laid villainous scheme on his part to bring his wife to this lonely house and immure her within its gloomy walls, away from every one whom she knew, on the vile plea that she was mad. To a woman of Catherine's temperament, such treatment could only end in madness that would be but too real, or in the more merciful alternative of death. But with a fortnight before me, if Rudyard held in the morning to the invitation he had given me overnight, it would go hard if I did not find some mode of releasing Catherine from the tyranny of this man; for that she was shut up somewhere under the roof of the old house, I did not for one moment doubt. Should Catherine die, Dunleap Tower and Isterby Manor would not be long without a fresh mistress—so much was evident to me already.

When every sound in the house was hushed, I softly unfastened the casement and leaped down into the garden; but the night was so intensely dark, and I was so ignorant of the plan of the premises, that I found it would be useless to attempt any exploration till morning; so I went back to bed and slept as best I could till daybreak, and then I started out on a journey of discovery before any one else seemed to be stirring.

About five hundred yards to the north of the house, which was a spacious, substantial, two-storied building, dating from the time of the Second James, but without any pretensions to architectural elegance, and on the summit of a steep slope, stood the object from which it derived its name—a gray, square, time-worn tower, keeping watch and ward over the coast, and gazing like a grim sentinel far away across the white-maned waves of the North Sea. It had been originally intended—so I learnt afterwards—as a place of refuge during those turbulent but romantic times when raids and forays across the Border were matters of frequent occurrence—a place where women and children, and even cattle and sheep, might find shelter and safety till the brief, fierce storm had burst and spent itself, or had swept across the moors in another direction. On a high hill only some mile or two away were the remains of a beacon, whence doubtless many a warning flash, in days gone by, had roused the country-side.

What if this old tower should prove to be the prison of Catherine! The thought sent a thrill through every nerve. From different parts of the garden, terrace, two sides of the tower were more or less visible; but in neither of them could I discern anything like a window, nothing but a few loopholes and a low-browed door. The third side looked towards the moors, while the fourth fronted the sea, and both were consequently hidden from me. Suppose I were to approach the tower a little more closely and ascertain whether it was in reality anything more than an uninhabited ruin?

On reaching the end of the garden, I found that the field, or rather the slice of moorland, on which the tower stood was separated from it by a high stone wall, through which the only means of admission was by a small oaken wicket, now locked. I was trying to open it, when a hand was laid on my shoulder, and a voice said in my ear: 'Do you particularly want to get to the other side of that door? If so, hadn't you better ask for the key?'

I turned with a start and looked at the speaker. He was a man about fifty years of age, with a keen foxey face, short stubby red hair, and small blue-gray eyes, full of craft and determination. He was dressed like a gamekeeper, and carried a gun over his shoulder; but it struck me at once that his language and bearing were superior to those of a man in his apparent position.

'Perhaps you would not mind obliging me with the key,' I said. 'I am desirous of examining that old tower.'

'Then I am afraid your desire will have to remain ungratified.'

'Are you aware that I am the guest of Mr Rudyard?'

'I am quite aware of that fact. You are Mr Max Jacoby, a travelling pedlar—according to your own account. You dined with Mr Rudyard yesterday, and when you and he parted at midnight, he gave you an invitation to stay a fortnight at the Tower.' His keen eyes had taken me in from head to foot as he spoke. He certainly looked as if he had no belief in my statement that I was nothing but a pedlar.

'Your information could scarcely be more accurate,' I replied. 'And now, you will perhaps enlighten me with regard to your own name and position?'

'Willingly. My name is Aaron Starke. I am Mr Rudyard's hallif, steward, gamekeeper, secretary, librarian, and general factotum—in short, his Jack-of-all-trades, and master of none.'

'I am pleased to make your acquaintance, Mr Starke. And now, perhaps you will kindly inform me why the grounds on the other side of this wall are kept so especially private?'

'Were you an ignorant clothopper,' he replied, 'I should tell you that the ground round the old tower of which this wall is the boundary is haunted by evil spirits—that it is said to have been the scene of more than one terrible crime; and that, if you do not wish to be carried bodily away by Lucifer himself, you had better keep on this side the boundary. In such a case, such an explanation would suffice; but to an intelligent individual like yourself, I can only say that it is one of Mr Rudyard's special whims—and if you ever come to know him better, you will find that he has many strange whims—that the tower and the ground round it shall be kept strictly private. No stranger ever passes through this door. When I have said as much as this to one of Mr Rudyard's guests, I have no doubt said sufficient.'

'Quite sufficient,' I answered dryly. 'I suppose I may take my morning ramble in any other direction without being looked upon as an intruder?'

'With this exception, you may walk for a dozen miles without being interfered with.'

We bade each other good-morning and separated. That Aaron Starke suspected me of being

something different from what I had represented myself to be was evident both from his tone and manner. I resolved to keep out of his way as much as possible during the remainder of my stay at Dunleap Tower.

I returned to the house for a small telescope which I had in my box, and then set out for a long walk. I took my way through the village, across the brook, and up a ravine that led to a rocky spur of the hills, which at this place shot out in the shape of a promontory for a considerable distance into the sea. From the edge of this promontory I judged that the third and fourth sides of the tower must be more or less visible, and while conversing with Aaron Starke, I made up my mind to visit the spot.

After some rough walking, I found myself close to the edge of the cliff. It was a lonely place, and rarely visited except by shepherds when gathering in their flocks from the uplands. I lay down and pointed my glass at the tower. Thence the whole of the third side of the tower—that which faced the moors—was plainly visible. Like the two sides I had seen from the garden, it was loopholed, but had no window. But on the fourth side, which faced the sea, I could clearly discern the outlines of a square window, although, even from my 'cogn of vantage,' I was only able to obtain a side-view of it. I waited patiently for more than an hour, keeping my glass fixed constantly on the window. At the end of that time I saw the casement opened and a white hand stretched out for a moment to fasten it back. Catherine was there!

STOCK EXCHANGE INVESTORS.

We believe that a few words on the subject of the Stock Exchange might not be out of place at the present time, with the object of affording some information to the general public, amongst whom we do not wish to include those who are habitual speculators or dealers in Capel Court, but that large mass of the inhabitants of the United Kingdom who look upon the Stock Exchange as a palace of mystery, in which fortunes are made and lost between dawn and dusk, and the members of which lead a life of constant excitement and pleasure which does not fall to the lot of ordinary mortals. To such persons, the very name of the Stock Exchange is suggestive of money, financial shrewdness, and abnormal clear-sightedness, with a sort of *arrière-pensée* of double-dealing and chicanery. Nowadays, nearly every one who is possessed of any capital is directly or indirectly brought into contact with the Stock Exchange, however much he may be prejudiced against that institution; and our object now is to show as simply as possible the *modus operandi* of Stock Exchange transactions, so that the ignorant operator may know exactly what takes place from their initiation to their completion, and be satisfied that nothing mysterious occurs, but that everything is conducted in the most prosaic and matter-of-fact way, and will bear the closest scrutiny.

The members of the Stock Exchange are divided into two classes—brokers and jobbers. The stockbroker is practically the only one known to the public; but the jobber bears a very important part in all the transactions that take place.

When any one wishes to buy or sell what is termed stock, the first step is to instruct a broker, who proceeds to the Stock Exchange, where are assembled the dealers or jobbers; the market for each class of stock, such as consols, English railways, foreign stocks, American railways, &c., occupying its allotted place in the building. Supposing, for instance, the broker's instructions are to buy one thousand pounds (Caledonian railway stock, he selects a jobber in the Caledonian market, and asks him to make a price in the requisite amount of stock. The jobber replies that the price is, say, 91½, which means that he is prepared at the moment to buy the required amount at 91½, or to sell it at 91½ per one hundred pounds stock, of course not being aware which the broker desires to do. The buyer is thus certain of getting the stock at the correct market-price at the time, as the jobber, for his own protection, is compelled to quote the exact market-price. The business, unless otherwise stipulated, is understood to be done for the next ensuing account-day, two of which occur in each month, about the 15th and 30th; the broker rendering a contract to his client in which is stated the amount of stock and the price, with the government stamp-duty, registration fee, and brokerage. The next step on the part of the broker is to issue, on the day preceding the account-day, what is called a 'ticket,' containing the name and amount of stock, with the stamp-duty and full designation of the purchaser. This ticket, having the name and address of the broker appended, is handed to the jobber, and by him to his seller, and so on, till it reaches the broker of the original seller and deliverer, each member in turn putting his name on the back of the ticket, so that the transaction may be easily traced if necessary. The delivering broker prepares the transfer from his client to the person named on the ticket, following out the instructions contained therein; and the deed, after being executed by the seller, is delivered to the buyer's broker, who gives a cheque for the amount of the consideration-money and stamp-duty. Thus the original seller is brought into contact with a purchaser, although the stock may have passed through fifty different hands. After the transfer has been signed by the buyer, it is sent with the certificate to the Company's office for registration; and after being approved by the directors, a new-certificate is issued in the buyer's name.

The case thus given is that of a registered stock; but stocks to bearer, which form a large portion of those dealt in on the Stock Exchange, are transferred by delivery only. British govern-

ment, Indian government, Bank of England, Metropolitan Board of Works, and several municipal and colonial stocks, are transferred in the books kept for the purpose at the Bank of England, where the seller must make the transfer either personally or by his attorney.

In these times of bad trade and general financial and mercantile depression, people look upon the Stock Exchange with a jaundiced eye, as the outward and visible herald of falling prices and increasing losses, and scarcely a good word is heard of the 'House' or anything connected with it. But the Stock Exchange, great as its influence undoubtedly is, cannot control events, and ignorance can be the only excuse of those who do not recognise it as an institution of great public utility, we might almost say of absolute necessity in a great commercial country, in which the savings accumulated by industry must find a ready means of investment. Far be it from us to say that the Stock Exchange is immaculate; but everything is done by the governing body to make it so; and it is the paramount interest of each member to fulfil his engagements promptly and honestly. No doubt, many flagrant cases of default have taken place; but when the magnitude of the transactions and the varied interests involved are taken into account, it must be admitted that the loss to the public from this cause is wonderfully small. We believe that one of the most fruitful causes of the disasters which have of late years helped to throw discredit on the Stock Exchange is the pernicious habit, if we may so call it, indulged in by many persons of leaving stock in the hands of their brokers for safe custody, collection of coupons, &c. When a man has bought stock and paid for it, he should in all circumstances insist upon having it in his own keeping, or at all events under his own control, at his banker's; or, if in London, in the vault of the National Safe-deposit Company, or other place of safety. The folly of leaving valuable securities in the hands and at the mercy of any one man, no matter who he is, and often for a long course of years, cannot be too much deprecated; and in these days, when bankers and others offer every facility to their customers for keeping papers of value in perfect safety and under their own control, there can be no excuse for such laxness. If this were attended to by every one—and why should it not be?—we are convinced that our convict prisons would not be so full, and society would not suffer so many rude shocks as have shaken it during the last few years.

We would refer, in conclusion, to one more form of temptation which is daily and hourly thrown into the way of investors, and which we also hold responsible for much loss to the unsophisticated. In these days of cheap postage, the public is deluged with prospectuses of every description, most of which are prepared in so alluring a manner, and appeal so specially to human cupidity, that the investing public are led away, and part with their money never to see it again. We can only advise such persons

never, on any occasion, to apply for shares in any Company submitted to their notice in this way without first consulting a respectable stock-broker.

POST-OFFICE NOTES.

WITH the rapidly increasing population of this country, it is only natural that increased work should be entailed upon the various departments of the State, and this is essentially the case with respect to the Post-office, for, in addition to the cause already mentioned, the better education of the people is brought to bear in increasing the mass of correspondence passing through that department for transit. Accordingly, we find, from the recently issued Report of the Postmaster-general, that the year's working for the twelve months ending the 31st of March 1885, shows an increase in correspondence of nearly four per cent., the yearly increase in population being about one per cent., or only a fourth of the increase in correspondence.

The number of letters, &c., delivered during the year was as follows: Letters, 1,360,341,400; post-cards, 160,310,500; book-packets and circulars, 220,116,800; newspapers, 143,674,500—making a total of 1,984,473,200. Of parcels, 22,904,373 were delivered during a grand total of 2,007,677,573 articles. These figures give an average of thirty-eight letters to each person in the United Kingdom. Including post-cards, the average is forty-two; a far larger proportion, the Report states, than in any other country. With book-packets, newspapers, and parcels included, the total average is nearly fifty-six. The number of registered letters carried was 11,365,151, showing a decrease of one-and-a-half per cent.

The total number of letters, post-cards, &c., received at the Returned Letter Offices during the year was 5,626,875, being a decrease of nearly two per cent. over the previous year; from which it may be gathered that the public at large has become more careful in addressing its correspondence correctly. Out of this total, 512,636 letters were unreturnable; 26,472 letters were posted *without any address*, and out of this number there were 1686 which contained value to the amount of £3898. Upwards of 45,000 parcels were undelivered, on account, chiefly, of insecure packing and incomplete addresses.

During the last year, 483 new post-offices have been opened, bringing the total number in the United Kingdom to 16,434. Letter-boxes have been added to the number of 773—thus making the total number of receptacles of all kinds for letters about 33,000.

To meet the increased work of the department, 1969 officers have been added to the permanent staff during the year, bringing the total number employed up to about 48,000. In addition to these, about 47,000 persons are employed throughout the country by different postmasters as assistants; but most of them have private occupations, and only perform postal duties for a short time in the day. The pension list shows a total of 3337 retired officers in receipt of pensions amounting to £175,602 per annum.

Several important improvements in the mail service have been carried out during the year, nearly all the large towns in Scotland being

benefited by an arrangement which reduces by forty minutes the time occupied in the transit of the mails from London to Perth. A new mail-train leaving King's Cross at 7.40 A.M. greatly improves the service between the continent and Yorkshire; in proof of which it may be mentioned that a letter posted in Paris on Tuesday evening would arrive in Yorkshire on Wednesday about noon; and a reply could be posted so as to be delivered in Paris early on Thursday morning. This is an instance of celerity which leaves nothing to be desired.

Several curious incidents are noted as having occurred during the year. A bird, described as a 'blue-breast,' hatched during the summer a brood of young ones in a private letter-box in a road near Lockerbie. She allowed the postman to feed her, and remained on the nest when he opened the box, but invariably flew away if any one else appeared. A box arrived at Greenock by parcel post which, in consequence of the strange noises which were heard to proceed from it, was opened by the postman, when it was found to contain a common screech-owl. As the bird was in an exhausted condition, it was taken care of and fed, and when properly recovered, sent on by railway to its owner. Two cheques, for one hundred and seventeen and twenty pounds respectively, were posted in a letter-box at Birmingham without cover or address, one being payable to bearer, and the other uncrossed! They were relegated to the Returned Letter Office, and duly restored to their owners. In Liverpool, a penny stamp was posted, on the back of which was written twenty-six words. This was duly delivered, as was also a second and similar epistle; but on the experiment being repeated with a halfpenny stamp, the novel missive became liable to a charge of one penny, as an insufficiently prepaid document; and this penalty was duly enforced.

A NEW CARPET-CLEANER.

It may not be generally known to our readers that carpets are now cleaned on an extensive scale in London and a few other of the great towns in England and Scotland. The machine is made so as to thoroughly beat every inch of the carpet subjected to it, besides removing all dirt and eradicating moths and their eggs, without damage to the fabric. The machine itself consists of an external wooden casing of over twenty feet long, strongly put together, oblong in shape, with a narrow orifice along the front of it, of sufficient width to admit of the thickest carpet; thus it will take a carpet of the largest dimension equally well as a small stair ditto. Through the centre of the machine runs an iron shaft, which is driven by steam or other power. The shaft is what is termed lagged, that is, lined externally with wood, to which are attached at equal distances around it four rows of wide leather straps, the whole length of it. The carpet is placed on the edge of the aperture of the machine, and as the shaft revolves, the leather straps or chains, each row in succession, strike the carpet that is being cleaned, so that no part is missed. The circular action of the straps as they rotate has a slight pulling tendency on the carpet, which slowly and surely draws it in, on to an elastic bed or platform, from which it

passes into the rear of the machine. The carpet is then reversed and put through again. This is usually sufficient for ordinary Brussels or Kidderminster; but thick-pile carpets of Axminster or Turkey make, which hold and retain the dust, &c., are subjected to repeated operations until properly cleaned. The material cannot be damaged, on account of the elastic platform, which gives way, and so modifies the pressure of the straps as they descend upon it. Then, again, the leather thongs being loose, like the lash of a whip, bend themselves to the contour of the article they fall upon, so different from the hole-producing rigid stick hitherto in use. The cleaning of a carpet of an ordinary sized dining or drawing room is begun and finished in from ten to fifteen minutes. When the fabric is drawn from the machine the colours show much of their pristine beauty now that they are freed from dust. The dust evolved during the process is sucked by a powerful fan and driven through an inclosed spout into a chimney shaft, where it meets the flame from a furnace, and is consumed.

The machine, we understand, is an American invention, and was first introduced into this country about six years ago, and may be seen at work in Leicester, Nottingham, Edinburgh, and other large towns.

ONLY FRIENDS.

SUMMER'S freshness fell around us,
Nature dreamed its sweetest dream,
Every balmy evening found us
By the meadow or the stream,
With our hearts as free from sadness
As the sunshine heaven sends;
Youth's light garden bloomed in gladness,
Where we wandered—only friends.

Not a word of love was spoken,
No hot blushes faded red;
Love's first sleep was left unbroken,
Bitter tears were never shed
We were young and merry-hearted,
Dreaming not of future ends,
And without a sigh we parted;
Fate had made us—only friends.

But a little germ of sorrow
Wakened in my heart's recess,
When I wandered on the morrow
By our haunts of happiness,
And this germ found deeper rooting
As the weary days wore on,
Till I felt a blossom shooting
In love's garden all alone.

No kind fate threw us together,
We had missed the lucky tide;
Golden-gilded summer weather
Not for ever doth abide.
But for me, though vainly sighing
For a love, time never sends,
Still is left this thought undying,
We, alas! were—only friends.

SOME MEDIEVAL BANQUETS.

AN old chronicler tells us that on the occasion of a tournament honoured by the presence of most of the nobility of England, the cooks who prepared the banquets entered into a friendly contest as to which of them should have the merit of designing the most acceptable dish. The cook to whom this honour fell sent in a sucking-pig harnessed to a chariot of plum-pudding with strings of sausages. To enjoy such a dish as this, our forefathers must, to say the least of it, have been very gross feeders. They were also great feeders, and the chief aim of a host was to load the table until it literally groaned beneath the weight placed upon it.

In 1470, the Archbishop of York gave a banquet which has probably never been surpassed for the abundance of the comestibles consumed. Three hundred quarters of flour were used, three hundred and thirty tuns of ale, a hundred hogsheds of hippocras, eighty fat oxen, six wild oxen, a thousand and four sheep, three hundred pigs, three hundred sucking-pigs, three hundred calves, three thousand geese, a thousand capons, two hundred peafowl, two hundred cranes, two hundred kids, two thousand chickens, four thousand pigeons, four thousand rabbits, two hundred and four herons, four thousand ducks, two hundred pheasants, five hundred partridges, four thousand snipes, four hundred waterhens, one hundred quails, one thousand bitterns, two hundred roes, four hundred deer, fifteen hundred and six venison pasties, fourteen hundred bowls of meat jelly, four thousand bowls of sweet spices, three hundred pikes, three hundred breams, eight dogfish, four dolphins, and four hundred fruit-tarts. Sixty red-faced cooks laboured and fumed to reduce these good things to dainty dishes; while a thousand serving-men waited outside the banqueting-hall, and five hundred and fifteen within. The lordly archbishop who sat at the head of the table was the brother of the celebrated 'King-maker,' and the occasion was his

elevation to the 'primacy of England.' The King-maker himself was no less notable for his house-keeping. At his London mansion his retainers consumed six oxen daily for breakfast! and at his numerous seats the same liberal scale of purveyance was absolutely necessary.

The tables of the great lords being furnished with this lavish extravagance, the waste of food must have been immense, not only because of the impossibility of cooking whole oxen, calves, sheep, and swine so that every portion of the flesh shall be eatable; but also because, in those days, it would not have been complimentary to the guests to provide for them as if you had wished them to eat as we moderns do.

The Germans, always celebrated for heavy eating, furnish us with some curious culinary items. In the middle ages the goose was the grand dish among them; but they also ate crows, storks, cranes, herons, swans, and bitterns—these last-named dishes being arranged in a circle of honour around the goose. The geier or European vulture, the dogfish, the dolphin, and even the whale, were eaten; whilst a roast guinea-pig was considered a very great delicacy. All their foods were highly spiced; and sauces were endless in their variety, three or four kinds being served up with each dish. In these sauces, pepper, mace, cinnamon, cloves, ginger, garlic, saffron, and pimento contended for the mastery; and the more decided the flavour, the better the cook.

Of course, the great art was to arrange these sauces in an ascending scale of piquancy. So great, indeed, was the passion for highly flavoured foods, that turkeys had often an allowance of musk in their daily rations. The most fashionable wines were those of Chios, Cyprus, and other Greek vintages; but, as highly flavoured foods require drink to correspond, the wine was generally spiced, and was served under the name of hippocras. It was not thought unpolite, even so late as the sixteenth century, for a guest to ask his host what wines he intended to provide, so that he might make his calcu-

'lations as to what he would take before he confined himself to the particular tippie which should place him under the table; nor was it thought unpolite in the middle of a banquet to undo the girdle in order to make more room for such tempting tit-bits as pike-tails, barbels' heads, skin of roast goose, and swan-tongues. The feast usually commenced at eleven in the forenoon; and the longer the host could keep the guests at table, the better was he thought of; but in the matter of drinking, he was expected to encourage potation by providing bacchanalian songs, or, at least, by being himself the first to become *hors de combat*. It was with this latter object that a rich man would mix his wines; while a poorer one would contrive to have his homely tankard strongly dosed with wine, or even spirits, when these had become general.

When Joachim I. of Brandenburg married the daughter of the Duke of Saxony in 1524, the first course consisted of hare, venison, birds, and apples roasted in butter; the second, of smerlin, quince and pear tarts, and hare-pie; and the third, of capon served with biscuits and sweet wines, also of whey and rice.

In addition to these dishes, there were served with each course immense piles of sugar and almond paste, to represent some group of figures, such as a tournament of knights, an historical or legendary event, or some sacred subject. These contrivances were called show-dishes; and the ingenuity of the court pastry-cooks and confectioners must often have been exercised for months beforehand in order to furnish them; while the good monks at the neighbouring monastery must often have been obliged to ransack their brains in order to suggest subjects which should prove both interesting and new.

In 1585, when Prince John William of Julich married Princess Jakobä of Baden, the show-dishes grew to such considerable proportions that they occupied a very large space in the dining-hall. The principal show-dish represented a garden, where grew laurel-trees with leaves covered with spangles, fruit-trees on great rocks; hills and mountains; rivers and ponds in which swam live fish; castles, cities, mansions, farms and huts; forests inhabited by elephants, lions, tigers, and singing-birds; whilst some musicians, skilfully hidden in the cardboard, discoursed sweet music to the delight of the guests.

Many a time, live animals, especially birds, were hidden away in a cake or a pie; and the guests were doubtless as much amused as our own youngsters are to this day with the 'four-and-twenty blackbirds baked in a pie,' a nursery song which must have been suggested by more than one real dainty dish set before a real king. But perhaps the most curious pie ever placed before royalty was that one in which Archie Armstrong the jester was served before Queen Anne of Denmark for her amusement.

In Elizabethan days, the first course on great occasions would probably be wheaten flummery, stewed broth or spinach broth, or smallage, gruel, or hotchpot. The second consisted of fish, among which we may note lampreys, poor-John, stock-fish, and sturgeon, with side-dishes of porpoise. The third course comprised quaking puddings, bag puddings, black puddings, white puddings, and marrow puddings. Then came veal, beef, capons, humble-pie, mutton, marrow pasties, Scotch collops, wild-fowl, and game. In the fifth course, all kinds of sweets, creams in all their varieties, custards, cheese-cakes, jellies, warden-pies, suckets, sallabubs, and so on; to be followed perhaps by white cheese and tansy-cake. For the drinks, ale and beer, wine, sack, and numerous varieties of mead or metheglin, some of which were concocted out of as many as five-and-twenty herbs, and were redolent of sweet country perfumes.

Queen Elizabeth's table was always laid with the utmost solemnity. The majordomo entered the banqueting-room with his white wand accompanied by one with the table-cloth. Both knelt three times reverently, the cloth was spread, and after some further reverent kneeling, they retired. In like manner the majordomo led in the man who carried the salt-cellar, the plates, and the bread, when the performances on the knees were again repeated. Two ladies of title now entered, one a matron and the other unmarried. These prostrated themselves three times, when the younger lady rubbed the plates reverently with salt and bread. After that came the yeomen of the guard, or 'beefeaters,' each bearing a silver dish. There were usually four-and-twenty to a course. A gentleman received each dish; and after it was placed by him on the table, a lady-taster took out a small portion, and gave it to the man who had carried it in, to eat, in case it should have been poisoned. During the whole of these observances, the prostrations were continued, just as if the queen herself had been present, and the trumpeters blew fanfares, and the kettledrums rolled. By this time the queen had entered her private room leading out of the banqueting-hall, and each dish was in turn carried in to her by an unmarried lady, and placed on the table for Her Majesty to make her selection; after which they were conveyed once more into the great room, to be consumed by those who had the honour of dining at court. Throughout the whole meal, the most reverential and solemn etiquette was rigorously exacted of all.

The same ceremonial observances were in a lesser degree customary throughout the land in the thousand-and-one red-gabled mansions which raised their proud heads from amidst the stately green trees of the parks, each knight and noble being a little king in his domain. No wonder, then, that in Queen Elizabeth's days Englishmen considered themselves born to rule the world,

and that, under their proud-hearted queen, they worked out for themselves the chief place among the nations.

A HOUSE DIVIDED AGAINST ITSELF.

CHAPTER XXXVII.

CONSTANCE WARING had not been enjoying herself in Bordighera. Her amusement indeed came to an end with the highly exciting yet disagreeable scene which took place between herself and young Gaunt the day before he went away. It is late to recur to this, so much having passed in the meantime; but it really was the only thing of note that happened to her. The blank negative with which she had met his suit, the air of surprise, almost indignation, with which his impassioned appeal was received, confounded poor young Gaunt. He asked her, with a simplicity that sprang out of despair, 'Did you not know then? Were you not aware? Is it possible that you were not—prepared?'

'For what, Captain Gaunt?' Constance asked, fixing him with a haughty look.

He returned that look with one that would have cowed a weaker woman. 'Did you not know that I—loved you?' he said.

Even she quailed a little. 'Oh, as for that, Captain Gaunt—a man must be responsible for his own follies of that kind. I did not ask you to—care for me, as you say. I thought, indeed, that you would have the discretion to see that anything of the kind between us was out of the question.'

'Why?' he asked, almost sternly; and Constance hesitated a little, finding it perhaps not so easy to reply.

'Because,' she said after a pause, with a faint flush, which showed that the effort cost her something—'because—we belong to two different worlds—because all our habits and modes of living are different.' By this time she began to grow a little indignant that he should give her so much trouble. 'Because you are Captain Gaunt, of the Indian service, and I am Constance Waring,' she said with angry levity.

He grew deadly red with fierce pride and shame.

'Because you are of the higher class, and I of the lower,' he said. 'Is that what you mean? Yet I am a gentleman, and one cannot well be more.'

To this she made no reply, but moved away from where she had been standing to listen to him, and returned to her chair. They were on the loggia, and this sudden movement left him at one end, while she returned to the other. He stood for a time following her with his eyes; then, having watched the angry abandon with which she threw herself into her seat, turning her head away, he came a little closer with a certain sternness in his aspect.

'Miss Waring,' he said, 'notwithstanding the

distance between us, you have allowed me to be your—companion for some time past.'

'Yes,' she said. 'What then? There was no one else, either for me or for you.'

'That, then, was the sole reason?'

'Captain Gaunt,' she cried, 'what is the use of all this? We were thrown in each other's way. I meant nothing more; if you did, it was your own fault. You could not surely expect that I should marry you and go to India with you? It is absurd—it is ridiculous,' she cried with a hot blush, throwing back her head. He saw with suddenly quickened perceptions that the suggestion filled her with contempt and shame. And the young man's veins tingled as if fire was in them; the rage of love despised shook his very soul.

'And why?' he cried; 'and why?' his voice tremulous with passion. 'What is ridiculous in that? It may be ridiculous that I should have believed in a girl like you. I may have been a vain weak fool to do it, but to know that I was only a plaything for your amusement; but it never could be ridiculous to think that a woman might love and marry an honourable man.'

He paused several times to command his voice, and she listened impatient, not looking at him, clapping and unclapping her hands.

'It would be ridiculous in me,' she cried. 'You don't know me, or you never would have dreamt— Captain Gaunt, this had better end. It is of no use lashing yourself to fury, or me either. Think the worst of me you can; it will be all the better for you—it will make you hate me. Yes, I have been amusing myself; and so, I supposed, were you too.'

'No,' he said, 'you could not think that.'

She turned round and gave him one look, then averted her eyes again, and said no more.

'You did not think that,' he cried vehemently. 'You knew it was death to me, and you did not mind. You listened and smiled, and led me on. You never checked me by a word, or gave me to understand— Oh,' he cried with a sudden change of tone, 'Constance, if it is India, if it is only India, you have but to hold up a finger, and I will give up India without a word!'

He had suddenly come close to her again. A wild hope had blazed up in him. He made as though he would throw himself at her feet. She lifted her hand hurriedly, to forbid this action.

'Don't!' she cried sharply. 'Men are not theatrical nowadays. It is nothing to me whether you go to India or stay at home. I have told you already I never thought of anything beyond friendship. Why should not we have amused each other, and no harm? If I have done you any harm, I am sorry; but it will only be for a very short time.'

He had turned away, stung once more into

bitterness, and had tried to say something in reply; but his strength had not been equal to his intention, and in the strong revulsion of feeling, the young man leant against the wall of the loggia, hiding his face in his hands.

There was a little pause. Then Constance turned round half stealthily, to see why there was no reply. Her heart perhaps smote her a little, when she saw that attitude of despair. She rose, and after a moment's hesitation, laid her hand lightly on his shoulder. 'Captain Gaunt, don't vex yourself like that. I am not worth it. I never thought that any one could be so much in earnest about me.'

'Constance,' he cried, turning round quickly upon her, 'I am all in earnest. I care for nothing in the world but you. Oh, say that you were hasty—say that you will give me a little hope!'

She shook her head. 'I think,' she said, 'that all the time you must have mistaken me for Frances. If I had not come, you would have fallen in love with her, and she with you.'

'Don't insult me, at least!' he cried.

'Insult you—by saying that *my* sister——' You forget yourself, Captain Gaunt. If my sister is not good enough for you, I wonder who you do think good enough. She is better than I am; far better—in that way.'

'There is only one woman in the world for me; I don't care if there was no other,' he said.

'That is benevolent towards the rest of the world,' said Constance, recovering her composure. 'Do you know,' she said gravely, 'I think it will be much better for you to go away. I hope we may eventually be good friends; but not just at present. Please go. I should like to part friends; and I should like you to take a parcel for Frances, as you are going to London; and to see my mother. But, for heaven's sake, go away now. A walk will do you good, and the fresh air. You will see things in their proper aspect. Don't look at me as if you could kill me. What I am saying is quite true.'

'A walk,' he repeated with unutterable scorn, 'will do me good!'

'Yes,' she said calmly. 'It will do you a great deal of good. And change of air and scene will soon set you all right. Oh, I know very well what I am saying. But pray, go now. Papa will make his appearance in about ten minutes; and you don't want to make a confidant of papa.'

'It matters nothing to me who knows,' he said; but all the same he gathered himself up and made an effort to recover his calm.

'It does to me, then,' said Constance. 'I am not at all inclined for papa's remarks. Captain Gaunt, good-bye. I wish you a pleasant journey; and I hope that some time or other we may meet again, and be very good friends.'

She had the audacity to hold out her hand to him, calmly looking into his eyes as she spoke. But this was more than young Gaunt could bear. He gave her a fierce look of passion and despair, waved his hand without touching hers, and hurried headlong away.

Constance stood listening till she heard the

door close behind him; and then she seated herself tranquilly again in her chair. It was evening, and she was waiting for her father for dinner. She had taken her last ramble with the Gaunts that afternoon; and it was after their return from this walk, that the young soldier had rushed back to inform her of the letters which called him at once to London, and had burst forth into the love-tale which had been trembling on his lips for days past. She had known very well that she could not escape—that the reckoning for these innocent pleasures would have to come. But she had not expected it at that moment, and had been temporarily taken by surprise. She seated herself now with a sigh of relief, yet regret. 'Thank goodness, that's over,' she said to herself; but she was not quite comfortable on the subject. In the first place, it *was* over, and there was an end of all her simple fun. No more walks, no more talks skirting the edge of the sentimental and dangerous, no more diplomatic exertions to keep the victim within due limits—fine exercises of power, such as always carry with them a real pleasure. And then, being no more than human, she had a little compunction as to the sufferer. 'He will get over it,' she said to herself; change of air and scene would no doubt do everything for him. Men have died, and women have eaten them, &c. Still, she could not but be sorry. He had looked very wretched, poor fellow, which was complimentary; but she had felt something of the self-contempt of a man who has got a cheap victory over an antagonist much less powerful than himself. A practical swordsman (or woman) of society should not measure arms with a merely natural person, knowing nothing of the noble art of self-defence. It was perhaps a little—mean, she said to herself. Had it been one of her own species, the duel would have been as amusing throughout, and no harm done. This vexed her a little, and made her uneasy. She remembered, though she did not care much about books or the opinions of the class of nobodies who write them, in general, of some very sharp things that had been said upon this subject. Lady Clara Vere de Vere had not escaped handling; and she thought that after it Lady Clara must have felt small, as Constance Waring did now.

But then, on the other hand, what could be more absurd than for a man to suppose, because a girl was glad enough to amuse herself with him for a week or two, in absolute default of all other society, that she was ready to marry him, and go to India with him! To India! What an idea! And it had been quite as much for his amusement as for hers. Neither of them had any one else: it was in self-defence—it was the only resource against absolute dullness. It had made the time pass for him as well as for her. He ought to have known all along that she meant nothing more. Indeed, Constance wondered how he could be so silly as to want to have a wife and double his expenses, and bind himself for life. A man, she reflected, must be so much better off when he has only himself to think of. Fancy him taking her bills on his shoulders as well as his own! She wondered, with a contemptuous laugh, how he would like that, or if he had the least idea

what these bills would be. On the whole, it was evident, in every point of view, that he was much better out of it. Perhaps even, by this time he would have been tearing his hair, had she taken him at his word. But no. Constance could not persuade herself that this was likely. Yet he would have torn his hair, she was certain, before the end of the first year. Thus she worked herself round to something like self-forgiveness; but all the same there rankled at her heart a scuse of meanness, the consciousness of having gone out in battle-array and vanquished with beat of drum and sound of trumpet an unprepared and undefended adversary, an antagonist with whom the struggle was not fair. Her sense of honour was touched, and all her arguments could not content her with herself.

'I suppose you have been out with the Gaunts again?' Waring said, as they sat at table, in a dissatisfied tone.

'Yes; but you need never put that question to me again, in that uncomfortable way, for George Gaunt is going off to-morrow, papa.'

'Oh, he is going off to-morrow?' Then I suppose you have been honest, and given him his congé at last?'

'I, honest? I did not know I had ever been accused of picking and stealing. If he had asked me for his congé, he should have had it long ago. He has been sent for, it seems.'

'Then has the congé not yet been asked for? We shall have him back again, then, I suppose?' said her father, in a tone of resignation and with a shrug of his shoulders.

'No—for his people will be away. They are going to Switzerland, and the Durants are going to Lombardy. Where do you mean to go, when it is too hot to stay here?'

He looked at her half angrily for a moment. 'It is never too hot to stay here,' he said; then, after a pause: 'We can move higher up among the hills.'

'Where one will never see a soul—worse even than here!'

'Oh, you will see plenty of country-folk,' he said—'a fine race of people, mountaineers, yet husbandmen, which is a rare combination.'

Constance looked up at him with a little *moue* of mingled despair and disdain.

'With perhaps some romantic young Italian count for you to practise upon,' he said.

Though the humour on his part was grim and derisive rather than sympathetic, her countenance cleared a little. 'You know, papa,' she said with a faintly complaining note, 'that my Italian is very limited, and young counts and countesses speak no language but their own.'

'Oh, who can tell? There may be some poor soldier on furlough, who has French enough to—' By the way,' he added sharply, 'you must remember that they don't understand flirtation with girls. If you were a married woman, or a young widow'—

'You might pass me off as a young widow, papa. It would be amusing—or at least it *might* be amusing. That is not a quality of the life here in general. What an odd thing it is that in England we always believe life to be so much more amusing abroad than at home.'

'It is amusing—at Monte Carlo, perhaps.'

Constance made another *moue* at the name of

Monte Carlo, from the sight of which she had not derived much pleasure. 'I suppose,' she said impartially, 'what really amuses one is the kind of diversion one has been accustomed to, and to know everybody: chiefly to know everybody,' she added after a pause.

'With these views, to know nobody must be bad luck indeed!'

'It is,' she said with great candour; 'that is why I have been so much with the Gaunts. One can't live absolutely alone, you know, papa.'

'I can—with considerable success,' he replied.

'Ah, you! There are various things to account for it with you,' she said.

He waited for a moment, as if to know what these various things were; then smiled to himself a little angrily, at his daughter's calm way of taking his disabilities for granted. It was not till some time after, when the dinner had advanced a stage, that he spoke again. Then he said without any introduction: 'I often wonder, Constance, when you find this life so dull as you do'—

'Yes, very dull,' she said frankly, 'especially now, when all the people are going away.'

'I wonder often,' he repeated, 'my dear, why you stay? for there is nothing to recompense you for such a sacrifice. If it is for my sake, it is a pity, for I could really get on very well alone. We don't see very much of each other; and till now, if you will pardon me for saying so, your mind has been taken up with a pursuit which—you could have carried on much better at home.'

'You mean what you are pleased to call flirtation, papa? No, I could not have carried on that sort of thing at home. The conditions are altogether different. It is difficult to account for my staying, when, clearly, you don't consider me of any use, and don't want me.'

'I have never said that. Of course, I am very glad to have you. It is in the bond, and therefore my right. I was regarding the question solely from your point of view.'

Constance did not answer immediately. She paused to think. When she had turned the subject over in her mind, she replied: 'I need not tell you how complicated one's motives get. It takes a long time to make sure which is really the fundamental one, and how it works.'

'You are a philosopher, my dear.'

'Not more than one must be with Society pressing upon one as it does, papa. Nothing is straightforward nowadays. You have to dig quite deep down before you come at the real meaning of anything you do; and very often, when you get hold of it, you don't quite like to acknowledge it, even to yourself.'

'That is rather an alarming preface, and very just too. If you don't like to acknowledge it to yourself, you will like still less to acknowledge it to me.'

'I don't quite see that; perhaps I am harder upon myself than you would be. No; but I prefer to think of it a little more before I tell you. I have a kind of feeling now that it is because—but you will think that a shabby sort of pride—it is because I am too proud to own myself beaten, which I should do, if I were to go back.'

'It is a very natural sort of pride,' he said.

'But it is not all that. I must go a little deeper still. Not to-night. I have done as much thinking as I am quite able for to-night.'

And thus the question was left for another day.

FISHES AND FROGS AS PARENTS.

It is by no means usual to associate either fishes or frogs with the idea of careful or affectionate parentage. On the contrary, it is more generally believed that not merely these two classes of animals, but others even higher in the scale, may appear tolerably destitute of any appearance of interest in their progeny either during or after their development. Thus the higher reptiles are by no means typical parents; and even amongst the birds there are careless, or at least unconcerned mothers to be found. In higher life still, that is, amongst the mammalia or quadrupeds, the case is widely altered. There, parent and young are more closely related, and as has been well remarked, the longer association of parent and progeny seen in the quadruped-race, is probably one source of those tender ties which, in humanity itself, bind the family together in its most kindly and typical aspect. But it is easy for the naturalist to show that the almost universally accepted idea of the callous nature of fishes and frogs viewed as parents, is by no means so widely applicable as has been supposed. Very curious and interesting pages of fish-history might be written concerning the odd ways and unusual paths of fish-development; and of frog-parents it may also be said that many very interesting exceptions exist to the rule that these latter animals take no heed or care of their young. The entire subject, indeed, tends to prove an oft-illustrated point in the studies of the naturalist, namely, that the ways of animals and plants must not be judged by hard and fast rules, and that everywhere life appears to strike out into new and fresh pathways, suited and adapted to the new or unusual surroundings of living beings.

Amongst the fishes, it is by no means unusual to find nest-builders. The case of the familiar sticklebacks, which build nests for the reception of the eggs, has already been noticed in these pages. Here, the display of anxiety for the developing young is of the most marked character. It is the mule stickleback which keeps watch and ward over the offspring. He is a pugnacious being, keeping all intruders at a distance. Even the mother-fish is not allowed to approach the nest; the unusual practice of forbidding the approach of the mother, being unfortunately clearly justifiable on the ground of her unnatural and cannibal-like propensity to feed upon the eggs. Hence the faithful little male stickleback performs the duties of guardian and nurse with great fidelity; constantly swimming round and round the nest, and menacing all intruders. But in other fishes, the parental cares do not cease with the hatching of the eggs, and the expulsion of the young fry into the waste of waters around. Almost every reader is familiar with the little 'seahorses' seen in all aquaria, and with their near allies the pipe-fishes. The seahorses, or *Hippocampi*, really merit their name. Their head closely resembles that of the horse in appearance, the prolonged jaws and the high forehead

being exactly imitated. They swim upright in the water, and it is an interesting sight to watch the quick twittering movement of the back-fin, which serves as the chief instrument in their progression. When at rest, the tail is coiled round some fixed object, and the fish remains in the same upright position.

The pipe-fishes belong to the same group as the seahorses. They derive their popular name from the elongated form of the jaws. The body is long and slender, and as in the seahorses, the gills are of peculiar nature, and differ from those of ordinary fishes, in that they are not comb-like but tufted in shape. Both seahorses and pipe-fishes attend to their young in a somewhat remarkable fashion. The male fishes are provided with pouches placed on the under surface of the body. The seahorse possesses a well-formed pocket, opening by a narrow aperture; whilst the pouch of the pipe-fish is not quite so perfectly formed, being merely a fold of skin developed from each side of the body below, and united in the middle. Such a disposition of matters recalls to mind the 'pouch' of the kangaroos and their neighbours; but the most curious feature in the case of the fishes appears to be the fact that it is the males which carry and protect the eggs, and not the female fishes. The latter produce the eggs, which are then placed in the pouch of the male, and there undergo their development. Even after hatching, the young fishes, for a time, appear to seek refuge in the parental pouch, and an American naturalist has suggested that the young may perchance find some nourishment in the secretion of the walls of their cradle. All naturalists agree in saying that the parent-fish pays great attention to the young. One instance is recorded in which a male seahorse having been captured in a net, the young were observed to leave the pouch and to swim about in the water as the parent was lifted into the boat. On the parent being held over the side of the boat, the young swam towards him and re-entered the pouch. This incident proves the existence of a bond closely allied to parental affection in higher animals; or at least indicating that the association between parent and young is of closer nature than might at first be supposed.

A more curious development of parental instinct in fishes, however, is found in the curious fishes belonging to the genus *Solenostoma*. These fishes present a very weird and grotesque appearance, and belong, curiously enough, to the seahorse group, which is thus largely distinguished by the peculiarities of its included members. The *solenostomes* inhabit the Indian Ocean, and it is the female fish which in this instance undertakes the parental duties. The mother-fish, it is observed, is more brightly coloured and conspicuous than the male fish, and she alone bears a pouch. It has been also remarked, that in the matter of being more brightly coloured than the male fish, the female *solenostoma* presents an exception to well-nigh every other known fish. This would seem, indeed, as if the additional care which the protection of the young entails, was rewarded by Dame Nature through the development of more brilliant coloration. In this fish, the inner surfaces of the ventral fins or paired 'belly-fins,' unite with the body itself, and thus form a pouch of considerable size, in which the

eggs are retained and hatched. In this respect, solenostoma resembles the pipe-fishes rather than the seahorses. But further provision for the care of the developing progeny is made. The inside of the pouch, when carefully examined, is seen to be furnished with a series of long thread-like bodies. These are arranged along the verge of the ventral fins, which, as we have seen, assist in forming the pouch. On these threads in turn, small projections are borne, and the threads themselves are described as being hollow. Such an apparatus, according to the best authorities, is evidently intended for the secure attachment, and possibly for the nutrition of the eggs; whilst it has been also suggested that the young after being hatched, may be retained in their earlier days within the sac and duly nourished by the filaments in question. It would thus seem as though in solenostoma, the care of the young had not only devolved upon the sex by which in higher life the offspring are tended, but that special provision in the shape of the peculiar furnishing of the sac has been developed for the effective discharge of the parental duties.

Passing now to other and still more unusual features of fish-life, we may find in several instances very striking modifications of habit and structure adapting fishes for the effective discharge of the duties of parentage. There exists a curious fish called the *Aspidot*, which illustrates one of the modifications just alluded to. When the season for the deposition of the eggs comes round, the skin and tissue generally of the under surface of the body in the mother-fish, assume a soft spongy texture. The eggs being deposited, the fish by pressing upon them succeeds in causing them to adhere to the softened skin of her body. Here they are found during the whole time of incubation or hatching. In this situation, the eggs will obtain from the water around the due supply of oxygen which is so necessary for their normal development. After the young are hatched, the parental duties cease, and the skin of the under surface assumes its normally smooth appearance. More extraordinary, in respect of the modified life of the fishes exhibiting it, is the habit certain species possess in carrying the eggs in their mouths during the development of the young. A fish, the *Arinus* of Ceylon, carries the eggs in the large and wide pharynx or back part of the mouth; the male fish discharging the duties of this strange nurse. Another fish, *Chromis*, found in the Sea of Galilee, similarly guards and hatches the eggs in the mouth. No better illustration of the remarkable shifts and expedients to which nature resorts in the care of the young could well be cited than those just mentioned.

A curious adaptation of fishes for the protection of the eggs is also found in the dog-fishes, sharks, skates, and rays. Here the eggs are inclosed in capsules, formed of a material closely resembling seaweed in its texture. These capsules are frequently picked up in an empty state on the seabeach, and are known familiarly as 'mermaids' purses.' In some cases, as in the Port Jackson shark (*Cestracion*), these egg-cases may exhibit a peculiar twisted appearance; and one curious fish (*Callorhynchus*) found in the southern seas forms an egg-case curiously resembling a frond of seaweed in appearance. These protective cases are formed within the body of the parent-fish, much

as the shell of the egg is developed within the body of the bird. Any one dissecting a skate at the time of egg-deposition, is certain to meet with the eggs in all stages of formation within the body of the fish. The young fish undergoes its development within the case, which, in the dog-fishes and sharks, is provided with spiral filaments, resembling the tendrils of plants, wherewith the egg-case is anchored to the stems of seaweed.

Such are a few of the more remarkable deviations from the ordinary rules of fish-existence, in which, as already remarked, care of the young is the exception rather than the rule. Above the fishes in zoological rank come the frogs, toads, newts, and their allies. These animals are known to zoologists as *Amphibia*. They are perfectly distinct from the reptiles, such as snakes, lizards, &c., although frogs and toads are popularly regarded as members of the reptile class. Indeed the frog-class shows many clear points of resemblance to the fishes. Thus, whilst no reptile, truly so called, breathes by gills at any period of its existence, frogs, toads, and newts invariably begin life with gills, and end life with lungs. Any one who has watched the transformation of the gilled 'tadpole' into the frog, knows this fact; although, when the lungs of adult life appear, the gills of frog-babyhood disappear. Only in a few members of the frog-class do the gills remain after the lungs are developed. The curious *Proteus* of underground caves in Central Europe, and the *Siren* or mud-eel of the South Carolina rice-swamps, exemplify members of the frog-class which breathe both by gills and lungs throughout the whole of their adult existence.

In the frog-class, many interesting examples of care of the offspring are to be found. The common frog and toad are perfectly indifferent to the fate of their offspring. The eggs are deposited in large masses, and the young are hatched out as tadpoles, and pass through their changes or 'metamorphoses' independently of parental care. But this callous indifference to the development of the offspring is by no means universal in the frog-class. There exists a small frog, common in France and Germany, and which is known to zoologists by the name of *Alytes obstetricans*. This species exhibits a highly singular habit in the care of the eggs. The mother-frog lays her eggs in the form of long chains, each containing some sixty or more eggs. The male frog, seizing the chain of eggs, twines the string round his thighs. Thus furnished with his load of offspring, the frog, to quote the words of a zoologist, looks like a courtier of the reign of James I. arrayed in trunk-hose and pulled breeches. With his egg-burden, the *Alytes* retires into obscurity, and retains the eggs until the young are ready to leave the egg. Then, as he enters the water, the young burst forth from the eggs, and swim away in their new-found liberty; whilst, rid of his load, the parent-frog returns to his usual habitat and life. Equally interesting is the case of another frog (*Opiathodelphys*) of America, and of the American tree-frog known as *Notoedra*. In both forms, a curious pouch formed of a fold of skin, exists on the back, opening towards the hinder aspect of the body. These pouches exist in the female frogs. The eggs are placed therein, and undergo their development in this curious

position. But the Surinam toad exhibits a still more remarkable modification of habit. The back of the female, like the under surface of the fish *Aspredo*, grows thick and soft at the time of egg-laying. The male frog, as soon as the eggs are laid, then performs the duties of nurse. He deftly seizes each egg, and imbeds it in the soft skin of the back of the female. The skin closes over the eggs, and imbeds each within a little cell. In this cavity, the egg undergoes its full development. The tadpole stage is passed herein, and the gills—useless, of course, for breathing in water!—are herein developed and shed. At the close of development, the young Surinam toads leave the mother's back perfectly developed, and resembling the parent in every respect save that of size. Over one hundred and twenty of these cells, it may be added, have been counted in the back of a single female frog of this species.

In Chili, a remarkable little frog exists, known as the *Rhinoderma Darwini*. In order to fully appreciate the peculiarity of the case of this frog, we must firstly refer to the structure of a common species, the edible frog (*Rana esculenta*) of Europe. When the male of this latter frog is examined, it is found to possess a pair of curious sac-like organs, situated one at each side of the mouth, and known as 'vocal sacs.' These organs aid in producing the well-known loud 'croak' of the male frog. Distending these sacs with air, the intensity of the croak is greatly increased, and the superiority in voice of the sterner over the gentler sex is thus demonstrated. Now, in the little *Rhinoderma* of Chili, the male is provided with a pair of similar organs, and there can be no doubt that they serve naturally to increase the resonance of the frog's voice. Indeed, the cry of this frog is reported as being of extreme clearness. In the *Rhinoderma*, however, these vocal sacs possess another function, obviously of acquired, and not of original, nature. The newly-laid eggs of the mother-frog are deposited in the vocal sacs of the male, which thus seems to resemble certain fishes already mentioned. Here, the young frogs are not only hatched, but remain until they are capable of taking care of themselves. It seems clear, then, that such a function of these sacs is both universal and extraordinary. That, in the course of time, the new duty of serving as nurseries has caused the vocal sacs of the Chilean frog to undergo much alteration, seems perfectly clear when their nature is further examined. The vocal sacs are found to be enormously enlarged over what certainly was their original size. They are found to reach forwards to the animal's chin, and they extend backwards on the abdomen; whilst not the least remarkable observation consists in the fact that the pressure of these sacs on surrounding parts has produced considerable alteration in the structure of these animals. Thus, the tongue has become shortened, probably to admit of free passage to and from the vocal sacs. The shoulder-bones are described as exhibiting a twisted and deformed appearance, due to the pressure of the sacs and their living load; and it is likewise certain that the internal organs of the animal are also seriously displaced by the load with which it is periodically burdened.

Such a case of altered structure appeals most forcibly to the observer of nature, and demon-

strates to him that the world of living beings is the scene of constant changes and alterations, through which the children of life advance to new habits, and to new ways and means of fulfilling their varied destinies.

DUNLEAP TOWER.

A STORY IN FOUR CHAPTERS.—CHAP. III.

WHEN I reached the tower on my return, I found that Rudyard had but just arisen. If he was aware that I had been out of the house, he made no comment on the fact, but invited me cordially enough to breakfast. We again spent the forenoon in the shooting-gallery, and the afternoon at billiards. Rudyard had not forgotten his overnight invitation, reminding me of my promise to stay a fortnight at Dunleap, a promise which I was only too glad to confirm. It may appear strange that a man in Mr Rudyard's position should invite a foreign pedlar to stay for a couple of weeks under his roof; but he was a man who through life, and of deliberate choice, had sought his associates in a grade of life much inferior to his own. The society of a dog-fancier had always had greater attractions for him than that of a gentleman, and he would rather consort with a groom than with his master any day. So are some men constituted.

In my case, it was no doubt the novelty of my society that constituted the attraction. I was of a different type from any that had come within the range of his experience, and so long as I could continue to entertain him and make hours, which otherwise would have lagged slowly, pass swiftly and pleasantly away, I should be welcome to stay on at Dunleap Tower; but how soon his fickleness might change, and my visit be brought to an abrupt termination, it was impossible for me even to hazard a guess.

And so several days passed away, our time being chiefly spent in pistol-shooting and billiard-playing, night always bringing the punch-bowl and cigar-box.

Rudyard still contrived to keep two or three tolerable horses in his stable, and most afternoons he and Miss Yavill rode out together for a couple of hours. Miss Yavill generally dined with us; and sometimes, when both she and Rudyard happened to be in an amiable mood, she would stay with us for an hour while we drank our punch, listening to some of my wild stories or playing quadrilles on the piano; but in her restless black eyes there was ever an expression of watchful distrust, which all my efforts failed to remove. Not infrequently, when one or both of them were out of temper, they would come to high words, and then Miss Yavill would sweep out of the room in a white fury of passion, followed either by a grinning sneer or an oath from Rudyard, according to the mood in which he happened to be.

After that first evening, Rudyard never so much as hinted at the existence of his wife. He had had so much to drink on that occasion, that I sometimes thought he retained no recollection of the wild words he had then spoken. One afternoon, when he was chalking his cue by the billiard-room window, I pointed to the old tower,

and remarked carelessly that it would make a capital subject for a pencil-sketch. He scowled suspiciously at me, and answered that he should like to see anybody taking a sketch of his property—a well-greased bullet would be the welcome any such rapscallions would receive from him.

During these few days I kept my eyes and ears constantly on the alert, in the hope of being able, after a time, to discover some means of communicating with Catherine. I was not long in discovering that Aaron Starke lived in a little white cottage which stood on the summit of a ridge a little to the left of his master's house, and that, from the position of this cottage, the whole space of ground lying between the boundary-wall and the old tower must be visible to its inmates, so that it would be impossible for any one to cross it by daylight without being seen. It was only early in the morning, or when Rudyard and Miss Yavill were out for their afternoon drive, that I had a chance of getting out for a ramble. On these occasions, I was nearly sure to encounter Starke, generally with his gun over his shoulder. He was evidently suspicious of my intentions, although the old tower was a subject never spoken of between us after that first morning. On one occasion, he told me, in an apparently offhand manner, that he was a bad sleeper, and that he had a habit of perambulating the grounds at all sorts of uncanny hours, and that to shoot any one whom he might find prowling about the house at such times would be a deed that would lie but lightly on his conscience. Of a truth, both he and his master, judging from their words, seemed to look upon a human life more or less as a matter of slight consequence.

My bedroom was situated at an angle of the house from which the old tower was not visible. One morning, on awaking as usual soon after day-break, I found that it was raining heavily, and that it was not possible to venture out of doors. Slipping on a few articles of clothing and opening my bedroom door quietly, I traversed with cautious footsteps the long corridor, at the end of which was the billiard-room. From the windows of this room there was an unimpeded view of the tower—the object of my daily and nightly thoughts. I drew aside one of the blinds and stood staring out with listless eyes into the gray rain-smitten dawn. Suddenly my gaze was attracted to a moving figure which was crossing the walled-in ground and going in a direct line towards the door in the tower. The figure, which was that of a female, was attired in a gray hooded cloak, and carried a small basket in one hand. Behind her, in stately dignity, stalked a huge black dog. A second glance was sufficient to convince me of the personality of the hooded female. There was something in her gait and bearing which told me that she was none other than a certain tall, thin, red-haired girl, the daughter or niece of Aaron Starke, as I took it, whom I had seen more than once passing between the cottage and the house. She paused at the low-browed door of the tower, and producing a large key from under her cloak, unlocked it, and went inside, the black dog gravely seating himself on his haunches and doing sentry-duty outside. A quarter of an hour later, the girl came out, relocked the door, and, accompanied by the dog,

which frolicked around her, set off back again in the direction of the cottage.

Had any further proof been needed to convince me that Catherine was a prisoner in the tower, what I had just seen would have sufficed to furnish it. It was evident that the girl supplied Catherine with her meals, and that her visits were made thus early in the morning, in order to escape observation. It was probable that a similar visit was paid after the shades of evening had shrouded the landscape in obscurity. And she was shut up there, friendless and alone, in that gray old dungeon by the sea, which must be haunted by so many sad and cruel memories. I tried to picture her to myself sitting there hour after hour through all the dreary day, with never a creature to speak one word of comfort to her, and lying there in the dark through the still more dreary night, with only the voice of the ever restless sea, sometimes moaning like a creature in pain, sometimes chanting a loud psalm of victory, to fill the empty caverns of her heart and brain. Could it be possible, I asked myself again and again, that the glad-eyed, bright-haired darling of my boyish love had been brought to this bitter strait, and by the man, of all others in the world, who ought to have loved and cherished her more than life itself? O Martin Rudyard, providence will have a long and bitter account to settle with you one day!

The enterprise that I had set before myself was evidently more difficult and dangerous than I had anticipated, and as one uneventful day passed after another, I began to despair of success. But even in the event of my being able to learn nothing more, I could at the end of the fortnight return to Mrs Staveley with the information I already possessed, and leave that lady to decide what further steps ought to be taken in the interests of her niece. Still, it would be infinitely more satisfactory if I could succeed in communicating with Mrs Rudyard in person, and take direct from her own lips a message to her aunt; and to that end all my efforts now tended.

I was standing in the dining-room one afternoon, looking out with a heavy heart towards the tower, whose gray battlements were just visible over the tops of the trees, when Rudyard and Aaron Starke came into the room. They did not seem to notice my presence.

'Saddle the mare at once,' said Rudyard to Aaron, 'and ride off to Rippleton without delay, and tell Morton to stop this horrible mortgage business till he hears further from me.' 'There must be no delay, for if it comes to Winstanley's ears that we are trying to raise the wind in this fashion, we shall have the bailiffs down upon us before we are two days older.'

Aaron left the room at once. Rudyard turned, and seemed to start when he saw me. 'Ah, Jacoby, you here?' he said. 'Well, there's no harm done. We are, most of us, more or less hard up at times.' With that he began to whistle, as though he had not a care in the world.

The afternoon was wearing apace; Rippleton was twenty miles away; and Aaron Starke could scarcely get back to the tower before morning. As if to aid my purpose, Rudyard complained that evening of a headache, and retired earlier

than usual; and as the turret clock was striking eleven, I found myself alone in my bedroom. I put out my candle, and after waiting half an hour in the dark, I opened one of the windows and leaped out into the garden. The shrubberies were soon threaded and the boundary wall reached, beyond which I had never yet passed. The wall was no great obstacle to an active man, and I was quickly over it and making my way across the moorland towards the old tower, which now rose grim and tall before me. It was a pleasant starlit night, and at intervals the young moon showed her white face through a rift in the clouds, so that I had as much light as I needed for my purpose. As I approached nearer to the edge of the cliff, I heard the murmurous lapse of the tide as it surged gently up the beach, and soon the foot of the tower was reached. Dark and silent it stood, with no sign of life about it, its strong oaken door securely fastened. Was Catherine awake, and if so, by what means could I succeed in attracting her attention? I could think of no other way than the old-fashioned one, which has been tried thousands of times before. Gathering a handful of gravel, I flung it up at the window; and then, after waiting a few seconds, I did the same thing again, and yet once again. Scarcely had I thrown the third handful, when a casement was opened and a voice called out: 'Who is there?'

It was Catherine's voice; I should have known it again anywhere. How my heart thrilled at the sound!

'I am Philip Burton; and I am here at the desire of your aunt, to aid and assist you in any way you may think best.'

'Villain!' hissed a voice in my ear. Before I had time to turn, I received a crashing blow on my head, and as I fell with fading senses to the ground, Catherine's shriek was the last sound that I heard.

When I recovered my senses, I found myself in utter darkness. For the moment, I fancied that I was lying in my little bed at Brewood, and I seemed to hear the far-off thunder of the night-mail; but on trying to lift my head, I found I had no power to do so, and on reaching up with my hands, I discovered that it was swathed in a wet bandage, and next moment all the events of the night flashed across my memory. Still groping about with my hands, I found nothing to touch either above or beside me; but under me was a straw mattress, on which I now lay stretched, unable to rise. Ah, it was not the distant thunder of the train that I heard, but the old familiar plaint of the sea as it came surging slowly up the sands. I was still, then, in Dunleap Tower, or in some place contiguous to it; confined, perhaps, in some dungeon into which daylight never penetrated; and even now the sun might be shining brightly beyond the walls of my prison—if prison it were. But no; I would not believe in such diabolical malice even from a man like Rudyard. Again and again I essayed to rise from my pallet; but all my efforts proved unavailing. I felt strangely weak and ill, and seemed to have no more strength than a child. The darkness was so intense that my eyes grew pained with gazing into it, and I closed them at length

as a relief, and lay back as still as a dead man, waiting and hoping for the dawn. I think I must have fallen into a doze, for when I next opened my eyes, a dull gray light, that just served to steal the heart out of the darkness, was filling the room, and, by fine gradations, brightening into the dawn of another day.

One by one the features of the room evolved themselves out of the darkness, assuming by imperceptible degrees, as the daylight advanced, an aspect dreary and commonplace enough, and one certainly not calculated to afford me much gratification. A small square room, with bare floor and bare unplastered walls, clammy with damp in several places; a chimney and fireplace, but no grate; for window, a small square opening high up in the wall, glazed with little diamond-shaped panes of dull glass, and secured outside by three massive iron bars; opposite the window, a heavy oaken door, in the centre of which was a small grated aperture, through which were visible two or three stone steps, part of a flight leading upward to some region unknown; for furniture, the tressel bedstead and straw mattress on which I was now stretched, a rude wooden chair, a small round table, and an earthen pitcher of water. Such was the place in which I now found myself. There was a second door in one corner, leading, as I afterwards discovered, to another room, larger in size than the first one, but having no window, and lighted only by two narrow loopholes.

Somewhere about eight or nine o'clock, the death-like stillness was broken by the sound of approaching footsteps—a sound which it gladdened me to hear, although I knew not whether they were those of a friend or an enemy; for I began to feel already as though I had been shut out long weeks ago from the world. There was a noise as of some one unlocking a door, then the footsteps descended the stairs, and there came into view through the grating first the figure and then the visage of Aaron Starke. Having unlocked the door of my room, by which I learned that I was a prisoner, he came in.

'Morning, master peillar! Not quite defunct yet, eh?' he said with a laugh. 'How is our crown this morning? Rather sore, I calculate. Well, here's some vinegar to bathe it with; and here, too, is some toast and coffee; for I suppose your appetite has not quite deserted you.'

'Perhaps you will have the kindness to tell me where I am, and also why it is considered requisite to lock me up?'

'In answer to your first question, I may tell you that you are at present in the lowest room, or rather in the dungeon, as it is more commonly called, of the old tower. In answer to your second question, I can only say that it is generally thought needful to lock up people who are mad!'

'Mad! You don't mean to say that I am mad?'

'Mr Rudyard says you are, so I feel bound to believe it. Yes, mad undoubtedly—crazy—daft, as they say in this part of the world.'

'And how long may it be the will of Mr Rudyard to keep me shut up here?'

'That depends upon the pleasure of his highness. You will probably have the opportunity of asking him the question personally before

long; but that by no means proves that you will get an answer to it. And now let me examine your upper story.'

I offered no resistance, but let him take off the bandage and bathe my head with vinegar and water; after which I drank the coffee he had brought me, for I saw at once that it was needful for me to regain my strength as soon as possible, so as to be able to make some effort for my liberty.

'My advice to you,' said Aaron in conclusion, 'is to get as much sleep as you can, and you'll soon be as right as a trivet. I'll look in again about noon;' and with a nod of the head he was gone.

I think there must have been an opiate in the coffee, for while still brooding over my fate, I lapsed after a time into a deep dreamless sleep, which lasted for several hours, and left me so much stronger and better, that I found it just possible to crawl across the room and examine my prison more minutely. Presently I again heard footsteps descending the stairs, then the door of my dungeon was opened, and Mr Rudyard, carrying a heavy hunting-whip in his hand, with Miss Yavill behind him, came in. There was a savage scowl on his face as his eyes fell on me; and, early as the day was, I could see that he had been drinking heavily. In the background stood Aaron Starke, with a complacent grin on his crafty face. 'Dash my wig!' said Rudyard, 'but I almost wish I had done for you altogether.'

'A poor lunatic, my dear,' said Miss Yavill, 'and hardly accountable for his actions.'

'Ay, crazy enough, in all conscience. He would most likely have murdered us all in our beds some night, if I hadn't found him out.'

'It's curious how these insane people always try to aid each other,' resumed Miss Yavill; 'a madman assisting a mad woman to escape. There's something quite romantic, as well as outrageously ludicrous, in the idea.' And then the point of it! He doubtless thinks both himself and her perfectly sane, and all the rest of the world hopelessly mad! Her hard ringing laugh resounded through the room.

'Well, we've caged our bird now, Margery; and we'll take care to keep his wings clipped for some time to come—oh, little one!'

'Just so. But how nicely he took you in, Martin! Upon my word, if all mad people are as entertaining company as Mr Jacoby, a lunatic asylum must be a pleasant place to live in.'

'Well, I let a little of his crazy blood out last night, and he looks all the better for it. Why, I'd sooner give a thousand pounds than miss the pleasure of seeing him here.'

'You are extravagant, Martin! A thousand pence would be enough; the pounds might be difficult to raise in the present state of our finances.'

'That sharp tongue of yours, Madge, will get you into trouble some of these fine days.'

'And get me out of it too, never fear;' and humming a little air, she took his arm and led him out of the room.

To all that Rudyard had said, I had replied not a word. I knew his brutal nature too well, especially in the mood in which he then was, not to be aware that it would have been worse

than useless for me to have appealed to him, or even to have asked him a single question. Such a course would only have drawn down on me some further insult; besides which, I was too weak and ill to say much, so I deemed it best to remain silent under the infliction of his presence. Aaron came back shortly afterwards with my dinner—bread and meat, and as much water as I might desire; and at dusk he visited me again, bringing with him a large horse-rug in which to wrap myself at night.

This, then, was the diabolical scheme which Rudyard's malignant brain had hatched. It was to be assumed that I was mad, in the same way as it had been assumed that his wife was mad! And what was there to prevent him from carrying out his scheme—from persisting in it as long as he should choose to do so? Nothing but his own conscience, and that was a commodity which he would have been the first to laugh to scorn. Here, in his own domain, among these lonely hills and moors, Mr Rudyard was an absolute autocrat. The nearest village was two miles away, and his own servants probably believed as he told them to believe. He, their master, said his wife was mad. Why should they dispute his word? As for the foreign pedlar, probably they had been given to understand that he had departed as suddenly as he had arrived. There was nothing extraordinary in that. Nowhere could I discover a ray of comfort.

It is not requisite, neither would it be possible, for me to enter into any detail of each day's experiences during my imprisonment in Dunleap Tower; indeed, the petty incidents of one day were so similar to those of another, and of many others, that when I look back in memory to that time, it seems to me little more than one long day and one long night of confinement, whose monotony was but seldom broken by any incident more noteworthy than another. Three or four times in the course of every twenty-four hours I was visited by Aaron Starke; but his visits took place at irregular intervals, his last visit being sometimes close upon midnight, and his first one soon after daybreak, so that I never knew when to expect him. He always brought me a sufficiency of plain food, such, I imagine, as was supplied to the servants at the house. Once every day he never failed to examine the window and the fastenings of the door, so as to satisfy himself that neither of them had been tampered with. Though not a bad-tempered man, his disposition was taciturn and reserved, and two or three moanings would sometimes pass without more than a brief greeting on either side. At an early period of my imprisonment, I did not fail to try what effect the promise of a bribe would have upon his fidelity; but he put away the idea at once, quietly but with determination; and soon it was an understood thing between us, without being expressed in so many words, that I was not to try to tamper with his good faith as a jailer, and that in return he would do whatever lay in his power to soften the rigour of my imprisonment. My health and strength improved rapidly after the first day or two, although I had lost so much blood from the wound in my head, and suffered so much from the want of fresh air and exercise, that I

never thoroughly recovered my vigour during the whole time of my confinement.

Rudyard came two or three times a week to see me, sometimes alone, sometimes accompanied by Miss Yavill, but always with Aaron for escort. If he chanced to be half drunk when he came, which was not unfrequently the case, he would stand and gaze at me for some minutes, and then stumble up the steps with a muttered oath of satisfaction. At other times he would be in a talkative mood, and would exult in the pleasure he felt at having me fast by the heels; but always in his low cunning way, going on the assumption that I was mad, and that some day it would be necessary to transfer me to an asylum. But whatever his mood might be, I always treated him with a silent contempt, which only served to deepen his hatred of me.

IN THE ORANGE GROVES OF FLORIDA.

A SOJOURNER'S EXPERIENCES.

FOR several years, the advantages of Florida as a land of promise for small capitalists with a bias towards horticulture have been widely proclaimed. Among the miscellaneous multitude who went in search of these advantages was a friend of the writer's. He had been sorely hit financially in New York. Wrecked in fortune, broken in health, he had left the hurly-burly of Broadway for the primeval wilds of Florida, there to seek strength of pocket and body. Deep in the forests of Orange County he had fixed his home. To it I was invited, after he had been settled a few months on what he proudly called 'his grove.' In America, change of occupation is as common as change of costume. The quitting of commerce for horticulture was not remarkable, the more so that my friend had some practical knowledge of gardening, for he had cultivated a pretty *paterre* at his villa in New Jersey. Still, when he wrote me in technical terms of the art of orange-growing, and of the certain competence awaiting those skillfully pursuing that easy and delightful pursuit, I feared the good fellow was unconsciously repeating the literature of land-agents and garden-manuals. I therefore was anxious to see with my own eyes how orange-growers lived, to experience personally their mode of life, and to apply such *£ s. d.* tests to the calculations of my enthusiastic friend as would prove them right or wrong. What I saw, learned, and surmised is here presented to the reader.

I reached my friend's grove at the latter end of winter, according to the almanac; but in full summer, according to the temperature. The family consisted of three: my friend, his wife—both elderly—and their son, aged thirty. I found the men singularly blackened in complexion; though brown-blondes naturally, they had become almost as dark as Arabs. The lady was of a palid-emerald tint. It was strange to see blue eyes gleaming out of such bronzed faces, and to note how many subtle modifications of mind and body had taken place in a few months. The young man had been somewhat of a dandy; he was now a rude backwoodsman, careless of externals, almost defiant of

them. The old gentleman existed in his shirt-sleeves; and wore a pair of trousers that he would not have given to a beggar in New York. Something of his old stolidity remained: he is of a proud English stock; but he was fast becoming undistinguishable from the prevailing type of settlers. His wife was the most deteriorated. No women dress more elegantly than those of New York. 'Frights,' 'dowdies,' and 'quaints' cannot exist in the modish atmosphere of that great centre. 'Dress or die' is the unwritten but terrible law of womendom. In Florida that is impossible. There, women die if they *do* dress, save in the evening. During the heat, a garment of gossamer is too oppressive; and when ladies have to cook with the temperature ranging from ninety to a hundred degrees, dress is one of the least considerations. And ladies can get no helps in the backwoods. Cooking, and washing-up afterwards, occupy some four or five hours daily; and when laundry-work and house-cleaning are added, the work is somewhat trying.

Yet my friend's home was a delightful one, and compared with the tenement-dwellings of New York, Brooklyn, and Jersey City, was an abode of bliss. It was a sort of daring compound of a Swiss chalet, log-hut, and framehouse, with the notion of an Indian bungalow. My friend's son was its author in idea and realisation; and it was by his strenuous toil upon it that he had become blackened so much. The inside was roomy and airy; the dining-room and parlour quite charming, the bedrooms exquisitely neat. Northern taste and good breeding were visible everywhere. But I am sure that if my young friend builds another home in a few years, it will not be like this. He will be satisfied with a log-hut. The climate is so rapacious that it devours timber visibly. Each dwelling is mounted upon log-piles, which have to be frequently renewed. These grow black in a very short time; and the sun and the moisture work unceasingly at the dissolution of the upper structure. Cracks begin in the roof; vegetation starts, grows subtly; and soon rot, wet and dry, completes the mischief.

The house was built upon the margin of a lake, which was almost circular in form, and about the third of a mile across. Round it the land rolled in knolls and wavy swells, topped with groups of weary-looking pine-trees, and in the hollows, copses of young oaks, green as ocean water in their spring foliage. Stunted palmettos, jungle-grass, and bushes belted the margin of the lake; and for several yards the water was carpeted with a dense mass of weeds. At intervals, other dwellings were placed near the lake. Some had been erected for a year or two, and were growing swart and grim. One was new-coated with whitewash, and gleamed overpoweringly in the blazing sun. It was enveloped in an orange grove; and the contrast between the rambling white building and the deep, impressive green of the trees was very beautiful as reflected in the lake. Nearly opposite, an old general of the Southern army was building a costly wooden villa, whence the noise of hammers fell in pleasant cadence, and added to the charms of the symphony the wind was

making in every vibrant thing. Swinging in a hammock under the veranda, smoking the rural pipe that stimulates the softer feelings of the heart, and opens it to impressions that are rarely known in city-life, and talking of the joys of retirement to my friend, I thought him the most fortunate of unfortunates to be driven from the inferno of New York to such a paradise. What was the gold of Wall Street to the golden fruits of the groves round about the lake? What silver was so beautiful as the waves of the lake as they glittered in the hot, impetuous wind? Here alone of all the vast space of America was there repose from the remorseless rush for the wealth which maddens the getter and kills the loser! Subsequent familiarity with the details of life in an orange grove proved to me that even that life has many bitters mingled with its sweets; and that the *dolce far niente* is impossible for people who have merely sought in Florida what they failed to get elsewhere—namely, an easy competency.

My friend's estate consisted of some dozen acres, one half planted with orange-trees several years old; the other just reclaimed from the forest and in process of plantation. As I went over the grove, I was somewhat disappointed with the trees. Many had a haggard, hopeless look about them. A few were vigorous, promising good harvests when older. The grove had been neglected for a time, I learned, the previous owner having died. My friend found it a wilderness, the trees positively lost in the weeds. These had eaten away the life of many young trees; and accounted for the languid, outworn appearance of the grove. How costly and formidable foes weeds are to settlers, I soon had experience of. How marvelously sensitive to good and bad treatment the orange-tree is, I also learned. At the first inspection of the grove, I feared my friend had simply come to Florida to be wholly ruined. Sickly trees, pining in arid sand under a burning sky, promised nothing but disaster. An examination of the kitchen garden was little more assuring. The vegetables were either weakly, or running into coarse rankness. Soil there was none; only sand, white as flour, and as fine. In this, native weeds evidently had every chance of success against exotic vegetables and fruit-trees.

I did not express my gloomy foreboding to the owner of this blighted spot. He talked gaily of his good-luck, of the improvement that had taken place in a few months, and of the phenomenal rise in land-values in those parts. In a few years he would have five hundred trees, producing fruit worth, on the average, ten dollars per tree. Anxious to go into the facts of orange culture, I proposed to my friend a plan by which I was to sojourn and labour with him. He agreed; and the following account contains my experiences.

We rose at half-past six, took breakfast about an hour later. It consisted of oatmeal porridge, buckwheat or other hot cakes baked in a pan, and a fried mass of all that was left from the previous supper. This was for economy's sake; for no food will remain untainted after a few hours. It was also for the stomach's sake, as the condiments mixed with it satisfied the peculiar gastric craving for a pungent stimulant. At eight o'clock we proceeded to the grove, where we

hoed round the roots of about twenty trees, clearing the weeds from a circle of four feet from the stems. How laborious this was can only be known to those who have worked at it. The weeds had to be extirpated, however deep they penetrated, or they began to grow afresh in a few days. A species of couch-grass was the most troublesome; it clung to the ground like an octopus to a rock, and it was as dense as felt. The hoeing aerated the roots of the trees, and also pruned the woody fibres. Upon a certain number of trees we bestowed all the slops and waste-water of the household. These *rejeta* were conserved with a care which a Chinaman would have respected. They were the chief fertilisers we employed; and it was marvellous to observe how quickly and extensively the trees responded. In a few days, yellow leaves began to grow green, hanging branches to brace themselves up, and a limp, unhappy-looking tree to put on a semblance of sturdiness. From what I saw, I consider the orange to be most responsive of all arboreal things, to human touch. Whether it be the peculiar climate of Florida, or that unexplained development of excellence which almost all fruits grown in America show, I do not pretend to decide; but it is certain that the oranges of Florida are already the largest in the world, and their quality is unequalled by the choicest fruit of Europe, of Syria, and the Brazils.

As I continued the work and noted its results, I began to think my friend's Alnascliar-dream of five thousand dollars a year might become a very plain fact, if he had the capital needed to fertilise the whole of his plantation. Given the *right situation*, abundant and appropriate food, and that devoted attention which it claims, and the orange-tree seems to offer as certain a return for money, time, and skill as any investment in the old or new world.

I give my impressions as I go on, though they somewhat interfere with the description of the life we led. Two hours' hoeing in the increasing heat were as much as I could endure without breaking-off for a while; so, about ten o'clock we retired to the shade of the veranda for coolness and a smoke. Refreshed and rested, we went to the kitchen garden, where weeding, digging, and planning occupied us until the delightful 'hollo, hollo!' from the house called us to the mid-day meal. Nowhere is the appetite keener than in Southern Florida. Human tissues burn away in its hot, damp atmosphere like the houses. I needed more than twice as much food as in the northern and middle States, or in any part of Europe I have lived in, and the food I most craved was nitrogenous. The quantity of haricot beans I consumed still astonishes me. These formed the *pièce de résistance*. Fresh meat was unprocureable, and we had to use stock-fish largely when our canned beef ran out. Farinaceous puddings gave variety to our dietary; and when salads and cabbages were ready, these added to our dainties. Fortunately, my hostess made capital bread, a noble art she had learned in England. Without this I could not have stood the steadily increasing drafts which the climate and the toil made upon me. Had I been restricted to the hot 'biscuit' which does duty for bread in the households of most Americans, I could not have lived more than a month or two

under the conditions of an orange-grower. Tea was taken with the mid-day meal; and I liked it the better the blacker and more astringent it was, though such a 'brew' would poison me now. This desire for strong tea was further evidence of the exhausting climate.

Remarkable as my appetite was, that of my friend's son was still more so. He had been delicate from childhood, and it was partly on his account that the family had gone South. For the first time, existence was a joy to him. He revelled in the heat, worked like a mule, and ate like a squad of navvies. Still more surprising was the physical change wrought in another young man whom I had known in New York, and who was living near my friend's grove. Forest-life had metamorphosed him from a willowy stripling into a strong man. His appetite was unappassable; and he had frequently to get up during the night to satisfy it. But the trencherman who surpassed all that I came near in Florida was a negro, named Tom Wilson. He was of magnificent proportions, over six feet high, immensely muscular, and notwithstanding his colour, a handsome man. He was the most skilful axeman in the country, and could bring down more pine-trees than any two men that had tried against him. He earned five dollars a day. But he was voracious as a shark; his dinner was often six pounds in weight, and it was one of the amusements of the neighbourhood to see Tom clear the huge jar containing it.

I have dwelt at length on this subject, as it is of transcendent importance to those who think of settling in Florida. The enhanced cost of personal maintenance, if the foregoing be fair samples of appetites generally, is a matter of serious importance, more especially as all food has to be imported, and often brought by vehicle from the railway or river-side wharf.

Owing to the absence of grass, it is not possible to have milk and its products. Florida certainly is not without cows; but they are small, unimproved creatures, picking up a scanty living in the marshes and hummock-swamps. As these are cleared and utilised for horticulture, cattle will disappear, for sheer lack of sustenance. I have seen some patches of Bermuda grass which thrives in the sand, and it may be possible to make pastures with it after a while. But for the immediate future, all the milk, butter, and cheese needed by settlers must be imported; and so must all animal food, save the diminishing supply of game. I will not enlarge upon the reckless slaughter of all things that run and fly by the incrowding multitudes settling in the Flowery Land. Every youngster has a gun and revolver, and shooting is a passion. I have seen the most wanton destruction of rare birds; even the celestial-voiced mocking-bird is not spared by those who love the detonation of firearms more than any other sound. I admit the fascination of the hunting instinct, and that sport is the only amusement in a wild and unsettled country. Nevertheless, it is banishing the tender, the beautiful, and the humanising; and it is impoverishing the country. As horticulture is the only business that can be carried on in Florida, and as insects are vastly destructive to fruits and vegetables, it is the height of folly to annihilate

the small birds. The orange-tree is the prey of many insect parasites, and sometimes a whole grove is blighted by them. I have seen scores of trees ghastly with 'scale,' and owners almost driven to desperation. Indeed, the difficulty is to keep the trees clean. Nothing struck me more than the contrast between the fruit of the groves, often black and wrinkled, and the brilliant plumpness of the wild oranges in the hummocks. I believe the health and beauty of the latter were owing to the birds, which preyed upon the insects, their natural food; whereas from the groves birds were banished, as every boy found his pastime in blazing away at them.

In the tropical climate of Florida, insect life is a huge and permanent affliction. All living things are subject to it. Gardens are desolated, animals are tormented, and man is driven frantic. Among the griefs that distressed my hostess was the army of cockroaches which invaded her larder and stores. The amount of food spoiled by these pests was serious. They would get into the dough, into puddings, into pies and stews; and of course all had to be thrown away when the monsters were discovered. At dusk, whole armies made their appearance, and the floors were literally black. Nor did they confine themselves to the living-rooms. They invaded the sleeping apartments and devoured all the leather they found. But repulsive as they were and costly, I could have tolerated them though taking measures to destroy them. Nothing, however, availed against, or could mitigate the miseries caused by the mosquitoes. Early in March, these insects began to appear, and soon they attained undisputed dominion. Before sundown their annunciatory hum began, and until full daylight next morning at never ceased. They always commenced by settling on my feet and ankles under the supper-table; and from thence bit impartially to the crown of my head as the night went on. The pain and irritation caused by mosquitoes often made the evenings a time of pure distress for me. As a new-comer, I was the chief attraction. Still, old and young suffered, and many a pleasant party was spoiled by the clouds that streamed in from doors and windows. By carefully fixing the mosquito-curtains, one might get rid of them. Yet the provoking trumpeting going on outside, and the heat which the curtains caused, often banished sleep altogether, and made the night season a prolonged anguish.

During the prevalence of electric storms, the twin troubles of Florida, weeds and mosquitoes, had a glorious time. Such lightning, thunder, and rain are not known in northern latitudes. The clear sky will suddenly grow wan; the forests will be dimmed with what seems the smoke of a vast conflagration rushing towards you; distant trees will ding about their upper branches like windmill sails, and then, like a park of artillery, simultaneously lightning and thunder blaze and crash, as if heaven and earth had collided. Down comes the rain in cataracts, in vast slanting walls of liquid, that drum on the earth, that pound the roof, that roar through the foliage of the groves with a might, a grandeur, an awfulness which even surpasses the wild magnificence of an ocean storm. One of these electric outbursts lasted for thirteen hours. During this time, two sullen-looking banks of

clouds in the north and east were the centres whence the stupendous pyrotechny proceeded. The lightning varied in colour from pale opal to pink. It shot in fan-like gushes, like the aurora borealis; it descended like glittering chains of steel; it zigzagged at every angle; and made vistas of supernal glory in the intensely black sky.

Responding to this meteorological convulsion, all the forest inhabitants began to speak. The tree-frogs whistled with frantic shrillness, the pond-frogs croaked in hoarse rhythm; the pine-tops hummed dreamily; occasionally the choking bray of a distant mule would be heard; and most startling of all, would strike-in the rumbling bellow of the alligators. These last sounds cannot be forgotten by those who hear them with nerves palpitating in response to an electric storm. The alligator is a formidable and a hideous neighbour in many parts of Florida; and almost every night, I heard them in the lake. Yet people do not seem to be afraid of them.

After the most copious deluge, the ground would be dry, for the sand swallowed it as it fell. Hence Florida presents a delightful contrast to many parts of America during the spring rains. No mud exists; the road-tracks are improved; the air is cooled; and the fragrance that arises from the orange groves as the sun mounts the sky is beyond words to express. But the older settlers complain of the fall of temperature; and seated round a huge logfire, shiver and huddle as if in process of congelation. Many take violent catarrhs; and the latent poison of malaria begins to re-form in their thinned blood. I have mentioned the blackening of the skin caused by the climate. After an attack of malarial fever, dysentery, or other local disease, this blackness sometimes disappears, and the skin becomes dully yellow. In the course of a few years' residence, a blanching process begins, and the skin looks like that of a consumptive person, and is often granulated like boiled rice. Indeed, the pallor of many who had lived in the country continuously for five or six years was almost repulsive. It betrayed by an outward sign the debilitation going on within, and led me to doubt if people of northern origin can permanently settle in the peninsula.

After a residence sufficiently long to test both the climate and the possibility of amateurs gaining a livelihood by orange culture, I came to the conclusion, that for six months—namely, from October to March—life in Florida can be made pleasant and profitable; but the other half of the year must be spent in the northern States, or in the highlands of Georgia, Tennessee, or other invigorating region. The orange is only one item towards wealth-making, and it is often an uncertain one, the lemon being the surer of the two trees most cultivated. But strawberries are still better for those having suitable ground. They are quickly raised, require little capital, and little attention save in the fruiting season; and if they can be produced in January and February in large quantities for the New York and Boston markets, an excellent living may be made. Early vegetables also are a certain source of income for those who devote themselves to their production; and as railways increase and accelerate their freight-trains, these delicacies may

be sold all over the cities of the busy, opulent, and frost-bound North.

But before Florida can become the winter fruit-and-market-garden of America, it must have a system of irrigation suited to the trade. It has the heat, it has the moisture; keep these in conjunction, and all sorts of, succulent plants must thrive. By using large quantities of moist weeds to the roots of our vegetables at the time of transplantation, we made all that had languished before to flourish. By persistent hoeing round the orange-trees, we made them advance rapidly. When the question of chemical fertilisers, suited to the orange and lemon, has been scientifically settled, progress wide and rapid will follow the groves. At present all is speculative and probationary. But that indomitable determination to succeed which marks the American and the British settlers in Florida, will have its certain rewards in time, and that sandy wilderness will be converted into a cosmopolis for all mankind.

In the meantime, life in an orange grove has many tribulations and disenchantments mingled with its undoubted pleasures. Out of the immense number of experiences now being gained by the multitudes colonising the Flowery State, many generalisations must emerge, which will increase the pleasures and diminish the pains of orange-growers. The outcome of my personal experience is, for the settler to begin upon a small scale, taking care of his capital and his health. The cleverest man must go upon facts; and though hints and book-instruction can help, they cannot make an orange-grower. The most important matter is the supply of suitable food. It should be got from the great purveyors of the North direct, and in such quantities as to make the freight low. Fowls should be the source of animal food, and goats for milk. All water should be boiled before drinking, and lemons should be taken for beverage instead of tea; they prevent headaches, one of the troubles of the country.

HINTS ON BOOKBINDING.

A CORRESPONDENT writes: It may be of some use to many of your readers to offer a few hints on the subject of bookbinding, in which not only is the large collector interested, but others who accumulate a small library of well-chosen books. The lover of books is always disappointed when he finds that the appearance of the binding becomes faded or shows signs of decay. The writer served an apprenticeship to the art of bookbinding from the year 1822 to 1829, and although he left that trade shortly after the expiration of his term, he has all his life been interested in books, is in possession of a large collection, and has purchased many works of comparatively small intrinsic value beyond that of their external appearance.

The remarks in *Chambers's Journal* for May 30, 1885, are correct so far as the deterioration of the material used in bookbinding is concerned. The modern preparation of leather is often injurious so far as durability is concerned; and an experienced hand may detect this by feeling it. A very inferior millboard is also used, which is liable to damage, where the old millboard would sustain none.

The best protection is to employ a well-known tradesman who has a reputation for honest work. As to the leather, it is rather surprising that calf is not named, which, if good, is certainly not the least durable, and is in many respects equal to russia or morocco, if good and properly finished. The writer possesses works in all kinds of material, from the best leather to paper boards, old binding and new binding, and all in good preservation. Some of the bindings are two hundred years old. All of them—if the term may be used—are in a green old age. There are some works in white vellum as sound as when they left the workman's hands, and for two centuries have been much used. Morocco and calf may generally be relied upon with more certainty than other leathers; but sheepskin, which is often made into an imitation of morocco, ought not to be used for works of permanent value.

One word as to pigskin. The writer has a vivid recollection of binding a family Bible for a farmer in the North Riding of York. It was a folio Bible, printed in Edinburgh. Its owner, who was one of the early followers of John Wesley, had collected a number of copperplates, maps, &c., illustrative of the text, newspaper cuttings with manuscripts of sermons, and autograph letters of the early associates of the founder of Methodism. He brought all these, with a carefully prepared index in his own writing; and it was the business of the binder to 'mount the loose sheets and interleave the Bible with them according to the pagination he rendered. When this was complete, the one volume had expanded into three. He wished the whole to be bound in pigskin, on the ground that he was riding upon a saddle that his father had also used; and that was evidence, he said, of its strength and durability. As the Bible contained the genealogy of his family in all its branches, he wanted it to be as imperishable as it could be made. He brought the pigskin from his own saddler. On the youngest son of that aged man going out to Australia in 1873, the binder had an opportunity of seeing the volumes, and although they had been used for so many years, the covers bore no marks of wear, beyond showing that they had been freely handled. A work printed in 1678 at Rotterdam and bound in white vellum, now at hand, is in equally good preservation.

The great enemies of books in libraries are gas, damp, and dust. In the library of a friend near London, havoc commenced among the upper shelves of very expensively bound and valuable books; the binding first showed a faded appearance; when opened, the joints split, and the leather on the back fell under the touch like tinder. Curtains on rollers had been placed as a protection against dust, and the whole house was heated by hot-air pipes. The explanation was easy, when an examination took place. The room was brilliantly lighted by two gasaliers, without any provision to carry away the products of combustion. In ten years the destruction had been serious. In some works in common use which were in the drawing-room, bound at the same time and in the same style, there were no perceptible signs of decay.

The owners of treasured books would do well

to take precautions on these heads. As a rule, it is better to have no gas-lighting in libraries; but where such is unavoidable, due care should be taken to have free ventilation and pipes to carry away the spent gas to the outer air. A library should be kept dry and well ventilated, and curtains drawn down in front of the books are preferable to glass cases.

A ROLAND FOR AN OLIVER.

The fair sex are occasionally placed in embarrassing situations, caused by their unthinking comments. An Englishman travelling by train in the principality of Wales found himself in a compartment in which two Welsh young women and himself were the sole occupants. Never imagining for a moment that the English stranger understood Welsh almost as well as a native, they amused themselves by freely commenting on the personal appearance and probable calling of their fellow-traveller.

'Not bad-looking, if it wasn't for his nose,' said one.

'I think his mouth is the worst,' remarked the other with equal politeness.

'Rather "loud" suit of clothes,' was the next comment.

'Well, he's only a cattle-dealer, I expect,' returned critic number two.

The subject of these remarks good-temperedly preserved his self-possession by the help of a friendly newspaper, and when he had undergone a further scathing fire of criticism; laid down his paper and calmly observed in excellent Welsh—'Since your liberal and witty criticism of myself and my affairs now seems somewhat exhausted, may I inquire where you young ladies come from, and what may be your names?'

To use the narrator's own words—he never knew till then what blushing scarlet meant, as he watched with amusement the dreadful confusion of his fair detractors.

'TELLE EST LA VIE.'

A GOLDEN curl,

A blushing girl,

So charming,

A handsome face,

A manly grace—

Alarming!

A lover's sighs,

His soft brown eyes

So tender!

Sweet dreamy hours

Among the Powers:

Surrender!

Without alloy,

Her new-found joy—

A lover;

But they forget

They know not yet

Each other!

A frower-wreathed brow,

A marriage vow;

For Dover!

A husband's kiss,

A three-months' bliss

Is over!

Two vows spoken,

Two hearts broken,

For ever:

The bitter pain—

They love again,

Ah, never!

A last good-bye,

A wife's low cry—

They sever:

For Elope has fled,

And Love is dead

For ever!

Two little vows

In haste are spoken;

Two young hearts

At leisure broken.

THE CAROLINE ISLANDS.

THE race for possession of new territories in remote seas is at present so keen, that those who are by profession neither international lawyers nor diplomatists, are finding a subject of engrossing interest in those principles which at once stimulate the energy and restrain the cupidity of colonising nations. The latest tidings of transpontine enterprise reach us from the Western Pacific. Germany, we are told, has occupied the Caroline Islands, and has sent notification of the fact to the European powers. Spain, it is said, asserts an ancient title to the same territory, and a difference is likely to arise between the two powers about a possession which has not yet been shown to be very valuable. Now, it would be difficult, perhaps impossible, on the information which has yet reached us, to decide between the two claimants; but it may be useful to notice those rules which must govern the decision of the question if it is to be settled in accordance with international law.

The time-honoured method which explorers used to adopt in order to appropriate the land which they had discovered, was for each one to set up his national standard on the most convenient hill-top, and declare the territory to belong to the sovereign he represented. The plan had many advantages. The eager discoverer had no need to establish his power either by force of arms or by the patient aggression of colonisation; he was troubled with no nice questions as to the rights of the aboriginal inhabitants, and his sweeping declaration of ownership did not condescend to define the limits of his appropriation. But those times are past. It is now more than a hundred years since our own Lord Kames, referring to the Law of Nations, wrote: 'Symbolical possession will confer no right, either on the person who uses the symbol, or on the State whose subject he is. To acquire the property and to exclude others, there must be real occupation.' This rule, which was

they new, has now acquired the respectability of age, and it is at length universally recognised that to confer a good title, both the intention to possess and the actual possession must be proved. It is obvious that the adoption of such a principle must go far to simplify questions of ownership between rival nations, and how dangerous these may be, any one can realise who is old enough to remember what was once known as the 'Oregon Question.' It will be observed that such a rule unceremoniously cuts down any claims founded on mere paper titles; and an old writer says, that navigators pay no more attention to a monument erected as evidence of possession, than they do to the regulation of the Popes who divided a great part of the world between the crowns of Castile and Portugal;—an observation which is curiously in point at present, when we learn that the Spanish claim rests, in part at least, upon the famous bull issued by Pope Alexander VI. in the year 1493. This celebrated document has often before been used to check the enterprise of roving mariners; indeed, it was once cited as an objection against the acquisitive voyages of our own Drake; but on that occasion Queen Elizabeth plainly told the Spanish Ambassador that 'she did not acknowledge the Spaniards to have any title by donation of the Bishop of Rome, so she knew no right they had to any places other than those they were in actual possession of.' Her Majesty's alreadiness had anticipated the reasoning of international jurists. In point of fact, no weight now attaches to royal letters-patent, or charters professing to make a grant of new territory, unless they are followed within a reasonable time by actual occupation; and this gives occasion to the inquiry, 'What is proper occupation?' Strictly speaking, occupation can only be complete when the country is placed at the disposal of the occupying state, and this of course is best achieved when her colonists have settled themselves over the whole area. But how seldom this is accomplished, let the history of our own colonies attest.

In many cases, the size of the territory and the number of the settlers make such acquisition an impossibility; and then arise doubts as to boundaries. When Charles II. made grants of land in North America, the limits landward were not defined, and it was suggested that these grants might carry a right to territory straight across the continent to the Pacific. But the rule which is now acknowledged to apply to such cases is, that occupation of a tract of land on the sea-coast gives a title to all the country landward as far as the watershed line. The circumstances of the case before us, however, are not likely to cause any difficulty as to boundaries. In all probability, no one of the islands which form the Caroline group is large enough to admit of a divided ownership; and in that case, the question between Germany and Spain as to each individual island will be decided wholly in favour of one of them, in accordance with that principle which declares that not only all the territory actually possessed by a settlement shall belong to it, but also all that in the hands of another power would be a menace to its security. For it is obvious that Spain could have but a precarious possession of the west side of an island of five-and-twenty square miles in extent, if Germany on the east side held a fort and coaling station. Yet it by no means follows that the whole archipelago must acknowledge the supremacy of the same state; for one of the three groups into which the islands are naturally divided, may be found to belong to one power, while the other claimant may successfully establish her right to the remaining two.

Discovery, then, is but an incomplete title unless it is followed up by Possession; but when so fortified, it will unquestionably extinguish every other claim. Now, the honour of discovering these scattered islands appears to rest with neither of the rival states, but with Portugal, by whom they were discovered in 1525; though as to the traders who are settled in them, Spain and Germany seem pretty equally divided. The proof, in short, in favour of one claimant's actual possession nearly balances that in favour of the other, and we are thrown back upon the effort to find some actings of one of the parties which shall establish at least an intention to possess; and if the whole matter should ultimately be submitted to arbitration, it is to this point that the arguments of the suitors will be mainly addressed. Germany will, of course, cite the definite act of appropriation which has at this moment raised the question of ownership, and will be able to show that notification of that act was duly given to the powers. Spain will point to her mission-work in the islands, to the announcement made in the last Cortes that she was about to appoint a special governor over them, and perhaps also to the fact that that officer had actually set out for his destination before information of the German action was received at Madrid.

But it may be objected that, amid this balancing of pretensions, the rights of the original inhabitants have been wholly ignored. Are the native Malays, who are reputed the hardest

and most skillful sailors of Polynesia, expected to acquiesce without a murmur in the assumption of sovereignty over their land by some European state, which has found there a fulcrum for trade, and a mine of archaeological wealth? The answer is, that no single nation is entitled to shut out another; and if the settlers of that other acquire importance by virtue of their trading energy and their skill in the arts, then annexation ought to be effected in the interests of the natives themselves, because, as a consequence of that public act, they will be protected in the peaceful possession of their lands—a right which they could not vindicate for themselves.

These, then, are the cardinal principles which must be applied to any proof which may be adduced by either power in support of her claim to these far-away islands. It is only by a process of very carefully weighing the two masses of evidence, that a decision can be reached which will comingle with the facts of the case; and unless such a comingle is attained, a substantial injustice will be done.

According to a contemporary, only five of the islands are of a mountainous character and apparently of remote volcanic origin; by far the greater number are flat coral islands. The vegetation is particularly rich and luxurious, if the variety of species is not great. The mountains are clad with trees to their summits. The character of the vegetation is pretty much that of other Pacific islands, approaching in the western islands to that of the Philippines and Moluccas. Ferns are found in extraordinary abundance, as are palms of various species (cocon, areca, nipa and sago palms), and also pandanus. Round the coasts are generally thick fringes of mangroves, followed by various fruit trees, and further up the hills, mountain forest, among which as a species of ficus are prominent, mixed with ardisia, myrsine, citrus, eucalyptus, catechu, &c. The fauna of the islands is not rich, and, except birds, probably of no commercial importance. The climate of the islands is essentially tropical, but without tropical regularity. It is preponderantly moist. There does not seem to be any regular rainy period. The eastern and central islands especially are liable to violent rain-storms; yet on the whole the climate is agreeable, and, away from the coast, healthy. The people themselves evidently belong to the same well-formed, brown, intelligent Pacific race as the New Zealanders, and, like them, alas, have suffered much in numbers, in physique, and in morals, by contact with a certain class of whites. The total population, even including the Pellew Islands (which some regard as a separate group), does not probably exceed twenty thousand. The archipelago is naturally divided into three groups, east, central and west, which, according to some authorities, correspond to political divisions, each group being under the general dominion of one chief, who has his residence in the centre. The Caroline natives are great traders both among themselves and with Europeans. At present the principal articles bartered with Europeans for iron goods, tobacco, spirits, bottles, &c., are trepang and cocoa-nut oil. Europeans are settled in several of the islands, mainly Ponape and Yap, and do considerable business with whalers.

We may add that hitherto these islands have not been regarded as being important, for they lie far out of the track of the great ocean highways. They are chiefly interesting from an archaeological point of view, for they possess some remarkable ruins of what must once have been magnificent buildings. Some of the stones employed by these early architects are said to measure thirty-five feet long, and twenty feet broad by fifteen feet in thickness. The rude sculptures which are found there bear close resemblance to those of Easter Island, which, however, is six thousand miles away. The purpose and origin of these monuments are quite unknown.

A HOUSE DIVIDED AGAINST ITSELF.

CHAPTER XXXVIII.

Next morning, Constance, seated as usual in the loggia, which was now, as the weather grew hot, veiled with an awning, heard, her ears being very quick and on the alert for every sound, a tinkle of the bell, a sound of admittance, the step of Domenico leading some visitor to the place in which she sat. Was it *he*, coming yet again, to implore her pardon, an extension of privileges, a hope for the future? She made out instantaneously, however, that the foot-step which followed Domenico was not that of young Gaunt. It was softer, less decided, an indelicate female step. She sat up in her chair and listened, letting her book fall, and next moment saw Miss Gaunt, old-fashioned, unassumed, with a troubled look upon her face, in her shawl and big hat, come out almost timidly upon the loggia. Constance sprang to her feet—then in a moment collapsed and shrank away into herself. Before the young lover, she was a queen, and to her father she preserved her dignity very well, but when *his* mother appeared, the girl had no longer any power to hold up her head. Miss Gaunt was old, very badly dressed, not very clever or wise. But Constance felt those mild, somewhat dull eyes penetrating to the depths of her own guilty heart.

"How do you do, Mrs. Waring?" said Mrs. Gaunt stiffly. (She had called her 'my dear' yesterday, and had been so anxious to please her, doing everything she could to ingratiate herself.) "I hope I do not disturb you so early; but my son, Captain Gaunt, is going away."

"O yes—I heard. I am very sorry," the guilty Constance murmured, hanging her head.

"I do not know that there is any cause to be sorry; we were going anyhow in a few days. And in London, my son will find many friends."

"I mean," said Constance, drawing a long breath, beginning to recover a little courage, feeling, even in her discomfiture, a faint amusement still—"I mean, for his friends here, who will miss him so much."

Mrs. Gaunt darted a glance at her, half wrathful, half wavering. It had seemed so unnatural to her that any girl could play with or resist her son. Perhaps, after all, he had misunderstood Constance. She said proudly, "His friends always miss George; he is so friendly. Nobody

ever asks anything from him, to take any trouble or make any sacrifice, in vain."

"I am sure he is very good," said Constance, tremulous, yet waking to the sense of humour underneath.

"That is why I am here to-day," said Mrs. Gaunt. "My son—remembers—though perhaps you will allow he has not much call to do so, Miss Waring—that you said something about a parcel for Frances.—Dear Frances, he will see her—that will always be something."

"Then he is not coming to say good-bye?" she said, opening her eyes with a semblance of innocent and regretful surprise.

"Oh, Miss Waring! oh, Constance!" cried the poor mother. "But perhaps my boy has made a mistake. He is very wretched. I am sure he never closed his eyes all last night. If you saw him this morning, it would go to your heart. Ah, my dear, he thinks you will have nothing to say to him, and his heart is broken. If you will only let me tell him that he has made a mistake!"

"Is it about me, Mrs. Gaunt?"

"Oh, Constance! who should it be about but you? He has never looked at any one else since he saw you first. All that has been in his mind has been how to see you, how to talk to you, to make himself agreeable if he could—to try and get your favour. I will not conceal anything from you. I never was satisfied from the first. I thought you were too good, too much used to fine people and their ways, ever to look at one of us. But then, when I saw my George, the flower of my flock, with nothing in his mind but how to please you, his eyes following you wherever you went, as if there was not another in the world!"

"There was not another in Bordighera, at least," said Constance, under her breath.

"There was not?—What did you say—what did you say?" Oh, there was nobody that he ever wasted a thought on but you. I had my doubts all the time. I used to say: "George dear, don't go too far; don't throw everything at her feet, till you know." But I might as well have talked to the sea. If he had been the king of all the world, he would have poured everything into your lap. Oh, my dear, a man's true love is a great thing; it is more than crowns or queen's jewels. You might have all the world contents, and beside that it would be as nothing—and this is what he has given you. Surely, he did not understand him when he spoke, or he did not understand you. Perhaps you were taken by surprise—flattered, as girls will be, and said the wrong words. Or you were shy. Or you did not know your own mind. Oh, Constance, say it was a mistake, and give me a word of comfort to take to my boy!"

The tears were running down the poor mother's cheeks as she pleaded thus for her son. When she had left home that morning, after surprising, divining the secret, which he had done his best to hide from her overnight, there had been a double purpose in Mrs. Gaunt's mind. She had intended to pour out such vials of wrath upon the girl who had scorned her son, such floods of righteous indignation, that never, never should she raise her head again, and she had intended to watch her opportunity, to plead on her knees,

if need were, if there was any hope of getting him what he wanted. It did not disturb her that these two intentions were totally opposed to each other. And she had easily been beguiled into thinking that there was good hope still.

While she spoke, Constance on her side had been going through a series of observations, running comments upon this address, which did not move her very much. 'If he had been king of all the world—ah, that would have made a difference,' she said to herself; and it was all she could do to refrain from bursting forth in derisive laughter at the suggestion that she herself had perhaps been shy, or had not known her own mind. To think that any woman could be such a simpleton, so easily deceived! The question was, whether to be gentle with the delusion, and spare Mrs Gaunt's feelings; or whether to strike her down at once with indignation and sharp scorn. There passed through the mind of Constance a rapid calculation, that in so small a community it was better not to make an enemy, and also perhaps some softening reflections from the remorse which really had touched her last night. So that when Mrs Gaunt ended by that fervent prayer, her knees trembling with the half intention of falling upon them, her voice faltering, her tears flowing, Constance allowed herself to be touched with responsive emotion. She put out both her hands and cried: 'Oh, don't speak like that to me; oh, don't look at me so! Dear, dear Mrs Gaunt, teach me what to do to make up for it' for I never thought it would come to this. I never imagined that he, who deserves so much better, would trouble himself about me. Oh, what a wretched creature I am to bring trouble everywhere! for I am not free. Don't you know I am—engaged to some one else? Oh, I thought everybody knew of it. I am not free.'

'Not free!' said Mrs Gaunt with a cry of dismay.

'Oh, didn't you know of it?' said Constance. 'I thought everybody knew. It has been settled for a long time—since I was quite a child.'

'My dear,' said Mrs Gaunt solemnly, 'if your heart is not in it, you ought not to go on with it. I did hear something of—a gentleman, whom your mamma wished you to marry; who was very rich, and all that.'

Constance nodded her head slowly, in a somewhat melancholy assent.

'But I was told that you did not wish it yourself—that you had broken it off—that you had come here to avoid—' Oh, my dear girl, don't take up a false sense of duty, or—honour—or self-sacrifice! Constance, you may have a right to sacrifice yourself, but not another—not another, dear. And all his happiness is wrapped up in you. And if it is a thing your heart does not go with!' cried the poor lady, losing herself in the complication of phrases. Constance only shook her head.

'Dear Mrs Gaunt! I must think of honour and duty. What would become of us all if we put an engagement aside, because—because—? And it would be cruel to the other; he is not strong. I could not, oh, I could not break off—O no, not for, worlds—it would kill him. But will you try and persuade Captain

Gaunt not to think hardly of me? I thought I might enjoy his friendship without any harm. If I have done wrong, oh, forgive me!' Constance cried.

Mrs Gaunt dried her eyes. She was a simple-minded woman, who knew what she wanted, and whose instinct taught her to refuse a stone when it was offered to her instead of bread. She said: 'He will forgive you, Miss Waring; he will not think hardly of you, you may be sure. They are too infatuated to do that, when a girl like you takes the trouble to—' But I think you might have thought twice before you did it, knowing what you tell me now. A young man fresh from India, where he has been working hard for years—coming home to get up his strength, to enjoy himself a little, to make up for all his long time away—' And because you are a little lonely, and want to enjoy his—friend—ship, as you say, you go and spoil his holiday for him, make it all wretched, and make even his poor mother wish that he had never come home at all. And you think it will all be made up if you say you are sorry at the end! To him, perhaps, poor foolish boy; but oh, not to me.'

Constance made no reply to this. She had done her best, and for a moment she thought she had succeeded; but she had always been aware, by instinct, that the mother was less easy to beguile than the son; and she was silent, attempting no further self-defence.

'Young men are a mystery to me,' said Mrs Gaunt, standing with agitated firmness in the middle of the loggia, taking no notice of the chair which had been offered her. She did not even look at Constance, but directed her remarks to the swaying palms in the foreground and the hills behind—'they are a mystery! There may be one under their very eyes that is as good a gold and as true as steel, and they will never so much as look at her. And there will be another that thinks of nothing but amusing herself, and that is the one they will adore. Oh, it is not for the first time now that I have found it out! I had my mind on it in the very first; but he was like all the rest—he would not hear a word from his mother; and now I am sure I wish his furlough was at an end; I wish he had never come home. His father and I would rather have waited on and pined for him, or even made up our minds to die without seeing him, rather than he should have come here to break his heart.'

She paused a moment and then resumed again, turning from the palms and distant peaks to concentrate a look of fire upon Constance, who sat sunk in her wicker chair, turning her head away.

'And if a man were to go astray after being used like that, whose fault would it be? If he were to go wrong—if he were to lose heart, to say What's the good? whose fault would it be? Oh, don't tell me that you didn't know what you were doing, that you didn't mean to break his heart! Did you think he had no heart at all? But then, why should you have taken the trouble? It wouldn't have amused you, it would have been no fun, had he had no heart.'

'You seem,' said Constance, without turning her head, launching a stray arrow in self-defence, 'to know all about it, Mrs Gaunt.'

'Perhaps I do know all about it; I am a woman myself. I wasn't always old and faded. I know there are some things a girl may do in innocence, and some—that no one but a wicked woman of the world— Oh, you are young to be called such a name. I oughtn't, at your age, however, I may suffer by you, to call you such a name.'

'You may call me what name you like. Fortunately, I have not to look to you as my judge. Look here,' cried Constance, springing to her feet. 'You say you are a woman yourself. I am not like Frances, a girl that knew nothing. If your son is at my feet, I have had better men at my feet, richer men, far better matches than Captain Gaunt. Would any one in their senses expect me to marry a poor soldier, to go out to India, to follow the regiment? You forget I'm Lady Markham's daughter as well as Mr Waring's. Put yourself in her place for a moment, and think what you would say if your daughter told you that was what she was going to do. To marry a poor man, not even at home, an officer in India! What would you say? You would look me up in my room, and keep me on bread and water. You would say the girl is mad. At least, that is what my mother, if she could, would do.'

Mrs Gaunt caught upon the point which was most salient and attackable. 'An Indian officer!' she cried. 'That shows how little you know. There were men in the Company's service that— The Company's service was— How dare you speak so to me? General Gaunt was in the Company's service,' she cried with an outburst of injured feeling and exalted pride.

To this Constance made reply with a mocking laugh, which nearly drove her adversary frantic, and resumed her seat, having said what she had to say.

Poor Mrs Gaunt sat down, too, in sheer disability to support herself. Her limbs trembled under her. She wanted to cry, but would not, had she died in that act of self-restraint. And as she could not have said another word without crying, force was upon her to keep silence, though her heart burned. After an interval, she said tremulously: 'If this is one of our punishments for Eve's fault, it's far, far harder to bear than the other; and every woman has to bear it more or less. To see a man that ought to make one woman's happiness, turned into a jest by another woman, and made a laughing-stock of, and all his innocent pleasure turned into bitterness. Why did you do it? Were there not plenty of men in the world, that you should take my boy for your plaything? Wasn't there room for you in London, that you should come here? Oh, what possessed you to come here, where no one wanted you? and spoil all?'

Constance turned round and stared at her accuser with troubled eyes. It was a question to which it was difficult to give any answer; and she could not deny that it was a very pertinent question. No one had wanted her. There had been room for her in London, and a recognised place, and everything a girl could desire. Oh, how she desired now those things which belonged to her, which she had left so lightly, which there was nothing here to replace! Why had she left them? If a wish could have taken her back,

out of this foreign, alien, unloved scene, away from Mrs Gaunt, scolding her in the big hat and shawl, which would be only fit for a charade at home, to Lady Markham's soft and lovely presence—to Claude, even poor Claude, with his beautiful eyes and his fear of draughts—how swiftly would she have travelled through the air! But a wish would not do it; and she could only stare at her assailant blankly, and in her heart echo the question, Why, oh, why?

Notwithstanding this stormy interview, Constance had so far to go in the afternoon, and was so utterly destitute of amusement else by way of amusement, that she walked down to the railway station at the hour when the train started for Marseilles and England, with a perfectly composed and smiling countenance, and the little parcel for Frances under her arm. Mrs Gaunt was like a woman turned to stone when she suddenly saw this apparition, standing upon the platform, talking to her old general, amusing and occupying him so that he almost forgot that he was here on no joyful, but a melancholy occasion. And to see George hurry forward, his dark face lit up with a sudden glow, his hat in his hand, as if he were about to address the Queen! These are things which are very hard upon women, to whom it is generally given to preserve their senses even when the most seductive siren smiles.

'You would not come to say good bye to me, so I had to take it into my own hands,' Constance said in her clear young voice, which was to be heard quite distinctly through all the palber of the Riviera functionaries. 'And here is the little parcel for Frances, if you will be so very good. Do go and see them, Captain Gaunt.'

'Of course he will go and see them,' said the general—'too glad. He has not so many people to see in town, that he should forget our old friend Waring's near connections, and Frances, whom we were all so fond of. And you may be sure he will be honoured by any commissions you will give him.'

'Oh, I have no commissions. Markham does my commissions, when I have any. He is the best of brothers in that respect.—Give my love to mamma, Captain Gaunt. She will like to see some one who has seen me. Tell her I get on—pretty well. Tell them all to come out here.'

'He must not do that, Miss Waring; for it will soon be too hot, and we are all going away.'

'Oh, I was not in earnest,' said Constance; 'it was only a little jest. I must look too sincere for anything, for people are always taking my little jokes as if I meant them, every word.' She raised her eyes to Captain Gaunt as she spoke, and with one steady look made an end in a moment of all the hasty hopes that had sprung up again in less time than Jonah's gourd. She put the parcel in his charge, and shook hands with him, taking no notice of his sudden change of countenance. And not only this, but waited a little way off till the poor young fellow had got into the train and had been taken farewell of by his parents. Then she waved her hand and a little film of a pocket-handkerchief, and waited till the old pair came out, Mrs Gaunt with very red eyes, and even the general blowing his nose unnecessarily.

'It seems only the other day that we came down to meet him—after not seeing him for so many years.'

'O my poor boy! But I should not mind if I thought he had got any good out of his holiday,' said Mrs Gaunt, launching a burning look among her tears at the siren.

'Oh, I think he has enjoyed himself, Mrs Gaunt. I am sure you need not have any burden on your mind on that account,' the young deceiver said smoothly.

Yes, he had enjoyed himself; and now had to pay the price of it in disappointment and ineffectual misery. This was all it had brought him, this brief intoxicating dream, this fool's paradise. Constance walked with them as far as their way lay together, and 'talked very nicely,' as he said afterwards, to the general, but Mrs Gaunt, if she could have done it with a wish, would have willingly pitched this siren, where other sirens belong to—the sea.

(To be continued.)

HOW TO CLEAN A BOOK WITHOUT INJURY.

AN adept in the art of washing or cleansing dirty books sends to the *Publishers' Circular* a few plain directions to be followed by those who wish to cleanse their soiled volumes. The amateur book-cleaner had better begin to practise on some worthless volume, until he acquires the necessary skill. All traces of lime, acid, &c., used in the cleaning process must be removed from the book, else in time it may be completely destroyed.

The first thing to be done in a book that wants washing is to cut the stitches and separate the work into sheets. Then a glance may be taken for the separation of those leaves, or sheets, which are dirty from those which have stains of ink or oil. The dirty leaves are now placed in a bath composed of a quarter of a pound of chloride of lime and the same quantity of soda to about a quart of water. These are left to soak until the paper has regained its proper tint. The pages are now lifted out tenderly into a second bath of cold, and if possible running, water, where they are left at least six hours. This removes all traces of lime. The paper, when thoroughly dried by exposure, must be dipped into a third bath of size and water, and again laid out to dry. This restores the consistency of the paper. Pressure between printers' glazed boards will then restore smoothness to the leaves.

The toning of the washed leaves in accordance with the rest of the book is a delicate process, which requires some experience. Some shag tobacco steeped in hot water will usually give the necessary colouring matter, and a bath in this liquid the necessary tone.

The process described above may do for water-stains; but if the pages are dirtied by grease, oil, coffee, candle-droppings, or ink, different treatment will be required. Dilute spirit of salt with five times its bulk of water, and let the oil-stained pages lie in the liquid for four minutes—not longer; then remove and wash, as before, in cold water. To remove ink, a solution of oxalic, citric, or tartaric acid should be

used, but care must be taken in the washing and sizing. If the grease is a spot in the middle of a page, place between two sheets of blotting-paper, or cover it with powdered French chalk (the blotting-paper is preferable), and pass a hot iron over the place. This will melt the grease, which is immediately soaked up by the chalk or paper.

For dirty finger-marks, the following is recommended: Cover the mark with a piece of clean yellow soap for two or three hours, then wash with a sponge and hot water, and dip the page in weak acid and water. Give another bath of hot water, and then thoroughly cleanse with cold water.

To remove ink-stains: Dip the page in a strong solution of oxalic acid, then in a solution of one part hydrochloric acid and six parts of water, after which, bathe in cold water and allow to dry slowly. Vellum covers which require cleaning may be made almost equal to new by washing with weak salts of lemon; or if not much soiled, warm soap and water. Grease may be removed from the covers of bound books by scraping a little pipeclay, French chalk, or magnesia over the place, and then ironing with an iron not too hot, else it will discolour the leather.

DUNLEAP TOWER.

A STORY IN FOUR CHAPTERS.—CONCLUSION.

I SOON came to the conclusion that Catherine was still shut up in the upper story of the old tower, my dungeon being the lowest in the tier, and there being, as I afterwards discovered, a couple of empty rooms between us, because, when Aaron came to see me, I frequently heard a female voice talking to him, followed by a quick patter of foot-steps on the stairs leading to the upper floor. At other times I would hear the outer door unlocked, then an adjunction to a dog to await its mistress's return, and after that, the footsteps on the stairs. Doubtless, it was Ann Starke whom I heard, whose duty it was to attend to the wants of Mrs Rudyard. Poor Catherine! if my case was a hard one, what was it compared with hers! Her confinement had already lasted several weeks longer than mine, for her there was but little prospect of release, but slight hope of future happiness to sustain her, and soften in some measure the bitterness of her imprisonment. She knew that her husband desired her death, and that, unless she could escape from him, he would not rest satisfied till, by fair means or foul, he had compassed that end.

I sometimes asked myself whether it was not all a horrible dream, whether such things could indeed take place in the heart of England in the middle of the nineteenth century, in the days of railways and telegraphs. Such events might well have happened three hundred years ago, and have seemed a not unnatural result of those days of cruelty and wrong. And yet, what need was there to wonder when every month of our lives the newspapers bring before us cases equally as romantic and improbable. But it would not do to let my thoughts dwell too frequently on such subjects, otherwise I should soon have become as mad in reality as Rudyard,

for his own purposes, now assumed me to be. Catherine and I were too far removed from each other, and the walls of our dungeons were too thick, to allow any sound of our voices to penetrate from one to the other; and Aaron, when I one day asked him a question respecting her, only shook his head and refused to reply at all. My only consolation, therefore, was to listen daily for the voice or footstep of Ann Starke; for I judged that, so long as her visits lasted, Catherine must still be there, under the same roof with me, and consequently still alive.

One day, to my surprise, the footsteps on coming down from the upper story did not pass out of the door as usual, but descended the flight of steps leading to my dungeon, and presently I saw the green, cat-like eyes of Ann Starke staring at me through the grating in the door.

"How do you like being shut up here?" she asked abruptly, after a long steady gaze, which took in both myself and my surroundings.

"Not at all," I replied; "and if you can in any way help me to escape, I shall be grateful to you for ever."

"You mustn't talk in that way," she said, "or else I must leave you. My uncle would be ready to strangle me if he thought I as much as spoke to you; for he has a terrible temper of his own, for all he looks so good-natured.—Dull here, isn't it?"

"Very," I replied sadly—"more dull and dreary than you can imagine."

"It's dull work, too, up there at the cottage. Hardly a fresh face to see from one month to another, and only my few books and my work to keep me alive.—But see, I've brought you an old newspaper to read, only you must hide it under your bed, and not let my uncle know that you've got it, and I'll try and bring you another in a day or two."

I protest I could not help it, but that little act of kindness quite unmanned me, and it was a minute or two before I could find words to thank her. "Do me one more kindness," I said at last; "tell me how the lady is whom you come here every day to see. Is she well? How does she bear her imprisonment?"

"Ah, you loved her once on a time, I suppose, and you can't forget her. She isn't well, and she isn't ill; she's low and melancholy, and hardly ever speaks, and never smiles. They say she's mad at times, poor lady, but that I know nothing about. But you mustn't ask me any more about her; for my uncle would be the death of me if he knew I had mentioned her name."

Ann came again the following day, and for many days after that, sometimes staying with me but a few minutes, sometimes half an hour, bringing me now and then a book or a newspaper; and though she would not talk with me about Catherine, I insensibly came to look forward to her visits as to the one bright spot in the dull round of hours which marked the days and nights of my imprisonment; and if by any chance I missed seeing her for a day, I was more despondent and melancholy than ever, and a darker shadow than usual rested on the hours that intervened till I saw her again.

"Tell me," I said to her one day, "how is it that you and your uncle remain in the service of a man like Mr Rudyard—one whom both of you must heartily despise?"

"Hush!" she said with a frightened look. "What words are you saying? But I'll whisper it to you. We stay here, because it's uncle's wish, and uncle knows what he's about. When the smash comes up there, nodding her head in the direction of the house, and come it must before long, then they'll find out who's master of Dunleap Tower and all the land about it. We are servants now; but it won't be so for ever; and we come, my uncle and I, of as good blood as the Rudyards or any other family in the neighbourhood. But for the last hundred years the Starkes have been sinking lower and lower; but uncle will lift the family up again, and we shall have houses and land of our own."

The little window which lighted my dungeon was, as before stated, high up in the wall, and was just level with the ground outside. It was evidently of a date long subsequent to that of the tower itself. I had not been shut up more than a couple of days before I became possessed with a strong desire to reach it by some means or other, and gaze on what small portion of the world might be visible through it. My only table was too old and rickety to allow of my venturing myself upon it; but later on, when I had in some measure regained my strength, I found that I could drag my bedstead out of its corner, and that, by standing on the board at its head, my eyes were just on a level with the window. I could then open the casement; and there was nothing but the three iron bars to impede my view, which ranged over the sloping sweep of moorland on which the tower was built till it reached the jagged sky-line, where the clouds seemed to come down and touch the moors; but I knew that between them lay the sea, whose voice reached me more or less loudly as the weather was rough or calm. I passed several hours of each day at the window, drinking in the silent beauty of the scene; while now and then the lowing of cattle, the bark of a dog, or the crowing of a cock, came to me from the distance, like sounds from a lost world, and with a familiar music in their tones which I had never recognised before. When tired of gazing through the window, I was obliged to fall back upon the very limited range of amusements and occupations which were all I had to keep me from going melancholy mad. In the way of bodily exercise, I always walked three or four hours a day from end to end of my dungeon. All the poetry and all the dramatic excerpts that I could remember were repeated aloud times without number; and when that occupation grew stale, I tried my own powers of rhyming, and during the course of my imprisonment, I strung together some hundreds of verses, nearly all of them of a nonsensical and burlesque character, for the more ridiculous they were, the better I was pleased, my thoughts being sad and serious enough at other times.

The tedium of my captivity was considerably lightened after Ann Starke began to visit me; and then, how welcome to me was a country newspaper a week old! and what a strange feeling came over me sometimes, as I read in my

lonely cell of the doings of the great world outside, from which—so difficult is it for the mind to measure accurately the duration of time past—I seemed to have been separated for long years. Had I not been born in a dungeon and bred in a dungeon, and did I not know it for the first time; and did my memory hold any recollection of real events, or of nothing more than a wild jumble of lunatic dreams? Ah me! how many long, bitter, and melancholy hours I passed lying on my pallet when the day was dying, and the gray shales of evening filled alike the dungeon and my mind with grim unrealities and ugly phantoms—when brain and body were wearied out—when existence itself seemed stale, weary, and unprofitable, and the grave no more than a pleasant refuge!

As I lay thus one evening watching the shadows darken in the opposite corners of my dungeon, I seemed to feel the bed move under me, and next moment there waddled forth from beneath it the figure of a veritable Chinese mandarin about two feet high, attired in *grande tenue*, with a pigtail which reached nearly to the floor. I rubbed my eyes and looked again, just in time to see this singular creature take a sudden spring and alight on the middle of the table, where, crossing its legs and squatting down after the eastern fashion, it turned upon me a pair of stony eyes, and began slowly to wag its head at me, as I had sometimes seen the Chinese images do in the windows of the teashops. It was a slow, grave, measured nod, always timing itself accurately between each repetition. I, of course, set the figure down as what it really was—an optical delusion, and at once proceeded to fling my boot at it, but without producing the slightest derangement of its centre of gravity. Fixing my eyes steadily on it, I then slowly approached it. As I advanced, it lost by degrees its clearness of outline and roundness of form, and slowly merged itself into the shadows of the advancing night, so that when I reached the table, nothing of it remained visible; but as I receded from the table, so did it seem to project itself out of the dusk, till by the time I reached the opposite end of my prison it was there again, gravely wagging its head at me as before, and apparently as much alive and as much a thing of substance as myself. Night after night it came, always at the gloaming hour, so that after a time I became so accustomed to its presence as to take but little notice of it, although for the first few evenings that interminable nodding of its head annoyed me greatly, inducing in me an intense desire to count the number of nods, which it required all my strength of mind to resist.

But this apparition of the mandarin was not the only mental hallucination to which I became subject during my incarceration. Waking suddenly sometimes in the dull, dead middle of the night, I heard strange, wild bursts of laughter coming now from one corner of my dungeon and now from another; sometimes fiendish and discordant in character, at others low, silvery, and gracious as the laughter of ladies and young children. Then there would be strange whisperings and mutterings around my bed in some language unknown to me; and then the uncertainly chorus of laughter would recommence, lasting

with short intervals till the first streak of dawn broke the charm, and brought with it peace and slumber unbroken. Was the dread shadow of madness beginning in reality to brood over me? In fear and trembling, I asked myself the question. If such were some of the effects produced by solitude and imprisonment on a strong man like me, what must be their effects upon the far more delicate organisation of Catherine! I trembled to think.

Rudyard had not visited me for some days, when late one afternoon I heard him speaking above; and presently he came down the steps leading to my dungeon, attended by Ann Starke with the keys. Ann having unlocked the door, Rudyard entered; she followed him and closed the door behind her, stationing herself close to it and holding the bunch of keys in her hand. Her face was paler than I had ever seen it before, and there was a cold, stern, revengeful glitter in her green eyes which boded no good to somebody. I was sitting in my chair near the window, and neither spoke nor stirred when Rudyard entered. He came forward with an insolent smile on his lips, and was evidently half drunk; he was smoking a cigar, and carried in one hand a formidable life-preserver, while from the folds of his waistcoat there protruded the butt-end of a pistol.

'Well, Master Gallowbird, and how are you by this time?' he asked in thick husky tones. 'Not dead yet; but as mad as ever, I see. A dangerous lunatic, that's what you are—dangerous to the community, and that's why I keep you shut up here, out of pure charity to my fellow-creatures. Ah, this old tower is a nice spot to keep lunatics in—snug and quiet. No fear of any country-folk prying about it: the fools all believe it's haunted, and wouldn't set foot near it for a bag of sovereigns. There's you here, and that white-faced cat up-stairs—I know not which is the madder of the two!'

Before he could utter another word, I had sprung from my seat and gripped him savagely by the throat. It was a momentary impulse, acted on without premeditation or forethought. I was weakened by my long confinement; but I seemed to have been suddenly endowed with a strength not my own, and though Rudyard was a big, powerful man, he quivered like a plaything in my grasp. Perhaps he saw in my eyes the madness which burned in my heart, for he quailed, and turned yellow with fear beneath the grip of my fingers. 'Liar and scoundrel!' I exclaimed; and holding him firmly with my left hand, with my right I rained on his head and face such a shower of blows as he would bear the traces of for many a day to come. He was paralysed by the suddenness of my attack; and before he could make use of his life-preserver, it was wrested from his hand and he himself flung back, a bruised and bleeding mass, to the other end of the dungeon, where Ann Starke, as cool and impassive as a statue, was still standing. Rudyard slowly gathered himself up, like a man who can hardly believe the evidence of his senses; but suddenly his face lighted up with a diabolical smile; he remembered the pistol which he carried. It was out of his vest and pointed full at me before I was aware of his intention; but Ann's quick eye had noted the

action, and at the moment he pulled the trigger, she struck up his arm, and the bullet passing over my head, flattened itself against the wall, and fell harmlessly to the ground. He turned on her like a baffled wild beast, and made as though he would have struck her with the pistol.

'Touch her, and you are a dead man!' I exclaimed, and coward as he was, he slunk back into a corner of the dungeon.

'This madman will murder me,' he whined. 'Run, Ann—quick, quick, and fetch your uncle or anybody you can find to help me.'

She turned on him, a white Fury, with green flaming eyes and clenched hands. 'Dog!' she exclaimed, grinding out the word from between her sharp white teeth, 'ask no help from me. I utterly hate and loathe you. I would not lift a finger to save you from the gallows. Do you remember the words you said to me three days ago? If you have forgotten them, I have not; and you thought by such foul lies to deceive me, as you have deceived others! But beware! Your career of vice and crime is nearly at an end.' Then turning to me, she said, 'Here are the keys of your prison; do with them as you will.' She handed me the keys, then turned and went out without another word.

After a few words of warning to Rudyard, who glared at me feebly in reply, but did not speak, I followed her, locking the door behind me, and found her waiting for me at the top of the stairs. 'Take these keys,' I said to her, 'and go up to Mrs Rudyard, and tell her that Philip Barton is waiting here to conduct her to a place of safety.'

While she was gone, I waited at the door of the tower. Can I ever forget the delicious sensations of those few minutes, as I stood gazing on the fast darkening landscape! I was once more a free man, and in those words everything is said.

Presently, Ann Sturke came down-stairs, followed by Mrs Rudyard, a thin, frail figure of a woman, with a white, sunken face, looking prematurely aged. But for the rare sweet expression in her eyes, I should scarcely have known her again. We each took a hand of the other in silence. 'You are come to take me away from this terrible place, are you not, Philip?' I ask no questions—I desire nothing but to quit this spot and die elsewhere in peace!

How my heart ached as I gazed upon her! Two young lives had been shattered—two loving hearts had been torn asunder, and all to what purpose? The answer was before me.

She took hold of my arm, Ann supported her on the other side, and walking slowly, we came after a time to the door in the boundary wall, of which Ann possessed the key; and so, after crossing a field or two on the other side, we found ourselves on the high-road.

The question was, what ought our next step to be? A sudden thought struck me. There was nothing to fear from Mr Rudyard for a little while; there might be much to fear from Aaron Sturke. Turning to the girl, I said, 'Where is your uncle?'

'He's gone with Mr Tyson to Berryfield Fair, and he won't be back till late,' was the answer; and it eased my mind wonderfully.

'Now, Ann,' I said, 'you must devise some means by which Mrs Rudyard can be got away at once to the nearest railway station.'

'Oh! there's no difficulty about that,' she replied. 'There's Dapple in the stable, and there's uncle's old shandrydan in the barn, which will hold three comfortably. The nearest railway station is only nine miles away.'

Here was comforting news.

'You are going with us, Ann?' I said.

'I daren't stay here, that's certain,' she answered simply. 'My uncle would half kill me, when he found out what I had done. But come up to the cottage, while I get a few things ready, and leave the keys,' she added. 'Mr. Barton can sit down while I get the shandrydan ready. There is not a soul about; they are all off to the fair.'

A quarter of an hour later, the shandrydan, a nondescript country vehicle, was in readiness. Ann had deposited among the straw at the bottom a small corded box containing some of her worldly belongings. Like all north-country girls, she possessed a profusion of warm wraps and shawls, and she was as anxious as I was that Mrs Rudyard should be well protected from the keen autumn breezes.

By Ann's advice, we took a byroad which debouched into the main road about three miles farther on. In order to reach this road, we were compelled to drive past the old tower. Ann's eyes met mine as we skirted a corner of the boundary wall, and at the same moment I felt a shudder run through Catherine. She and I had set eyes on those cruel old walls for the last time.

We reached the railway station without adventure, and sent the shandrydan back under care of a porter. My first duty was to despatch a telegram to Mrs Staveley, asking her to meet us at a certain hotel in London as early as possible the following day. Mrs Staveley's house was within a few miles of Isterby Manor; and in the state of Catherine's health, I did not deem it advisable to take her at once back to a neighbourhood fraught to her with so many painful recollections; besides which, Mr Rudyard in one of his mad fits might choose to go in search of his wife, and Mrs Staveley's house was one of the first places he would be likely to visit. In London, Catherine would at least be safe from his violence.

Before noon next day, Mrs Staveley had the satisfaction of embracing her long-lost niece.

But little more remains to be told. We never heard whether Rudyard made any efforts to trace his wife, nor did we care to inquire.

Mrs Staveley took a pretty little furnished house in the suburbs of London, and there Catherine went to live with her aunt. She had a long illness, during which she was faithfully nursed by Ann; it was nature's reaction after all she had suffered and gone through during those terrible weeks in Dunleap Tower; but when at length it left her, it left her stronger and better in health than she had been for years, more especially when she found that her husband seemed to have no intention of molesting her. But not for long had she any need to start and tremble whenever a louder ring than ordinary came to the door. Little more than six months after our escape, Mr Rudyard, in one of his mad

gallops, was thrown from his horse, and died within twenty-four hours. His affairs were found to be hopelessly involved. Isterly Manor and Dunleap Tower were brought to the hammer. To the surprise of every one, except a few who were in the secret, the whole of the mortgages on the latter estate were found to be in the hands of Aaron Starke; and, as his niece had prophesied, Aaron is now the squire of Dunleap. Ann went back to live with him after Rudyard's death; and as it is not likely that her uncle will ever marry, she is already regarded as his heiress in prospective.

It was a mystery to me at the time, and it has been a mystery ever since, why Aaron Starke should have allowed himself so readily to become Mr Rudyard's tool, in the latter's illegal dealings, both with his wife and myself. He was too crafty a man not to have some strong motive for acting as he did. What that motive was, is best known to himself.

I had made up my mind to return to Australia as soon as I had seen Catherine safely domiciled with her aunt; but just at this time, through Mrs Staveley's influence, I received the offer of a situation which made it worth my while to remain in England; and in England I am likely to remain.

I have nothing to add, except that the eyes which are looking over my shoulder as I pen these last lines are those of my first and only love—those of Catherine my wife. The past is not forgotten by us, nor can it ever be; but Time has brought healing on its wings; and it may be that the memory of bygone trials serves but to heighten the happiness of the present, and while life is spared us, will but render more indissoluble the bonds of the future.

THE MONTH:

SCIENCE AND ARTS.

SIR PETER LUMSDEN'S interesting paper on his experiences in Afghanistan, read before the Royal Geographical Society, contains an account of the curious lake upon which the Tekke Turcomans are dependent for their supplies of salt. This lake is six miles square, is situated at an elevation of about fourteen hundred feet above the sea-level, and is surrounded on all sides by a steep precipitous descent. The yield of salt is practically unlimited, for the bed of the lake is one solid mass of level rock-salt, covered only by an inch or two of water, the depth of the deposit being unknown. A second lake furnishes the Saryks of Penj-deh with salt. This lake is much larger than the one just described, and the salt in it does not present such a smooth unbroken surface. The salt is dug out in the form of flakes about four inches in thickness, which are packed into bags, and carried on camels to market without any kind of preparation.

A recent number of the *Amateur Photographer* contains a letter from Captain Peters—dated from Quebec—who has just returned from the rebellion in the Canadian north-west. He tells how, throughout the campaign, he carried on his saddle a small photographic camera, of which he made so good a use that he secured sixty good negatives. These included about a

dozen taken during the battles of Batoche and Fish Creek. He remarks, with justifiable pride: 'I do not think that any photographer has yet accomplished a picture under fire; one of nine was taken during a volley from the rebels' pits about one hundred and fifty yards distant.' There are certainly few men who would have the nerve to go through the somewhat delicate manipulations involved in taking a photograph with death almost staring them in the face. Captain Peters is likely for a long time to enjoy the distinction of being the only one who has accomplished such a feat.

The work of the wandering photographer is constantly being rendered more easy by the ingenuity of instrument-makers; but the last note in this direction possibly marks the beginning of a revolution in the art. Relinquishing glass for the negative image, the Eastman Dry-plate Company have introduced a system of coating paper with the necessary sensitised gelatine. This paper is supplied in rolls several feet long, which fit into a specially contrived dark slide for insertion in the back of the photographic camera. By means of a winding-key, like that of a clock, the paper roll is unwound from one reel and wound upon another at the other side of the dark slide. In this way, pictures can be taken by exposing in the camera successive portions of the paper until the supply is exhausted. The paper strip is afterwards cut into sections so as to separate the pictures, which are developed in the usual way, and subsequently, by simple treatment, rendered as transparent as a negative on glass. The chief advantages of the system are the lightness of the material used as compared with glass, the impossibility of breakage, and the very small space in which a number of negatives thus prepared can be stored. The entire process is shown in operation at 13 Soho Square, London.

A new kind of lighthouse is being constructed at the Colwell Iron-works, United States, which is destined for the Delaware River. It is composed of cast-iron plates riveted together, weighing collectively two hundred tons, and presenting, when put together, a tapering tower eighty feet high. The circumference of the structure is at the base sixty-six feet, and at the top fifty-four feet. This iron casing will be taken piecemeal to the concrete foundations prepared for it, and after erection, will receive a solid lining of brickwork. This novel plan of construction is claimed to be effective, expeditious, and very cheap.

The chief Director of the Norwegian fisheries has made some curious observations upon the height to which a salmon can leap in order to clear a waterfall which bars its progress upstream. It would seem that the most favourable condition for a good jump is the presence of a deep pool immediately below the fall, in which case a salmon has been known to rise perpendicularly to a height of sixteen feet. Such high leaps are not common, yet they have occurred upon one Norwegian river, where man has been planted below a fall for the purpose of actual measurement. The same observer states that on more than one occasion a fish failing to clear the fall at one bound, was seen to remain in the falling water a foot or two below

the top, and then, with a rapid twitch of the tail, to accomplish its purpose. This only happens when the fish succeeds in striking the falling water straight with its snout. If it strikes obliquely, it is immediately carried down to the pool below.

We have much pleasure in calling attention to a new material which is intended more particularly for the clothing of those who risk their lives on the water. It has been invented by Mr William Jackson of London, and it consists of cotton, silk, or woollen fabrics interwoven with cork cut into the thinnest shreds imaginable. The material was lately submitted to a severe test. Three persons who could not swim were dressed in clothing made of it: one as a naval officer, the second in boating costume, and the third in ordinary lady's attire. The three were then unceremoniously thrown into the sea from the end of Hyde pier, with the result that they floated without difficulty and without any kind of exertion on their part. We may mention that machinery has been contrived that will cut the cork into shreds as thin as paper or linen.

Messrs Brown and Porter, of Liverpool, have patented a very clever contrivance to enable workmen to ascend tall chimneys and similar high structures quite independently of scaffolding. It consists of a staging which grasps the chimney, and which, by the turn of a wheel, ascends it by a spiral movement. In the case of a circular chimney, the staging is triangular in shape, and can be lightened as it rises, so as to adapt itself to the reduced circumference of the structure towards the top. The parts of the staging which actually touch the brickwork are three rollers set at an angle, and it is by turning one of these that the contrivance is made to creep up the structure. The staging for square chimneys is still more simple. It consists of two frames, one depending from the other, either of which can be firmly bolted to the chimney. On the lower one is a gallery for workmen to stand upon. Its mode of progression up the chimney is somewhat like that of a leech, one frame being fastened, while the other creeps up to it by means of screws. Then the first one is released, and, after the second is bolted to the chimney, is raised to a higher level. By this step-by-step motion, the staging is made gradually to ascend to any height required.

A new method of ventilating ships has been suggested by an Australian inventor. Pipes are made to extend from the various places that require ventilation, to the furnace in the engine-room. The furnace-doors are made to fit very tightly, so that no air can reach the fuel except through these ventilation pipes. Powerful suction is in this way established, and all foul air is drawn off into the furnace, while fresh air is made to take its place through orifices provided for the purpose. The plan is only applicable to steamships, unless in other cases a special furnace be employed.

The necessary plant for lighting the Low Moor Colliery by electricity is now being prepared, and the whole of the apparatus is to be erected at the bottom of the pit. Permanent wires are being fixed along the principal roadways from the shaft to the extreme end of the workings, while branch wires—which are movable, so that

the miners can shift the lamps from place to place as they work—extend on either side into the several workings. The lamps used are of the incandescent form, inclosed in a stout glass globe, which is further protected on the outside by wirework. A small switch in connection with each lamp will allow the workman to reduce or increase the amount of light at pleasure. The system has already been tried experimentally, and gives every sign that when established permanently, it will prove a success.

Mr Thomas Burt, M.P., in addressing an audience of colliers at Barnsley the other day, maintained that an explosion in a colliery should be followed by a searching inquiry by experienced men, such as always follows a railway disaster. He reminded his hearers that they had other perils to guard against besides the risk of explosion, and told them of the great danger of omitting to support the roof of the workings with a sufficiency of props and stays. He stated that the number of lives lost during the past thirty years as a result of insufficient timbering was nearly double that due to explosions of fire-damp.

Engineering states that last year four thousand five hundred tons of borax were produced in the States of California and Nevada, and that the supply can never fail, because as fast as the deposits are removed, they are renewed. Many new uses for this substance have been found since it has become so plentiful. A few years back, it was used in the United States almost solely as a flux in welding iron. Now it is employed in glazing iron and pottery, for softening water, in the manufacture of soap, and lastly, as a preservative for meat.

In factories, warehouses, theatres, and other large establishments where it is considered desirable to employ night-watchmen or firemen, it has long been customary to place tell-tale clocks in different parts of the building, which show whether or not the watchers have regularly gone their rounds every hour throughout the night. Dr Millar, of Bethnal House Asylum, has contrived a clock of very simple design which accomplishes this work with great accuracy. The axle for the hour-hand carries a paper disc instead of the usual hand, and the whole arrangement is contained in a strong box. In the lid of this box is a hole just large enough to admit a pencil; and it is the duty of the night attendant in passing a station where one of these clocks is placed to insert a pencil into the hole and give it a twist, so that it leaves a mark on the disc of paper slowly travelling below. The next morning an inspection of the paper will show how many times the spot was visited and at what hours. By using differently coloured pencils and slightly shifting the paper disc, records for a whole week can easily be made on one piece of paper. More than one hundred clocks on this principle are already in use at different asylums in this country.

A new form of torpedo has lately been tried with some success in the United States. It consists of an iron tube measuring sixteen inches in diameter and forty-two inches in length, containing, besides its explosive, a charge of rocket composition. It is fired from another tube, which gives it initial direction in its course.

In practice it is found that it will attain a velocity through the water of ten feet per second, and that it will preserve a straight course even when contending with a swift current. It is obvious that such a weapon may prove quite as efficient as the complicated torpedoes in present use, whilst its cost must be very moderate in comparison with them.

Those who have visited any large engineering works will know that rivets for iron-work, instead of being hammered into position as of old, are now pressed into place by a mighty squeeze from a pair of huge jaws worked by hydraulic power. The same plan is being adopted for riveting up the plates and girders at the Charing Cross Railway Bridge Extension Works, London. But the novel part of this adaptation of the system is that the hydraulic power is borrowed of the London Hydraulic-power Company, whose mains now traverse all the important thoroughfares of the city. The near dwellers to the bridge will have reason to thank this Company for relieving them of the incessant din which night and day usually accompanies iron-bridge construction.

A method of making sheet-lead which presents some novel features has been patented in Germany. The apparatus employed consists of an iron box called a receiver, the bottom of which is movable, and can be raised from beneath by an hydraulic ram. This box corresponds in length with the width of the sheet of lead to be made. At the top is a pair of jaws running the whole length of the box, the opening between which can be adjusted so as to form a slit of any desired size, such size agreeing with the thickness of the sheet-lead in course of manufacture. The operations are as follows. The receiver is filled with molten lead, which is allowed to cool down to a semi-plastic state. In the meantime the jaws are brought to the required distance from one another. The hydraulic ram is now put into motion, and the bottom of the box slowly rises, forcing the soft metal through the jaws in the form of a compact sheet. We may mention that the old method of making sheet-lead is to roll out a mass of the metal until it is reduced to the required thickness.

Some months ago, we adverted to the system which has been introduced by the New York Steam-heating Company of warming houses by steam supplied by pipes from a central station. The system also comprises the feeding of all kinds of stationary steam-engines, which are thus rendered independent of separate boiler-power. It is now proposed to extend the steam-pipes to dry-goods stores, so that they may act as fire-extinguishers. The plan proposed is to establish stand-pipes in each building, with big nozzles opening on to the separate floors. The steam could at any time be turned on from the street, and would, it is said, quickly drive out the air from the place and smother an incipient conflagration. The proposal to use steam for the purpose of putting out fires is by no means a new one, and possibly it has never been tried on a practical scale, because the necessary apparatus was not easy to find. But in New York, where the pipes and boiler are all ready to hand, we may look forward to some experimental trials of the system, from which much good may accrue.

A rival to india-rubber and gutta-percha, which is enthusiastically described by an American firm as 'the best gum in the world,' has been found in the dried milk of the bullet-tree (*Mimusops globosa*). This gum, which is commonly known as Balata, seems to possess all the advantages of india-rubber and gutta-percha without the intractable nature of the one or the friability of the other. It is now regularly collected in British Guiana, and has for some time been exported as a superior kind of gutta-percha.

Professor Poleck has demonstrated by recent experiments that dry-rot increases in rapidity according to the amount of potassium and phosphoric acid which is contained in the wood where it occurs. Wood felled in the spring is rich in both these constituents, and in such wood the professor has found no difficulty in cultivating dry-rot spores. But winter felled trees contain much less both of the acid and the potassium, and the cultivation of the spores in wood from such trees has been found quite impossible. The experiments also show that the spores require a certain definite time for full development.

The government astronomer of Hong-kong has published an account of the phenomena which precede typhoons. The first signs are feathery clouds in the sky of the cirrus type, looking like fine tufts of white wool, and which travel from east to north. These appearances are accompanied by a slight rise of the barometer, clear weather, heat, and light winds. The barometer then begins to fall; the heat becomes oppressive; there is a swell on the sea, and the sky assumes a threatening appearance. As the storm approaches, these effects become more marked, while the wind gradually increases in force. Near the centre of the storm, the wind blows with such violence that no canvas can hold against it, and the rain pours down in torrents. Still nearer the centre, the sea is lashed into such fury that this is the most dangerous position for ships. Typhoons are most common during September and August, but they are met with all the year round.

According to the American papers, the researches which Professor S. A. Forbes, of the Illinois State College, has instituted into the cause of the terrible mortality recently prevailing among fresh-water fish in some parts of the American continent have been rewarded with complete success. The Report he has just submitted on the subject shows that the disease is due to a minute spherical microbe or germ whose diameter is only about the 1-25,000th part of an inch. This germ he discovered in the liver and kidneys of the diseased fish. There it forms abscesses, which ultimately destroy the cells of those organs, and therewith the life of the fish. Professor Forbes says that there are various species of this germ, the different varieties of which cause specific diseases, such as fever, and especially smallpox, chicken-pox, hog-cholera, and so forth. The case which more particularly prompted him to undertake this investigation was the extraordinary mortality among the perch and other fish of Lake Mendota, Wisconsin, where the fish have for some time past been dying in enormous numbers.

Central American advices give details of the eruption of the volcano of Cotopaxi, which

occurred early on the morning of the 23d of July. Cotopaxi, in the eastern chain of the Andes, is the highest active volcano in the world, its height being about nineteen thousand and five hundred feet. It is also distinguished for its symmetrical figure, being almost a perfect cone. The *Naccha* of Guayaquil states that about one o'clock in the morning people were awakened by loud reports as if from artillery. The explosions followed one another with wonderful rapidity, sometimes causing a continuous roar, shaking the earth and causing the windows and the doors of the houses to rattle. A telegram from Chimbo to Guayaquil states that in that city, situated almost at the foot of the volcano, there was what the residents, along the river Yana-Yacu call an aluvion. The phenomenon which these people understand by 'aluvion' is really the stream of lava which descends the mountain sides, melting the snow with which it is covered, and pouring down a tremendous mass of lava, mud, stones, and all obstacles encountered in its progress. Investigation during the day showed that the shocks produced by the explosions during the night were exceedingly heavy. The smoke hung like a pall over the face of the country, and the steady fall of ashes thrown constantly out of the terrible crater intensified the darkness. Accounts from Latacunga state that the eruption began with a terrible storm. The damage done was considerable, but the number of victims is not known. A similar catastrophe occurred in June 1877.

The recurrence of exceedingly low prices for Cheviot wools has directed attention to the extreme fluctuations which have occurred in the value of this staple commodity, a commodity of so much importance to the commerce of Scotland. It is probable that no article of constant and general consumption has been subject to such wide fluctuations in money value. Cheviot wools have not been at such low value as at this time since the year 1849, when they were quoted as low in some instances as 6d. per lb. In 1817 the prices were 8½d. and 8¼d., and fell to the lowest point in 1849, when it sank to 6¼d. It rose for the next four years, and in 1853 was at 1s. 1d., and again fell to 1s. 1d. in 1855. In 1860 it was up again to 1s. 8½d. In 1865 it rose to 2s. 3d., but in 1870 was back again to 1s. 1d. From this was a sudden and extraordinary rise to 2s. 6d. in 1872, at which rate a number of the best Border Cheviot clips were sold. From 1872 the prices have receded with varying fluctuations, until they have reached their present low rate of about 8¼d. per lb.

Now that the existence of Ambulance Societies has made more widely known the use of surgical appliances, it may not be out of place to notice two inventions that have recently been patented, and which promise to be of utility in the event of accidents. The first is an invention of Messrs John H. Peck & Co., Wigan, noticed in detail under our Occasional Notes, and consists of a stretcher made entirely of steel, with adjustable head-rest and removable cover. It is large enough to carry one man, and weighs under thirty pounds. The other invention is by Whittles & Co., of Lorcels, Birmingham. It is a pocket ambulance, termed the Nyl Case, containing articles suitable for the immediate dressing of wounds or stanching of blood, such as plaster,

bandages, tape, safety and surgical pins, as also a bottle of ammonia for venomous bites. These articles are all in a small metal case which can be carried in the vest pocket, and must be of great use to bicyclists, anglers, &c.

RECENT PATENTS.

ROWING WITH ONE'S FACE TO THE BOW OF THE BOAT.

Few exercises are more popular than that of rowing, and there are many enthusiastic oarsmen who would scout the idea that there are any conditions of their favourite pursuit susceptible of improvement. To those, however, less biased by strong predilection, it may have occurred that inasmuch as an oar-man is obliged under present conditions to sit with his face turned in the opposite direction to that in which the boat he propels is proceeding, he is confronted with what can only be regarded as a disadvantage. Of course, as it will be urged, a boat can be steered by the helm-man; but, as a matter of fact, when it is picking its way among a lot of craft, or has to pass a companion boat in a narrow part of a river, the circumstance that the rudder is under skilful management will not do away with the necessity for the oarsman constantly to turn round to regulate his speed, see whether he must 'ship' his sculls, &c. Thus the inventor, in devising a pair of sculls which permit of the user keeping his face turned in the direction of the boat's course, has not directed his energy into an altogether useless channel; and we may congratulate Mr. Spong and Company, of 236 High Holborn, London, that it has fallen to them to bring before the public the patent 'Face to Bow' Rowing Appliance.

The rowlock, a small metal apparatus, is clamped to the gunwale by means of thumb screws which work from the inside. It has two semicircular uprights, which stand at right angles to the gunwale, and these have each a perforation. The scull consists of two lengths of wood, one comprising the blade and a portion of the stem, and the other comprising the remainder of the stem. Where the juncture takes place there is a mechanical contrivance, which represents the very heart of the invention. Firmly attached, by means of a metal socket, respectively to each portion of the scull are two stout cog-wheels. These two wheels revolve into immediate proximity—being connected by rods fixed to a common groundwork—and act one upon the other. The complete scull is placed upon the rowlock, between the two semicircular uprights; and a stout metal rod is inserted in the perforation on the one side. This rod, passing through a boring in the metal groundwork upon which the two cog-wheels revolve, reappears outside the perforation on the other side, and is made fast by a descending pin.

The oar-man takes his seat in the boat facing the bow, grasps the scull-handles in his hands, and, as in ordinary rowing, pulls them towards him. The cog-wheels upon the shorter lengths of the sculls revolving in one direction, cause the cog-wheels on the longer lengths of the sculls to revolve in the opposite direction; and thus the course taken by that part of the

scull touching the water is the reverse of the course taken by that part which is in the oarsman's hands. The boat is thus propelled. By means of the simple arrangement of a spring, the sculls are made to 'feather'; though it is satisfactory to know that as they will not do so when a short stroke is taken, it is the easiest thing possible to 'back-water.' If—as when rowing in tolerably rough water—it is the wish of the operator that the scull should not 'feather' at all under any circumstances, he can attain his desire by merely unscrewing a small steel plate. The new sculls can be applied, we are told, to any boats; and among the advantages claimed for them, as against the ordinary appliances, is a quicker recovery, a longer and more powerful stroke, an absence from noise, the impossibility of 'catching crabs,' and facility of 'shipping.' The mechanical fittings are made of gun metal and malleable iron, and consequently possess considerable strength. The future success of the apparatus will, however, entirely depend upon its being found to be *practically* available.

A BOTTLE FIRE-EXTINGUISHER.

Public attention has recently been drawn to the possibilities which are now making themselves manifest of extinguishing fire by the application of chemicals whose properties are antagonistic to combustion. Especial prominence has been given to the Harden Hand Grenade, the utility of which has been established by practical experience. Messrs Spong have brought out a 'hand fire-extinguishing ball,' which, being made of india-rubber, does not, like the glass grenade, require to be forcibly broken before its properties can be brought into direct contact with a fire. But the invention of this firm which, from its novelty and utility, deserves to be specially described, is their 'Ever-ready' self-acting fire-extinguisher. This is a new departure, and it consists of a glass bottle charged with a chemical liquid. By means of a simple device, the lifting of a slide causes a thin stream of the liquid to be propelled with considerable force from the vessel, and this stream can be aimed in any direction at pleasure, even to a distance of thirty or forty feet. Only a limited quantity need be used at a time—the residue suffering no deterioration from keeping; and thus one charging of the bottle will prove sufficient to extinguish more than one small conflagration; while it is confidently asserted that a very severe fire can be put out with the contents of two or three bottles. The price of the article is six shillings, and it can be recharged any number of times by an outlay of one shilling. The bottles are put up in two small bottles, where they can be kept for years, uninjured by climate. It is important, it appears, for the bottle to burst, as the hole which is punctured in its side acts as a safety-valve. It is manufactured, too, to bear double the pressure it will actually be called upon to endure.

A RAPID BOOT-CLEANING MACHINE.

Our present mode of cleaning boots is a very long and laborious one, and anything which can be devised to simplify it will meet with a warm welcome at the hands of hundreds

of servants and mistresses. An invention has recently been brought before the public which goes far in the required direction, and is certainly deserving of a wide patronage. Its mechanism is exceedingly simple. From a stout metal upright which has to be screwed down to a firm ground-work, such as a table or bench, project at an angle two arms. At the terminations of these arms there are perpendicular borings, and through these borings run metal rods, at whose extremities are attached upper and lower wheels. The right-hand upper wheel is supplied with a handle by which it can be revolved; while its edge is grooved. The left-hand upper wheel—which is superficially smaller than its companion on the right hand—has its top surface covered by a circular brush, and has also a grooved edge. A band passes round these two wheels, and therefore, when one revolves, the other revolves in harmony. Then, too, when one of these two upper wheels moves, the corresponding lower one is set in motion simultaneously, as both are fixed to the same axle. Thus, when the upper right-hand wheel is revolved by means of its handle, the remaining three wheels revolve too. It now remains for us to explain in what manner this simultaneous quadruple rotation is utilised for the purpose of cleaning boots. We have said that on the upper left-hand wheel a small brush is placed; and the reeler has now to learn that brushes, considerably larger superficially, are also placed on the two lower wheels. The right hand of these two brushes has hard bristles, and is devoted to the work of removing mud from the boot; while the left-hand brush is of a softer bristle, and is intended to do the polishing. The blacking is spread upon the boot by the small upper brush. In operating, the handle is turned by the right hand; and the left hand holds the boot and applies it to the three brushes. By means of the machine, it is found that, after a little practice, any person can clean boots and shoes in one-fourth of the time occupied by the usual method. It is quite clear, too, that many other advantages belong to the invention; though it is but fair to name one small drawback. When the article is in use and the boot is applied to the brush carrying the blacking, it cannot but happen that small specks of that liquid will fly off and bespatter the operator. This is a disadvantage, and should be obviated in future manufacture, either by the erection of a screen in front of the wheel in question, or by its readjustment. The invention is called the 'Rapid' Boot-cleaning Machine, and is brought out by the General Agency Company, 9 New Oxford Street, London.

A SIMPLE FORM OF DISINFECTOR.

A means has been devised whereby, at a very small cost and with no personal trouble, the drains, traps, and other sanitary appliances of a house can be continuously disinfected; and thus a barrier is made to block the channel through which deadly infectious diseases so frequently enter our homes. A cylindrical body is suspended in or placed at the bottom of the cistern, where for a year it can remain without being interfered with in any way, performing its function perfectly automatically. This cylindrical

body is called by the manufacturers—Messrs Sharp & Co., of 11 Holborn Circus, London—Austin's Patent 'Porous' Disinfectant, and consists merely of a case of a porous material in which a crystal disinfectant is hermetically sealed. The action of the water dissolves the crystals, and the solution, permeating the pores of the case, exercises its sanitary influence upon the successive fillings of the cistern. Thus, with every flush of water, the drains of a house are disinfected with a fluid which it may be stated is inodorous, non-poisonous, and non-corrosive.

A PORTABLE RAILWAY.

A patent has been taken out for a railroad which can be laid down and taken up with astonishing ease and despatch. The elaborate processes usually entailed in the construction of a line the setting down of 'sleepers,' the fixing on of iron sockets to receive the rails, and the rigid attachment of these rails - ate by this new system done away with, and an arrangement adopted by which certain lengths of parallel rails fixed across iron 'sleepers' are turned out of the manufactory complete, and requiring merely to be laid consecutively along the course of the intended line. The fact that this railway can be easily laid and relaid without suffering any injury, promises for it a future of great utility in commercial enterprise and military operations. Recently, three miles of this 'portable railway' were shipped for Afghanistan. The consignment included one hundred yards of curved length, twelve complete sets of points and crossings, ten 'turn-tables' - contrivances by which engines can be revolved and their heads reversed and all other necessary accessories. The rail weighed twelve pounds per yard, and were of an eighteen inch gauge; while the wagons which were constructed to carry from twelve to fifteen hundredweight each, were fitted with cast-iron wheels, and were much admired for their strength and finish.

The firm of engineers responsible for the 'portable railway' are Messrs Kerr, Stuart, & Co., Ltd., who have constructed examples of it in Russia, Africa, Australia, the West Indies, South America, and other parts of the world. It is, we should think, calculated to be of considerable use on sugar, cotton, and other plantations, on farms and brickfields, in collieries and mines, and about docks, harbours, &c. It is claimed that the iron is stronger and more durable than the wooden 'sleepers.' A corollary consequence insured on the 'portable railway,' one of the most fruitful causes of accident does not exist. The arrangement by which the lengths of railroad are attached one with another is of the simplest character.

CARBONIC ACID GAS AS A MOTIVE-POWER.

Carbonic acid gas is a force so very powerful, that, until recently, no means have been contrived by which it could be brought sufficiently under control to be of practical use. Many have been the attempts made to drive engines by the gas; but as yet no successful results have been made public. Nevertheless, an advance has been made by the invention of machinery which will sufficiently control the gas to enable the operators to lift enormous weights, such as houses, blocks of

stone, &c. It is not unlikely that the invention will be used on the Rhine Railway, the level of which is to be raised several feet. The large stone-built station-houses will, it is said, be lifted bodily to a height of seven or eight feet by means of carbonic acid pressure. The ordinary carbonic acid gas can, by machinery, be condensed five hundred volumes into one, and then stored and handled freely in cylinders of wrought-iron. The pressure is about six hundred pounds to the square inch, at a temperature of thirty-two degrees Fahrenheit. By heating, a pressure of eighteen thousand pounds, it is said, has been obtained. There is no doubt that this invention can be applied to many and varied purposes.

OCCASIONAL NOTES.

LIGHTHOUSE ILLUMINANTS.

AFTER twelve months' of experiments in all kinds of weather at the South Foreland, the Trinity House Committee have made their report upon the relative merits of electricity, oil, and gas as lighthouse illuminants. After weighing carefully the evidence given by photometrists and eye observers, and taking into account the questions of effectiveness, economy, and convenience as affecting each lighting system, the Committee thus sum up their opinion with regard to the relative merits of electricity, gas, and oil as lighthouse illuminants:

(1) That the electric light as exhibited in the experimental tower at South Foreland has proved to be the most powerful light under all conditions of weather, and to have the greatest penetrative power in fog. (2) That for all practical purposes the gas light as exemplified by Mr Wigham's multi-form system in B experimental tower, and the oil light as exemplified by the Trinity House Douglas six wick burners in multi-form arrangement up to triform in C experimental tower, when shown through revolving lenses, are equal, light for light, in all conditions of weather, but that quadriform gas is a little better than triform oil. (3) That when shown through fixed lenses as arranged in the experimental towers, the superiority of the superposed gas light is very marked. The larger diameter of the gas flame, and the lights being much nearer to each other in the gas lantern, give the beam a more compact and intense appearance than that issuing from the more widely separated oil burners. (4) That for lighthouse illumination with gas the Douglas patent gas-burners are much more efficient and economical than the Wigham gas-burners. (5) That for the ordinary necessities of lighthouse illumination mineral oil is the most suitable and economical illuminant, and that for silent headlands, important landfalls, and places where a very powerful light is required, electricity offers the greatest advantages.

Every publicity was given to the trials; the report stating that many members of scientific societies, especially those connected with engineering, had been invited and had visited the station. The French Lighthouse Department, who have given much kind assistance in obtaining observations, sent their representatives to view the arrangements. Germany, Denmark, Norway and

Sweden, Russia, Italy, Spain, Brazil, the United States, and Canada have all deputed officers to visit the station, and in showing them the various details, suggestions have been in each case invited for assisting in the completeness and insuring the impartiality of the trial.

A NEW AMBULANCE.

Much attention has recently been given to ambulances, and inventors have been very busy in this direction; but it is doubtful whether they will be able to improve on the stretcher exhibited by Messrs J. H. Peck & Company, manufacturers, Wigan, among their other exhibits at the Royal Agricultural Show, Preston. It was shown suspended from two wooden bars representing the sides of a cart; spiral springs attached to straps, two on either side of the stretcher, support it, and prevent all jarring and jolting, however rough the road. Side-boards are made of angle steel, one inch by one and a quarter inch by one-eighth of an inch, lightened where possible. The cross-bars, which close up, are carried from leg to leg—which are six inches long—and are a simple and ingenious contrivance much resembling a field-gate; and the four legs are kept in position by two drop-hinges. To permit of a sufferer lying full length on ambulance in pit-cage, the handles are made to drop with their own weight; and when not in use—for rapid transit to scene of accident or for storage—the whole doubles up to five feet nine inches by three inches by four inches. The head-rest is adjustable to various heights, and the feet may be raised above the head in case of hemorrhage. The cover is removable for cleansing; and the sufferer lies in contact with canvas only, the cross-bars being much below and beyond all possibility of touching. There is much ingenious simplicity in this apparatus; in fact a boy of thirteen can erect and explain the same; and, judging from all precedents, Messrs J. H. Peck & Company may be congratulated on having met a long felt want in a thoroughly efficient manner at a merely nominal cost. It is suggested that this contrivance should be of special use in collieries; for, in the first instance, the expense is small; while it folds up so as to be packed away in diminutive proportions when not in use; while it affords ready means of conveying an injured workman with freedom from painful jolts and friction. This excellent stretcher should find a wide application in all works, mills, factories, &c., as well as in hospitals, for police use, &c.

PHOTOGRAPHS OF GUN INTERIORS.

Experiments were recently made at the Royal Gun Factories, Woolwich, in order to test the application of a new electric lamp designed for making examinations and photos of gun interiors. The system of scrutinising the bores of guns by means of electricity has been only a short time in vogue, and has proved of great value; but the want of an electric dynamo has prevented its general adoption at many places where it would have been of considerable use; and the authorities have now taken up readily a portable battery, designed by Messrs Johnson and Phillips, for the purpose of supplying the place of a

dynamo in such cases. The battery, without being necessarily powerful, is chiefly serviceable on account of its constancy, as it can maintain a light of unerring brilliancy for a period of ten hours if requisite, and thus enable the examiners to make their inspection with all the leisure they may desire. The experiment made was to try the battery and a dynamo in competition. Two eight-inch guns were placed side by side in the new boring-mills, and photos were taken of their interiors by both processes, the results, as far as could be judged by a cursory view, being equally satisfactory. In future, it may be expected that reports of damaged guns sent in from distant stations will be accompanied by photographs, both internal and external.

THE WOODLAND GRAVE.

No sacred monumental urn,
Nor vaulted funeral praise,
Here lures the passer-by to turn
With mute and reverential gaze.

No cypress throws quaint shadows here
Upon some sculptured marble tomb,
Where rests some one to memory dear,
Amidst the churchyard's solemn gloom.

But in some unfrequented glade,
Where fragrant flowers bloom and die,
And where, beneath the wood's deep shade,
In wild profusion ferns lie,

Where bluebells, with the golden furze,
The wild-rose, and the daffodil,
With ivy, moss, and countess burrs,
Lie scattered o'er the verdant hill;

Beside some cool sequestered stream,
Shaded from the stormy weather,
Where the sun's last lingering gleam
Fades upon the mountain heather—

There, where the moss is soft and green,
With meadow-sweet and cowslips too,
And fairest snowdrops may be seen
Weeping in the morning dew;

And where the holly grows so tall and free,
Comes the woodland muse, all day long,
Linger in the murmuring trees—

Just there, beneath that laurel's shade,
Where moss and ivy deck the ground,
The truest, kindest friend is laid—
My noble, faithful, trusty bond.

A. M. CARADOC.

The Conductor of CHAMBERS'S JOURNAL begs to direct the attention of CONTRIBUTORS to the following notice:

- 1st All communications should be addressed to the Editor, 339 High Street, Edinburgh.
- 2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
- 4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

If the above rules are complied with, the Editor will do his best to ensure the safe return of ineligible papers.

CURIOSITIES OF POISONS.

IN popular language, a poison is a substance which, administered in small doses, destroys life. Obviously, however, the toxicologist must of necessity enlarge the definition, and embrace many substances not generally accepted as poisons. No one outside the faculty would, for example, consider such well-known medicines as cream of tartar, tartaric acid, alum, Epsom salts, and even ordinary table salt, to be poisons, and yet each of these substances has been the cause of more than one accidental or criminal fatality. Not only so, but the commonest of domestic remedies may be made, by abuse, to come under the cognisance of the toxicologist. A number of years ago, a paragraph appeared in some of the medical journals concerning the death of an innkeeper from the effects of a quack pill. It appeared that the man was in the habit of taking the pills to such excess that he was often obliged to send for medical advice to cure him. Being warned against the danger of the practice, he began to take them in secret, exceeding the number that he still continued to buy by stating that he gave them to his horses. A post-mortem examination left no doubt whatever about the cause of his death. We merely quote the case to show the truth of the aphorism, that while a poison may in small doses be a medicine, a medicine in large doses may also be a poison.

Modern investigation and discovery, especially into those subtle and active principles derived from the vegetable kingdom, have undoubtedly done much to enlarge the scope, and render the study of toxicology more elaborate and difficult than it was in more remote times. Still, early investigators seem to have been aware of what, even in this enlightened age, may be called a fundamental principle of the treatment of cases of poisoning—namely, the prevention of the absorption of the poison into the system. Thus, Nicander, Galen, and Dioscorides all recommend the application of cupping instruments, sucking the wound, cauterising with hot irons, and the

application of leeches in the treatment of bites from venomous animals and insects. On the same principle, hot oil was a common remedy for internal poisoning, on the supposition that the oil not only acted as a quick emetic, but also prevented the poison from being absorbed into the system. It is curious to notice in passing how thoroughly modern practice is in accord with the principles here laid down nearly seventeen centuries ago. Let any one, however ignorant in other respects, be bitten by a dog or cat, particularly in the summer season, when rabies is thought to prevail, and the first impulse is to get the wound cauterised. If this is impossible, the more primitive plan of sucking the wound is almost instinctively adopted. In like manner, for internal poisoning there is scarcely an instance, even with all the many subtle organic poisons of the present time, in which the free administration of emetics, followed by oleaginous or mucilaginous drinks, to prevent absorption, is not applicable. Again, it was remarked by Avicenna, in the beginning of the eleventh century, that venesection should not take place unless where the poison was distributed over the whole system, a, when the veins were full, the poison could not get admission into them. The wisdom of this observation has been amply confirmed by the researches of Orfila, Magendie, Paris, and others in the present century. Not only have such specialists investigated the action of poisons on the human system, and thus demonstrated what was previously, to a great extent, mere conjecture, but they have also instituted a scientific treatment of poisoning, which sharply marks the toxicology of the present time from that of any other age—namely, the use of chemical antidotes. The importance of this last point can only be properly estimated when we consider the number and potency of many of the chemical and medicinal poisons discovered in recent times.

Tartar emetic, which probably, next to arsenic, has attained the most unenviable notoriety in our day for criminal proceedings, was discovered towards the middle of the seventeenth

century. Hydrocyanic acid, the most potent of poisons, the vapour of which, accidentally inhaled, has been known to produce serious consequences, was only discovered towards the latter end of the eighteenth century. Oxalic acid, which has probably caused more deaths than any other poison from accidental administration, owing to its having a somewhat distant resemblance to the well-known medicine Epsom salts, was discovered about the same period. Morphine, the most important and useful of the vegetable poisons, although known in a very impure state as 'Magisterium Opii' in the seventeenth century, was not obtained as a well-defined base until the beginning of the nineteenth century. Strychnine was discovered about the same time; while aconitine—first brought into distinct prominence in this country in connection with the notorious criminal Lamson—was discovered a few years later still. After this, in rapid succession, followed the discovery of nicotine, the active principle of the tobacco-plant; amorphine, the active principle of the deadly nightshade; chloroform, the well-known anæsthetic; and chloral, long considered a chemical curiosity, but, within the last few years, introduced, and used as an opiate by the hundredweight. Medicine has at the same time been enriched by the addition of such powerful agents as the ordeal or Calabar bean of Africa, and the arrow-poison or curara of the Indians.

The very mention of these deadly agents is sufficient to indicate the difficulty and importance of the work of the toxicologist, as well as of medical men generally, at the present time. The difficulty and importance lie in various directions, but particularly in the preliminary detection of the symptoms of poisoning, in the prompt administration of the most suitable antidotes, and in the post-mortem detections of the poison in cases of death. This last point is not the least important, as one curious fact in connection with the majority of the fatal poisons is the rapidity of their action, and the consequent difficulty of detecting them shortly after death. This is characteristic of every organic poison; but several of those just mentioned are not of organic origin, such as hydrocyanic acid, chloroform, chloral, &c., and yet, being volatile, or readily decomposed into volatile principles, they also very soon escape the possibility of detection. This is not the case, however, with the older and better known mineral poisons, as they are all indestructible by the lapse of time. Several well-authenticated cases of the detection of mineral poisons long after death are given in every text-book on Poisons; but the following remarkable cases have not been cited, so far as we are aware.

A wealthy county farmer in England having died, was buried in the tomb where his father had been interred thirty-five years before. An examination of certain of the bones of the father disclosed brilliant particles of a metallic-looking substance, which, on being collected together, presented a considerable quantity of what was proved to be oxide of mercury. The mercury had thus been preserved for more than the third of a century in the body of the deceased, the probability being that he had been in the habit of taking it medicinally during the latter part

of his life. An equally remarkable case, or rather series of cases, came under the notice of the late eminent chemist, Mr Horripath of Bristol, in which he found abundant traces of arsenic in the bodies of several young children after a lapse of eight years; the evidence both of criminal poisoning and of the presence of the poison used being so clear, that the jury without hesitation returned a verdict 'that the deceased children died from the effects of arsenic, but how or by whom administered, there is no evidence to show.'

The presence of small quantities of certain metallic poisons, such as arsenic, copper, lead, or mercury in the system does not, however, necessarily imply either accidental or criminal poisoning. Mercury in one form or another is often administered as medicine; lead is frequently present in our food as well as in the water we drink; copper is used to give certain preserved vegetables the bright green of the French fruit; while arsenic is so frequently met with in nature that a French chemist undertook to find 'it in the legs of any old chair.' It is found in considerable traces in certain soils; and this fact led at least in one instance to the acquittal of a prisoner indicted for murder, through the ingenious suggestion, that the arsenic found in the body might have filtered through the wet soil into a crack found in the lid of the coffin, and thus passed on to the body where it was found. There is no end to the ingenuity of counsel in such cases. In another instance, arsenic was found in the liquid contents of the stomach in considerable quantity, but the analysis in this case had not extended to the tissues. The counsel in defence contended that the proof of poisoning had failed, inasmuch as the medical evidence should have proved the absorption of the poison by the tissues to produce poisoning. The prisoner was acquitted. Not less ingenious was the defence of counsel in the case of Madeline Smith in 1857 for the murder of L. Angelier at Glasgow by the administration of arsenic. Counsel founded their defence mainly on two points. The first was the fact, that eighty-eight grains of arsenic had been found in the body, and that such a large dose had never before been proved to have been voluntarily swallowed; arguing from this that the poison must have been self-administered. The second point was, that the purchases of arsenic which the prisoner was proved to have made were intended for cosmetic purposes.

The idea of using arsenic as a cosmetic takes us almost unconsciously back to the beginning of the eighteenth century, when an old hag, named Toffana, of Naples, was strangled for having directly or indirectly been the cause of poisoning more than six hundred persons. The poison which she prepared was proved to be merely a solution of salts of arsenic, and this preparation was found to be in circulation throughout Italy under the assumed name, for secrecy, of a famous oil, supposed to possess miraculous healing properties. Any one in the secret could buy the poison under the guise of using it as any liniment or cosmetic might be used, while under its cover lay death to the victim in a day, week, or month, at the will of the administrator.

Strange as it may appear, national crime like

this seems very much to have run in cycles in some continental countries; and although our own country has been free from it in such gigantic proportions, it has not altogether been so free from the crime of murder as not to make us thankful that modern investigation has rendered the perpetration of such villainy almost impossible. Every murderer of modern times has but made the perpetration of future murder less easy; and the very ingenuity of counsel in their defence of such cases has only assisted to this end, by exposing all the weaker points for the future guidance of the public prosecutor. Were proof of this needed, it is only necessary to point out that some of the most notorious crimes of modern times have been committed with the most subtle and powerful of all known poisons, and directed with a skill and ability which could only proceed from a trained and scientific acquaintance with the substance used. What, however, has been the result? Strychnine in the hands of Dr Palmer, tartar emetic in that of Dr Pitt-Rivers, and acconine in that of Dr Lanson, too certainly accomplished the purpose for which they were intended; but with all the ingenuity and skill and opportunity at their disposal, they could not escape the fruits of their villainy. Their history is a striking proof of the fact, that if modern discovery has given the agents for perpetrating crime, it has no less yielded the means for their scientific detection.

Not the least interesting of many curious features connected with the production and consumption of certain poisons, is the extraordinary quantities that are in some instances manufactured. What becomes of them? It is comparatively easy to understand what is implied by one thousand and Winchester quarts of chloroform, and one thousand or even ten thousand ounces of morphia; but what of a poison like chloral? It has already been stated that chloral is at present being manufactured by the hundredweight. This, however, as a matter of fact, falls far short of the reality, as one German manufacturer recently admitted the production of half a ton weekly in his laboratory alone. There is no recognised outlet for the consumption of this substance saving that of internal administration, and we confess the imagination gets baffled in endeavouring to estimate the hundreds of thousands of pain-stricken, weary mortals who must swallow an indefinite number of half-tons weekly, in doses of twenty or thirty, or at the most forty grains each. A number of years ago, something little short of a panic was occasioned by attention having been called to the fact that strychnine was being manufactured in enormous quantities, one thousand ounces having been known to be purchased at one time. What became of this extraordinary quantity was the question that not unnaturally seized the public mind. As a medicine, its use is necessarily very limited; while its indiscriminate sale or employment as a destructive agent for vermin—the only other legitimate purpose to which it is known to be applied—is restricted by legislative enactment. In such circumstances, it was reasonable to seek some other explanation for its enormous production, and the public mind somewhat mysteriously fixed upon *her* as being the medium. For a time, it was currently believed that the bitter principle of the hop was substi-

tuted, or at least fortified, by the help of strychnine; and although this was ultimately disproved, the mystery of the quantities in which it was being manufactured was only partially solved by the suggestion, that it was probably destined for the colonies, to assist in exterminating vermin there.

Still another curious fact remains to be noticed in connection with strychnine—the frequency with which it has been found in admixture with another neutral principle called *santonine*. *Santonine* is derived from the seeds of the *Artemisa santonica* (wormseed), and is much used in medicine as a simple vermifuge, particularly for children. It will therefore be at once understood that a mixture of the two substances means death to any one getting such a dose; and as a matter of fact, deaths have occurred in our own country, in France, Spain, Germany, and in America, from this extraordinary cause. It will be kept in mind that we do not speak at present of a simple case of substitution, in which the doctor or the druggist lifts and dispenses from the wrong bottle. Deaths, unfortunately, have occurred in this way also, but, generally speaking, there is no mystery whatever about such cases. The mystery we refer to is, that *santonine*, which is not a poison, has been in the first instance derived from various sources, extending over a period of years, and in the experience of various nationalities, has been proved to be mixed with strychnine. Various suggestions and theories have been put forth to account for the fact. Amongst others the probability that the seeds may have been adulterated by other seeds resembling them, but strychnine-yielding, and also that the cases of poisoning narrated were not caused by strychnine, but were actually produced by an overdose of *santonine* itself, acting on some peculiar idiosyncrasy of the constitution. This last suggestion is at once met by the direct fact, that strychnine was not only discovered in the mixture of the poisons, on a post-mortem examination being made, but its source was also traced, and, in every case the mixture as stated, satisfactorily proved. As to the other theory, the mixture of seeds, granting that the same process which extracts the *santonine* from the *santonica* would also extract the strychnine from the strychnos, it is hardly conceivable that the adulteration would escape the notice of the different manufacturers; far less would it be possible, even if it did, to produce a simple mixture of crystals, such as appears to have been characteristic of these fatalities. In the process of distillation, the two substances would not have crystallised separately to form a mixture, but would have blended together to form a distinct and uniform crystal. The more probable explanation is, that a distant resemblance both in the spelling and the pronunciation of the two names, favoured by a similarity in their physical appearance, has led to some confusion at one point or another, whereby the one has been accepted for the other. Still, even with this explanation, it remains a curious fact, that the error has so frequently repeated itself both in this and other countries.

Mistakes of any kind with poisons will almost always lead to results more or less serious, as well as mysterious, if not detected in time. The dismay, for example, that was caused five or six

years ago by numerous fatalities from the use of a dusting powder largely adulterated with arsenic must still be fresh in the memory of every one. Fifteen children died from arsenical poisoning produced by the use of this powder, and while, fortunately, its supply was distinctly and quickly traced to its source, and its use confined to a comparatively limited area, the mystery, we believe, has never been explained as to how the arsenic was substituted for *terra alba*, which it was sold as, and supposed to be, or how it came to be supplied in such large quantity without detection in some manner or other.

Equally serious and still more mysterious was a case that happened in a madhouse in the Southern States of America with aconitine, shortly after this powerful agent had been brought prominently into note in connection with the trial of Laumon. The medicines—in this instance all simple, it appears—were given to the patients of the asylum in open dishes, carried on trays; and whilst the trays were waiting for the nurses to take them to their different wards, it is thought some one must have tampered with them. Within a few minutes after the medicines had been taken, the patients complained of the effects; and within ten minutes several had died, whilst other two died after two hours, and another still after two days. Post-mortem examinations discovered the presence of aconitine in considerable quantity, and some of it in the crystalline form. The fatal results could not be attributed to any of the ordinary preparations of aconite; while, to add to the mystery, aconitine was unknown in the laboratory of the asylum, neither was it kept in stock by any chemist in the town. Anything more fiendish than this, if done intentionally, can scarcely be conceived. It opens up, however, a question which has often forced itself upon the writer as a probable solution of some unexplained and apparently unexplainable crimes. Has the secret possession of or the power of obtaining such powerful agents as those we have been speaking of, not a tendency to act on certain morbid minds, instigating to the perpetration of crime? Every one has read of the impulse which seizes some individuals on looking over any huge precipice, to cast themselves headlong from it. The impulse is described in some instances as being awful in its intensity. Is it not possible that certain individuals may thus also be acted upon to commit some fearful crime, when possessed of the means to do so? Read in this light, some historical crimes become intelligible, at least in so far as supplying the link that is so often wanting as to their cause—namely, motive.

A HOUSE DIVIDED AGAINST ITSELF.

BY MRS OLIPHANT.

CHAPTER XXXIX.

AND Constance, too, had found it amusing; she did not hesitate to acknowledge that to herself. She had got a great deal of diversion out of these six weeks. There had been nothing, really, when you came to think of it, to amuse anybody: a few dull walks; a drive along the dusty roads, which were more dusty than anything she

had ever experienced in her life; and then a ramble among the hills, a climb from terrace to terrace of the olive gardens, or through the stony streets of a little mountain town. It was the contrast, the harmony, the antagonism, the duel and the companionship continually going on, which had given everything its zest. The scientific man with an exciting object under the microscope, the astronomer with his new star pulsing out of the depths of sky, could scarcely have been more absorbed than Constance. Not so much; for not the most cherished of star-fishes, not the most glorious of stars, is so exciting as it is to watch the risings and flowings of emotion under your own hand, to feel that you can cause ecstasy or despair, and raise up another human creature to the heights of delight, or drop him to depths beneath purgatory, at your will. When the young and cruel possess this power—and the very young are often cruel by ignorance, by inability to understand suffering—they are seldom clever enough to use it to the full extent. But Constance was clever, and had tasted blood before. It had made the time pass as nothing else could have done. It had carried on a thread of keen interest through all these commonplace pursuits. It had been as amusing, nay, much more so than if she had loved him; for she got the advantage of all his follies without sharing them, and felt herself to stand high in cool ethereal light, while the unfortunate young man turned himself outside in for her cold comfort. She had enjoyed herself. She did not deny it; but now there was the penalty to pay.

He was gone, clean gone, escaped from her power; and nothing was left but the beggarly elements of this small bare life, in which there was nothing to amuse or interest. The roads were more dusty than ever, lying white in heat and dust, which rose in clouds round every carriage—carriage! that was an euphemism—cab which passed. The sun blazed everywhere, so that one thought regretfully of the dull skies of England, and charitably of the fogs and rains. There was nothing to do but to go up among the olives and sit down upon some ledge and look at the sea. Constance did not draw, neither did she read. She did nothing that could be of any use to her here. She regretted now that she had allowed herself at the very beginning to fall into the snare of that amusement, too ready to her hand, which consisted of Captain Gaunt. It had been a mistake, if for no other reason, at least because it left the dullness more dull than ever, now it was over. He it was who had been her resource, his looks and ways her study, the gradual growth of his love the romance which had kept her going. She asked herself sometimes whether she could possibly have done as much harm to him as to herself by this indulgence, and answered earnestly, No. How could it do him any harm? He was vexed, of course, for the moment, because he could not have her; but very soon he would come to. He would be a fool, more of a fool than she thought him, if he did not soon see that it was much better for him that she had thought only of a little

amusement. Why should he marry, a young man with very little money? There could be no doubt it would have been a great mistake. Constance did not know what society in India is like, but she supposed it must be something like society at home, and in that case, there was no doubt he would have found it altogether more difficult had he gone back a married man.

She could not think, looking at the subject dispassionately, how he could ever have wished it. An unmarried young man (she reflected) gets asked to a great many places, where the people could not be troubled with a pair. And whereas some girls may be promoted by marriage, it is *almost always* to the disadvantage of a young man. So, why should he make a fuss about it, this young woman of the world asked herself. He ought to have been very glad that he had got his amusement and no penalty to pay. But for herself, she was sorry. Now he was gone, there was nobody to talk to, nobody to walk with, no means of amusement at all. She did not know what to do with herself, while he was speeding to dear London. What was she to do with herself? Filial piety and the enjoyment of her own thoughts—without anything to do even for her father, or any subject to employ her thoughts upon—these were all that seemed to be left to her in her life. The tourists and invalids were all gone, so that there was not even the chance of somebody turning up at the hotel; and even the Gaunts—between whom and herself there was now a gulf fixed—and the Durants, who were bones unspeakable, were going away. What was she to do?

Alas, that exhilarating game which had ended so sadly for George Gaunt, was not ending very cheerfully for Constance. It had made life too tolerable—it had kept her in a pleasant self-deception as to the reality of the lot she had chosen. Now that reality flashed upon her—may; the word is far too animated; it did not flash, nothing any longer flashed, except that invariable, intolerable sun—it opened upon her dully with its long, long, endless vistas. The still rooms in the Palazzo with the green *persiani* closed, all blazing sunshine without, all dead stillness and darkness within—and nothing to do, nobody to see, nothing to give a fresh turn to her thoughts. Not a novel even! Papa's old books upon out-of-the-way subjects, dreary as the dusty road, endless as the uneventful days, and papa himself, the centre of all. When she turned this over and over in her mind, it seemed to her that if, when she first came, instead of being seduced into flowery paths of flirtation, she had paid a little attention to her father, it might have been better for her now. But that chance was over, and George Gaunt was gone, and only dullness remained behind.

And oh, how different it must be in town, where the season was just beginning, and Frances, that little country thing, who would care nothing about it, was going to be presented! Constance, it is scarcely necessary to say, had been told what her sister was to wear; indeed, having gone through the ceremony herself, and knowing exactly what was right, could have guessed without being told. How would Frances look with her little demure face and her neat little figure? Constance had no unkindly feeling towards her

sister. She fully recognised the advantages of the girl, who was like mamma; and whose youthful freshness would be enhanced by the good looks of the little stately figure beside her, showing the worst that Frances was likely to come to, even when she got old. Constance knew very well that this was a great advantage to a girl, having heard the frank remarks of society upon those beldams who lead their young daughters into the world, presenting in their own persons a horrible caricature of what those girls may grow to be. But Frances would look very well, the poor exile decided, sitting on the low wall of one of the terraces, gazing through the gray olives over the blue sea. She would look very well. She would be frightened, yet amused by the show. She would be admired—by people who liked that quiet kind. Markham would be with them, and Claude, perhaps Claude, if it was a fine day, and there was no east in the wind! She stopped to laugh to herself, at this suggestion, but her colour rose at the same time, and an angry question woke in her mind. Claude. She had told Mrs Gaunt she was engaged to him still. Was she engaged to him? Or had he thrown her off, as she threw him off, and perhaps found consolation in Frances? At this thought, the olive gardens in their coolness grew intolerable, and the sea the dreariest of prospects. She jumped up, and notwithstanding the sun and the dust, went down the broad road, the old Roman way, where there was no shade nor shelter. It was not safe, she said to herself, to be left there with her thoughts. She must break the spell or die.

She went, of all places in the world, poor Constance! to the Durants in search of a little variety. Their loggia also was covered with an awning; but they did not venture into it till the sun was going down. They had their tea-table in the drawing-room, which, till the eyes grew accustomed to it, was quite dark, with but one ray of subdued light stealing in from the open door of the loggia, but the blinds all closed and the windows. Here Constance was directed, by the glimmer of reflection in the teapot and china, to the spot where the family were sitting, Mrs Durant and Tatie languidly waving their fans. The *dolce far niente* was not appreciated in that clerical house. Tatie thought it her duty to be always doing something, knitting at least for a bazaar, if it was not light enough for other work. But the heat had overcome even Tatie; though it could not, if it had been tropical, do away with the little furnace of the hot tea. They all received Constance with the languid delight of people in an atmosphere of ninety degrees, to whom no visitor has appeared, nor any incident happened all day.

'Oh, Miss Waring,' said Tatie, 'we have just had a great disappointment. Some one sent us the *Queen* from home—and we looked directly for the drawing-room, to see Frances' name and how she was dressed; but it is not there.'

'No,' said Constance; 'the 29th is her day.'

'Oh, that is what I said, mamma. I said we must have mistaken the date. It couldn't be that there was any mistake about going, when she wrote and told us. I knew the date must be wrong.'

'Many things may occur at the last moment

to stop one, Tasie. I have known a lady with her dress all ready laid out on the bed, and circumstances happened so that she could not go.'

'That is by no means a singular experience, my dear,' said Mr Durant, who in his black coat was almost invisible. 'I have known many such cases; and in matters more important than drawing-rooms.'

'There was the Sangazures,' said the clergyman's wife—'don't you recollect? Lady Alice was just putting on her bonnet to go to her daughter's marriage, when'—

'It is really unnecessary to recall so many examples,' said Constance. 'No doubt, they are all quite true; but as a matter of fact, in this case the date was the 29th.'

'Oh, I hope,' said Tasie, 'that somebody will send us another *Quon*: for I should be so sorry to miss seeing about Frances.—Have you heard, Miss Waring, how she is to be dressed?'

'It will be the usual white business,' said Constance calmly.

'You mean—all white? Yes, I suppose so; and the material, silk or satin, with tulle? O yes, I have no doubt; but to see it all written down, with the drappings and *bouillonnés* and all that, makes it so much more real. Don't you think so? Dear Frances, she always looked so nice in white—which is trying to many people. I really cannot wear white, for my part.'

Constance looked at her with a scarcely concealed smile. She was not tolerant of the oh-young lady, as Frances was. Her eyes meant mischief as they made out the sandy complexion, the uncertain hair, which were so unlike Frances' clear little face and glossy brown satin locks. But fortunately, the eloquence of looks did not tell for him in that closely shuttered dark room. And Constance' nerves, already so jarred and strained, responded with another keen vibration when Mrs Durant's voice suddenly came out of the gloom with a bland question: 'And when are you moving? Of course, like all the rest, you must be on the wing.'

'Where should we be going? I don't think we will get anywhere,' she said.

'My dear Miss Waring! that shows, if you will let me say so, how little you know of our climate here. You must go: in the summer, it is intolerable. We have stayed a little longer than usual, this year. My husband takes the duty at Homburg every summer, as perhaps you are aware.'

'Oh, it is so much nicer there for the Sunday-work,' said Tasie; 'though I love dear little Bordsighera too. But the Sunday-school is a trial. To give up one's afternoons and take a great deal of trouble for perhaps three children!—Of course, papa, I know it is my duty.'

'And quite as much your duty, if there were but one; for, think if you saved but one soul. Is that not worth living for, Tasie?' Mr Durant said.

'O yes, yes, papa. I only say it is a little hard. Of course, that is the test of duty.—Tell Frances, please, when you write, Miss Waring, there is to be a bazaar for the new church; and I daresay she could send or do me something. Two or three of her nice little sketches. People like that sort of thing. Generally, things

at bazars are so useless. Knitted things, everybody has got such shoals of them; but a water-colour—you know that always sells.'

'I will tell Fan,' said Constance, 'when I write—but that is not often. We are neither of us very good correspondents.'

'You should tell your papa,' went on Mrs Durant, 'of that little place which I always say I discovered, Miss Waring. Such a nice little place, and quite cool and cheap. Nobody goes; there is not a tourist passing by once in a fortnight. Mr Waring would like it, I know.—Don't you think Mr Waring would like it, papa?'

'That depends, my dear, upon so many circumstances over which he has no control, such as, which way the wind is blowing, and if he has the books he wants, and'—

'Papa, you must not laugh at Mr Waring. He is a dear. I will not hear a word that is not nice of Mr Waring,' cried Tasie.

This championship of her father was more than Constance could bear. She rose from her seat quickly and declared that she must go.

'So soon?' said Mrs Durant, holding the hand which Constance had held out to her, and looking up with keen eyes and spectacles. 'And we have not said a word yet of the event and all about it, and why it was. But I think we can give a guess at why it was.'

'What event?' Constance said with chill surprise—as if she cared what was going on in their little world.'

'Ah, how can you ask me, my dear? The last event, that took us all so much by surprise. I am afraid, I am so very afraid you are not without blame.'

'O mamma! Miss Waring will think we do nothing but gossip. But you must remember there is so little going on, that we can't help remarking.—And perhaps it was quite true what they said, that poor Captain Gaunt'—

'Oh, if it is anything about Captain Gaunt,' said Constance, hastily withdrawing her hand; 'I know so little about the people here'—

Tasie followed her to the door. 'You must not mind,' she said, 'what mamma says. She does not mean anything—it is only her way. She always thinks there must be reasons for things. Now I,' said Tasie, 'know that very often there are no reasons for anything.' Having uttered this oracle, she allowed the visitor to go down-stairs.—'And you will not forget to tell Frances,' she said, looking over the balustrade. In a little house like that of the Durants, the stairs in England would have been wood, and shabby ones; but here they were marble, and of imposing appearance. 'Any little thing I should be thankful for,' said Tasie; 'or she might pick up a few trifles from one of the Indian shops; but water-colours are what I should prefer.—Good-bye, dear Miss Waring. Oh, it is not good-bye for good; I shall certainly come to see you before we go away!'

Constance had not gone half-way along the Marmia when she met General Gaunt, who looked grave, but yet greeted her kindly. 'We are going to-morrow,' he said. 'My wife is so very busy, I do not know if she will be able to find time to call to say good-bye.'

'I hope you don't think so badly of me as she does, General Gaunt?'

'Bully, my dear young lady! You must know that is impossible,' said the old soldier, shuffling a little from one foot to the other. And then he added: 'Ladies are a little unreasonable. And if they think you have interfered with the little finger of a child of theirs— But I hope you will let me have the pleasure of paying my farewell visit in the morning.'

'Good-bye, general,' Constance said. She held her head high, and walked proudly away past all the empty hotels and shops, not heeding the sun, which still played down upon her, though from a lower level. She cared nothing for these people, she said to herself vehemently, and yet the mere feeling of the farewells in the air added a forlorn feeling to the stagnation of the place. Everybody was going away except her father and herself. She felt as if the preparations and partings, and all the pleasure of Tase in the 'work' elsewhere, and her little fussiness about the bazaar, were all offences to herself, Constance, who was not thought good enough even to ask a contribution from. No one thought Constance good for anything, except to blame her for ridiculous suppositions, such as not marrying Captain Gaunt. It seemed that this was the only thing which she was supposed capable of doing. And while all the other people went away, she was to stay here to be burned brown, and perhaps to get fever, unused as she was to a blazing summer like this. She had to stay here, she, who was so young, and could enjoy everything, while all the old people, to whom it would not matter very much, went away. She felt angry, offended, miserable, as she went in and got herself ready mechanically for dinner. She knew her father would take no notice, would probably receive the news of the departure of the others without remark. He cared nothing, not nearly so much as about a new book. And she, throbbing with pain, discomfiture, loneliness, and anger, was alone to bear the burden of this stillness and of the uninhabited world.

OLD TINDER-BOXES.

BY AN OLD FOGEY.

THOSE who have seen, in old Rome, that beautiful little circular gem of pagan architecture called the Temple of Vesta, will remember with what reverence the sacred fire was guarded there, how that the priestesses who presided over it were appointed for thirty years; and how that if, by any mischance, the fire went out, it could never be relighted except by the rays of the sun itself.

Reader, do you remember the old-fashioned tinder-boxes, from which our fathers and our grandfathers obtained their lights and their fires? If not, you cannot be so old as I am, for I remember them well; but only half a century has gone since then. The idea of getting light and fire out of a box! Let us recall the value of the sacred fire, and think of the said vestal virgins guarding it so assiduously two thousand years ago, and we need not turn up our noses, even if we have to get fire from a

tinder-box. Nowadays, we have come to look upon fire and light as the commonest of common things, the common wealth of the world, and forget the difficulty of producing them in olden days by the attrition of pieces of dry wood—a tedious operation—or by the use of flint and steel. This brings me to the use of the tinder-box when I was a boy, and probably in use in outside places at the present day.

It is somewhat of a puzzle to me how Robinson Crusoe first got the light and fire which roasted his kids and by which he read his Bible. Very likely he picked up a strike-a-light in the cabin of the doomed vessel; however, he seems to have lost it again; for after having made many fires and candles for years after the shipwreck, we read, that whilst exploring a certain grotto, he gave over the search for that time; 'but resolved to come again the next day provided with candles and a tinder-box, which I had made of the lock of one of the muskets, with some wild-fire in the pan.' Was this the tinder-box which he made when cast ashore amongst the wild animals of the famous island, or the result of a brilliant idea for lighting up the cavern he intended for an arsenal? Anyhow, the poor fellow had his flint and steel to make him comfortable, to fire off his fowling-pieces, to bring down the birds and the goats wild.

We are certainly much indebted to the bit of flint and steel in the old matchlock, the old fowling-piece, the old pistol, the old carbine; and who may say how much we owe to Blucher and the Guards and this identical steel and flint for the victory of Waterloo, certainly to some extent brought about by the tinder-box of our soldiers of yore—Defoe's 'old tinder-box, made out of a musket-lock, with some wild-fire in the pan.'

How rough and clumsy were the implements of warfare that depended on flint-locks, compared with our exquisite rifles and their compact cartridges. What an unsatisfactory contrivance on the whole was Defoe's 'musket-lock and steel pan,' and trigger with square flint, and the highwayman's deadly pistol, formed on the same principle, and which, if it did not level a man at one end, would assuredly do so at the other. After all, these weapons of our forefathers did much dreadful work surely, if slowly, sometimes.

During our last spring cleaning—popularly known as the 'spring fever'—I was rummaging in an old cellar, and turned up, amongst many relics of the 'good old times,' a certain japanned box, nine inches long by half as much broad. It contained a lot of small articles, notably a piece of steel with a handle like the crozier of a bishop; a match or two of rough deal splinters, cut to a point, and be-moored with brimstone; a piece of flint; and a bit of charred linen with a fusty smell. This linen was blackened by having been set on fire, and rapidly extinguished by putting a flat piece of lead upon it. This was the old tinder-box, from which many a good fire, which had cooked many a good dinner, had been lighted—from which the morning candle of merchants, and tradesmen had been lit, and to which they owed much of their wealth.

It was so long since I had seen such a box, that I had much ado to remember how, when I was a boy, an old aunt of mine went down on her knees in the early winter morning, encouraging the kitchen fire to blaze by this round-about method of evolving light and fire for domestic purposes. The method was this, and a cold one it was on a frosty morning. The maid-servant having opened the shutters, knelt down—a very suitable position for dispensing 'sacred fire.' She opened the box, took the crosier in one hand, and the flint in the other; and by striking rapidly the one against the other, a spark sprang out upon the bit of burnt linen, technically called tinder. If the spark were fortunate, it caught hold of the fibres of linen, and set them aglow. Then the maid patiently watched the sacred fire run along the tinder whilst she blew it with her mouth, holding the brimstone match to it, till happily a blue flame resulted, from which she lighted her morning candle, and afterwards her fire. Then the tinder-box was closed. It had done its duty for another day.

I have often seen the operation performed, and have frequently collected nice pieces of flint from the outlying wolds, where it prevailed, to bring them home for the domestic tinder-box, or to give to less fortunate neighbours, who, like the unhappy virgins of old, had lost their light, for want of trimming, or who had mislaid the spark-producing mineral.

Considering all this had to be gone through every morning and everywhere, except where fires were kept alight all night, one looks back on those days with surprise. But then there was no other way. What would our young fellows with their pretty match-boxes think, if they had to light their cigarettes in this primitive style? There were no cigars lighted in the streets; all had to be done at the temple of light, the orthodox fire. There was no such thing as carrying fire in your waist-coat pocket, with a French picture and a hundred lights for a penny. In the times when the curfew rang at eight o'clock every night, for all good people to put out their lights and fires, what a fuss there must have been amongst the men and maidens bringing back light and fire from heaven to earth again. The world has spun round many times since then.

But the tinder-box died hard, and it was long before this means of evoking light was snuffed out altogether. The dear old tinder-box, how we ought to value it, as the precursor of all the cheap lights, and better, of the present hour. Let us hope that there may be a tinder-box placed in every antiquarian museum, to show unbelieving men what used to be, and to show also how much can be done in half a century in the way of lighting up an old world cheaply and effectually.

It was reserved for England to abolish the tinder-box and make the match of the future. She has given us an easy and cheap means of producing light, which will last us till the 'crack of doom.' All sorts of things were tried before the right idea was hit upon, but it came at last. At one time we used the old phosphorus bottle, and I remember well how a distinguished friend and myself nearly set a house on

fire during the composition of one of these bottles, intended to light a match by simply inserting it therein and withdrawing it for the atmospheric air to act upon it. A sudden flame was the inevitable result.

After the match-bottle period came long tiresome trials of rubbing prepared matches, between pieces of sand-paper. This was a great improvement on the old plan, for a candle could be lighted in the middle of the night without inconvenience. The tinder-box and strike-a-light were now doomed. Every smoker had his tobacco-box rigged out with sand-paper strip and paste-board match. For a change, the tobacconists introduced the German tinder. It would not blaze like the ruder match, but would light a cigar or a pipe very satisfactorily. Then came the red-tipped fuses, which were broken off the brown pasteboard as occasion required. These were a cleanly and useful invention, and served the use of the public for many years. They had a great run, and were a veritable success. But the world was taken by storm when some genius introduced the wax taper known as a *vesta* match, a marvel of 'sweetness and light,' so daintily made—about an inch in length, one might apply the words of Hood to it:

Fashioned so daintily,
Your servant is I.

with its brown-tipped waxen fibres, no thicker than whiptail. Was there ever a brighter idea? And it holds good to this hour. It ought to have made the fortune of the inventor, and perhaps did so. It was the outcome of a great thought—a scintillation, something like what Byron or Goethe would have given mankind if they had dabbled in chlorate of potash and phosphorus.

After this splendid addition to public utility, with a tiny box to strike the light upon, there came a host of claimants, and the fully developed lucifer-match for ordinary uses, the making of which employs so many hands, and requires such large manufacturing appliances in our large towns. In the way of merchandise and the introduction of a new trade, as well as in personal comfort, what a chasm has been bridged over since the time of the obsolete tinder-box! Matches that strike in their own way, on their own box; vestivians, and fuses, highly odiferous, that deal out light with the persistence of a November squib or a rocket; Limited Liability Companies for match-making! And not only have lucifer-matches introduced a new trade, but the manufacture of boxes to contain them has created a new industry. In almost every shop-window you see some device for retaining the precious match—in German or real silver, in paper-maté, in pasteboard, wood, or copper, in tin or leather, or iron or china. There are all sorts of contrivances: boxes, in animal and bird forms, and illimitable vases, all containing the ubiquitous little match for bonfire and bedroom, and pocket and mantel-shelf. The French and Italians are not behind us in pretty designs—in fact, their boxes are almost unique, with their self-acting springs, and bright little pictures of groups and familiar scenery.

Only, think of the comfort of these compact, well-filled boxes going the tour of the world by

the ton, joy-producers and light-carriers to the ends of the earth. They illuminate town and jungle and bush, caves and tunnels and mountains, marts and churches, railways and steamers—every spot except the bottom of a coal-mine, where even their tiny mightiness might put in action all the forces of nature, and blow up mine, minerals, and men. Shall we imperil our safety by all this luminosity and pyrotechny? No; we cannot now dispense with these valuable aids to light and convenience. Perhaps the future may produce greater wonders as light-givers; but alongside the old tinder-box in the museum, let us place the vesta taper, the vesuvian fuse, and the common striking-match, ye leapt Lucifer, just to show what modern science, as opposed to the science of old days, can accomplish when it takes a thing in hand. We have well-nigh forgotten the old light, and have got the new one, that despises flint and sand-paper and steel; and there is no fear that we shall play with the fire and the light until we tire or burn our fingers, or that we shall ever wish ourselves back amongst the glooms of the old tinder-box.

THE STUPID COUPLE.

AN EPISODE OF THE ATLANTIC.

‘THE STUPID COUPLE’—at least that was what the other passengers called them during the first few days of the voyage, after the ship had sailed from Queenstown. Not that they were so very stupid either, but people readily get nicknames on board a vessel, and a nickname once acquired is apt to stick.

John Pierrepont and his wife had come on board the *Shasta* at Queenstown by the last tender a few minutes before the propeller commenced to revolve slowly, and they had not yet found their stateroom, when the signal, ‘Full speed ahead,’ passed from the bridge to the engine-room; and the throbbing of the great engines told all old travellers that their voyage was commenced in earnest, and that, till the ship entered New York harbour, the engines would not rest for a moment from their work of driving the great ship on. The saloon of the *Shasta* was quite full of cabin passengers, and she had many steerage and second-cabin passengers as well. She was the largest and newest ship of the line, and was commanded by the Company’s commodore, Captain Hood, a general favourite, and known among old travellers to and from America as the luckiest skipper that had ever sailed the Atlantic. Perhaps it was because there were so many of these seasoned travellers, wise in the ways of steamers, on board, that John Pierrepont and his wife seemed to be particularly inexperienced in travel, and therefore deserving of being called stupid; they must certainly never have taken a long voyage before; they showed no disposition to struggle for what some thought the best seats at table, and they accepted without a grumble the stateroom assigned to them, which was one of the smallest in the

ship. In fact, they were too easily satisfied. The Pierreponts were reserved because they knew no one on board; but this seemed to give them no concern, they being perfectly satisfied with their own society. Many of the American families and other passengers had known each other at home or had met before, either in other ships or travelling about in Europe, and were like a large party of old friends.

This journey in autumn to America was what the Pierreponts called their wedding trip; but it was a long deferred one, for they had been married nearly six years, and had left three little children at home in careful hands. Before they were married, they had really settled to go to America for their wedding trip; but just then Mr Pierrepont had inherited a property, and each year afterwards something had happened to prevent their plan from being carried out.

The weather was splendid out in the Atlantic. The ocean had its long low roll, sometimes showing a ripple where the wind touched it tenderly, and sometimes crisped by a light breeze, which generally died away at sunset, and each day the voyagers saw a red sun sinking into the water right ahead. At length, one afternoon, the voyage was half over—mid-Atlantic had been reached. Pierrepont and his wife were far aft on the poop, close to the rail, he reading, and she knitting, as their custom was. She is a fair gracious woman, with gray eyes and squirrel-coloured hair, perhaps about twenty-five years of age. He is a long-limbed, well-knit fellow of thirty, deep-chested and lean, black-haired, with a crisp beard and tawny skin. He is dressed in one of his old white flannel cricketing suits, with a hat of the same stuff. People were pretty much what they liked on deck, and this was John Pierrepont’s fancy; while some of the other gentlemen, with tall hats, glorious scarfs, diamond pins, and everything else to match, endeavoured by their dress to fascinate the ladies, who were sitting, or walking about the deck, in all the brilliant colours of a flower-garden.

There was one passenger who attracted more attention than any other, and this was not a young lady, nor a gentleman with a diamond pin; he was simply a little boy of eight; but then he was Captain Hood’s son, and every one wished to be friendly with him and to amuse him. He had made friends of all the passengers, and was quite at home on board, and now was running to and fro on the poop among the groups of ladies and gentlemen, jolling a great coloured ball of hollow india-rubber.

Captain Hood’s home was on the Hudson, a few miles from New York city. His elder children were girls, and little Jack was his only son. It had been an old promise, that as soon as Jack was eight years of age, his father was to take him a voyage to England and back; indeed, from the time that Jack was four years old, he had talked about this great treat he was to have; and in the meantime his interest in nautical matters grew large by watching the craft of all kinds passing up and down the Hudson, right in front of the windows of their house. When the time came, and Captain Hood

saw he could take Jack over, his mother was very unwilling to let him go; she feared some harm might happen to him, and raised all the difficulties and objections she possibly could; but Jack and his father carried the day. The first eastward run of the *Shasta* was a chance not to be missed; and the weather was very fine, and settled. Mrs Hood with her daughters came down to the wharf at New York to see the steamer off. Her last words to her husband were: 'Remember, if you don't bring Jack safe home, you needn't come without him.' The captain remembered these words later. He replied: 'All right, little woman; we'll be back with you for breakfast some fine morning in less than five weeks.'

During the voyage to Liverpool, all went well. The chief stewardess took Jack under her special care, and he slept in her cabin. While the ship was in the Mersey, Jack and his friend the stewardess went to stay at a farm in Lancashire, and only came down a day or two before the steamer sailed on her present voyage. The boy was now quite accustomed to life on board a steamer, and went where he liked all over the ship; the bridge and the steerage were the only forbidden places. He had become quite friendly with many of the sailors; and he had not the least objection to a confidential chat with some of the grumpy and half-naked stokers, most of them Irishmen, who came up on deck when they could, from the depths of the stoke-hole, to get a breath of fresh air. The solemn old Scotch engineer was his particular favourite.

On this very day, when the voyage was supposed to be half over, and before the passengers came on deck to enjoy the evening sun, the conversation at dinner had turned upon the subject of persons falling overboard from a ship going fast, and the chances of saving them. Various persons at the table told their experiences of such matters; and after a little while, it seemed that the passengers who were joining in the discussion had formed themselves into two parties, one of which, comprising chiefly the landsmen and younger travellers on board, seemed to hold the opinion that it was a simple enough matter to pick a person up who had fallen over in daylight and in fine weather. 'If he can swim,' they said, 'he can keep himself up till a boat is lowered and rows to him. If he can't swim, some one who can, jumps overboard, and holds him up till both are rescued. Or a life-buoy is thrown to him, and that keeps him up.' But they had to admit that they had never seen this done.

The other party at table, headed by some captains of ships who were passengers by the *Shasta*, and some of the older travellers, were of a different opinion. They said that help almost always came too late; and that no matter how quickly a boat is lowered, the person who has fallen over is left so far astern that he sinks before he can be found—that, from a boat, it is very difficult to see such a small object as a man's head among the hollows of the waves, and this even in fine weather and with good light. If a man is a very good swimmer and has presence of mind, he has some chance, for he can keep himself up a long time; and if a boat is sent after him, he can call to it, or

signal it, when he happens to rise on a wave at the same time that the boat rises.

One skipper told a story, which, however, did not relate to a man. He said: 'When I was homeward-bound from India last time, the first mate had a splendid large cockatoo, a great pet, and so tame that he would sit on your finger. Well, one day he flew overboard and settled down on the water astern. We had just come into the north-east trades, and were going about six knots. I threw all sails aback as soon as I could, and sent some hands in our quarter-boat after the bird. It took ten minutes or a quarter of an hour to get the boat out, and all the time I kept my eye on the bird; and when the boat was off, I went up into the mizzen rigging and watched the poor cockatoo for a long time; but the men in the boat couldn't find it; and we could not succeed in directing them to where it was. They came back without it.'

Another captain said: 'When I was in a steamer, I always kept one boy ready for lowering, with cover off and oars, and all in her; but it takes you to be very quick to pick a man up who has fallen over. Many sailors can't swim, and then of course they go to the bottom at once.'

Shortly after this, the passengers came on deck. They did not know that, this day, the thing they had been talking about was to be enacted before their eyes.

Jack Hood was rolling his great ball and rushing about after it screaming with delight, when, after a strong throw, it fell on the rail, and, with a bound, into the sea. The child stood still with amazement for a second; and then, running to where his ball had disappeared, he climbed on the rail to see what had become of it; and before any hand could reach him, he had fallen over into the waves. The terrified passengers saw him rise to the surface and stretch out his arms, while the seething foam from the ship's propeller turned him round and round in the water, and the ship rushed on, leaving him behind. The Pierreponts were not very near the place where little Jack fell over; they were at the other side of the deck; but Mrs Pierrepont, when she saw him clumby, laid her hand quickly on her husband's shoulder. He looked up instantly, and following her eyes to the spot, saw the boy just as he fell. In one moment he was on his feet, kicked off his canvas shoes, threw his hat on the deck, and turning his face towards the bridge, where he knew some of the ship's officers were always stationed, he called out in a voice which rang like a trumpet-call over the ship, 'Man overboard!' Then, with a quick run and leap, he had cleared the rail, and the broken twisting water of the ship's track had closed over him. He was on the surface again in a moment, and, taking a glance back at the ship, to know his position, stretched out into a long, steady stroke in the direction where he knew the child was.

Great confusion and excitement fell upon the passengers, but not upon the officers of the ship. Captain Hood was standing on the bridge talking to the second officer, when he heard the cry of 'Man overboard!' He looked aft, and saw a man disappearing over the stern; then

he saw in the steamer's wake two heads, one dark, and the other small and fair; and further away, floating high, the coloured ball. A sailor who was cleaning some brass-work near the stern, ran forward, calling out to the captain: 'Your son has fallen overboard, sir, and a passenger has jumped after him.' The captain's hand was on the engine-room telegraph, and down into the depths of the ship went the signals. The engineer and some of his subordinates were sitting about in front of the great engines, in the mixture of lamplight and dim daylight which pervades that region. Some of the men had stretched themselves out on the floor of checkered iron plates. It was an idle time. The engines were going full speed and working well; one man was telling a story, when, to the astonishment of them all, the telegraph bell rang, and the index, which pointed to 'Full speed ahead,' moved across the dial to 'Stand by.' There was a general cry of 'What's wrong?' The engineer was close to the wheel which controlled the engines, and his assistants stood by. Again the bell rang, and the index pointed to 'Stop.' The engines came to a stand, the revolutions of the propeller stopped, a strange quiet fell on the engine-room; and the tremor all over the ship ceased. They all watched the telegraph. The bell rang again, and the index moved to 'Astern—slow;' and again in a minute or two, to 'Half.'

The engineer now had time to speak: 'What's wrong on deck? One of you run up and bring down word quick.'

Mickey, a fireman, with bare feet and bare shoulders, was standing at the foot of the almost perpendicular iron ladder, and at the engineer's word, he ran up as nimbly as a monkey; but he did not return; and in a few minutes another man went up, who returned immediately, all breathless, and told the others what had occurred; and that he had seen the first messenger, Mickey, in the boat which had been sent off to the rescue. All who could then went up on deck, to see the result. The head-engineer would not quit his post. The reversing of the engines had now brought the steamer to a stand. The next signal came down, 'Slow;' and the good steamer moved slowly backwards on her track.

When the first alarm was given, and while the captain, who never lost his presence of mind for a moment, was communicating with the engine-room, he made a sign to the second officer, who called out: 'Man overboard! Stand by to lower away the gig.' The sailors who were on deck ran to obey this order. A boat's crew of four hands and a coxswain were at once ready. The boat was safely lowered, and the men were at their oars. Before she cast off, the coxswain cried: 'I want a man for the boat's bow.' Mickey the fireman waited for no orders, but laying hold of the ropes, swung himself over, and slid down into the bow of the boat, which at once rowed quickly away. Before it set off, Mrs Pierrepont ran over to the side and threw down into the boat's stern the Scotch plaid on which her husband had been lying.

Mrs Pierrepont was quite calm; but the other passengers seemed afraid to approach her; they did not know just what to say—whether to congratulate her on her husband's daring, or

to condole with her upon his danger. Some of the ladies were in hysterics; all were watching with the greatest concern the course of the boat, and trying to make out the child and the swimmer among the waves far astern; for the steamer had run more than a quarter of a mile before the boat was ready to leave her.

The men in the boat rowed fiercely. The passengers could see the coxswain and the bowman standing up, trying to distinguish something where the waves lifted; but even with glasses, they could see nothing of the swimmer.

A famous general, who had marched with a great army to victory, was on board; he did not know the Pierreponts; but he came up now to Mrs Pierrepont, and holding his hat in his hand, said: 'Madam, your brave husband has done a noble act. It is grand to see such pluck and dash. I trust you will have him back soon. Will you come up on the bridge beside the captain, where you can have a much better outlook over the sea; and perhaps you will make use of my binoculars.'

'Oh, thank you,' she said. 'I shall be glad to have your glass, and to go on the bridge—if the captain allows me,' she added, smiling. 'But I don't think my husband is in danger; he has often been a long time in the water, and can swim well in his clothes. There is still plenty of light for the boat to find him. I only hope he may catch that dear little child in time. The boat should reach them soon.'

The general led Mrs Pierrepont up to the bridge, and said a word to the captain. The captain at once came over, saying: 'The boat is close to them now; I saw them less than a minute ago through my glass on the top of a wave.'

'Do you see them? Are they together?' asked Mrs Pierrepont.

'Yes,' replied the captain; 'I believe they are.' But his voice was now broken, and he took hold of Mrs Pierrepont's hand. 'I watched my child from here, with the glass, till at last he floated so low that I could scarcely see him; and just as he seemed sinking, your husband dashed across the spot where he was, and I saw by a wave of his hand towards the ship that he had caught him. He is now waiting for the boat. —What a splendid swimmer he is!'

'O yes; he is a good swimmer. I am so glad he was near,' said Mrs Pierrepont. '—I believe, captain, he will bring back your little boy safe.'

When Pierrepont sprang over, he had been so quick, that he was not very far from the child; but he knew that all depended on reaching him soon, and he could only see him now and then, when the waves lifted them both at the same time, but those glimpses gave him the direction; and without minding in the least the fact that the steamer was receding from him at the rate of fifteen miles an hour, and that he was left alone in the middle of the great Atlantic with no one near him but a little sinking child, he waded on as quickly as possible, saw the child on the side of a wave, made a dash at him, and caught him by the arm as he was sinking. Jack's fears had got the better of him; he had given up hope; but now he roused up, and with a cry, caught John Pierrepont's beard.

Pierpoint raised the child's head as far as he dared, and placed his little cheek against his own, while passing his left arm round Jack's waist. Jack began to recover from his fright, and as he had often bathed in colder water than this, he did not mind the sea so much, now that he had something to hold on to.

'Well, Jacky, how are you now, and what made you jump into the water?' asked Pierpoint.

'Oh, take me back to papa—take me back to the steamer! Where is the steamer?'

'Now you must keep quiet, and not fret,' said Pierpoint. 'We have just to wait here till we are sent for. Your father is sending a boat for us.—Are you cold, Jacky?'

'No; not very cold; but show me where the steamer is.'

'Well,' said Pierpoint, 'rub the salt water out of your eyes against my cheek, and I'll turn round till we face the steamer; then, when we rise on the top of a wave, you must look quick.'

They looked; and there was the great steamer with her four masts and low red funnels, with clouds of white steam rushing out of her escape-pipes, as she lay almost stationary on the water about a quarter of a mile away.

Pierpoint could see that the upper decks and bulwarks and the lower rigging were swarming with people; every one on board seemed to have come up. When they rose on the next wave, a great change had taken place for them—the sun had set. Pierpoint saw it disappear as the wave lifted them, and the surface of the water became a dark gray; but the strong light still shone for a few seconds longer on the funnels and masts of the steamer.

Pierpoint with his little burden floated so low that the men in the boat had not yet seen him; but he had seen the boat just as the sun disappeared, and now knew where to look for it. He pulled a white handkerchief out of his coat-pocket, and when they were on the top of a sea, he gave a shout and waved; but the call was unheeded; the sea sank from under them, and they were in the hollow before the boat had risen. The next time he succeeded. As the boat rose, the cockswain heard a call, and saw the swimmers on a wave. The boat's course was slightly altered, and in a few minutes the boat had them alongside.

All this time, Pierpoint had been treading water quietly, only keeping a lookout, and encouraging Jack to keep up his heart; but Jacky could not have kept up much longer. The fright and cold were telling upon him, and as the boat came up, his big eyes closed, and his cheek dropped heavily against Pierpoint's.

The cockswain now took charge of the situation. 'Don't be in a hurry, sir,' he called.—'How is the boy?'

'Oh, I think he is all right,' said Pierpoint; 'he was quite lively a minute ago.'

The cockswain then called: 'Be careful now; steady, lads, there; be very careful. One of you catch the child by the arm, another of you my hold of the gentleman.'

Pierpoint had laid his hand lightly on the boat's gunwale and still held Jacky firmly.

Mickey the fireman fastened his toes among the bottom boards of the boat, and stretching down till his face almost touched the water, caught little Jacky first by one arm and then by both, and with a dexterous twist raised him quietly from the water and laid him in the bottom of the boat. Two of the sailors then caught Pierpoint by the shoulders and pulled him in; then they patted him on the breast and back, a way that sailors have of expressing sympathy and approval; and then they cheered and waved their caps towards the ship. The rowers again took their places, the boat was quietly turned, and the men rowed back towards the steamer.

Mr Pierpoint and Mickey attended to the child. His colour now returned, and his eyes opened, and he sat up, the water running out of his linen clothes. Pierpoint's eye now caught sight of his plaid lying in the boat, and he asked the cockswain to pass it to him.

'A lady threw it in as we were leaving,' the steersman said.

'O yes; I know very well who the lady was,' Pierpoint replied. 'I wish I had her here just now to take care of the boy.' Then, seeing in what a womanly, gentle way Mickey was handling the child, he said: 'My black friend, I'll appoint you nurse, if Jacky does not mind the soot.'

Jacky looked up, and recognising the fireman as one of his friends, put his arms round his grimy neck.

'Sute, sir,' said Mickey, 'Master Jacky knows me quite well.'

'Then,' said Pierpoint, 'pull off his wet clothes and roll him up in the plaid.'

This was done, and Jacky felt quite warm and dry. Mickey kept him on his knee, rolled up like a mummy.

One of the sailors handed Pierpoint an old rough jacket, which he pulled on over his wet clothes.

The steamer had drifted round till her broadside was towards the boat, and therefore, as she could do nothing to lessen the distance, the men in the boat had to do the more rowing, and they got on but slowly, for the sea was a little rougher, and the light was going. The captain still stood on the *Shasta's* bridge, watching the boat through his binocular. He saw Pierpoint and the boy pulled in, and then he could only see that the men seemed busy about something in the bottom of the boat; after that, he saw Pierpoint sitting up, and a brown bundle in the fireman's arms. He knew this was his boy, rolled up in something; but he could not help questioning within himself whether his boy was coming back to him alive or dead.

Mrs Pierpoint was still beside Captain Hood, and felt that she knew what was passing in his mind. The boat was now much nearer; they were both watching it intently, but the light was failing. At the same moment, they both saw Mr Pierpoint stand up and wave his right hand in a peculiar way.

'That was a signal, madam; what does it mean?' asked the captain.

'Wait a minute till he repeats.—Yes; I see it plainly this time. He says, Ah well,' replied Mrs Pierpoint.

These words were heard by some of the ship's officers and passengers who stood near, and they raised a cheer, which was taken up all over the deck, and passed across the water to the boat, which was getting near.

'Thank God!' said Captain Hood. 'We will soon have them on board again.' He then left the bridge in charge of the first officer, and went aft, accompanied by Mrs Pierrepont, to the place where the gig would be brought on board. Here the quartermaster made a clear space on deck, and in the centre of the space stood the captain, Mrs Pierrepont, and the stewardess. To her Mrs Pierrepont said: 'Order a warm bath to be ready for the child;' and a steward was sent down to have this done.

The boat was now alongside under the davits; the oars were unslipped; the hooks of the lifting-tackle were fixed in the rings for raising the boat; all the hands but two climbed up the tackle ropes, to lighten the boat, and then a number of willing hands hauled away upon the tackle. The boat left the water, and mounted slowly high into the air till it was above the level of the ship's bulwarks; the davits were swung round, and the boat was gently lowered upon the deck. Then a mighty cheer burst out, hats and handkerchiefs were waved, and cheer upon cheer rang over the water.

Little Jack looked out of his plaid with a smile on his face, while Mickey handed his precious bundle into Captain Hood's arms; and in a few minutes more Jack was having a warm bath, under the superintendence of his friend the stewardess; and a little later he was in the saloon with dry clothes on, as merry as if nothing whatever had happened.

When Pierrepont stepped on the deck, he took his wife's hand in his for a moment; and then a rush was made at him, and both his hands were shaken till he thought his arms would be pulled off, but the captain came on deck at once and bore him off to one of the bathrooms, where a warm bath awaited him. A steward brought him a supply of dry clothes; and in half an hour he was in the saloon, and had to undergo another course of hand-shaking.

The captain said all he had to say in a very few words, and with a hand-grasp which said more than words.

The 'stupid couple' were now the heroes of the ship; and when the *Shasta* arrived in New York harbour, John Pierrepont managed, by the captain's help, to escape being interviewed by the reporters. The reporters, however, heard the story in all its details from the passengers and officers, and the Pierreponts found themselves famous.

Before the passengers separated, such a number of invitations were offered to the Pierreponts, that, had they been able, they might have spent a year or two in America merely paying visits. Some of these invitations they were able to accept.

Captain Hood carried them off at once to his house on the Hudson, where little Jack was the first to bring his mother an account of the event of the voyage.

The Pierreponts returned to England for Christmas without any sea adventures; but before they had been two days in America,

John Pierrepont wrote to his father to tell of their safe arrival in America, and he addressed the letter: 'The Earl of Hurst, Hurstpierpoint, Sussex, England.'

THE TEHUANTEPEC SHIP-RAILWAY.

Of the various projects which have been brought forward during the last fifty years to establish interoceanic communication between the Atlantic and Pacific Oceans, none deserves more consideration than that of a railway for the conveyance of ships across the Isthmus of Tehuantepec in Mexico. On the successful completion of the jetties at the mouth of the Mississippi River in 1879, Mr. J. B. Eads conceived the grander project of extending that great river, commercially, into the Pacific Ocean. Since that day to the present moment, his time and energies have been directed to bringing forward and developing this important undertaking. The two principal reasons for its inception are—first, the shortening of the voyage by seven hundred miles over that of Nicaragua, and from twelve hundred to two thousand over that of Panama, on all the main commercial lines of the world. Second, the economy of this method in construction and operation.

Immediately on obtaining the concessions from the Mexican government, he visited the Isthmus of Tehuantepec, and took with him engineers, who made the necessary surveys of the route. He extended and completed these surveys two years later, and obtained definite and detailed information which enabled him to locate the line for the construction of the railway, and to make the necessary sections and plans of the work, and a careful and detailed estimate of the cost of construction. These surveys showed that the ground was favourable over its entire length for the construction of a railway. These and other previous examinations made by other parties also established the fact that the climatic conditions were not unfavourable, and also that valuable materials and available labour were procurable on the Isthmus.

While the surveys were being made upon the Isthmus, and the estimates prepared, close attention was given to the mechanical appliances. The result has been that arrangements have been made for lifting, hauling, and handling vessels up to five thousand tons, and for conveying them by rail from ocean to ocean. These mechanical appliances are briefly as follows. The Coatzacoalcas River drains the main valley of the Isthmus on the Atlantic side. At its mouth is a bar, composed of alluvium brought down by the river. There are now fifteen feet of water on this bar, which can be cheaply deepened by means of parallel jetties. Inside the bar is a fine anchorage for ships with sixty feet depth of water. The river for twenty-five miles will be utilised for navigation. The terminus of the railway will be located at Minatitlan. An excavated basin from the river leads to the lifting-dock, which will be capable of raising the largest vessels in about fifteen minutes. It will be about four hundred and seventy-five feet in length, seventy-five feet in width, and twelve feet in depth, built of steel plates, with substantial bulkheads fore and aft and athwartships.

On a second deck, about seven feet below the upper deck, will be built a system of hydraulic rams, perhaps one hundred and fifty or more in number. These are to be connected together by pipes, and the whole system connected with an hydraulic pressure-pump, for actuating the rams.

The rams are arranged in longitudinal lines and cross lines, and the latter are spaced six feet seven inches apart. Under the central part of the vessel there will be one ram under the keel, one under the bottom on each side, one under the bilge, and one at the side of the vessel. These rams when raised come up through the upper deck of the floating dock. On this upper deck are placed six ponderous rails like those to be used on the railway. The carriage for transporting the vessel, has a system of supports that correspond exactly with the rams in the dock. There is a continuous keel-block, and the supports, as well as the keel-block, are actuated by the rams underneath. Powerful centrifugal pumps will pump the water from the pontoon, which rises with the carriage upon it, under the vessel. Just before coming into contact with the vessel, the hydraulic pressure-pumps raise the presses under the supports, and bring the latter up to the vessel's hull, so that they exert a gentle pressure against the keel, bottom, and bilges, besides bringing up a series of adjustable girths at the sides of the vessel.

As the vessel rises slowly out of the water, its weight becomes greater and greater upon the supports, and consequently upon the rams that are holding them up. The peculiar arrangement of the rams causes the weight of the vessel to be equalised over the whole system, so that when it is entirely out of the water, and its whole weight resting upon the rams, they must bear it equally from stem to stern and from side to side. The supports, as they are thus placed against the vessel by the rams, are now locked to the girders of the carriage by adjusting nuts or hand-wheels, which are run down on the screw-thread cut into the columns of the supports. When this is done, the valve of the pressure-pump is opened, and the water which was under compression and held up the rams, escapes, and the rams recede downward into the pontoon. By this means the distributed weight of the vessel is transported to the carriage, and it now rests upon the girders in the same way that it rested upon the cross-lines of the rams. For instance, if there are thirty lines of rams, and the vessel weighs three thousand tons, there would be just one hundred tons upon each line of rams. When the load is transported from the rams to the carriage, there will be one hundred tons upon each of the thirty girders. Now there are just as many wheels under one girder as under another; consequently, each wheel bears its exact proportion of the load; that is, if the whole weight is thirty-six hundred tons, and there are three hundred and sixty wheels, there will be just ten tons, no more and no less, upon each wheel. It is not intended to bring more than eight or nine tons upon a wheel, although in their manufacture they will be tested to twenty tons. There is with each wheel a powerful spring, which will also be tested

to bear a weight of twenty tons before closing. They will have a 'run' of about six inches; and when the maximum load is upon them there will still be a space of about three or four inches, which will allow the carriage to overcome any slight irregularities there may be in the track, and will also give an easy cushion for the vessel and the carriage to rest upon during the journey across the Isthmus.

The power for transporting vessels across the Isthmus will be one, two, three, or more locomotive engines of very powerful construction, capable of hauling two or three thousand tons each; such locomotives have already been constructed, and still larger ones may be, without going beyond the limits of a proper construction. The road-bed will be built of materials which are found on the whole line of the road; and the super-structure of the road-bed will consist of two feet of broken stone ballast and long steel-plated ties, on which will rest six steel rails, weighing from one hundred to one hundred and twenty-five pounds per lined yard. The gradients to be overcome are comparatively light, and can be surmounted by locomotive power. The changes of direction, where it is necessary to make them to save very heavy mountain cuttings, will be made by large floating turn-tables. The vessel with its carriage will be run upon these tables; the water will then be pumped out of the pontoons which constitute the tables, and they will be revolved, resting upon a cushion of water, until they are in the new direction required. There are five of these floating turn-tables required to make the changes of direction. On the Pacific side, the terminus will be in a lake or lagoon, which will require dredging to give thirty feet of depth; and the harbour on this side will be commodious and entirely protected from the sea.

These in general are the plans proposed, and more recent investigations in reference to the comparative economy of transportation by ship-canal and ship-railway have shown conclusively that the latter is more economical both in construction and in operation. There is no doubt that ships may be moved with economy and with safety at a speed of about ten miles per hour, so that the distance of one hundred and thirty-four miles may be traversed, all delays included, in from eighteen to twenty hours. The time required to pass through the Panama Canal, about fifty miles in length, will not be less than twenty-four hours, comparing it with the time required in the Suez Canal. The canal at Nicaragua, one hundred and eighty-six miles total length, with from twelve to twenty locks, may require, perhaps, four days for ships to pass from ocean to ocean. The cost of the Panama Canal, as recently given by the naval officers of the United States and by other impartial parties who have examined the works, and also by the *London Financial News*, is three hundred million to six hundred million dollars. The cost of the Nicaragua Canal would probably be not less than two hundred millions; the most reliable estimate being that of Major McFarland, U.S.A., who estimated it at one hundred and forty million dollars.

It is more than probable that Mexico and the United States will unite to bring forward this important project to a speedy conclusion. The

work of construction, it is hoped, will commence in earnest this coming year; and it is calculated that four years is sufficient to complete and put the railway into operation.

• A LITTLE TOAD-LORE.

When the faint bloom of dew is upon the lawn of a country-house, an odd creature will sometimes crawl out from amidst the thickets of rose and dahlia. Its presence is tolerated there, but only because grubs and slugs are worse company still. If its habits were not so secret, if it were given to parading where muslins flutter and clouded canes stab the air, it would hardly be permitted to find a covert in the old garden. And even as it is, there are few people who do not regard the toad with some aversion.

The strange tadpole transformations; the absorption of the tail, the gradual change of a gill-breather into a lung-breather—these wonders are common both to the toad and the frog families. But there is a considerable difference in the appearance of the spawn of the two reptiles: frog-spawn is deposited in masses, toad-spawn in strings that are often from twenty to thirty feet in length. The dots, too, that develop into toads are smaller and darker than those that indicate the imminent frogling. Later on in life, further points of difference are established. The frog has a large array of feeble teeth; the toad is toothless, whilst warts (or tubercles) exuding an acrid juice are peculiar to the latter animal. This distillation, it may be remarked here, is more acrid than the poison of serpents, but has not a like injurious effect when taken into the circulation. Toads are commonly tailless, but Carpenter tells us that tadpoles secluded from the light and kept at a low temperature will retain their tails and continue to grow as tadpoles. This explanation is strengthened and illustrated by the fact that the proteus, which inhabits underground lakes in the Tyrol, and is a member of the same family as the toad, has a tail somewhat tadpole-like.

The toad when squatted in the moss of a hill-side, or when dug out of a garden border, looks anything but a lively and active animal. Its appearance somewhat belies him. He has a more than womanly quickness of tongue, for instance; the root of that organ is placed near to the front of the mouth, and when at rest, its tip reposes in the aperture of the throat. Its motions are of a marvellous rapidity: the eye cannot follow them; a passing insect seems to melt into thin air, rather than to be caught by that agile organ and swallowed. As a climber, too, the toad is more than respectable, and there are numerous instances on record of his powers in this direction. He has been known to mount plastered and white-washed walls to ascend flights of steps, and even to perform the feat of getting into a flower-pot; no easy matter, when the inclination of the exterior is considered. In ascending for these climbing feats, the very considerable stretch of his body and limbs when extended must not be forgotten. Capable, like the lion, of large meals and of long abstinences, the toad has a lion-like pride about the nature of his food. It is said that

he will not prey upon anything that is not in motion; he disdains all butcher-meat, and has a gentlemanly instinct for pursuing flying game. Slugs, grubs, and worms and insects are the 'chief of his diet;' and there is an account of a naturalist who used to dissect toads and obtain rare insects, which he promoted from the stomach to the cabinet. There is little doubt that toads will eat bees and defy stings; as many as thirty-two bees have been found on opening a toad; and wasps and bees have been seen hanging by their stings to the mouths of toads. Snakes eat toads; and toads sometimes return the compliment, and eat small snakes. The toad's oddest meal, however, is that which he makes upon his own skin. When this is cast off, he rolls it into a comatous parcel and swallows it; thus affording an illustration of economy that would appear to have been overlooked by many instructors. This shedding of the skin causes the toad to appear of different colours at different times, and some people have been led to believe that his complexion changes with the weather. Other points of interest about him are the humiliating resemblance of the muscles of his thigh and leg to those of a man; the curious fact that he cannot breathe if his mouth be held open; and the equally curious fact that in his family, as in that of the cuckoos, there is a large preponderance of males.

The distribution of the toad in our islands is rather irregular; in a few districts, toads are even more numerous than frogs; in general they are much scarcer. The natterjack toad, distinguished by a bright yellow line along the middle of the back, and other peculiarities, while found in some localities, is entirely absent in others. In Gilbert White's time, this variety was plentiful in the neighbourhood of Selborne, but is said now to have entirely disappeared. The common opinion, that there are no toads in Ireland, is incorrect; in the south-western part of the island the natterjack abounds, in spite of the strenuous disbeliefs of all true fishermen in his existence. Either the natterjack or the common toad makes an amusing pet, and even where they are kept indoors, are easily fed on worms and meat. They have an advantage, too, over other pets, inasmuch as they are creatures that will live forty or fifty years, or even more, in confinement.

The toad has an interesting natural history, and an unnatural history not less entertaining. There are the well-worn stories of the jewel in the toad's head, and of his sojournings for years in stone. There is a queer old story, too, of his resorting to a certain plant in order to cure himself of spider-bites. The old necromancers used him freely, and two toads dressed in green velvet that were unearthed some years ago had probably been part of the stock-in-trade of a friend of darkness. Nor are superstitions about toads gone from England yet; there are localities where the application of a toad is supposed to stop bleeding, and a dried toad is worn as a charm against rheumatism. In Devonshire, there is a family of foreign extraction, widely scattered over the county, whose members have a reputation for curing 'king's evil' by means of toads. In Tibet, according to Hué, the toad has a more terrible office. A kind of arch-toad dwells amidst

the mists of a lofty mountain-range, and unless duly propitiated, flings ice and avalanches down upon those who painfully thread the passes of the region!

FARMING AND FRUIT-CULTURE IN CALIFORNIA.

A farmer and fruit-grower in California writes as follows to the *Field*:

'Although I cannot entirely indorse the many encomiums which have lately been so lavishly bestowed upon the resources of our Golden State, I can truly say that it offers to intending emigrants, who are able and willing to work, opportunities for profitably investing a small capital, and obtaining in a few years a valuable property and a competence for life, which can hardly be found in any other portion of the globe.

'The errors into which I find most of my fellow-countrymen have fallen are, either purchasing too largely in proportion to their means, or making injudicious selections of land in their haste to commence operations. The result of my observation and experience is that the object of every settler should be to plant as many acres of vines and orchard as he can, and make both ends meet, pending their fruition, by what is called mixed farming. We make excellent wine, which sells at highly remunerative prices; and most of our counties produce excellent fruit, which, in canned form, has obtained a world-wide reputation.

'Space will not permit me to enter minutely into the profits of viticulture and horticulture; but a clear net profit of sixty pounds an acre is far from an excessive estimate of what is being regularly realised from the two last-named industries. Orchards or vineyards, however, like Rome, are not built in a day; and therefore it is necessary that a man of moderate means should, while they are maturing, produce cereal and root crops, not for sale as such, but in the more profitable form of stock, hogs, poultry, &c., for which there is a ready sale at good prices.

'To illustrate what can be done, I will take my own county of San Luis Obispo, where vines, olives, and all non-tropical fruits flourish in profusion. There good land, with ready access to market, can be bought at prices varying from one to three pounds an acre, adapted in all respects to the purposes I have mentioned; so that, with a minimum capital of six hundred pounds, an energetic man can acquire within six years a vineyard and orchard, producing a handsome income, and be able to exist in the meanwhile by his mixed farming. To carry out this plan, it is obvious that the settler must have some knowledge of viticulture and general farming, which he can only acquire thoroughly by working under some practical farmer, and taking ample time in selecting a suitable location, when, but not until, he is satisfied such occupation is certain to suit him.

'I have entirely ignored grain-raising, as, in my opinion, small capitalists cannot compete with men who, with all the appliances of modern science, grow wheat by the mile. Cattle-raising, though profitable, requires a large capital both to buy land and then stock it.

'One great factor in the happiness, contentment, and prosperity of the farmer is the excel-

lence of the climate. The mean temperature of San Luis Obispo in January is fifty-six degrees Fahrenheit, and in July sixty-six degrees Fahrenheit. As compared with the mean temperature of Surrey, we find it fourteen degrees warmer in winter and two cooler in summer. The shortest day gives two hours more sunlight than in England, and the rainfall for the last twenty years averages twenty inches.

'It has been said that the greatest pleasures are the cheapest, and here we have excellent amusements at a nominal cost. We have lawn-tennis, polo, good shooting and fishing; and private theatricals are much in vogue. *Our Boys* having been played in our village hall with great success. We get all important news from Europe by telegraph in our local papers on the same day, and altogether are well within the pale of civilisation; and my young English friends here thoroughly enjoy alike their work and their play.'

HOMELESS.

Sad and weary, lonely, old,
Tossing on through winter's cold,
Homeless 'mid the snow and sleet,
Ragged limbs and naked feet,
Helpless, feeble, bent, and gray,
There he sweepeth all the day,
None to pity, none to give
Aught that makes it life to live.
Love—the word that makes a home
Far or near, where'er we roam;
Love—that guides us on our way
Through the dusk of sorrow's day;
Love—ah! what a power is this,
Filling darkest hour with bliss:
But he stands, the sweeper old,
Loveless, homeless, pale and cold,
'Mid the city vast and dim,
Not one soul to care for him
Darkness sinks upon the street,
Snow is falling, swift and deep,
Yet he creepeth slowly on,
Faltering sorely, weak and wan.
Now before his dim old eyes,
Distant dreams of beauty rise,
Dreams of moments long, long dead,
Days and hours for ever fled;
Cottage home and dewy lane;
Summer-time he sees again;
Children pattering to and fro;
Silvery voices come and go;
Love is there, and Joy, and Home—
Whence no more his feet shall roam.

For a beam of glorious day
Chase all his dreams away;
Angel voices swell the song;
Harps are pealing loud and long;
Gates of heaven, dazzling, bright;
Glory bursts upon his sight.
Rest, at last, no more to roam—
God in love has brought him Home.

NORSKE FARMS AND FARMERS.

While travelling in Norway recently, the writer had an opportunity of obtaining some practical information in connection with farming in that country, and the following remarks are intended to illustrate the typical condition of the peasantry. In certain portions of the south, principally in the Christiania district, comparatively large farming operations are carried on. The contrast between Norwegian farms and those he has left behind at home, must strike the least observant British tourist. Yet, though he sees much that seems to him rude and antiquated, one soon finds there are not a few lessons awaiting the English agriculturist in the land of the vikings. So adverse are the conditions under which the Norse farmer struggles, that the latter must be almost 'after the manner born.' And it is not too much to add that, to an average John Bull, certain bankruptcy would result where a Norwegian farmer can make his bread and prosper.

The first impression of an ordinary Norwegian farmstead is not very favourable. A cluster of houses, small and aged, crowd around a larger dwelling-house, which generally looks somewhat dilapidated. But this appearance is deceptive; for the walls being of wood, they look old in a few years, and become blotched and seared by the weather. The roof is of the same material, or, in the case of the principal building, either of red tile or slab. Sometimes the dwelling-house is painted white, when the effect is to relieve the sombre aspect of the group. The walls are usually stout and thoroughly weather-proof, planks about four inches thick being used in their construction. These planks are placed edgewise on one another, crossed and counter-sunk at the angles, and calked in the seams with dry moss. A skin of thin wood is placed over the outside, while the interior is lined smoothly with boards. Inside, there is an air of comfort and cleanliness. A table stands in the centre of the chief room; and along the wall

a bench runs, which serves for chairs, of which there is usually a deficiency. From pots on the floor, ivy is sometimes trained upwards to the roof, giving the room a festive and refreshing look. Not unfrequently, the worthy farmer is proud to have the dresses of his daughters hung in conspicuous positions, in order that swains who call may see that the damsels are well provided with garments in case of a matrimonial alliance.

The cowhouses are generally an improvement on those usually seen in England and Scotland. The building is larger, and more space is allotted to each animal; while a clean wooden floor is ordinarily beneath the cattle. Little or no bedding is given. The level of the cowhouse is in most cases raised high enough to allow of a space beneath, into which the refuse is regularly swept through an opening in the floor.

Outside the buildings, one is apt to ask, But where is the farm? Look about you. Mountains hem us in on all sides; there is no room for fields as we know them at home; but grass grows luxuriously among the rocks, with occasionally a patch as large as an ordinary village garden. There, the farmer cuts a portion of his hay-crop, on which his horses and cattle are mainly dependent during the eight winter months. But his hay-field is yet wider spread. Glance upward some fifteen hundred feet, there, where an opening occurs in the dwarf-birch, and you will observe the unfinished form of a man busy at work. That is the farmer, a thorough mountaineer, cutting the grass which grows on yonder narrow ledge of rock. He has been up since early morn, and will probably not descend till evening. Not a tuft of grass will be left ungathered; not a foot of level ground on that steep and rugged mountain side but will be visited, and its small crop carefully removed by the industrious bergsman. If he has a wide stretch of field (hill-pasture or moorland) in his boundary, the farmer erects wooden sheds, in which he stores his hay till winter, when, by an ingenious contrivance, he has the whole

rapidly and easily conveyed to the valley. A familiar object in a Norwegian glen is the strong steel wire which stretches from the foot to the summit of the mountain. Down this wire the bundles of hay are expeditiously sent without labour, and then carried in sledges to the steadings. Without such a method, many weary journeys would be necessary ere all the hay required for a long winter could be brought down. It appears the Norwegian farmer borrowed the idea of this hay-telegraph from his brother hillman of the Tyrol about eight years ago. The hay-crop is the product of natural grass, no seed being sown, nor any admixture of clover being used.

The cereals are generally oats and barley; these are planted wherever there is a likelihood of their growing. Small patches from twenty feet to as many yards square are common; while not unfrequently the corn-fields are but a name, for they meander like a stream in all directions among the huge boulders and bare rocky hillocks which compose so great a part of the surface of a farm-land. The heads are usually very light, and their appearance would cause a painful smile on the face of a Lothian farmer. Still, the people cheerfully sow and thankfully reap their scanty harvest, contented if providence gives them sufficient for their few wants.

The method employed in drying the hay and corn crops is different from that which obtains in Britain. In the former case, poles are erected on or near the patches, and between them ropes or long sticks are laid till a sort of six-barred railing is made. On the poles the hay is laid, and dried in a most effective manner. The corn, on the other hand, is tied in small bundles and napped on poles placed at intervals in the field. These poles are about nine feet high, and capable of holding ten sheaves each. The grain is thus elevated above the ground; and should a rain-storm set in before it can be conveyed to the granary, little harm results, for half an hour's wind and sun-burn thoroughly dries the crop. In the great valley of Voss, the fields are more extensive than those just described. Indeed, a field of two to three acres can be seen on more than one farm near Tringne.

With regard to the potato crop, the same kind of miniature farming occurs, only 'much more so,' as Mark Twain would say. A seed is dropped here and there wherever a possibility exists of its taking root. In the Nerodal, the writer noticed potatoes growing on a boulder, where a soil of about a foot in depth had gathered or been placed. The 'tuck' was a triangle, whose sides were each about twelve feet in length!

Turnips would appear to be outside the economy of a Norwegian farm. Though a wide area was visited, embracing Bergen-Aut, Hardanger, and part of the Sogne district, not a bulb was visible: a curious feature, considering the importance of such a crop for winter food.

That portion of the farm given up to crop and fallow is styled the *in-maken*, or inside field; between that and the field are the *out-maken*. The latter are reserved, as a rule, for the cattle during winter; the hay being allowed to grow in the summer while the cows are at the *seters* on the mountains. Manuring is not resorted to

as a regular part of the routine; the fields are left from time to time for three or four years, by rotation, in grass.

The farmers themselves are worthy of more than the brief description which can be given here. A life of constant activity and mountain climbing has bred a class of men scarcely to be excelled. They are tall and strongly built, with no excess of flesh, for they are always in training. Their athletic frames are supplemented by good-humoured honest faces, always ready to break into a laugh. A uniform suit of pilot-cloth does not, however, enhance their appearance. One does not readily associate the Sunday clothes of a navvy with the Norwegian farmer. Their former dress, which some of the old men retain, is more becoming. And happily, we still find the true mountaineer's costume in some of the more secluded districts—a broad hat, short jacket of home-made cloth, ornate with bright buttons; leather knee-breeches; and heelless shoes of a soft tough hide. The never-failing knife hangs suggestively at the right side. Add limbs of large proportions, a frank face, a back as straight as a Guardsman's, and you see the typical field man. The farms of Solø and Skjerveidals will be familiar examples to the tourist.

In the summer months, female servants, or the daughters of the farmer, tend the cattle high up in the field, living in *seters* or cabins, where they prepare cheese and butter. This isolation of young women for three or four months each year is a peculiar feature, and one not calculated to meet with approval from the British mind. Indeed, the evil which springs from such a domestic arrangement as are real as their probability is evident; and they form a distinct blot on the otherwise simple and moral life of the people.

Excepting for such luxuries as coffee, sugar, and tobacco, the farmer in Norway can be independent of the outside world. His needs and stock give him food and clothing; while from the timber on his hill-sides he builds his houses and manufactures his furniture. There is no lack of plate in those little farmhouses; the hosts can muster quite a display of silver mugs, spoons, and drinking-cups. Some of the spoons are worthy of special notice, for the patterns are delicate and chaste. A favourite kind is that with the thin twisted handle. Any Sunday or fête-day, one may also observe the profusion with which the female population adorn themselves with silver and gold. The arrival of a steamer in some of the less frequented districts is enough to stimulate the wives and ladies to attire themselves in all their bright costume and fidgety knicknacks. It is occasionally the fortune of a wanderer among the fjords and fields thus to witness these gatherings of the women-folk. Many of the ornaments and plate find their way to shops in the larger towns, and also to hotel parlours, where they lie, tempting objects to the British matron and miss. On inquiring into the cause which led to the Norske women parting with their adornments, we were informed that it was generally done by intending emigrants, who thus turned their little hoards to good account.

There is no feudal principal in Norway. The land is held by its owner absolutely, without

any tenure from the king or superior. Property thus requires no charter, and the owners have never been subject to military service as vassals. The facility with which property can be transferred is refreshing to one who contemplates the complicated and costly machinery of the law to be encountered in Great Britain. A stroke of the district judge's pen is sufficient under the simple laws of Norway.

On the death of a farmer, his children—sons and daughters alike—have the property equally divided among them. Should the farm be insufficient for all their wants, an amicable arrangement is usually made, by which the surplus relinquish their shares on payment of a compensatory sum, and settle elsewhere, or emigrate. It might seem that this system of subdivision would ultimately result in impoverished holdings; but, as justly remarked by Mr Samuel Laing in his *Diary*, the reason that such an issue is prevented lies in the fact, that in Norway, the land being held in full ownership, its aggregation by the deaths of co-heirs, and by the marriage of female heirs among the body of landowners, balances its subdivision by the equal succession of children.

There is no aristocracy in Norway, unless it be that of successful enterprise and labour. The farmer owns no superior, is uniformly polite and hospitable to all, while certain vices and equities are utterly foreign to his nature.

Sufficient has been given in this short sketch to enable the reader to form an idea of Norwegian farms and farmers. It is that should occur to any one to enquire why it is that men toil year by year in a hard and constant struggle, when, farming is a task of the utmost difficulty and hazard, we feel sure the right, and only reply, is that the land they till is *their own*. They love it, for on it their fathers lived—many of them can trace their ancestors as far back as the grand old days of the vikings—and they, unless compelled by force of circumstances, are happy to reap and sow the same acre season after season. With all the forces of nature arrayed against them, these men can show that their small holdings feed them and their children; and make them the backbone, the strength, of *simple Norge*.

A HOUSE DIVIDED AGAINST ITSELF.

CHAPTER XL.

WARING was not so indifferent to the looks or feelings of his daughter as appeared. After all, he was not entirely buried in his books. To Frances, who had grown up by his side without particularly attracting his attention, he had been kindly indifferent, not feeling any occasion to concern himself about the child, who always had managed to amuse herself, and never had made any call upon him. But Constance had come upon him as a stranger, as an individual with a character and faculties of her own, and it had not been without curiosity that he had watched her to see how she would reconcile herself with the new circumstances. Her absorption in the amusement provided for her by young Gaunt had somewhat revolted her father, who set it down as one of the usual

exhibitions of love in idleness, which every one sees by times as he makes his way through the world. He had not interloped, being thoroughly convinced that interference is useless, in addition to that reluctance to do anything which had grown upon him in his reclusive life. But since Gaunt had disappeared without a sign—save those of a little irritability, a little unusual gravity on the part of Constance—her father had been roused a little to ask what it meant. Had the young fellow behaved badly, as people say? Had he danced attendance upon her all this time, only to leave her at the end? It did not seem possible, when he looked at Constance with her easy air of mystery, and thought of the shy, eager devotion of the young soldier and his impassioned looks. But yet, he was aware that in such cases all prognostics failed, that the conqueror was sometimes conquered, and the intended victim remained master of the field. Waring observed his daughter more closely than ever on this evening. She was *distrait*, self-absorbed, a little impatient, sometimes not noting what he said to her, sometimes, in warring an irritable tone. The replies she made to him when she did reply, showed that her mind was running on other matters. She said abruptly, in the middle of a little account he was giving her, with the idea of amusing her, of one of the neighbouring mountain castle: 'Do you know, papa, that everybody is going away?'

Waring felt, with a certain discomfiture, which was coming, yet annoying, like one who has been suddenly pulled up with a good deal of 'way' on him, and stop himself with difficulty—'a branch of the old story,' he went on, having these words in his very mouth—and then, after a precipitate pause, 'Eh? Oh, everybody is——? Yes, I know. They always do at this time of the year.'

'It will be rather invidious, don't you think, when every one is gone?'

'My dear Constance, "every one" means the Gaunts and Durants. I could not have supposed you cared.'

'For the Gaunts and Durants?—O no,' said Constance. 'But to think there is not a soul—no one to speak to—not even the clergyman, not even Tove!' She laughed, but there was a certain look of alarm in her face, as if the emergency was one which was unprecedented. 'That frightens one, in spite of one's self. And what are we going to do?'

It was Waring now who hesitated, and did not know how to reply. 'Well,' he said, 'To tell the truth, I had not thought of it. Frances was always quite willing to stay at home.'

'But I am not Frances, papa.'

'I beg your pardon, my dear; that is quite true. Of course, I never supposed so. You understand that for myself I prefer always not to be disturbed, to go on as I am. But you, a young lady fresh from society—— Had I supposed that you cared for the Durants, for instance, I should have thought of some way of making up for their absence; but I thought, on the whole, you would prefer their absence.'

'That has nothing to do with it,' said Constance. 'I don't care for the individuals; they are all rather boring. Captain Gaunt,' she added

resolutely, introducing the name with determination, 'became very much of a bore before he went away. But the thing is to have nobody—nobody! Ope has to put up with bores very often; but to have nobody, actually not a soul! The circumstances are quite unprecedented.'

There was something in her air as she said this which amused her father. It was the air of a social philosopher brought to a pause in the face of an unimagined dilemma, rather than of a young lady stranded upon a desert shore where no society was to be found.

'No doubt,' he said, 'you never knew anything of the kind before.'

'Never,' said Constance with warmth. 'People who are a nuisance, often enough; but nobody, never before.'

'I prefer nobody,' said her father.

She raised her eyes to him, as if he were one of the problems to which, for the first time, her attention was seriously called. 'Perhaps,' she said; 'but then you are not in a natural condition, papa—no more than a hermit in the desert, who has forsworn society altogether.'

'Allowing that I am abnormal, Constance, for that is what I am, I say:—'

'And I was. I say, more or less—that is, she could content herself with the peasants and fishermen, who, of course, are just as good as anybody else, if you make up your mind to it, and understand their ways. But I am not abnormal,' Constance said, her colour rising a little. 'I want the society of my own kind. It seems unnatural to you, probably, just as your way of thinking seems unnatural to me.'

'I have seen both ways,' said Waring, in his turn becoming animated; 'and so far as my opinion goes, the peasants and fishermen are a thousand times better than what you call society, and solitude, with one's own thoughts and pursuits, the best of all.'

There was a momentary pause, and then Constance said, 'That may be, papa. What is best in the abstract is not the question. In that way, mere nothing would be the best of all, for there could be no harm in it.'

'Nor any good?'

'That is what I mean on my side—nor any good. It would be better to be alone—then (I suppose) you would never be bored, never feel the need of anything, the mere sound of a voice, some one going by. That may be your way of thinking; but it is not mine. If one has no society, one had better die at once, and save trouble. That is what I should like to do.'

A certain feminine confusion in her argument, produced by haste and the stealing in of personal feelings, stopped Constance, who was too clear-headed not to see when she had got involved. Her confusion had the usual effect of touching her temper and causing a little *crise* of sentiment. The tears came to her eyes. She could be heroic, and veil her personal grievances like a social martyr so long as this was necessary in presence of the world; but in the present case it was not necessary; it was better, in fact, to let nature have its way.

'That will not be necessary, I hope,' said Waring, somewhat coldly. He thought of Frances with a sigh, who never bothered him, who was contented with anything! and carried on her

own little thoughts, whatever they might be, her little drawings, her little life, so tranquilly, knowing nothing better. What was he to do, with the responsibility upon his hands of this other creature? whom all the same he could not shake off, nor, even—as a gentleman, if not as a father—allow to perceive what an embarrassment she was. 'Without going so far,' he said, 'we must consult what is best to be done, since you feel it so keenly. My ordinary habits even of *villaggiatura* would not please you, any better than staying at home, I fear. We used to go up to Dolceacqua, France, and I; or to EZA; or to Porto Fino, on the opposite coast. At no one of which places was there a soul—as you reckon souls—to be seen.'

'That is a great pity,' said Constance; 'for even Frances, though she may have been a Stoic born, must have wanted to see a human creature who spoke English now and then.'

'A Stoic! It never occurred to me that she was a Stoic,' said Waring with astonishment and a sudden sense of offence. The idea that his little Frances was not perfectly happy, that she had anything to put up with, anything to forgive, was intolerable to him; and it was a new idea. He reflected that she had consented to go away with an ease which surprised him at the time. Was it possible? This suggestion disturbed him much in his certainty that his was absolutely the right way.

'If all these expedients are unsatisfactory,' he said sharply, 'perhaps you will come to my assistance, and tell me where you would be satisfied to go.'

'Papa,' said Constance, 'I am going to make a suggestion which is a very bold one; perhaps you will be angry—but I don't do it to make you angry; and please, don't answer me till you have thought a moment. It is just this—why shouldn't we go home?'

'Go home!' The words flew from him in the shock and wonder. He grew pale as he stared at her, too much thunder-struck to be angry, as she said.

Constance put up her hand to stop him.

'I said, please, don't answer till you have thought.'

And then they sat for a minute or more looking at each other from opposite sides of the table—in that pause which comes when a new and strange thought has been thrown into the midst of a turmoil which it has power to excite or to allay. Waring went through a great many phases of feeling while he looked at his young daughter sitting undaunted opposite to him, not afraid of him, treating him as no one else had done for years, as an equal, as a reasonable being, whose wishes were not to be deferred to superstitiously, but whose reason for what he did and said were to be put to the test, as in the case of other men. And he knew that he could not beat down this cool and self-possessed girl, as fathers can usually crush the young creatures whom they have had it in their power to reprove and correct from their cradles. Constance was an independent intelligence. She was a gentlewoman to whom he could not be rude, any more than to the Queen. This hushed at once the indignant outcry on his lips. He said at last, calmly enough, with only a little sneer

piercing through his forced smile: 'We must take care, like other debaters, to define what we mean exactly by the phrases we use. Home, for example. What do you mean by home? My home, in the ordinary sense of the word, is here.'

'My dear father,' said Constance, with the air, somewhat exasperated by his folly, of a philosopher with a neophyte, 'I wish you would put the right names to things. Yes, it is quite necessary to define, as you say. How can an Englishman, with all his duties in his own country, deriving his income from it, with houses belonging to him, and relations, and everything that makes up life—how can he, I ask you, say that home, in the ordinary sense of the word, is here? What is the ordinary sense of the word?' she said, after a pause—looking at him with the indignant frown of good sense, and that little air of repressed exasperation, as of the wiser towards the foolisher, which made Waring, in the midst of his own just anger and equally just discomfiture, feel a certain amusement too. He kept his temper with the greatest pains and care. Domenico had left the room when the discussion began, and the lamp which hung over the table lighted the girl's animated countenance, presenting in the strength of a position which she felt to be invulnerable, and the father's clouded and withdrawing face; for he had taken his eyes from her, with unconscious cowardice, when she fixed him with that unwavering gaze.

'I will allow that you put the position very strongly—as well as a little unduly,' he said.

'Unduly? Is it one's duty to one's father to be silly—to give up one's power of judging what is wrong and what is right? I am sure, papa, you are much too candid a thinker to suggest that.'

What could he say? He was very angry; but this candid thinker took him quite at unawares. It tickled, while it defied him. And he was a very candid thinker, as she said. Perhaps he had been treated illogically in the great crisis of his life; for, as a matter of fact, when an argument was set before him, when it was a good argument, even if it told against him, he would never refuse to acknowledge it. And conscience perhaps had said to him on various occasions what his daughter now said. He could bring forward nothing against it. He could only say, I choose it to be so; and this would bear no weight with Constance. 'You are not a bad dialectician,' he said. 'Where did you learn your logic? Women are not usually strong in that point.'

'Women are said to be just what it pleases men to represent them,' said Constance. 'Listen, papa. Frances would not have said that to you that I have just said. But don't you know that she would have thought it all the same? Because it is quite evident and certain, you know. What did you say the other day of that Italian, that Count something or other, who has the castle there on the hill, and never comes near it from one year's end to another?'

'That is quite a different matter. There is no reason why he should not spend a part of every year there.'

'And what reason is there with you? Only what ought to be an additional reason for going—that you have'—Here Constance paused a little, and grew pale. And her father looked up at her, growing pale too, anticipating a crisis. Another word, and he would be able to crush this young rebel, this meddler with things which concerned her not. But Constance was better advised; she said hurriedly—'relations and dependents, and ever so many things to look to—things that cannot be settled without you.'

'And what may these be?' He had been so fully prepared for the introduction at this point of the mother, from whom Constance, too, had fled—the wife, who was, as he said to himself, the cause of all that was inharmious in his own life—that the withdrawal of her name left him breathless, with the force of an impulse which was not needed. 'What are the things that cannot be settled without me?'

'Well—for one thing, papa, your daughter's marriage,' said Constance, still looking at him steadily, but with a sudden glow of colour covering her face.

'My daughter's marriage?' he repeated vaguely, once more taken by surprise. 'What! has Frances already, in the course of a few weeks—?'

'It is very probable,' said Constance calmly. 'But I was not thinking of Frances. Perhaps you forget that I am your daughter too, and that your sanction is needed for me as well as for her.'

Here Waring leant towards her over the table. 'Is this how it has ended?' he said. 'Have you really so little perception of what is possible for a girl of your breeding, as to think that a life in India with young Gaunt—?'

Constance grew crimson from her hair to the edge of her white dress. 'Captain Gaunt?' she said for the first time, avoiding her father's eye. Then she burst into a laugh, which she felt was weak and half hysterical in its self-consciousness. 'O no,' she said; 'that was only amusement—that was nothing. I hope, indeed, I have a little more—perception, as you say. What I meant was'—her eyes took a softened look, almost of entreaty, as if she wanted him to help her out.

'I did not know you had any second string to your bow,' he said. Now was his time to avenge himself, and he took advantage of it.

'Papa,' said Constance, drawing herself up majestically, 'I have no second string to my bow. I have made a mistake. It is a thing which may happen to any one. But when one does so, and sees it, the thing to do is to acknowledge and remedy it, I think. Some people, I am aware, are not of the same opinion. But I, for one, am not going to keep it up.'

'You refer to—a mistake which has not been acknowledged?'

'Papa, don't let us quarrel, you and me. I am very lonely—oh, dreadfully lonely! I want you to stand by me. What I refer to is my affair, not any one's else. I find out now that Claude: of course I told you his name—Claude—would suit me very well—better than any one else. There are drawbacks, perhaps; but I understand him, and he understands me. That is the great thing, isn't it?'

'It is a great thing—if it last!'
'Oh, it would last. I know him as well as I know my self.'

'I see,' said Waring slowly. 'You have made up your mind to return to England, and accomplish the destiny laid out for you. A very wise resolution, no doubt. It is only a pity that you did not think better of it at first, instead of turning my life upside down and causing everybody so much trouble. Never mind. It is to be hoped that your resolution will hold now; and there need be no more trouble in that case about finding a place in which to pass the summer. You are going, I presume—home?'

This time the tears came very visibly to Constance's eyes. There was impatience and vexation in them, as well as feeling. 'Where is home?' she said. 'I will have to ask you. The home I have been used to is my sister's now. Oh, it is hard, I see, very hard, when you have made a mistake once, to undo it! The only home that I know of is an old house where the master has not been for a long time—which is all overgrown with trees, and tumbling into ruins, for anything I know. But I suppose, unless you forbid me, that I have a right to go there and perhaps visit Charlotte!'

'Of what are you speaking?' he said, making an effort to keep his voice steady.

'I am speaking of the Warren, papa.'

At this he sprang up from his chair, as if touched by some intolerable recollection; then composing himself, sat down again, putting force upon himself, restraining the sudden impulse of excitement. After a time, he said: 'The Warren! I had almost forgotten the name.'

'Yes, so I thought. You forget that you have a home, which is cooler and quieter, as quiet as any of your villages here—where you would be as solitary as you like, or see people if you liked—where you are the natural master. Oh, I thought you must have forgotten it! In summer, it is delightful. You are in the middle of a wood, and yet you are in a nice English house. Oh, an English house is very different from those palazzos. Papa, there is your *colloppatura*, as you call it, just what you want, far, far better than Mrs Durant's cheap little place, that she asked me to tell you of, or Mrs Gaunt's *pension* in Switzerland, or Homberg. They think you are poor; but you know quite well you are not poor. Take me to the Warren, papa; oh, take me home! It is there I want to go.'

'The Warren,' he repeated to himself—'the Warren. I never thought of that. I suppose she has a right to it. Poor old place! Yes, I suppose, if the girl chooses to call it home!'

He rose up quite slowly this time, and went, as was his usual custom, towards the door which led through the other rooms to the loggia, but without paying any attention to the movement of Constance, which he generally followed instead of directing. She rose too, and went to him, and stole her hand through his arm. The evening had been put aside, and the soft night-air blew in their faces as they stepped out upon that terrace in which so much of their lives was spent. The sun shone on the roofs of the houses on the Marina, and swept onwards in a pale clearness towards the sky, which was soft in

summer blueness, with the stars sprinkled faintly over the vast vault, too much light still remaining in heaven and earth to show them at their best. Constance walked with her father, close to his side, holding his arm, almost as tall as he was, and keeping step and pace with him. She said nothing more, but stood by him, as he walked to the ledge of the loggia and looked out towards the west, where there was still a lingering touch of gold. He was not at all in the habit of expressing admiration of the landscape, but to-night, as if he were making a remark called forth by the previous argument, 'It is all very lovely,' he said.

'Yes; but not more lovely than home,' said the girl. 'I have been at the Warren in a summer night, and everything was so sweet—the stars all looking through the trees as if they were watching the house, and the scent of the flowers. Don't you remember the white rose at the Warren, what they call Mother's rose?'

He started a little, and a thrill ran through him. She could feel it in his arm—a thrill of recollection, of things beyond the warfare and turmoil of his life, on the other, the boyish side, recollections of quiet and of peace.

'I think I will go to my own room a little, Constance, and smoke my cigarette there. You have brought a great many things to my mind.'

She gave his arm a free pressure before she let it go. 'Oh, take me to the Warren! Let us go to our own home, papa.'

'I will think of it,' he repeated.

FLOWERS AS NATIONAL AND PARTY EMBLEMS.

THE works of nature, no less than those of art, have their place in the fancy's varied page, and many are the associations which attach to the most common object of the vegetable creation. The origin of flowers as national emblems may in most cases be accounted for by some occurrence in past history. Some of these events we would endeavour briefly to recall, adding the stories of a few of those floral badges which have a national as well as a personal interest.

The rose, the national flower of England, has ever been distinguished as the emblem of beauty. Ancient fable derives the crimson hue of many of its varieties from the blood of the heathen goddess of beauty. With equal credit, medieval writers relate that the red rose sprung from the maidens' blood round an early Christian martyr at Bethlehem. Tradition tells us that a rose appeared in the centre of King Arthur's Round Table at Winchester, and some antiquaries would deduce from this source its adoption as the emblem of England. But a more probable derivation is from the badges of the Plantagenet princes. The red rose was chosen as the device of his House by John of Gaunt, Duke of Lancaster, the fourth son of Edward III.; while his brother Edmund, Duke of York, assumed the white rose. Years passed on, and the descendants of these princes, Henry VI. of Lancaster, and Edward IV. of York, gave to these badges a deeper significance by the Wars of the Roses, waged for the

possession of the crown of England. We need hardly remind our readers of the rival claims of the two Houses—that of York by descent through a female from Lionel, Duke of Clarence, the third son of Edward III.; while the Lancastrian king was the direct descendant of John of Gaunt. In Shakespeare's well-known play of *Henry VI.*, we have a description of a picturesque scene in the Temple Gardens, where the leading noblemen on either side select the badges of their leaders from among the beautiful flowers of summer. But the white rose of York was doomed to be dyed with the crimson blood of thousands of the sons of England, ere the rival Houses were united by the marriage of Henry VII., the representative of Lancaster, to Elizabeth, the daughter of Edward IV. of York. Henceforth the rose appears as the national device of England. In the variety colour of the old-fashioned rose, the red petals of which are streaked with white, no less than in its popular name of the York and Lancaster rose, we have a memento of this troubled time in our country's history.

The rose has another association with English history, belonging to a later date. After the Revolution of 1688, the white rose was adopted by the Jacobites as the badge of the exiled House of Stuart, and the 10th of June was for a long time called White Rose Day, that being the birthday of the Pretender, as the son of James II. was called.

The Scottish thistle—said to be one of the most ancient badges on record—next claims our attention. The following legend accounts for its adoption as the emblem of Scotland. On one occasion in ancient times, an army of Danes landed unobserved on the Scottish shore. Finding that the Scots were encamped at a little distance, they resolved, contrary to their general rule, to endeavour to surprise them by night. Stealthily advancing upon the enemy's camp, they had nearly effected their purpose, and victory seemed already within their grasp, when one of the barefooted invaders tread upon a thistle. He was unable to suppress a cry of pain. The alarm was given; the Scottish warriors flew to their arms, and fell upon their assailants, whom they defeated with great slaughter. In gratitude to the plant which had thus guarded the sleeping camp, it was henceforth assumed as the ensign of Scotland. The device, with the appropriate motto, 'Nemo me impune lacessit,' distinguishes the order of the Thistle, instituted in the sixteenth century. Dunbar's poems are said to contain the earliest mention of this flower as the Scottish emblem. His poem *The Thistle and the Rose* was written in 1503, on the occasion of the marriage of James IV. to Margaret Tudor. Unfortunately it is impossible to determine which is the true Scottish thistle, but the best opinion seems to be that it is either *Onopordum acanthium* or *Cirsium Marianum*.

We may now pass to the emblem of the sister isle, the trefoil or shamrock. It is related that when St Patrick landed in Ireland in the fifth century, having overcome the hostility of the savage islanders, he proceeded to instruct them in the doctrines of Christianity. But in vain did he endeavour to explain to them the doctrine of the Trinity in Unity. His untutored hearers failed to comprehend his reasoning, till,

plucking a trefoil to serve as an illustration, he inquired of them, 'Is it not as possible for the Father, Son, and Holy Ghost, as for these three leaves, to grow upon a single stalk?' This argument, according to the legend, immediately convinced the Irish, who yielded to St Patrick's efforts for their conversion. The shamrock was thenceforth dedicated to the saint, and became the national cognisance. It is somewhat unfortunate that this pretty story is not to be found in any of the lives of the great saint of Ireland, but it is still more unfortunate that it is again impossible to determine which is the true shamrock. According to the best authorities, however, the honour is due to the Black non-such or *Medicago*, or to the Dutch clover. Both these plants are worn on St Patrick's Day, and are held to be the true shamrock.

The little kingdom of Wales, early united to her more powerful neighbour of England, has also a distinctive badge drawn from the vegetable world. The origin of the Welsh leek is traced back to the seventh century. On St David's Day, 630, the Welsh under Cadwallar were marching against an English army, and wishing to adopt badges which might distinguish them from their enemies, they availed themselves of those most easily obtained. Each man plucked a leek from the field through which he was passing, and stuck it in his cap. The Welsh arms were victorious; the leek was adopted in grateful memory of the event as the national emblem, and was long worn by loyal Welshmen on every anniversary of St David's Day. In Shakespeare's play of *Henry IV.*, that Prince claims the right, by his birth at Monmouth, to wear the leek. It would appear also that the Welsh contingent of the English army had worn this emblem at the battle of Poitiers. We recollect that a leek in diamonds occupied a prominent place in a present given by the ladies of the principality of Wales to the Princess of Wales on the occasion of her marriage.

The origin of the *fleur-de-lis* and the date of its adoption as the floral emblem of France have furnished an ample field for controversy, and indeed the original flower used seems not to have been the white lily at all, but a common purple iris. In this case also, a legend, quoted by Dr Brewer from Chifflet, declares its adoption to have been out of gratitude for victory. An aged hermit of Jove-en-Vallée saw one night a miraculous light stream into his cell, and an angel appeared to him bearing an azure shield, on which were emblazoned three golden lilies. The celestial visitor commanded the hermit to give the shield to the pious Queen Clothilde. By her it was presented to her newly converted husband, who displayed in its favour the three black teats which had been hitherto his device; and as a result, the arms of Clovis were victorious over all his enemies.

A more probable origin of the *fleur-de-lis* is that which is ascribed to Louis VII., who called it *l'hermine*, his own name. In early days the French standard was thickly strewn with that flower; but the number was reduced by Charles VI. to three, perhaps to correspond with the mystical number of the Trinity. The *fleur-de-lis* is five times mentioned by Shakespeare, four of the passages

relating to the flower as the cognisance of France. King Henry V., in his charming wooing scene with the French princess, Katherine, thus addresses her: 'But, Kate, dost thou understand thus much English, canst thou love me? What sayest thou, my fair Flower-de-luce?' Edward III. added the flower to the arms of England on account of his claim to the crown of France; and we find it retained on the shield, and thus upon the gold and silver coinage of Great Britain up to the year 1801, or for two hundred and forty-three years after the loss of Calais.

The lily has been adopted as their badge by many smaller states, to denote in some instances descent from and union with the mighty power of France. In the long struggle between Pope and Emperor, whose conflicts form so large a share of the history of the twelfth, thirteenth, and fourteenth centuries, the white lily was adopted as their party badge by the Ghibellines, or supporters of the Emperor; while the Pope's partisans, the Guelphs, wore the red lily.

We have another national emblem derived from the vegetable world in the pomegranate (Spanish *granada*) of Spain. The town of Granada is said to take its name from this fruit; by reason, it is supposed, of the number of pomegranate trees in its vicinity. When the Moorish power in Spain had been crushed, and Ferdinand and Isabella had entered Granada in triumph, and received the submission of the unfortunate Abdallah, the device of Granada was emblazoned on the arms of Spain; forming a fit emblem of the sunny and fruitful *vega* ('tract of land') added to the dominions of the Catholic sovereigns.

We are not aware that any distinctive historical associations are advanced to account for the adoption of the violet as the emblem of Athens, of the mugonette as that of Saxony, or of the sugar-maple as that of Canada. One other device of this nature we will recall—namely, that of the orange as the arms of the small town, inclosed on every side by French territory, from which the Princes of Orange took their name. The badge and colour of the Stadtholder's family during the troubles that followed the French Revolution became so hateful to the popular party, that, not satisfied with expelling their prince, the people not only eradicated the orange, lily, and marigold from their gardens, but even went so far, in their hatred of the aristocratic colour, as actually to forbid the sale of oranges and carrots in their markets. But time worked its usual result, and the banished Stadtholder returned to his people, as king of the Netherlands, greeted with enthusiastic shouts of 'Orange boven!' ('Orange for ever!')

We may now recall a few of those floral badges adopted by prominent characters in history. One of these, the *Planta genista* or broom, an emblem of humility, has given its name to a race of our kings. It was first assumed by Geoffrey, Earl of Anjou, the father of the first Plantagenet king, Henry II. According to tradition, the earl, when encamped on a heath just before a battle, plucked a golden spray and placed it in his helmet. The flower gleamed everywhere amid the swaying storm of battle, and the triumphant victor adopted his chance badge as his device. Another tradition makes him assume it during

a pilgrimage to the Holy Land, as a symbol of humility.

After the battle of Bosworth (1485), where the House of York was finally overthrown, Henry VII. adopted as his device a crown in a hawthorn bush, in allusion to the crown which his predecessor Richard had so proudly worn, and which was found dented and battered, hanging in a hawthorn tree on the field of battle.

The badge of the Stuarts was the Chluaran or Thistle. At the Restoration in 1660, twigs of oak were worn because Charles II. had escaped after the battle of Worcester by hiding in an oak-tree. It is understood, too, that an order of knighthood with the title of Knights of the Oak was at one time in contemplation, and some knights of the order were actually created; but the project was abandoned from a desire not to perpetuate vindictive distinctions between the old and new adherents of the restored dynasty. The forget-me-not, the very name of which breathes its romantic story, served as the badge during his exile of the banished Henry of Lancaster, who was subsequently to ascend the throne of England as Henry IV. All his partisans wore the badge, and the rapturous welcome and ready support accorded to the aspiring Prince on his return, showed that though 'out of sight,' he had not been 'out of mind.'

In comparatively recent times, we have a flower with a hidden meaning associated with a somewhat similar cause. The violet was the badge of the Bonaparte party, when he who thought to rule the world was banished to his little sovereignty of Elba. 'To return in spring' was the meaning it conveyed to his adherents. In the following March, their expectations were realised by his reappearance in France. But his sun had already set, and a few months later saw him removed to a more distant place of exile.

Our readers will no doubt recall other instances of a similar nature to add to the historical memories of flowers; but we are content, by means of a few examples, to have pointed out the interest which clings to many plants and flowers apart from their recognised beauty and usefulness. On the other hand, lesser details such as these lend life and brightness to the records of past days.

ARIZONA DAN.

IN TWO CHAPTERS.—CHAP. I.

So much has been written about mines, miners, and mining adventures, that I am happily saved all necessity for explanation at the commencement of my brief story. For instance, everybody knows what a 'rush' to any particular 'diggings' means; and it was through exaggerated reports of the richness of the deposits at Big Trees Gulch, Colorado, that I joined in the rush to that place. Like every other mining speculation I had tried—and I had tried many—this was a sad disappointment to the great majority. About one miner or one associated group in fifty, did well, and about one in fifty of these lucky ones had sense enough to keep their gains. Their comrades squandered all;

while the herd of unlucky ones toiled from early to late, at the hardest and most unpleasant work imaginable, for the payment of an ordinary mechanic in the cities—often for no payment at all. I had left tolerable prospects and a good home in England, against the advice of my friends, to make my fortune, by a short cut, in the gold-fields of the West; and, lucky or unlucky, shame prevented me—as it has prevented many prodigal sons before me—from acknowledging my error, and going back.

At our camp—we called it a 'city' in the columns of the *Big Trees Banner*—there were not a score of even wooden houses of any pretensions; tents, and ill-built huts or shanties, not good enough for stables in civilised countries, lodged our population. Such was the city; while we had in our community a fair share of the ruffians and bullies that are usually found on the frontier, or at the mines of the West—men of whom we read in the pages of divers writers, who would fain persuade us that there is something droll and joeular in the manners of these roughs, and a good deal of amusement to be found in their companionship. I have been much in the neighbourhoods where they are found, and never knew any general feeling beyond fear, dislike, and even disgust to be felt for such men. In these sentiments I was a thorough sharer, and yet late so ordained it that the worst and most notorious of the whole crew—Arizona Dan—became my most intimate chum at Big Trees. I was trusted by him, and was with him in his last illness.

I had not been long at the town, where I was doing but badly, yet had of course heard all about the most prominent rowdies of the community, and among these, Arizona Dan was pre-eminent. He had acquired this name, not from his being a native of the territory, but because he had killed two men in the same evening at a mining camp, there. I had seen this hero, but had not come into contact with him, or his partner, Five Ace Jemmy, a man still more disliked and dreaded than his bolder associate. Every man in the camp had a sobriquet. This partner was more of a gambler than fighting rowdy, although he was credited with several homicides, and suspected of several others. The general disbelief in his fair-play may be traced in his nickname.

One night I was returning to the town from an outlying camp where I had been inspecting a claim which was for sale, when a storm broke upon the district with a suddenness only seen in mountain regions. At first, there was no rain, although, ere long, a tremendous deluge descended; but the thunder and lightning were almost continuous, for before the last sullen murmurs of a peal had rolled into silence among the distant peaks, another crash would burst. Then the lightning perplexed me more than the darkness. The track which I followed was

rocky and broken, with abrupt unguarded descents on one side, which were almost precipitous. I knew the road, however, and hurried on. I had arrived almost at the end of the worst piece, when there was a brief lull in the roar and blaze of the thunder and lightning. This lull was followed by the deluge of rain I have mentioned, and with still heavier peals of thunder, but, in the brief interval, I thought I heard a groan. I was startled. Although not superstitious, there was something which seemed unearthly in the sound, and my first impulse was to hurry from the spot. It was repeated, however, and was too plainly the moan of a human being to allow me to leave without trying to find out from whom it proceeded. I moved cautiously to the side of the road whence the sound had come—for the ground was especially treacherous there—and leaning over the rocks, listened intently. As I did so, with a rush and a roar little inferior to the thunder itself, the first burst of rain fell; and a flash of lightning which bathed everything first in yellow, then in blue, and then in white light, showed every object as clearly as at noonday; and I saw, lying in a pool many feet below me, half covered by the water, the figure of a man. He had apparently fallen over.

The town was a mile distant. I could not hope to reach it and return with assistance in less than half an hour, and before that time, the dry gullies and fissures in the rocks would be flooded, and the pool where the miserable man was lying would be broadened and deepened, so that he would be drowned to a certainty. There was no alternative then. I crept carefully down the rugged face of the rocky bank, and half guided, half dazzled by the lightning, and almost beaten from my hold of the rocky points by the rain, I reached the water, and was able to find the man. With much difficulty I dragged him from the pool, into which half a score of small but angry torrents were already rushing, and then I saw that he was, or had been bleeding from an ugly cut on the scalp, just within the hair. I assumed that he had fallen down the precipice, and that this injury had stunned him.

I drew my flask from my pocket, and poured a few drops of whisky between his lips. The man eagerly sucked in the drops, drew a long breath, and showed signs of revival. I put the flask again to his mouth; again he eagerly sucked in the minute dose, and then, to my amazement, ere I could withdraw the flask, he thrust out his arm, clutched the vessel, tilted it almost upright, and took such a draught as would have choked me, and which, on the part of a man so nearly dead as I thought him, was nothing short of marvellous. When he ceased his draught, he drew another long breath, and looking at me, as a fresh flash lighted up the scene, said: 'Stranger, I reckon you have saved my life. Was I in that pool?'

'Yes,' I replied; 'you were insensible. I thought I heard a groan, and by the lightning I saw you, as I went along the track.'

'And you got down those rocks, in such a storm as this, stranger? You are real grit. But I won't talk now. I am Arizona Dan,

who never forgets a friend or an enemy. But I feel a kind of giddy and cold; so help me up, stranger!

We found an easier path a little way on; but the gully in which we stood was so rapidly becoming flooded, that we were ankle-deep in water, although we knew our path, and picked the best places. Dan noted this, and said: 'The water will be six feet deep in that pool before this storm is played out.'

This was the commencement of my intimacy with Arizona Dan, who, as I supposed, had fallen over the rocks from missing his way in the darkness, or from an excess of whisky, to which he was addicted. He recovered quickly from his injuries, but not from his immersion in the pool. How long he had lain there, he did not himself know, but it was long enough to give a chill to his system, from which he never thoroughly recovered.

He insisted upon my telling him who I was, and where to find me, before we parted; and he came to my claim the next day. I thought he would have forgotten all about me; but I was mistaken in so supposing. With the snapping on his brow, and two or three ugly bruises on his face, he looked more truculent and dangerous than ever. He took me off to the *National Eagle Saloon*, our chief place of refreshment; and here he presented me to the assembled company, whom he addressed as 'the boy,' saying that this was his best and firmest friend, Thomas Lester, who had risked his own life to save the speaker's; and that if any man who heard him wished to do him, Arizona Dan, a good turn, and show him off his friend, he must be a friend to Thomas Lester. On the other hand, if any man wanted a fight, with or without notice, I could have it by saying a wrong word of Thomas Lester, or looking at him in an insulting manner. To show he was in earnest, he would stand refreshment all round; and if there was any man there who would not drink with him, let him come forward. Every man drank, and I believe every man shook me by the hand.

I was rather embarrassed by this public laudation of my merits, yet the annoyance was not without some counterbalancing good. I was by no means one of the 'shoot-at-sight' class, and the openly proclaimed champion-ship of such a man as Arizona Dan meant a good deal in the way of protection. This I felt at the time; but I was not prepared for what followed. After the ceremony at the saloon, Dan desired my company at his claim, and thither we went.

His first object was to introduce me to his partner, Five Ace Jenny, to whom I took an immediate and quite mistle-like dislike. There was about this man none of the roughness which marked not only Arizona Dan, but nearly all the miners, myself among the others. In lieu of his face being covered with an unshorn beard, in which whiskers and moustache were mingled, his small peaked black beard and moustache were as neatly trimmed as though he had been a resident in London or Paris. His hair, too, was smooth and orderly; but with all this there was—or I fancied it—a sinister look about his narrow black eyes, which would have spoilt far handsomer features than the lean crafty face of Five Ace Jenny could boast.

'See here,' began Arizona Dan, after he had introduced us to each other; 'my partner, Jenny, is going to quit this claim to attend to his other business, and I shall want another man with me. Jenny will still have a share in the workings, but not half, of course.—Now, Squire Lester, I have heard of you before, and your character is good; but if you were a perfect stranger, and the worst scallywag in the diggings, you saved my life last night, and you should be my friend. This is a big claim; we have struck a great lead, and you, Squire Lester, are coming in as my partner.'

And this was how I became a partner in the first profitable 'claim' I had ever worked, and this was the commencement of my intimacy with Arizona Dan. But for his great liking for me, which continued unabated, and induced him to defer to me in most things, and to waive some of his peculiarities in my presence, we might not have remained friends for any considerable time; but being how thoughtful and considerate he was in his way, I at last grew to like him much better.

This was by no means the case with Five Ace Jenny, who divided his time between Big Trees city and another large camp at some distance, at each of which he had established gambling saloons, which were reputed to be of enormous profit to him. He came to see us at the old claim, sometimes; but I avoided him as much as possible, which was the easier to do, as he never cared to take any notice of me, whom he regarded as a contemptible, purrlesse fellow, without enough brains or courage for either a runner or a gambler. Yet it was from him that I first learned the great change which was coming, and had indeed come, over Dan. Perhaps I was not so observant as I should be, but to me the big miner always seemed as rough, burly, and over-whelming as he had ever been. Jenny, however, coming into our hut one day when I was there alone, asked after Dan, and ere I could answer, said: 'Oh! I see him. He is talking to the boys on the Copperhead Gulch claim; I reckon I will go to him, for I want to see the boys myself. I guess Arizona Dan will never see Arizona again—not that he wants to; he is a New Jerseyman. But he will join the majority before next spring.'

'What do you mean?' I said. 'What is there wrong about Dan? He is quieter and more friendly with everybody than he has ever been.'

'No one doubts that, squire,' returned Jenny; 'but he has got the poison in him. He's a dead man. Look at him. If you had seen him three years ago, when he first came from!'—He left off abruptly, as though he felt he was saying too much, and went out of the hut, but his brief speech had opened my eyes.

I saw then how stuken were Dan's eyes, and how hollow his cheeks, while his voice, although still loud, was hollow also. My heart warned to the man now; I never had really liked him before, although I had seen traces in him of better things than those on which his unpleasant reputation was built.

We were more together, too; for this last-mentioned visit of Five Ace Jenny was to arrange for his absence during a considerable

time from Big Trees. In plain language, he had so offended the miners, that they were resolved to 'lynch' him if he did not leave, or 'vamoose the ranche,' as he phrased it. He had received a strong hint of this, and as, in such a case, even Arizona Dan's courage and prestige would not help him—would, indeed, only provide two victims instead of one—he discreetly resolved to go without further ceremony.

Five Ace Jemmy quitted Big Trees that very day. I was glad he was gone, for I had always felt a dislike of the man almost amounting to dread.

I could not help looking with increased interest at Dan on his return to the shanty, and as I did so, wondered how the change, now so visible in him, could have escaped my notice. He was so strange a man, although invariably friendly to me, that I scarcely knew how to speak to him on the subject. I thought that perhaps he had, of his own prompting, consulted the doctor—our only one. I hoped he had done so. But on seeing Dr Haken-schells—a broken-English-speaking German, much given to beer-drinking, to smoking, and to gambling, but not an unskilful or unkindly man, for all that—I found that Dan had not been near him, and that the doctor was afraid of obtruding his advice on him.

I assured the medicine-man that Arizona Dan was by no means known in private life, that he was rather of a melancholy turn than otherwise. With many polylogal oaths and international expressions, he declined to interfere, but recommended me, as a friend who had confidence in Dan's amiability, to take the matter up. This was the gist, at any rate, of Dr Haken-schells' reply.

I had already made up my mind to do this, and that very night an opportunity offered. Dan was out late, as was often the case, and I had lain down on what we called a bed, and was dozing, when he came in. In lieu of throwing himself on his own buffalo robes and blankets, as was his practice, he sat for a while over the fire, to which he added a few sticks of wood, for the nights were now cold. The blaze from these showed his features distinctly, and perhaps, by their wavering light, increased the ominous look he wore. Be that as it might, the gloom and depression in his face were such as I had never before seen, and this, added to the unquestionable ravages which disease had made, changed his expression so much, that he would hardly have been recognised by any one who happened to catch a passing glimpse of the interior of our shanty.

'Dan,' I said, at last, after watching him for some time in silence, 'you are ill. You look unhappy, too. Why do you not confide in me, or some friend? and why do you not go and see old Hirkenschebbs before it gets too late?'

Dan roused himself with an effort from his reverie, looked at me steadily for a few seconds, then broke into a short laugh, which was peculiarly bitter and unpleasant. 'Too late, Tom!' he ejaculated; 'it is too late. I have known for many days and weeks past that this winter will find rest for me at last. 'Tis high time.'

'I am sorry to hear you say so, Dan. Sorry, but not surprised, to hear you speak in such a tone of yourself. Your talk, when we are alone, is not like that of the run of the miners here; and though you have sometimes told me that I am not inquisitive, yet I have often thought that you were not always not always—'

'Not always Arizona Dan!' he exclaimed. 'No, since I was not. You would hardly think it, Lester, he continued after a pause, and in a voice and with an accent totally different from his usual style; 'yet I was once a respectable member of society. It does not seem possible, does it? Yes, I once had a home, was a law-abiding citizen—and once,' he said slowly, after another pause; and then went on with again a change of tone; 'Well, I may tell you even that, some day, but not now. I am glad I have you for a friend, Tom; it will be some comfort to have an honest man about me when I die.'

'Die!' I exclaimed, with a laugh which was far from being real; 'we will talk about dying when we are a score of years older, when'—

'Don't drop into that false and useless style, Tom,' interrupted my companion. 'I am doomed. I know it; and I think you know it. We will talk more another day; for to-night, I want to sit and think of the past. This is somebody's birthday.'

Of course, after this I was silent, and at last fell asleep; but as long as my eyes were open, I saw Arizona Dan sitting and brooding moodily over the fire.

This conversation had broken the ice between us as regards the past; and as Dan grew weaker, which he did from day to day, he seemed to rely more on me and cling more to my society. At last he fairly broke down in strength, so that he could no longer go to the claim, and it was plain that the end drew near. At his wish, I sent for Five Ace Jemmy; but the latter had moved on to some more distant town, and although my message was forwarded, it was not likely that Jemmy would be with us very soon.

'I hope he comes while I am alive,' said Dan; 'if he does, I will speak my wishes before some of the best men in the city; and Five Ace Jemmy must abide by them. If not, he will cheat you, Lester, and would not mind killing you, to help him in it; for he is a dangerous man.'

I had known that intuitively, from the first time I spoke to the gambler; but I soothed Dan as well as I could by the conventional utterances about hoping for the best and so forth. Dan smiled sadly at these shallow consolations, and then turned away to dose.

One night, however, he had not spoken in his usual manner, had indeed scarcely spoken at all, and I thought he was sleeping. I knew, too, the time was at hand when he would not wake from his sleep, and this final slumber might come at any time, might even be now, so I was revolving many chances and changes in my mind, when suddenly Dan sat up in bed and exclaimed: 'Are you awake, Lester?—I see you are,' he continued, as I moved in answer. 'I have made up my mind to tell you something of my life. I thought I would go with my history untold,

as I could do no good to any one by revealing it; but I feel an irresistible longing to speak freely to some one, and my strength will not hold out many days longer. So come over here, and Arizona Dan will tell you who and what he was before he became the bully and ruffian you have known him; of what he was, when no one foresaw in him the whisky-drinking rowdy of the mines.

I sat and listened. His story would perhaps interest the reader, as all such histories of decline and ruin have a painful interest and moral in them; but there was nothing very new. The fault was all on his own side; that was plain enough from his narrative; nor did he seek to disguise it, or to excuse himself in the least. Yet he said he had not told me all, perhaps not the very worst; he lacked courage to do so then; on another day he might have more nerve.

My heart ached for him when he told me what he had lost, what harm he had done, and spoke with such bitterness of his pre-cut condition. He detested his confederate, Five Ace Jemmy; but it appeared that they had known each other in the past, and that the bond between them was the bond of evil-doing then, strengthened and forged afresh by much of the same kind since. He sent no messages, urged me not to try and find out those who knew him, although he told me his real name. It would be better, he said, that nothing should ever be heard of him by those to whom his name could only bring painful recollections, shame, and distress. Although he manifested some shame for me which had marked our intimacy. I hardly like, for fear of appearing egotistical, to say why this was so, but he fancied I was a better and honest man than perhaps in reality I am, and so he liked to have me about him.

On the next day, Five Ace Jemmy arrived; and Dan must have arranged all beforehand, for Jemmy's appearance was evidently a signal which called together eight or ten of our most prominent citizens, men who could command ten times that number of rifles; and in their presence the fast-sinking miner dictated his wishes, and explained the share Five Ace Jemmy had in the claim and other property. It needed no great penetration to see that this was very unpalatable to the latter; but there was no help for it. He was only there on sufferance, and no fraudulent pretences were likely to find favour with the leaders of Big Trees society.

The settlement was none too soon; Arizona Dan died that night, my hand clasped in his; and by his death I became immediately a rich man, for he had left me wealth of which I knew something, as his mining claim was a valuable one.

'Five Ace has gone,' said Squire Hape, one of our dignitaries; 'and it is well for you, sir. That is so. If he could or dared have stayed in this city, your gold dust and your greenbacks would have benefited you but little. And if I was an insurance agent, I wouldn't have accepted your life at no figure. No, sir, I would not.'

That Jemmy was quite capable of the desperate acts the friendly speaker hinted at, or

any other atrocity, was shown soon after by an audacious robbery of the mail, when an unusually valuable consignment was in transit; and there was every reason to suppose that this was arranged by the gambler.

SLEEP-WALKING FREAKS.

It is now some thirty years or more since I began life as a commercial traveller. During my travels on the road I have both seen and heard much that would make the poor penned-up citizens open their eyes with wonder. To those who are of active habits, and to whom the trammels of office-work would prove irksome and unendurable, the life of a commercial traveller appears all that could be desired. To me, its greatest attraction consists in the never-ending change of scene and society it entails. Every day one comes in contact with strange faces, makes short but pleasant acquaintances, and is enabled to study character in its ever-varying forms.

It was on one of my first journeys in the Midland counties, that I found myself compelled, one wet, disagreeable afternoon, to cut short my day's work and to put up at the only inn worthy of the name of which the village could boast. Fortunately, the host proved a homely, sensible fellow, ready to do all in his power to render me comfortable, so that my regret at being forced to take refuge in such an out-of-the-way place soon disappeared. After having, at my hunger and finished what was left of my dinner, I repaired to the parlour, to see what was going on, for I thoroughly enjoy a chat after my day's work, and soon manage to get on friendly terms with those whom I may meet. On this occasion there were but four persons present when I took my seat and lighted my pipe. One was a ruddy-faced countryman, enjoying his mug of ale; another, a gentleman-farmer in the neighbourhood; the third person present, a doctor from London; and the fourth, a shabby-genteel-looking individual with a dissipated look, whom I afterwards learned was the son of a neighbouring clergyman.

When I entered, the conversation was upon the crops and local matters of which I knew little or nothing. By degrees I turned upon other questions, such as politics, upon which I was enabled now and again to offer an opinion, till, insensibly, I had worked my way into the little conclave and was thoroughly at my ease. Naturally, seated as we were round a comfortable fire, with soothing pipe and cheery glass, we felt on the best of terms with all the world. Anecdotes and stories of all kinds were narrated by each of us in turn, varied occasionally by personal remarks, banter, and repartee, which only tended to increase our good-humour. Our worthy host, who had a fluent tongue and an unflinching fond of anecdote, was in the midst of narrating some hunting experiences, when a cry of alarm—it was hardly a shriek—caused him to break off suddenly and make his way to the passage. Our curiosity, being aroused, we followed him more leisurely, to learn whence the cry proceeded. In the hall we found the explanation. The host's wife had been surprised by finding one of her children seated at the foot of the stairs in his

night-shirt, endeavouring to lace up an imaginary pair of boots, with the intention apparently of going out. The boy was afterwards induced to return to bed, and we on our part resumed our seats in the parlour.

This little incident caused our conversation to turn upon sleep-walking, and many were the theories advanced as to the origin and cure of the infirmity. Our host informed us that his son had on one or two previous occasions walked in his sleep, but could hardly be considered a confirmed somnambulist. The family were one evening having supper, when they were startled by the youngster suddenly walking in, in his night-dress, and then going to the chimney, where he strove his best to get up the chimney. But the freaks of this youngster were not to be compared with those of a school-fellow of the clergyman's son above mentioned, who narrated to us the story of the really remarkable feats performed during his sleep. Incredible as the story may appear, I have every reason to believe that the facts were by no means exaggerated; but of this my readers can judge, as I will repeat the narrative to the best of my ability as I heard it.

'I was educated,' said the clergyman's son, 'at a grammar-school near Leeds, and among the boys was the son of a wealthy farmer in the neighbourhood. Young Buckridge was dull and incapable of learning. All his thoughts seemed to centre upon the horses and cattle he had left, and his only wish was to be able to leave his books and return to his former playmates on the farm. It was both painful and irksome to him to prepare his lessons, for he could never retain anything long in his memory, although he might have laboured for hours to master his task. In spite of every encouragement on the part of the master to brighten up the boy's faculties, no sign of improvement could be seen. He seemed to become daily more wearied and tired of the disagreeable struggle he had to maintain to prepare his lessons. This state of things went on for some time, when suddenly an inexplicable change became manifest in the manner in which Buckridge prepared the tasks he was set. He who had been the dulllest and most callous of scholars, suddenly became one of the most correct and perfect in the school. Formerly, he had been unable to struggle through his exercises, but now they were found to be carefully written and almost faultless. How he managed it was a mystery. During the day, he seemed as listless and inattentive as ever. He did not curtail his hours of play, neither did he give a minute more to study than formerly. The key to the enigma was at length discovered by an accident.

'In a room adjoining the dormitory where Buckridge slept, one of the junior masters used to sleep; and one night, fancying he heard a noise below in the schoolroom, he rose to see whether any one had broken into the house. Stealing quietly down-stairs, he peeped into the room and caught sight of Buckridge with a lighted lamp in his hand. Seeing that the boy was evidently asleep, he was led by curiosity to watch his movements. Buckridge walked to his desk, took out his books, arranged them in proper order, and began to study. The master, thinking it was a trick on the boy's part, shook

and pinched him repeatedly, but without avail. The boy was insensible to everything. Having gone through all his lessons and mastered them, he walked up to the principal's desk and went through his imaginary examination with ease. The master informed the principal of what he had seen, and it was decided to watch his performance again the next night. Again the boy rose, stole stealthily down to the kitchen, lit a lamp, and repaired to the schoolroom. Here he once more opened his desk and prepared his lessons, with the addition of writing out an exercise. This finished, he walked up to the master's desk, where he repeated his lessons accurately in their proper succession. He even answered correctly several questions the master (was supposed to) put to him; and having passed through the ordeal, he returned with his lamp to the kitchen, and finally found his way back to bed.

'On being questioned next morning as to how he managed to become so perfect in his lessons, he declared he could not say, for it surprised himself. That his sleep was real, was undoubted, for he knew nothing of his nightly wanderings; nor was his vision affected when a strong light was held up close to his eyes. There can be no doubt that the worry attending his studies had preyed upon his mind, and his brain was still affected by the excitement and anxiety they caused him, even when his physical sensibilities were dulled by sleep.

This story was listened to with keen attention by the small knot of interested listeners, and it was apparent at the close of the narrative that there was an inclination to doubt the veracity of the narrator. But whatever doubts we may have entertained speedily vanished when the doctor, a good specimen of the old-fashioned courtly English gentleman, ventured to observe that he was perfectly satisfied in his own mind of the genuineness of the story, for he had once in his own experience met with a case offering quite as many remarkable points as that we had just heard described. He was, he remarked, perfectly ready and willing to narrate the details of the case, if we cared to be troubled with a second narrative. Being assured that we were all eager to learn the particulars of his story, the doctor at once began:

'It was one Sunday evening in October that I received an urgent summons to go round to see a lad in the employment of a butcher close by. Apparently, the lad had caused great alarm by his extraordinary behaviour. It seems that he had sat down in a chair during the evening and dropped asleep. Presently, he started up, went for his whip, put on his spurs, and proceeded direct to the stable. The saddle not being in its usual place, he returned to the house for it, and being asked why he wanted it, he replied, to go his rounds. Returning to the stable, he mounted the horse, without a saddle. As he was powerfully made, it was only after considerable struggling that he was forced from the horse and taken indoors. At this moment I arrived upon the scene. The boy apparently seemed to think himself stopped at the turnpike gate. Taking sixpence out of his pocket, he held it out to pay the toll, and demanded the change. The sixpence was returned

to him, when he stated he wanted no nonsense, but his change. Threepence-halfpenny was then handed to him. "None of your gummion—that is not right," was his immediate reply; "I want a penny more"—making his proper change. This being given him, he made the motion of whipping and spurring his horse on. Being yeld down on his chair by force, he peremptorily ordered us to get out of his way and to let go his horse, or he would soon make us. He again spurred his steed, apparently to make it restive and to kick, crying out to us "to let go its head." Being afterwards taken into the shop, he was asked what orders he had taken. He then proceeded to go through the list of the customers, stating what each had ordered, naming rump steak for one, shoulder of mutton for a second, leg of lamb for a third, and so on. Ordered to clean the shop, he at once tucked up his sleeves preparatory to executing the order. It was only by main force that he was prevented.

"Thinking there might be some trickery at the bottom of his extraordinary conduct, I suggested that a good thrashing might teach him better manners. Several heavy strokes from a riding-whip were then laid across his back, but failed to cause any impression. After certain other measures had been adopted, he woke up with a start, being quite at a loss to understand the scene around him. He could not be persuaded that he had been doing anything but sleeping, and it was evident that he was perfectly unconscious of what had passed. He recollected very well several things he had done just before he fell asleep, but after that all was blank. His eyes were several times forced open during his trance, and the pupils contracted and dilated, but his vision was unaffected. When I first saw him, his pulse was one hundred and thirty-six, full and hard; but afterwards it sank to eighty, with a slight perspiration on his forehead. I afterwards learned that he had shortly before been attacked by fever, which had affected his head.

"Strange and unaccountable as this story may appear, I can assure you that it is not a solitary one, for I have been called in to attend many other cases of somnambulism, though none were so pronounced and striking as that which I have just described."

These cases, as dreams also do, that our mind can do by no means torpid during sleep; and it is curious that persons who are of such habits should be able during sleep to do such things, and to accomplish so many marvellous feats, from which they would shrink with dread when not under the influence of sleep.

AN INCIDENT IN A NATIVE REGIMENT.

THE sentry who perambulated in front of the Quarter-guard of the 106th Regiment of Bengal Native Infantry had ceased his monotonous walk for a minute to strike the brass gong, that hung suspended from a primitive-looking tripod, exactly eight times to denote the hour. Morning parade was just over, and Jack Sepoy had performed some of the most intricate evolutions laid down in the battalion drill-book with as much smart-

ness and precision as the redoubtable Tommy Atkins himself; now the time had arrived for Colonel Longley Poole to hold 'orderly-room.' The building set apart for this purpose was a small brick structure, facing the parade-ground. It consisted of a broad outer veranda, two little wing rooms, and a central room of moderate dimensions. In this latter apartment, amid jangle of spurs and clank of scabbards on the *pucca* floor, the officers now assembled. The colonel sat in state before a large table, dotted over with books and writing paraphernalia. At his right elbow stood the adjutant, Lieutenant Philson; while on either side were grouped the remaining officers, European and native, of the regiment.

"Any prisoners this morning, Philson?" briskly inquired the commandant.

"Yes, sir, a couple," replied the adjutant.

"Have them marched in, please."

In a few seconds two sepoy stood facing their commanding officer. With a hand beside him, as a guard, a file of men, all with naked bayonets—

The more strolling-looking of the prisoners, a *naek* (corporal) named Luchman Singh, was well worthy of notice. A shade or so fairer of complexion than the ordinary Hindin, he seemed quite six feet in height; and though rather slender of frame, was well and compactly built. A profusion of dark hair, consisting of beard, moustache, and whiskers, grew on his face; this was carefully braided to right and left, and munching behind the ears, was drawn upwards and securely stowed away under his *chola* or turban. As he stood there, neat, snappy, athletic, in his smart capardal uniform, he looked the embodiment of an active and daring oriental soldier. Scanning him more attentively, however, one detected a latent fierceness in his blazing black eyes, and an unpleasantly unusual expression on his handsome features.

Colonel Poole held the cross-sheet in his hand, and translated the charge aloud into Hindustani. The offence, which it was unnecessary to specify, was a gross one; and the listeners knew if the trick were found guilty, he would, at the least, be expelled from the regiment with ignominy.

There was an instant's pause, then followed the question: "Well, Luchman Singh, what have you to say to this charge that is brought against you?"

The man's answer in Hindustani came promptly: "It is entirely false, your Worship."

"Bring forward your evidence, Philson," said the commandant.

The witnesses, who were waiting without in the veranda, were duly summoned and heard; among them was Sher Singh, the *subadar* (native captain) of the prisoner's company. From their testimony it became apparent that the case against the naek was well-nigh overwhelming.

Once more Colonel Poole addressed him: "You have heard the evidence, Luchman Singh; what have you to urge in your defence?"

"Sahib," said the accused boldly, "I am a man of high caste, a Rajpoot; wherefore should I commit this great crime? It is a conspiracy to dishonour me—to ruin my life, and Subadar

Sher Singh is at the head of it. He has always been my enemy. As for the evidence, it is an easy matter for one in his position to suborn men as false witnesses. Moreover, am I not a naïck? and hasn't he a nephew in the ranks, on the lookout for promotion—?"

"Hold your tongue!" broke in Colonel Poole sternly. "These insinuations will certainly not benefit your case, but the contrary. As, however, it will be out of my power to punish adequately such a crime as this, I have resolved to have you tried by a general court-martial; you had therefore better reserve your defence."

Next, the inquiry relative to the second prisoner was proceeded with, and he too was sent down for trial. Both the men were then ordered out. The sepoy, who was only a private, was marched back to the Quarter-guard for confinement; while the naïck, being a non-commissioned officer, remained as heretofore under arrest—that is, with his honour not to leave the lines of his corps; otherwise, he was free.

At the time I write of—some ten years ago—the 100th Native Infantry were quartered at Barrabad, in the North-western Provinces of India, and Colonel Langley Poole had only recently been appointed to the command of the regiment. He was a stout officer, very erect of figure, and extremely neat in his apparel. There was, however, one portion of his attire to which the colonel paid especial attention—this was his boots. It was a pet weakness of his to be always well and elegantly shod. Now, it so happened, that on the day previous to the orderly-room scene I have just described, he had received a pair of new dress-boots from a certain well-known Calcutta tradesman, with whom he had dealt for several years past, and, as far as appearance went, the articles left nothing to be desired; but it still remained for Colonel Poole to see if they fitted. From previous experience, however, he had but little doubt of this, and he intended to wear them to dinner that evening. When, accordingly, about half past seven, he strolled over to mess, he was surprised to find that they were tight and uncomfortable. But it was too late to change, and of course he could bear the discomfort for a couple of hours or so.

Here, leaving the officers at dinner, I must, for the clear comprehension of the story, say a few words respecting the situation of the mess-house, both as regards the lines of the regiment and the commandant's bungalow. The latter was a commodious building, standing in the midst of a large compound or enclosure, and facing due east. The house was, so to speak, a corner one. A good metalled road ran outside the front wall of its grounds, and met to the south a similar one at right angles. Turning down this road, the mess-house was the second building on the left-hand side; hence it lay to the north-west or left-rear of the commandant's bungalow. By this way the distance between the two houses was about four hundred yards. There was, however, another and considerably shorter route, which Colonel Poole almost invariably used. This passed through his garden at the back, then through a gap in the enclosure-wall, skirting along the rear of the intervening compound, and so on to the mess-house. It was a mere path, full of inequalities and stony;

nevertheless, it was a great convenience. As for the lines of the corps, they lay due north of the mess-house, and were about half a mile from it.

Evening twilight had deepened into night, and a young moon, gliding slowly towards the horizon, was shedding a ghostly radiance over the country, when across the broken ground above mentioned there lifted a dark shadowy figure, holding in its hand something that gleamed and glittered in the waning beams, and which a closer view would have revealed as a naked tulwar. The figure passed stealthily yet swiftly along the path that led to the colonel's bungalow, and just entering the compound, crouched behind the mule-enclosure, as if in ambush. An adjoining neem-tree cast its black shadow over the spot, adding to the gloom, and in a measure screening the intruder from the eyes of the inmates of the compound.

Meanwhile, at the mess-house the officers had risen from dinner. Colonel Poole was longing to get quit of the too fervent grip of his brand-new boots, for, as may be imagined, the passing hours had in no degree abated his sense of discomfort. But the walking home over the rough, stony track would be purgatory, and it required something of an effort on his part to make a start. At length, about ten o'clock he got up with the intention of moving homewards. Leaving the mess-house, as he descended the last step he slightly miscalculated its height, and the unexpected jar sent a thrill of pain through the imprisoned limb. "Bother these wretched boots!" he ejaculated irritably.

By good luck, the adjutant happened just then to be smoking in the veranda. Noting his chief's discomposure, he said: "But, colonel, why need you go by the path? Along the *pacca* road is, perhaps a trifle further; but, on the other hand, it is smooth and even, and you will escape all chance of jerk or jar."

"Capital suggestion that of yours, Philson," replied the commandant. "What creatures of habit we are, to be sure! Somehow, I thought it incumbent on me to return by my accustomed route; but I'll take your advice—Good-night." Saying which, he wheeled slowly towards the broad level road. In process of time he passed into his grounds by the wide gateway, then quietly and gingerly up the carriage-drive, and so entered the building. Immediately on his arrival, the whole house seemed to wake up; the lamp-lights were raised; servants began to stir; and his beaver, an old and valued retainer, stood ready to proffer such service as might be required of him.

At this moment, a succession of shouts from the *chokedār* or night-watchman created some excitement. "Hillo! who's that? Who is running away there?"

"What is all this clamour about?" asked the colonel.

The *valet* slipped out to inquire; presently he returned. "A man was peering into the house from behind the big neem-tree," he explained; "and the *chokedār* thinks he was armed with a drawn sword; but as soon as he was challenged, he disappeared."

"The *chokedār* must have awoke suddenly from nightmare," said Colonel Poole dryly. Having partially undressed, he seated himself in

his most comfortable chair, while the bearer gently and delicately released his imprisoned extremities. Next thrusting his feet into a pair of handsome slippers, he lighted his pipe and took up a book, as it was much too early yet to think of sleep. In this way half an hour or more must have elapsed, and the colonel was considering whether the time had not now arrived for him to retire to bed, when he heard the rapid rush of many feet outside, and a subaltern of his, named Knowles, broke suddenly into the room.

'Colonel,' he gasped, breathless from excitement and running, 'Luchman Singh has run riot through the regimental lines. He has killed Subadar Sher Singh, and wounded several other men!'

'Take a good breath, my dear fellow, then tell me quietly all that has occurred,' said the colonel calmly, but even as he spoke, he commenced slipping on a pair of walking-boots.

'Indeed, sir, there is not much else to tell. A few minutes ago, the subadar-major in great haste sent Havildar Ahmed Khan—the man is waiting outside—to the mess-house to report that Luchman Singh had given way to homicidal mania, and had cut down Sher Singh with a tulwar, and injured two or three other sepoy. But you yourself have had a narrow escape, colonel!'

'What on earth do you mean, Knowles?' demanded the colonel, looking up in astonishment.

'Havildar Ahmed Khan says'—began the sub.—'Ho! Ahmed Khan, come in!' interrupted the colonel.

The man entered, the bearer following him; the two had evidently been exchanging confidences in the veranda.

'The havildar says,' resumed the sub., 'that just before the attack attacked the subadar, he was seen returning from a prowl over the bit of broken ground behind this bungalow of yours.'

Here the bearer, who had evidently caught the sense of the conversation, said in a low voice: 'Hazoor, a while ago, a man with a drawn sword was lurking behind the big neem-tree near the gap in the compound-wall; the night-watchman will swear to it.'

For an instant the colonel looked startled; the two accounts dovetailed and supplemented each other so curiously.

'Gracious powers!' he exclaimed, drawing a long breath, 'can it be possible that but for my returning home by the road, I should ere this have been foully murdered!' He paused a second, then hurriedly completing his toilet, strode swiftly out of the house, and, followed by Lieutenant Knowles and the havildar, made for the scene of the disturbance.

'I suppose Philson started for the lines as soon as he heard of the occurrence?' inquired Colonel Poole. 'Had the man been captured?'

'Not then, I believe,' answered the sub. 'They must, however, have made a prisoner of him by this time.'

And so it proved; for, on entering the regimental lines, the commandant was met by the adjutant, attended by a posse of native officers. They informed him that the consternation and

excitement consequent on the crime had in a great measure subsided, that Luchman Singh had been taken after a desperate struggle, and was now secure, a prisoner in irons; that he was probably under the influence of *blang* or some kindred intoxicant, for he had raged like a madman, raving incessantly of the wrongs and indignities he had been made to suffer, and asserting that the whole regiment, from the commanding officer downwards, was in league to ruin and destroy him.

It appeared he had intended, in the first place, before wreaking vengeance on lesser victims, to cut down the colonel as he returned from mess; but through (to him) some inexplicable circumstance, the latter had evaded him by coming home by the high-road. Being balked in this, he at once proceeded to carry out the second portion of his plan, by killing Sher Singh, and wounding as many of his friends and acquaintances as had endeavoured to seize him.

Next morning, Naick Luchman Singh was handed over to the civil authorities, by whom he was in due course tried and executed.

THE INDIAN'S PRAYER.

The Indian prays for his people, and for his country, and for his king, and for his God.

Falls the evening o'er the forest,
And the sun behind the trees,
Tinges all the leaves with crimson,
As they flutter in the breeze.

Swiftly flows the sacred river,
Dashing with the glowing night;
Fires flash across the water,
Little streams of lustrous light.

Through the tangled forest ere long
Comes a soft-eyed Indian maid,
With a leaf-boat, that, fire-freight, it,
Sends a halo through the shade.

Now upon the sacred river
Launches she the little boat,
And the wind and water playing,
Hurry to the lamp aloft.

Till the wavelets, lapping, lapping,
Tinkle o'er the tiny leaf,
Indian maiden, watching, watching,
See, thy bark has come to grief.

For the flickering gleam has vanished,
On the dark in wintry air,
Leaving on the river, darkness;
Leaving in thine heart, despair.

All the dreams thy young heart cherished,
All the hopes thou lovedst so long,
Shattered—for the sacred river
Never gives its omens wrong.

Morning dawns across the river,
Bearing seaward on its breast,
Here, a leaf, and there, a maiden;
And the maiden is at rest.

AMONG THE SINAI MOUNTAINS.

MOUNT SERBAL is one of the most distinct landmarks in the Sinai peninsula. Standing by itself eight thousand feet above sea-level, its lofty peaks are distinguishable from a great distance. By some it has been thought to be the actual Mount Sinai. It is a very magnificent mountain, and being isolated, has perhaps a more imposing effect than some of the others—Um Shammur and Katrima, for example, which are really loftier.

Our caravan had encamped at the fertile oasis of Feraa, after a seven days' journey through the desert. About a mile through a wild-looking valley, Wady Aleiyat, roughly strewn with rocks and boulders, we came to the foot of Serbal. Here, dismissing the camels, our dragoman produced the luncheon-bag, not, it must be confessed, a very wise proceeding for the commencement of a climb. We had, in fact, rather underrated the difficulties of the ascent, and being shod with thin boots, and carrying umbrellas in place of alpenstocks, as one looked up at the shining and apparently perpendicular peaks, it seemed rather a heavy contract. Our guide was a morose-looking Bedouin, named Hassan, who gazed wonderingly at us while at luncheon, and exchanged a few words with the dragoman Raad, informing him that the mountain belonged to him. At the entrance to Wady Aleiyat, Raad had already had a row with a Bedouin concerning *backshesh* before we should go on 'his mountain'; but Hassan's claim was disposed of by a few stones thrown at his head, while the dragoman facetiously bade him 'take his mountain then.' However, he proceeded to 'guide' us after his own peculiar fashion, which consisted in his advancing rapidly before us till he was out of sight, and then sitting down for a comfortable smoke till we came up and discovered him.

Our path at first lay over a mere incline, filled with large boulders, till we came to a steep ravine between the peaks through which we were to

make the greater part of the ascent. This part of the climb was very fatiguing. Huge blocks of rock some nine or ten feet sheer had to be surmounted; while treacherous stones and shifting sand had to be carefully guarded against, and the danger of dislodged rocks was a continual source of anxiety. The peak itself was the least difficult part of the climb, although from below it seemed, from its smooth and shining sides, to be quite unpracticable. As we ascended, the view became very grand and impressive, and the air was perfumed with the odour of wild thyme and other sweet herbs. It was not much more than an hour to sundown when we reached the top of Serbal; and the view certainly repaid our toil. Um Shammur, the monarch of the Sinaitic range, alone seemed to compare with Serbal; the other mountains all appeared dwarfed, but marked as distinctly as on a map. The greater part of the peninsula was spread out beneath us, the view on the north reaching over the Debbet or Ramlah to the dreary desert of Tih; on the south, the deep blue of the Red Sea merged into the darkness of the African coast; on the east, lay the mountains of Tûr Sinai, properly so called, Katrima Suksafah Mîsa; while westwards, the Rahali range, and the whole course that we had travelled from Egypt, lay before us.

But the rapidly declining sun warned us that we had no time to linger, and we commenced the descent, which, easy enough while the sun remained above the horizon, became very difficult afterwards. Before we had accomplished a fifth part of the descent, we were in darkness. There would be no moon till midnight; and the darkness was deepened by the shadows of the peaks on either side of the ravine. To remain on the mountain till daybreak was our first thought; but we were parched with thirst, and Hassan said he feared to go down by himself to bring us some water. This was accounted for by our having come across the remains of an antelope at the top, that had evidently formed a recent repast for either leopard or wolf. There was

nothing for it but to find our way down as well as circumstances would allow, though now a slip of the foot or the loosening of a stone meant broken limbs—perhaps worse. Slowly we toiled along in the deep darkness; we shouted, if perchance we should make them hear the echo down below; we lighted fires of the mountain brushwood, partly to light our steps, partly in the hope of attracting the attention of the camel-men. Overhead, the stars shone brightly, only to make the darkness about us more complete. The thought of the hours that must go by before we could possibly get any water served to increase the terrible thirst. Sometimes a rock would be dislodged, and go leaping and crashing down the mountain-side with an appalling sound. As we approached the bottom, we saw a light in the distance, upon which we began to shout—that is to say, the dragonman did; and then we fired another bush. Read now pushed forward, promising to send us some water. Two of the camel-men shortly appeared with lanterns, but no water. 'Rash jebb moich!' (Run; bring us water!) we shouted from our limited stock of Arabic; and were delighted to find, from the look of intelligence on the face of one of the men, and the 'Tayih!' (Good!) with which he sped away, that he understood our wants. No nectar of the gods, no Hadesieck's monopole of the desert, no flaming Bass after a hot morning amongst the stubble, no shandygaff after a tough spin to Bartsbite or Illey, was ever quaffed with the eagerness and enjoyment with which we drank that water.

It was past midnight when we reached the camels; and after drinking half-a-dozen pannikins of water, fairly 'done up,' we rolled ourselves in our rugs, and lay down by the Bedouins' fire till the chill night-air began to warn us of colds and rheumatism and other ills; so, mounting our camels, we rode back to the camp. And here let it be told, to the infinite credit of Iskander the cook, that at half-past three A.M., dinner (!) was placed upon the table, even to dessert and coffee, as though nothing out of the way had occurred. On complimenting him on his taste, he merely shrugged his shoulders, and remarked that he 'knew we must be somewhere; that we must come back somehow, and some time; and that we should certainly want dinner whatever time we did come.' So he had gone comfortably to sleep at his usual time, having told off one of the Bedouins as scout to inform him when there was a likelihood of our turning up. And thus dinner was cooked just as usual, only rather late. O British cook of the average *maquis*, what would you have done under like circumstances? Cooked your dinner at the usual time, and 'kept it hot' for the next few hours, fretting and fuming meantime, and making yourself and everybody else very uncomfortable!

What is thought to be the veritable Horeb is a long day's march from the foot of Serbal. Jebel Mûsa (Mount Moses) and Jebel Sûsafah are also supposed to be the Sinai of Scripture. In a valley at the base of these mountains is the Greek convent of St Katherine, where the traveller is always welcomed by the monks, and supplied with guides for the various places of interest in the neighbourhood. The convent has

a fortified appearance, surrounded as it is by high walls with small embrasures, a precaution by no means unnecessary in former times, when the monks had to hold their own against the lawless Arabs around them. Till within a very few years, visitors were only admitted 'through an opening in the wall, some twenty feet from the ground, on presentation of the letter that every party is obliged to have from the convent in Cairo. This being satisfactory, a chair was lowered by chains, and you were hoisted up. Now, however, you enter by the gate, and the monks are at peace and in friendship with the Bedouins; but the doles of bread to which every Arab is entitled in certain proportions—so much for man or woman or child—is still distributed through the opening.

Aside, the convent is cut up into little irregular-shaped courts and passages and alleys—flowers and shrubs here and there, and vines trained over the walls. You pass the monks at their various tasks—one washing clothes, another sifting beans, others rope-making or carpentering, or at masons' work. They all seemed very dirty, except the Superior, and the Oeconomus, the latter of whom acts as a sort of barrister or manager of the conventual affairs. Dean Stanley spoke of these Sinai monks as being the 'sweepings of the convents' (Greek) 'of Europe'; and nobody thinks he belied them. They are sent here as to a sort of penitentiary. The Superior was a particularly affable old gentleman. He spoke French, and eagerly asked us for news of the Western world—of Germany, France, England, and, to our surprise, touched upon the current subjects of interest in each country. We were sorry we had not brought some newspapers with us, he seemed so dreadfully bored with himself and his surroundings. But perhaps, after all, this interest in Western affairs was assumed for our benefit—meant *back-breach*, in fact. He had been at the convent for about eight months, and was in hopes of leaving before the year was out. Our dragonman was informed by one of the monks that he (the Superior) was undergoing a penance of banishment for some little trouble he had got into at Jerusalem.

On our arrival, we had been shown into a plainly furnished little room, and supplied with coffee and mastic—a very nasty liqueur, made from dates; after which refreshments and several glasses of cool water from the convent well—it is only in the desert one learns to appreciate the true enjoyment of pure water—we made a round of the convent, accompanied by the Superior. The church, built by Justinian, is remarkable for a mosaic of the Transfiguration, behind the altar, with the portrait of the founder; and we were also shown the Chapel of the Burning Bush, which is considered the holiest spot in Sinai. It is very rich in silver and oriental carpets, and every one removes his shoes on entering, as in the Mohammedan mosques. The paintings and decorations of the church, as is commonly the case in the East, are tawdry and vulgar. In the library are some unregal-for, ill-bound books, carelessly thrown together higgledy-niggledy, and we were told that there were eighty chestsful more—somewhere! Mental pabulum is clearly not in much demand amongst the monks of Sinai. In a room called the Archbishop's Room, showing some traces of furniture and with secular

pictures on the walls, we were shown a copy of the Psalms of David, written microscopically and beautifully on twelve duodecimo pages; and a manuscript of the four Gospels on vellum, in letters of gold, and supposed to date from the eighth century. Here is kept a visitors' book, in which you are at liberty to give your opinion about the convent. Most people refrain from this unkindness.

The garden of the convent is a charming spot, in the midst of the rock-bound Sinai; and the gay blossoms of the almond, orange, and peach mingle well with the melancholy looking cypress and dead green olive trees. In a recess is the charnel-house, with hundreds of skulls scattered about, with bones in heaps and in basketfuls. As in the Franciscan convent at Malta, the monks have here the contemplation of what they must some day come to always before them. The Superior did not accompany us inside the charnel-house. He said he hadn't been in yet; and added significantly, that he didn't intend to go if he could help it!

On the following day, we made the ascent of Mounts Mûsa and Sûsahel. Our camels took us up Mûsa till we reached a small plateau where there was a well of water and a solitary cypress tree. Here we dismounted, visited the chapels of Elijah and Elisha, and saw the entrance to a cave said to be that in which Elijah dwelt in Horeb. The ascent—which is now steep, but rendered easy by steps of stones—brought us in about an hour to the summit of Jebel Mûsa. Here is a small chapel and a mosque, and a fine view of the Tûr mountains. On an adjoining rock, our guide pointed out to us a discoloured mark spreading over a superficies of about ten square yards, which he informed us with all gravity was 'the mark of the back of Moses.'

This guide, by the way, was a particularly unclean monk from the convent, called Emmanuel. His garbity was only equalled by his mendacity. He spoke a language in greater part Greek, but adorned by Arabic and Italian. Even Raad seemed able to make nothing of his longer stories. Every pebbly rock or tree or cairn or mound had its particular (and quite apocryphal) history; and scarcely a saint in the calendar but was pressed into his service. This sort of thing is annoying; and while one is fully impressed by the general features of Sinai, one is only wearied and disgusted with the palpable falsehood at that endeavours to give a history to every object, regardless of probability even. So it is that at Jerusalem one can regard with reverence the immovable mountains and valleys—Mount Olivet, Mount Zion, the valleys of Kedron, Siloam, and Jehoshaphat; perhaps, too, the almond and olive trees remaining stones of the Temple; while one is only moved to feelings of contempt at the localisation of events, encouraged by the Greek and Armenian priests for the deception of the poor and simple Russian and other Eastern pilgrims, to the profit of their respective churches.

We now descended, and lunched close by the chapels of Elijah and Elisha. Here the monk, surrounded by three or four little Arab boys, who had accompanied us, made coffee, and proffered some of the vile mastic, which latter we declined. Brother Emmanuel, however, helped

himself rather freely, the result of which was that although his loquacity was in no degree lessened, his articulation became indistinct and his movements somewhat erratic. After traversing some comparatively level but broken ground between the peaks of the two mountains, we ascended the steep side of Sûsafeli, and at last reached a point where the great Plain of Rahah was spread before us. We recognised what Dr Robinson calls the 'adaptedness' of this spot to the events of the scriptural narrative, and it requires but little imagination to stir up in the mind a realisation of the events themselves.

The other places of interest about Sinai do not necessitate climbing, unless you should care to ascend Jebel Katerina; but it is a long day's task, and scarcely repays the trouble. In Wady Tîr, the 'Valley of the Deir of Aibain (the Convent of the Forty), called in reference to the murder of forty monks by Arabs in the fourth century. Now, it is only occupied by a few of the dependents of St Katharine, who cultivate the gardens surrounding it. In this wady there is a plentiful supply of water from springs in the mountain-side; and there are three or four gardens rich in fruit-trees. A cubic slab of granite in which are about a dozen slits, from which the water is supposed to have gushed when Moses smote it, is pointed out as 'the Rock of Moses.' The hole in which Aaron cast the golden calf, and the mount on which he stood when 'the people danced around' it, as also the spot where Moses threw down the Tables of the Law and broke them, are all pointed out for the benefit of those who care to accept the statements of the Sinai guides.

The convent claimed three pounds for the coffee and mastic and the services of Brother Emmanuel; while the Superior was made happy by a present of tinned meats, butter, and other articles of a distinctly unclean character. The monks of Sinai are reported to live in a very ascetic manner; our experience of the chief and the brother led us to a different opinion.

With the peaks of Horeb covered with snow, and in the pure crisp and bracing air amongst these mountains, with their vastly interesting associations, an interval of three or four days may be very pleasantly passed, before again facing the scorching, shadeless desert journey.

A HOUSE DIVIDED AGAINST ITSELF.

CHAPTER XII.

FRANCES ate a most unpalatable dinner alone, after the agitations to which she had been subject. Her mother did not return; and Markham, who had been expected up to the last moment, did not appear. It was unusual for her now to spend so many hours alone, and her mind was oppressed not only by the strange scene with Nelly Winterbourn, but more deeply still by Claude's news. George Gaunt had always been a figure of great interest to Frances; and his appearance here in the world which was as yet so strange, with his grave, indeed melancholy face, had awakened her to a sense of sympathy and friendliness which no one had called forth in her before. He was

as strange as she was to that dazzling puzzle of society, sat silent as she did, roused himself into interest like her about matters which did not much interest anybody else. She had felt amid so many strangers that here was one whom she could always understand, whose thoughts she could follow, who said what she had been about to say. It made no difference to Frances that he had not signalled her out for special notice. She took that quietly, as a matter of course. Her mother, Markham, the other people who appeared and disappeared in the house, were all more interesting, she felt, than she; but sometimes her eyes had met those of Captain Gaunt in sympathy, and she had perceived that he could understand her, whether he wished to do so or not. And then he was Mrs Gaunt's youngest, of whom she had heard so much. It seemed to Frances that his childhood and her own had got all entangled, so that she could not be quite sure whether this and that incident of the nursery had been told of him or of herself. She was more familiar with him than he could be with her. And to hear that he was unhappy, that he was in danger, a stranger among people who preyed upon him, and yet not to be able to help him, was almost more than she could bear.

She went up to the empty drawing-room, with the soft illumination of many lights, which was habitual there, and which lay all decorated and bright, sweet with spring flowers, full of pictures and ornaments, like a deserted palace, and felt the silence and beauty of it to be dreary and terrible. It was like a desert to her, or rather like a prison, in which she must stay and wait and listen, and whatever might come, do nothing to hinder it. What could she do? A girl could not go out into those haunts, where Claude Ramsay, though he was so delicate, could go; she could not put herself forward, and warn a man, who would think he knew much better than she could do. She sat down, and tried to read; and then got up, and glided about from one table to another, from one picture to another, looking vaguely at a score of things without seeing them. Then she stole within the shadow of the curtain, and looked out at the carriages which went and came, now and then drawing up at adjacent doors. It made her heart beat to see them approaching, to think that perhaps they were coming here—her mother perhaps; perhaps Sir Thomas; perhaps Markham. Was it possible that this night, of all others—this night, when her heart seemed to appeal to earth and heaven for some one to help her—nobody would come? It was Frances' first experience of these vigils, which to some women fill up so much of life. There had never been any anxiety at Bordighera, any disturbing influence. She had always known where to find her father, who could solve every problem and chase away every difficulty. Would he, she wondered, be able to do so now? Would he, if he were here, go out for her, and find George Gaunt, and deliver him from his pursuers? But Frances could not say to herself

that he would have done so. He was not fond of disturbing himself. He would have said: 'It is not my business;' he would have refused to interfere, as Claude did. And what could she do, a girl, by herself? Lady Markham had been very anxious to keep him out of harm's way; but she had said plainly that she would not forsake her own son in order to save the son of another woman. Frances was wandering painfully through labyrinths of such thoughts, racking her brain with vain questions as to what it was possible to do, when Markham's hansom stopping with a sudden clang at the door, drove her thoughts away, or at least made a break in them, and replaced, by a nervous tremor of excitement and alarm, the pangs of anxious expectation and suspense. She would rather not have seen Markham at that moment. She was fond of her brother. It grieved her to hear even Lady Markham speak of him in questionable terms: all the natural prejudices of affectionate youth were enlisted on his side; but, for the first time, she felt that she had no confidence in Markham, and wished that it had been any one but him.

He came in with a light overcoat over his evening clothes; he had been dining out; but he did not meet Frances with the unembarrassed countenance which she had thought would have made it so difficult to speak to him about what she had heard. He came in hurriedly, looking round the drawing-room with a rapid investigating glance, before he took any notice of Frances. 'Where is the mother?' he asked hurriedly.

'She has not come back,' said Frances, divining from his look that it was unnecessary to say more.

Markham sat down abruptly on a sofa near. He did not make any reply to her, but put up the handle of his cane to his mouth with a curious mixture of the comic and the tragic, which struck her in spite of herself. He did not require to put any question; he knew very well where his mother was, and all that was happening. The sense of the great crisis which had arrived took from him all power of speech, paralysing him with mingled awe and dismay. But yet the old little figure on the sofa sucking his cane, his hat in his other hand, his features all fallen into bewilderment and helplessness, was absurd. Out of the depths of Frances' trouble came a hysterical titter against her will. This roused him also. He looked at her with a faint evanescent smile.

'Laughing at me, Fan? Well, I don't wonder. I am a nice fellow to have to do with a tragedy. Screaming farce is more like my style.'

'I did not laugh, Markham; I have not any heart for laughing,' she said.

'Oh, didn't you? But it sounded like it.—Fan, tell me, has the mother been long away, and did any one see that unfortunate girl when she was here?'

'No, Markham—unless it were Mr Ramsay; he saw her drive away with Emma.'

'The worst of old gossips,' he said, desperately sucking his cane, with a gloomy brow. 'I don't know an old woman so bad. No quarter there—that is the word.—Fan, the mother is a trump. Nothing is so bad when she is mixed up in

it.—Was Nelly much cut up, or was she in one of her wild fits? Poor girl! You must not think badly of Nelly. She has had hard lines. She never had a chance: an old brute, used up, that no woman could take to. But she has done her duty by him, Fan.

'She does not think so, Markham.'

'Oh, by Jove, she was giving you that, was she?—Fan, I sometimes think poor Nelly's off her head a little. Poor Nelly, poor girl! I don't want to set her up for an example; but she has done her duty by him. Remember this, whatever you may hear. I—am rather a good one to know.'

He gave a curious little chuckle as he said this—a sort of strangled laugh, of which he was ashamed, and stifled it in his birth.

'Markham, I want to speak to you—about something very serious.'

He gave a keen look at her sideways from the corner of one eye. Then he said in a sort of whisper to himself, 'Preaching;' but added in his own voice, 'Fire away, Fan,' with a look of resignation.

'Markham—it is about Captain Gaunt.'

'Oh!' he cried. He gave a little laugh. 'You frightened me, my dear. I thought at this time of the day you were going to give me a sermon from the depths of your moral experience, Fan. So long as it isn't about poor Nelly, say what you please about Gaunt. What about Gaunt?'

'Oh, Markham, Mr Ramsay told me—and mamma has been frightened ever since he came. What have you done with him, Markham? Don't you remember the old general at H—?—his mother? And he had just come home for his holiday, after years and years. And they are poor—that is to say, they are well enough off for them; but they are not like mamma and you. They have not got horses and carriages; they don't live—as you do.'

'As I do! I am the poorest little beggar living, and that is the truth, Fan.'

'The poorest!—Markham, you may think you can laugh at me. I am not clever, I am quite ignorant—that I know. But how can you say you are poor? You don't know what it is to be poor. When they go away in the summer, they choose little quiet places; they spare everything they can. That is one thing I know better than you do.—To say you are poor!'

He rose up and came towards her, and taking her hands in his, gave them a squeeze which was painful, though he was unconscious of it. 'Fan,' he said, 'all that is very pretty, and true for you. But if I hadn't been poor, do you think all this would have happened as it has done? Do you think I'd have stood by and let Nelly marry that fellow? Do you think—? Hush! there's the mother, with news; no doubt, she's got news. Fan, what d'ye think it'll be?'

He held her hands tight, and pressed them till she had almost cried out, looking in her face with a sort of nervous smile which twitched at the corners of his mouth, looking in her eyes as if into a mirror where he could see the reflection of something, and so be spared the pain of looking directly at it. She saw that the subject which was of so much interest to her had passed clean out of his head. His

own affairs were uppermost in Markham's mind, as is generally the case when a man can be supposed to have any affairs at all of his own.

And Frances, kept in this position, as a sort of mirror in which he could see the reflection of his mother's face, saw Lady Markham come in, looking very pale and fatigued, with that air of having worn her outdoor dress for hours which gives a sort of haggard aspect to weariness. She gave a glance round, evidently without perceiving very clearly who was there, then sunk wearily upon the sofa, loosening her cloak. 'It is all over,' she said in a low tone, as if speaking to herself—'it is all over. Of course, I can't come away here!'

Markham let his hands without a word. He stalked away to the front window, and drew the curtain aside and looked out. Why, he could not have told, nor with what purpose—with a vague intention of making sure that the hansom which stood there so constantly, was at the door.

'What is Markham doing?' said his mother with a faint querulous tone. 'Till him not to fidget with these curtains. It worries me. I am tired, and my nerves are all wrong—Yes, you can take my cloak, Frances. Don't call anybody. No one will come here to-night. Markham, did you hear what I said? It is all over. I waited till!'

He came towards her from the end of the room with a sort of smile upon his gray sandy-coloured face, his mouth and eyebrows twitching, his eyes screwed up so that nothing but two keen little glimmers of reflection were visible. 'You are not the sort,' he said, with a little tremor in his voice, 'to forsake a man when he is down.' He had his hands in his pockets, his shoulders pushed up; nowhere could there have been seen a less tragic figure. Yet every line of his old face was touched and moving with feeling, totally beyond any power of expression in words.

'It was not a happy scene,' she said. 'He sent for her at the last. Sarah Wintebourn was there at the bedside. She was fond of him, I believe. A woman cannot help being fond of her brother, however little he may deserve it. Nelly?—'

Here Markham broke in with a sound that was like, yet not like, his usual laugh. 'How's Nelly?' he said abruptly, without sequence or reason. Lady Markham paused to look at him, and then went on.

'Nelly trembled so, I could scarcely keep her up. She wanted not to go; she said what was the good? But I got her persuaded at last. A man dying like that, is a—s—a— It is not a pleasant sight. He signed to her to go and kiss him.' Lady Markham shuddered slightly. 'He was past speaking—I mean, he was past understanding. I—I wish I had not seen it. One can't get such a scene out of one's mind.'

She put up her hand and pressed her fingers upon her eyes, as if the picture was there, and she was trying to get rid of it. Markham had turned away again, and was examining, or seeming to examine, the flowers in a jardiniere. Now and then he made a movement, as if he would have stopped the narrative. Frances, trembling and crying with natural horror and distress, had

loosened her mother's cloak and taken off her bonnet while she went on speaking. Lady Markham's hair, though always covered with a cap, was as brown and smooth as her daughter's. Frances put her hand upon it timidly and smoothed the satin braid. It was all she could do to show the emotion, the sympathy in her heart; and she was as much startled in mind as physically, when Lady Markham suddenly threw one arm round her and rested her head upon her shoulder. 'Thank God,' the mother cried, 'that here is one, whatever may happen, that will never, never—' Frances, my love, don't mind what I say. I am worn out, and good for nothing. Go and get me a little wine, for I have no strength left in me.'

Markham turned to her with his chuckle more marked than ever, as Frances left the room. 'I am glad to see that you have strength to remember what you're about, mammy, in spite of that little break-down. It wouldn't do, would it!—to let Frances believe that a match like Winterbourn was a thing she would never—never—I though it wasn't amiss for poor Nelly, in her day.'

'Markham, you are very hard upon me. The child did not understand either one thing or the other. And I was not to blame about Nelly; you cannot say I was to blame. If I had been, I think to-night might make up: that ghastly face, and Nelly's close to it, with her eyes staring in horror, the poor little mouth!—'

Markham's exclamation was short and sharp like a pistol-shot. It was a mere villa! but not one to be put into print. 'Stop that!' he said. 'It can do no good going over it.—Who's with her now?'

'I could not stay, Markham; besides, it would have been out of place. She has her maid, who is very kind to her; and I made them give her a sleeping-draught—to make her forget her trouble. Sarah Winterbourn laughed out when I asked for it. The doctor was shocked. It was so natural that poor little Nelly, who never saw anything so ghastly, never was in the house with death; never saw, much less touched!—'

'I can understand Sarah,' he said with a grin smile.

Frances came back with the wine, and her mother paused to kiss her as she took it from her hand. 'I am sure you have had a wearing, miserable evening. You look quite pale, my dear. I ought not to speak of such horrid things before you at your age. But you see, Markham, she saw Nelly, and heard her wild talk. It was all excitement and misery and overstrain; for in reality she had nothing to reproach herself with—nothing, Frances. He proved that by sending for her, as I tell you. He knew, and everybody knows that poor Nelly had done her duty by him.'

Frances paid little attention to this strange defence. She was, as her mother knew, yet could scarcely believe, totally incapable of comprehending the grounds on which Nelly was so strongly asserted to have done her duty, or of understanding that not to have wronged her husband in the one unpardonable way, gave her a claim upon the applause of her fellows. Fortunately, indeed, Frances was defended against all ques-

tions on this subject by the possession of that unsuspected trouble of her own, of which she felt that for the night at least it was futile to say anything. Nelly was the only subject upon which her mother could speak, or for which Markham had any ears. They did, not say anything either after Frances left them, or in her presence, of the future, of which, no doubt, their minds were full—of which Nelly's mind had been so full when she burst into Lady Markham's room in her finery, on that very day. What was to happen after what 'the widow'—that name against which she so rebelled, but which was already fixed upon her in all the clubs and drawing-rooms—was to do; that was a question which was not openly put to each other by the two persons chiefly concerned.

When Markham appeared in his usual haunts that night, he was aware of being regarded with many significant looks; but these he was of course prepared for, and met with a countenance in which it would have puzzled the wisest to find any special expression.

Lady Markham went to bed as soon as her son left her. She had said she could receive no one, being much fatigued. 'My lady have been with Mrs Winterbourn,' was the answer made to Sir Thomas when he came to the door late, after a tedious debate in the House of Commons. Sir Thomas, like everybody, was full of speculations on this subject, though he regarded the subject from a point of view different from the popular one. The world was occupied with the question whether Nelly would marry Markham, now that she was rich and free. But what occupied Sir Thomas, who had no doubt on this subject, was the—afterward? What would Lady Markham do? Was it not now at last the moment for waiting to come home?

In Lady Markham's mind, some similar thoughts were afloat. She had said that she was fatigued; but fatigue does not mean sleep, at least not at Lady Markham's age. It means retirement, silence, and leisure for the far more fatiguing exertion of thought. When her maid had been dismissed, and the last night dress was all that was left in her empty room, and in her luxurious room, the question—what was in her mind—were manifold. Markham's marriage would make a wonderful difference in his mother's life. Her house in Eaton Square she would no doubt retain; but the lovely little house in the Isle of Wight, which had been always hers—the solemn establishment in the country would be hers no more. These two things of themselves would make a great difference. But what was of still more consequence was that Markham himself would be hers no more. He would belong to his wife. It was impossible to believe of him that he would ever be otherwise than affectionate and kind; but what a difference when Markham was no longer one of the household! And then the husband, so long cut off, so far separated, much by distance, more by the severance of all the habits and mutual claims which bind people together—with him what would follow? What would be the effect of the change? Questions like these, diversified by perpetual efforts of imagination to bring before

her again the tragical scene of which she had been a witness—the dying man with his hoarse attempts to be intelligible—the young, haggard, horrified countenance of Nelly, compelled to approach the awful figure, for which she had a child's dread, kept her awake long into the night. It is seldom that a woman of her age sees herself on the eve of such changes without any will of hers. It seemed to have overwhelmed her in a moment, although, indeed, she had foreseen the catastrophe. What would Nelly do? was the question all the world was asking. But Lady Markham had another which occupied her as much on her side. Waring, what would he do?

CHOLERA:

CAN IT BE PREVENTED BY INOCULATION?

HAPPILY for mankind, some men are 'specialists,' and keep their attention fixed on one subject, continuing to labour for its elucidation when there is no general public interest in the matter. As there is no royal road to what we call science, more than to other learning, it is only by such patient and continuous labour, aided it is true now and then by flashes of what looks like inspiration, that its victories are won. The object of the writer is to give what seems like an illustration of this truth in a short account of what some recent experiments have taught us to the best methods of averting the fatality caused by cholera, to which public attention has been directed, consequent upon its ravages in Spain and its later reappearance in France and Italy. The whole question is still surrounded with difficulties, and will for some time be the subject of much discussion. Without espousing either side in the controversy, we wish to lay before our readers a brief résumé of the facts and arguments that are being adduced.

Professor Jardon Sanderson, in May last, delivered before the Royal Institution a lecture in which were summarised the facts as to which experts are agreed with regard to this disease. And first let it be noted that true cholera—that is, Asiatic cholera—is native in India. Of course the opportunities of studying it there are very much greater than in Europe, where happily for the inhabitants its appearance is much more rare. Why this is so will appear further on. In October of the year 1817, 'an event occurred which at once gave the disease a significance it had not before possessed. The Marquis of Hastings, with an army of over ten thousand Europeans and a much larger native force, was in Bundelcund, not far from Allahabad, where cholera was then raging. Cholera had on several previous occasions interfered with military operations, but this time it attacked Hastings's European troops with a violence of which there had before been no example. The pestilence continued for several weeks with unabated destructiveness, until early in November the army was withdrawn from the Bundelcund, and moved westwards in its march towards Gwalior, on which the mortality at once subsided. Thousands of dead and dying were left behind, but

cholera was left behind with them, and a lesson was learned which has since been often repeated in Indian experience—that when a military force is encountered by cholera, removal from the infected locality is the only effectual way of checking it.'

Now if cholera, as is popularly supposed, is, like zymotic diseases such as scarlet fever, capable of being communicated from one person to another, it does not seem at all clear how this result could happen. And yet it is certain that the removal of a person suffering from the disease will carry the infection from one district to another. Professor Sanderson puts another fact before us, namely: that after a period of quiescence, the poison-matter of cholera may recover its activity under suitable conditions. It is also certain that whatever the contagium or poison-matter is, it undoubtedly possesses the power of enormous multiplication, which is an essential property of all organisms. Summing up these facts and the conclusions from them, he observes: 'The contagium, therefore, that cholera, like other zymotic diseases, owes its power of spreading to a living and self-multiplying organism, is so well founded, that we are justified in taking it as a starting-point from which we may at once proceed to inquire—first, where this self-multiplication takes place; and secondly, how it is brought about.'

In zymotic diseases between the time of infection with the specific organism and death (or the culmination of the disorder if it be not fatal), the organism multiplies in the body until it has consumed all its appropriate nourishment, or until it has produced such a quantity of its particular poisonous products, that like a human being confined in a close room, who is smothered from having converted a great part of the oxygen into carbonic acid, existence is no longer possible to it. This occurs not only in the human body, but in other media, and to organisms concerning which we know much more than we do about those peculiar to zymotic diseases, which are as yet very imperfectly understood. Yeast will cease to grow in a beer wort chiefly from two causes: first, when it has exhausted all its saccharine or other food; and secondly, when it has produced a large proportion of alcohol. The ferment which produces lactic acid is another example. Under suitable conditions it grows vigorously until it has produced lactic acid to the extent of about two per cent. of the liquid medium. Then it stops; but if the lactic acid be neutralised by the addition of an alkali—the organism will begin to grow again until the two per cent. limit be reached.

A single yeast cell, a single cell of the lactic ferment, a single rod of the peculiar bacillus or rodlike organism of splenic fever, or of the spirillum of relapsing fever, will, if placed in a suitable medium, in or out of the animal body, at once go on reproducing itself and producing its definite products, which in the animal or man 'communicate the disease.' This is not so with cholera. Not only have scientists up to the present time (according to Professor Sanderson—but on this point we shall have something to say further on) been unable to identify the peculiar organism; but, as Professor Sanderson remarks: 'Nor has it been found either that the bodies

of persons affected with cholera, or that any part of them, possessed the power of infecting healthy persons. Consequently, the opinion first arrived at, and formulated by Professor Pettenkofer, has come to be very generally adopted—that in cholera the multiplication of the germ takes place, not in the tissues of the sick person, but *in his environment*. . . . Putting this into plainer language, it means that when the cholera germ invades a previously uninfected locality, the first thing it does is not to find a home for itself—as the germ of smallpox, of cattle plague, or of splenic fever would do—in the body of some healthy person, but to sow itself in *whatever material at or near the surface of the earth is fit for its reception and vegetation*. Now in our study of the laws of diffusion of cholera we have seen that, although cholera may be repeatedly introduced by personal intercourse into an uninfected locality without result, it finally, after a longer or shorter latency, bears fruit; and thus we explain on the hypothesis that of the two conditions which are essential to the fructification of the germ—namely, the presence of the organism itself, and the presence of a soil suitable for its growth, the latter is of more importance than the former; that, in short, the reason why a given town or country remains exempt from cholera—is not that the seed of infection fails to reach it, but that those local conditions which are necessary for its vegetation are wanting.

We may remark, in passing, that the law stated in the last paragraph is entirely in accord with that proved to be true by Pasteur, Tyndall, and others, who have studied the question of those organisms whose seeds or germs are generally *aërienne*. They are so minute, and so constantly present, that the chief reason they do not propagate more freely is that only a few media are suitable for their development. Professor Sanderson then goes on to point out that if we want to find this germ of cholera, we must search for it either in the soil or in the alimentary canal of infected persons; and he observes that it has hitherto been only sought in the latter. As is well known, Dr Koch, the discoverer of the germ or *bacillus* of consumption, which he has shown how to make visible under the microscope by a most ingenious plan of staining, claims to have discovered (1) 'That the germ in cholera has the form of a curved rod, which he likens to a comma; and (2) that the disease (cholera) is caused by the presence, growth, and multiplication of this organism in the apparatus for absorption contained in the lower part of the small intestine, and by the consequent formation there of an animal poison which produces the collapse, and the other fatal effects of cholera.' The incredulity with which these claims of Dr Koch have been received by the scientific world, and the reasons assigned by Professor Lankester and Dr Dallinger for not accepting them, are well known; and when Dr Klein, who was at the head of a commission appointed by the Indian government to report generally on the practical bearing of Koch's alleged discovery, swallowed a tumblerful of the organism in question without results, it seemed evident that the finding of the commission represented the true facts of the case—namely, that 'although the so-called cholera bacillus swarms in the intestine of every person affected with cholera,

it does not there play the part which is attributed to it.'

But this is not quite the last word upon the matter, and if we turn to the August number of the *Nineteenth Century*, we shall hear what Dr Cameron has to say on the method of 'Anti-cholera Vaccination' practised by Dr Ferran, of Tortosa, in Spain. Dr Cameron, after animadverting on the Philistine spirit with which Englishmen have received Dr Koch's alleged discoveries, and Dr Ferran's method of inoculation based upon them, goes on to say: 'But the world moves, even though we may shut our eyes to the fact, and pool-pool it as a mere hypothesis. For my part, I prefer to examine evidence instead of ignoring it; and looking at the evidence in *Dr Ferran's* discovery, and comparing it with what can be adduced in support of the discovery of Jenner, I have not the slightest hesitation in saying that that evidence is as ample as it could well be made during the six months which have elapsed since Ferran inaugurated his system on himself, and that it is infinitely more crucial and convincing than anything which Jenner could bring forward ten years after his first experiment on his son.'

He then gives statistics to prove that the chance of not dying from smallpox is about thirty-one and a half times greater among the vaccinated than the unvaccinated; and contrasts with these figures those derived from a test experiment made by Dr Ferran in the island of Alceira, which contains sixteen thousand inhabitants, in April, May, and June of the present year. The results of this experiment go to show that the security against a *fatal* attack of cholera is as 22½ to 1. This is, no doubt, a grand result to have obtained, and as it is authenticated by eleven doctors in Alceira, there seems no good reason to doubt the accuracy of the statement, unless it is asserted that the eleven doctors wished to palm off cooked statistics on the public.

The theory upon which Ferran's procedure is based is founded upon the (as-erted) discovery of Dr Koch, that the comma bacillus is the cause of cholera. We do not think Ferran's success can be said to have strictly *proved* Koch's assumption, but it certainly helps to strengthen it. Thus Dr Cameron seems to admit, and even Professor Lankester does not go so far as to say that the comma bacillus is *not* the cause of cholera, but only asserts that Koch had not rigorously established his case that it was.

Let us see what Ferran's method of inoculation is. It is, perhaps, now tolerably well known that most, if not all, of the small, almost ultra-microscopic organisms, for which Sedillot devised the name of microbes, like almost all other organisms in nature, have an egg or spore form as well as an adult stage. Their habits and forms are almost innumerable. They are the active agents in fermentation, putrefaction, and decay. Plants could not grow, digestion in animals would cease, if microbes were banished from the world, and on the other hand many diseases would cease. They propagate with such immense rapidity, that (as Dr Cameron says) during one revolution of the earth a greater number of generations will have sprung into life than man can boast of since the days of Adam. They

will flourish not only in their natural media, but in artificially prepared solutions, where the difficulty arises to keep the species pure. Here again Dr Koch has devised a simple and most ingenious method to insure this purity or separation of species. By cultivation in a preparation made in the form of a jelly, with proper precautions, this is accomplished.

Supposing now we have a pure cultivation of the comma bacillus in gelatine: if we introduce it into the human body, what happens? Dr Klein, as we have seen, when in India swallowed full doses, and was none the worse. Dr Koch utterly failed to reproduce the disease in animals, and, indeed, went so far as to say that he considered the brute creation insusceptible to it. Dr Cameron says: 'And yet these microbe dinners proved absolutely nothing more than would be proved if a philosophic horse should set himself to show that the parasitic hot-worm had nothing to do with the gully, by swallowing a mouthful of the full-grown insect. He would find himself none the worse; but he would have proved nothing, for he had simply swallowed the fly instead of the egg. . . . The puzzling thing about Koch's comma bacillus . . . was, how it could possibly do the mischief which he attributed to it. The smallest trace of acid killed it, and the gastric juice of every animal, including Dr Klein, into whose stomach it was introduced, digested it with perfect ease. . . . The most assiduous care on the part of Koch and his disciples having failed to induce it to produce spores, they asserted . . . that the cholera microbe does not propagate itself by spores. . . . Well, what Dr Ferran briefly alleges is, that he has discovered a method of inducing Koch's comma bacillus to produce spores, and that those spores, like the spores of other microbes, manifest a vitality incomparably greater than the adult form of the organism. Introduced into the stomach, they defy the acids of the earlier processes of digestion, and safely reach those portions of the intestine in which their happy hunting-ground is placed.'

This entirely agrees with what we before learned about the transmission of the disease. The organism requires to be in a different environment, and probably in a different stage of its life history, before it can infect mankind. So far theory, but science demands proof by experiment. Dr Ferran is stated by Dr Cameron to have finished this proof by the following experiment before the Barcelona Commission: 'Under the eyes of its members, the comma bacillus has been developed into spores and spirilla, and these again into comma bacilli. Before their eyes a quantity of the culture of the infective form has been taken, and divided into two parts. One strained through a Chamberland (porcelain) filter, so as to free it from organisms, has been injected into one series of guinea-pigs, and the result has been *nil*. The second, unfiltered, in half the previous doses, has been similarly injected into another series of guinea-pigs, and all have died, and from the blood of the infected animals the comma bacillus has been recovered. But there remained the proof of the prophylactic power claimed by Ferran for his vaccine. Again, before the eyes of the Commission, twenty guinea-pigs were taken, ten inoculated and ten not. A week later, they were

subjected to injections of the same infective cultivation, the inoculated animals receiving it in larger doses. Again the result accorded with the prediction. The whole ten inoculated guinea-pigs lived, the ten not inoculated died. The demonstrations of other experimenters in the field of the causation of disease have stopped short at *nil*. Ferran's did not. In the beginning of December, himself and his friend, Señor Pauli, the enthusiastic sharer of his researches, had inoculated themselves.'

Dr Ferran and his colleague evidently had faith in the efficacy of their preventive method, and were prepared to undergo a great deal of pain to demonstrate it, for Dr Cameron describes the alarming symptoms which supervened to be very like (as might have been expected) those of cholera. But by an improved method of 'gradual' inoculation these inconveniences seem to have been eliminated from the system. Before long it was put to a practical test by the Alcala experiment before referred to—which had the apparent result of saving fifty-three cases of cholera and forty-two lives in a population of eight thousand in eighteen days. Dr Cameron concludes thus: 'On the evidence I take my stand, and so far that evidence—which of course further evidence may explain or refute—seems to me to point to one conclusion, namely, that Ferran has discovered a hitherto unknown form of the cholera microbe, and that in that form it can be used as a vaccine hardly less potent against cholera than cowpock is against variola.'

Such an assertion, supported by such evidence as we have endeavoured to place before our readers in as concise a form as possible, is worthy, we think, of very careful attention. Dr Willoughby, in the *Nineteenth Century* for September, 1886, says very enough—on what he calls the 'Cholera Exhibition Gallery,' and Dr Cameron's 'special pleading,' in its behalf. But surely it is not to be assumed as altogether unlikely that a Spanish doctor can discover where Englishmen have failed. It is stated that only Pasteur in France and Dr Cameron in this country have raised a voice in favour of Ferran. Of course Ferran may turn out to be utterly wrong; but Pasteur's reliability has been abundantly proved; and the fact that Ferran is a Spaniard is hardly sufficient proof that he has made a mistake. At any rate, Englishmen should, we submit, try to maintain what Mr Arnold calls 'an open mind and a flexible intelligence' in thus as in many other matters.

ARIZONA DAN.

IN TWO CHAPTERS.—CHAP. II.

My fortunes improved from this time. The death of Arizona Dan seemed to mark an epoch in my life, from which my luck changed. I sold the mining claim for a large sum, and then left the district, bearing in mind the judicious hint of Squire Hape, and believing it was as well for me to be out of the way of Five Ace Jemmy. So I realised, and left for a distant State, where I speculated in claims, bought gold of the miners, started stores, and entered into a diversity of transactions, all of which were now as successful as some years before they had been the

reverse. At last I determined to leave the mines and the West altogether, and go back to England. But I did not carry out this resolution. Some slight business which I had undertaken for a friend at the mines caused me to visit a well-known town in an eastern State, which it will be convenient to call Streamville. I was much pleased with the busy yet snug and quiet town, and with the people I met there. Principal among these, and the one with whom I became most intimate, was a Mr Gabriel Lang, to whom my business call was directed. I was soon a frequent guest at his house, where he had the happiest home I ever knew; while his wife, to whom he had been married only a year or two, was the most amiable woman I had ever met. She was so quiet and retiring, that a stranger might at first regard her as tame and colourless; but this impression disappeared when she was better known. She then shone as a cheerful and delightful companion.

I think I never saw a couple so attached to each other, as were my friend Gabriel and his wife; and so much did I like their society, such an attraction had they for me, that I believe I should have settled at Streamville without further inducement. The further inducement was, however, supplied. Mr Lang's sister was living with him, and as one of my chief objects in returning to England had been to find a home and a companion for life, I soon saw that I could never hope to find a happier home, or a gentler partner, than I might choose in this quiet town in the State of New York. As my story does not profess to deal with such matters, I may condense greatly all I have to say in regard to my brief and happy courtship, and my still happier wedded life, for I married Phillis Lang ere many months were over. This was as much to the gratification of Mr Lang, I may almost say, as myself; while his wife in her own quiet way was as happy as any of us.

In England, I should probably have retired; but here, where nobody ever thought of doing such a thing until he retired to the cemetery, I caught, I suppose, the prevailing taste, and, by way of compensating myself, bought a large share in some local speculation; which speculation was as fortunate as all my recent attempts had been. At this time, I daresay, we all had our share of the minor crosses and troubles which beset everybody; but as all things are softened by distance, it seems to me, on now looking back, that for a couple of years there was absolute peace and unalloyed happiness in our little households. I know that Phillis was a devoted wife, and that when our first-born came, a son, she proved a devoted mother; while the happiness of Mr and Mrs Lang seemed enhanced by our own. At the risk of being tedious, I cannot help dwelling on the invariable cheerfulness of my friend Gabriel, and on the serene peacefulness which filled his home. This was perhaps rather more subdued than it would have been, from the retiring manners of Mrs Lang; but even this had its special charm. The almost shrinking reserve which marked her at first, was due, I fancied, to some prolonged illness she had at one time suffered, or perhaps to some great sorrow; but I never heard the latter spoken of, or in any way suggested.

We had been married more than two years, when I noticed a change in my friend Gabriel—a change greatly for the worse. He grew at once depressed and irritable. With this came also a too evident desire to avoid me, and even his sister. I thought at first that we had given offence in some way, and anxious, if I had done so, to remedy it, I approached the subject one day; but he perceived my drift instantly, and in a manner which was painfully earnest, assured me that I was wrong. He admitted that he was disturbed and harassed, but said that it was from no fault of his own, and, above all, from no fault of mine. I was never to entertain that belief, or to regard him otherwise than as an unchanged friend, even if he went to his grave without daring to explain what it was which so affected him. This was ominous enough, and although it silenced me for the time, yet it stimulated rather than dampened my anxiety.

Of course I told Phillis, and she was more distressed than before at hearing it. She spoke to Mrs Lang, and found that she, too, had noticed this change, and was about to solicit our aid to find out its cause. Her husband was kinder than ever, but was much from home, and could not bear to remain an hour in one place. His restless manner suggested some money difficulties. Perhaps his business affairs had gone wrong, although I was at a loss to see how this could be. I determined to make another trial, and if my conjecture were right, he should be relieved from all anxiety, if it lay in my power to do it.

Phillis had gone to the Sycamores (Lang's home) to see her sister-in-law, and to give her some idea of what I proposed to do, but returned much earlier than I expected with traces of weeping and emotion in her face, and she was almost hysterical. When she recovered, she told me that she had found Mrs Lang, usually so calm, quiet, and self-possessed, in a state bordering upon distraction. She could get no explanation from her; indeed, Mrs Lang declared that her lips were sealed; and when Phillis, thinking that some impeding crash was probably the cause of this emotion, told her of my intentions, and my hope of relieving her husband, she frantically exclaimed that such help was of no avail; that she knew all now, and that no business troubles assailed them. She begged Phillis to press her no further, and not speak to her brother on the subject, as the grief which now haunted them could be removed by no one.

This roused me to do or at least to attempt something. I did not believe in a policy of allowing the canker to gnaw at the hearts of the persons whom, out of my own household, I loved best in the world, without making an effort; and I went straight—'right away' would be the correct expression there—to the Sycamores. I fancied, and perhaps correctly, that even the face of the help who admitted me looked more troubled than was right, and finding that Lang was in his own room, half counting-house, half study, I went directly to him. He was seated at his desk, his head leaning on his hand; but no papers or books were there to give him even the show of being occupied. His air was that of a dejected, hopelessly broken-down man, as different from the cheerful Gabriel Lang I had known, as a corpse is from a living body. He

looked up at me with a sad smile, and ere I could speak, said: 'So you have come again, Tom, like a good fellow as you are. I am glad you have done so. I don't want to go mad, or shoot myself, but I shall do one of the two, or both, and perhaps shoot some one else at the same time, unless I can relieve my brain. So I will tell you all.'

I need hardly repeat what I said; everything that friendship suggested, I spoke, and told him that if it lay in the power of any human being to help him, I would sacrifice every dollar to do so.

'But dollars will not help me,' he said, with the same sad smile; 'and yet I shall have to part with a good many. But I would gladly spend ten times as many could I at once close, and then forget this fearful— But you shall hear.' He paused, as if to nerve himself for the narrative, and indeed it required some effort to reveal the story he had to tell. I must condense it, so will only give the substance of what I heard.

Gabriel Lang and his wife had been sweethearts when they were boy and girl; and as they grew up, always thought to be married early. The friends on each side were agreeable. But misfortunes fell on Gabriel's family; and although such a disaster is less fatal to the hopes of young persons in the United States than almost anywhere else, yet it is always bad for them. The Lang family were obliged to remove. A removal in this case meant a journey of a thousand miles; and it was some time before any improvement in their fortunes took place.

During this time, another lover appeared for Milly, the girl to whom Lang was attached. This admirer was not only bold in his suit, but unscrupulous in the means he took to forward it. The postmaster also must have been in league with him; for all Gabriel's letters were intercepted, with all the earnest appeals to break his strange silence, which Milly wrote. One of them also procured the insertion of several apparently insignificant paragraphs in the local papers of the district to which the Lang family had gone; but these paragraphs were full of evil meaning for those left behind. In fine, the stranger won her parents over; and in desperation, believing herself to be deserted by Gabriel, the girl accepted him. They had been married about a year, when the postmaster was discovered to have been guilty of delations, and he fled the town. Then a letter reached Milly, referring to many others which had been sent; to her cruel silence; and saying also that the writer—of course Gabriel—only renewed the correspondence, because he was now prosperous, was able to return to the East, and wished her to know that he was as devoted to her as ever—that he was unchanged and unchangeable.

The agony this letter caused, the treachery it revealed, almost killed the girl. When she recovered, her manner had the subdued, shrinking air which still marked her. She bitterly reproached her husband, who was not a man calculated to keep her love and respect, apart from this matter, and every semblance of happiness fled from their home. For another year she lived the life of a captive; while he broke

through all restraints, and finally was obliged to fly, as his associate had done, but for a still graver crime; the law called it murder. He shot a man; six months after, he was himself killed in a western territory, in similar fashion, and some one—his previous associate, it was supposed—sent a newspaper, containing a full account of the catastrophe, to Milly's friends.

Gabriel also heard of it. He had previously learnt from a sister of Milly of the subtle treachery which had been practised. At once he came back to the East, where he found Milly leading the life of a recluse, or a nun, and sinking in health from day to day. He would not be repulsed, however. They had both been deceived; Milly had been guilty of no fault, and he demanded her hand as a recompense for all he had suffered. After some time she married him, and they experienced the most perfect happiness. Now, however—Gabriel's voice faltered here—the scoundrelly associate had reappeared; his party being in power, some services he had rendered them, with some partial reticence he had made, secured him from prosecution. But he had come as a messenger from Milly's first husband, whose death was a ruse to screen him from pursuit, as he had again been engaged in fatal brawls.

He was alive, but dared not come back to the East, where, indeed, he had no wish to appear. He had no desire, he said, to disturb the wedded bliss of his dear Milly; he had found another more to his taste, out West. But he did want money. If Lang would give a good sum down, and forward a little more as his wife's old friend required it, the first husband would remain incog.; but he must have the dollars. If any difficulty about this were made, he must write to a few old acquaintances in the town, revealing his existence, and leaving Milly and her husband to get out of the fix as best they could. The agent produced such letters and tokens as showed beyond doubt that he did come from the husband. And this frightful claim was what had been weighing upon Gabriel of late. He dreaded to comply with this demand for black-mail, as it was sure to encourage further applications, and what was worse, the man himself—this husband—was such a wild desperate character, that, pay what Gabriel would, he was certain to declare himself some day.

These considerations had caused Lang to hesitate, and the ennui being annoyed at this, made an application to Mrs Lang herself, proposing, as he said, to take a mild course, rather than cause a 'bust-up,' by writing to his principal. Such a revelation, naturally, had nearly driven Mrs Lang out of her mind, and in this dreadful position, what was to be done? What could be done? I was at a loss what to propose or say, to give him comfort. I stammered out two or three phrases which I knew, as I said them, to be miserably conventional and hollow.

'I have promised to see him to-morrow, Lester!' exclaimed Lang, paying no regard to my commonplace; 'I have promised to meet him at the Florida Hotel. Anything rather, than that he should come here! And if I can control myself, I have made up my mind to buy him off. I have determined upon doing so, then—during the lull which will come for a time—

realising all I have here, and under changed names, going with Milly to Europe. It is my only chance. But I can scarcely trust myself to arrange it. Will you come with me at noon to-morrow, and be my friend and spokesman?'—

I readily promised this; and as I saw he brightened with the idea, professed highly to approve of his European scheme. I wrung his hand when we parted, with a renewed pledge to be with him on the next day, and so left him in somewhat better spirits.

There were many details I should have liked to hear, but did not care about troubling him then. As I had to pass the *Florida Hotel* on my road home, a feeling of curiosity, natural enough, I suppose, induced me to call there, and take a glass of sherry and bitters at the bar. I thought I should like to scrutinise the customers who came to the counter, or who passed in and out of the billiard-rooms, to see if haply I could guess the man whom I was to meet on the morrow. I had not stood at the bar for three minutes, when a man, who was evidently a resident, came up, and asked the clerk if there were any letters for him. The official answered in the negative, and the customer went up-stairs. I drank off my sherry, and left the hotel, with a new and unlooked-for train of thought flashing through my mind. I decided that I had seen the very man. I could not be mistaken in him, and I thought I could now see further into the scheme than poor Gabriel Lang had ever dreamt of. I could not be positive; but yet my conviction was enough to satisfy me, and it now seemed as though I ought to have found the clue earlier. I made up my mind to the come—I would pursue, and waited the arrival of the appointed hour with, I doubt not, as much anxiety as my friend Gabriel himself. I thought it best not to confide my new suspicion to my wife, who was naturally anxious to know what her brother had said to me. I gave her a vague, general account, which might not have satisfied her but for my telling her of the appointment for the next day, when she thought she should learn full particulars of this mysterious trouble.

I met Gabriel as agreed, at a point a little distant from his own house, and we went at once to the *Florida Hotel*. My friend was pale, and owned that he had passed an almost sleepless night, nevertheless there was an air about him which savoured more of firmness and resolution, and this I was very glad to see. We inquired for Mr Battenby, and were told that he was in parlour No. 13 awaiting a gentleman; so we went up. I was right; it was the same man. Of course he had not expected to see two persons, and in spite of a great deal of self-possession—he was gifted with that quality—I could see he was startled. He would have been much more startled could he have recognised me as I did him, for I had known him on the previous night as Five Ace Jemmy; but I was so changed by the shearing away of all my ragged exuberant beard and shaggy hair, and by widely different costume, that he looked at me as an entire stranger.

'This is my friend,' said Gabriel; I had asked him not to mention my name at first, without giving him any reason. 'I have told him all.

It will be better to have the assistance of a third person, as we shall be cooler in our discussion.'

'I shall be cool enough anyhow you may fix it,' returned Battenby—to call the man by the name he was there known by. 'If you choose to tell all the town your business, it is only a matter of taste, I suppose. You see, sir—this was to me; you must see it if you have thoroughly taken hold of this matter—that our friend here can't help himself. His wife's first husband is alive, is a particular friend of mine, and can spile their domestic felicity; but he is a forgiving man, and has his own reasons for being so. That, he admits; so will rather take a few dollars now and then, than disturb this worthy couple.'

'And if I buy you off now, my life will be passed under constant drain of your blackmail'—began Lang.

'If we are to come to business,' interrupted Battenby, 'we shall save time by not opening matters that are settled. I have given my word as a gentleman and man of honour, that I will adhere to any agreement we may make, and what more can you want? Besides, you can't help yourself anyhow.'

'I am not certain about that,' I said. It was the first time I had spoken, and the gambler looked keenly round at the sound of my voice, as though there was something in it which again startled him; but he merely said, 'Well?'

'Who is, or was, your friend?' I continued. 'What is his name? Where is he? Why does he not come himself?'

'As to the last item, stranger,' replied Battenby, with an ugly scowl which showed that he did not desire close questioning; 'he don't come, because he don't please. His name is Wilcott, as your good friend Mr Lang, or as his wife, anyhow, could have told you. He is in Colorado.'

'He is in Colorado,' I repeated, with a strong emphasis. 'Do you mean to say he lives there, or is dead and buried there?—Now, no evasions, Mr Battenby. You talk of being business-like; keep to your professions. Is the man you speak of alive this day in Colorado?'

'He is so, stranger,' answered the other, while Lang looked at me in the utmost amazement. 'But I tell you I don't propose to have any fooling around here. My friend Wilcott will come up and play an all-fired game in this town, if you try to fool him or me.'

'You lie!' I said, and then made a purposed pause.

'I lie! do I?' said the gambler, with an imprecation. 'When this affair is over, I shall have something to settle with you.'

'You will settle with me now,' I continued. 'The man you speak of was known as Arizona Dan'—Battenby started, and, so far as his dark, sallow complexion was capable of such a change, turned deadly pale—'he died in Big Trees city, Colorado, five years ago—nearly a year before my friend's marriage to his widow. You are the expelled gambler and cheat, Five Ace Jemmy, who fled the camp to avoid lynching, and who, it was afterwards proved, robbed the mail.—Move, you scoundrel, if you dare! and I will put a bullet through your brain.' I drew my revolver as I spoke, and 'covered' the gambler with it. I knew my man, and had come prepared.

'I have the drop on you, and will shoot you like a dog. If I give the alarm, and tell who you really are, you will be in the jail here in ten minutes. You know there was a thousand dollars offered for you by the mail Company; the reward is still out.'

'Who—are you, then?' said the man, who was clearly beaten and, baffled, and a cold perspiration which bedewed his forehead, showed that he was frightened also. 'Gabriel Lang,' I said, speaking to my friend, but never taking my eye from Jenny, or my finger from the revolver; 'you may go home a free and happy man. This Wilnott, who was a homicide and a rowdy, but who was attached to me, and grateful for a service I rendered him, is dead. He died in my presence, and I stood by his grave. He confided to me his real name, and a great part of his career; not enough, however, to enable me to identify, at first, your wife with his unhappy victim. Of the truth of what I say, I can give you overwhelming proof, should it be needed.'

'And you' suddenly exclaimed Battenby, 'you must be that loading Tom Lester, of Big Trees.'

'I am,' I answered briefly.

'Many a day I have had a mind to draw a bead on you,' he continued—by which he meant, to shoot me—'and I wish I had done it. I knew there was no good in you.'

'This man, this detected cheat, shall own it all to you before he goes,' I went on; 'it shall be the price of his going—Now, no swearing, Five Ace,' I said, as he commenced an explosion of violent language. 'You need not own it, unless you please; but you know the penalty; and that penalty shall be yours, even if you do agree, and are afterwards found in or near this State. Ring the bell, Gabriel, and send the waiter to the police barracks. Let him tell them that Five Ace Jenny from Colorado is here. I will take care he does not escape.'

'I would rather avoid an exposure, for the sake of my wife'—began Gabriel.

'Of course you would,' I interrupted; 'and this fellow owes his only chance of escape to my desire to spare Mrs Lang. He has told you how he likes me. I like him as little, and would sooner see him in the hands of the police than not. He is the only man for whose apprehension I would take money; but I own I should like to earn that thousand dollars through him; and I will do it if he delays five minutes—Take out your watch, Gabriel.'

My tone and manner convinced the gambler that I was in earnest; as indeed I was, for I had seen quite enough of this man and his like, to know that no child's play would serve.

'Well—I cave in,' said Battenby, after a pause. 'You hold better cards than I do; but I wish I had guessed'—He said a great deal that was bitter, but owned that my statement was true, and that it was for his own benefit and profit he had devised the scheme. He frankly owned that he considered he had 'struck it' in black-mailing a wealthy citizen like Lang, and one well known to be devoted to his wife. With the same frankness, when once the promise to connive at his escape was passed, Mr Battenby owned that he had, as was surmised, intercepted the letters of Gabriel and Milly.

Five Ace Jenny left the town the same afternoon, being unwilling, probably, to trust or to tempt us too much. We never saw him again, and are certain we shall never see him now, for he met a deserved fate at the hands of the vigilantes of an offended mining community in California.

I wish I could describe the change from hopeless misery to overflowing happiness, which filled the home of Gabriel Lang; or the delight of his wife, which was nearly equalled by the delight of name. But even if I could tell this, I should be at a loss to convey an idea of the amazing admiration in which I was held. There never was any hero of ancient or modern renown who received more absolute adoration than I did, for the next few weeks. The only thing I can say to my credit is that I was heartily ashamed at having my services so unduly estimated, and tried my best to quench the ardour of my friends.

At anyrate, we were all the happier for the denouement, and I was thankful for having had the means in my hands of baffling such an atrocious scheme. Mrs Lang brightened from that time, and at this day looks younger and more cheerful than she did fifteen years ago.

AMERICAN BOOK-PIRACY.

THE curious literary anomalies which prevail at present between England and America are worthy of attention. Our American cousins sell us shiploads of cotton, grain, tanned meats, and other useful commodities, for all of which John Bull pays honest cash; but when it comes to a question of paying for our own home-grown literature, that is quite another matter. Why pay for a thing which can be had for the taking without payment? and so our British copyright books are freely reprinted and sold to a public of fifty millions or so for the sum of twopence-halfpenny upwards. Did the author and his publisher participate in the profits of this sale, the profits to both would be more than doubled; but such is the state of the American copyright law at present, that a book selling here at any price from a couple of shillings to a couple of guineas, may be freely reprinted across the water, and sold at a merely nominal figure without benefiting the British author or publisher by one halfpenny.

Such being the state of the law, let us see what effect it has when carried out in practice. We find it pressing hard in the first place on the American author and publisher, who is forced to compete against the brightest, freshest, and strongest stream of good literature that the world has ever seen. This has dwarfed and arrested the career of the American author not a little. Publishers having the best English literature at command for the taking, an American writer, unless he possesses great power or originality, has small chance of succeeding. And his price is also beaten down, for much better literature than he can produce can be published for the mere cost of production. He cannot stand against this.

It must not be supposed that an effort has not been made to mend matters. The American

Copyright League for the past fourteen months has urged the passing of an international copyright law, giving foreigners property in their books when published in America. A Bill was introduced into the House of Representatives, and another Bill into the Senate; but, sad to state, the forty-eighth Congress has adjourned without acting upon either. When international copyright was pressed upon Congress fifty years ago, it received the support of Webster, Clay, and Everett; but trade interest has hitherto prevented legislation on the subject. All our own leading literary men, including Dickens, Thackeray, and Carlyle, have spoken and written strongly upon the matter. While the property of the foreign patentee is defended, and the foreign playwright is allowed perpetual property in his acted play, the foreign author is mercilessly plundered. There are wealthy publishing houses in the States which would have had no existence but for the reprinting of English copyrights. Take away these, and many a publishing business would collapse like a pricked balloon. To the credit of many of these publishing houses be it mentioned, however, they are willing to pay the British author or publisher, and do pay, all they can; but the state of the law prevents them doing so. There would be little use in buying a book one day, when the next, another publisher could reprint it and under-sell the person who made the bargain.

The executive Committee of the American Copyright League numbers amongst its members some of the most influential of her literary men. A series of public readings was lately given in New York on behalf of its funds, and a large sum was realised. Amongst those who took part and read from their own works were Mark Twain, (Samuel L. Clemens), John Hawthorne, Henry Ward Beecher, Will Cullen, Howells, Stoddart, and Boyesen.

The programme, amongst other mottoes and extracts, contained the following: 'There must be an international copyright arrangement; first, because it is justice; secondly, because without it you never can have, and keep, a literature of your own.—*Charles Dickens (from a speech).*

'Authors and inventors are among the greatest benefactors of mankind. We should all be shocked if the law tolerated the least invasion of the rights of property in the case of merchandise; while those which justly belong to the works of authors are exposed to daily violation.—*Henry Clay and Daniel Webster (in a report).*

'All useful labour is worthy of recompense; all honest labour is worthy of the chance of recompense; the giving and assuring to each man what recompense his labour has merited may be said to be the business of all legislation, polity, government, and social arrangement whatsoever among men.—*Thomas Carlyle (Petition on Copyright Bill).*

'It has been urged that an extended copyright would damage the public interest—that it would enhance the price of books. . . . Accordingly, I wrote to my butcher, baker, and other tradesmen, informing them that it was necessary, for the sake of cheap literature and the interest of the public, that they should furnish me with

their commodities at a very trifling percentage above cost price. It will be sufficient to quote the answer of the butcher: "Sir: Respectin your note, Cheap literatur be blowed. Butchers must live as well as other peep—and if so be you or the readin publick wants to have meat at prime cost, you must buy your own beasts, and kill yourselves."—*Tom Hood (Copyright and Coppering).*

'Congress excludes Chinese labour because it interferes with white labour. But Congress still compels the American who writes a book to offer his labour in the market against labour which is not merely cheap, but is actually unpaid.—*Address of the Copyright League?*

The 'libraries,' as the collections of books are called in which cheap reprints of British copyrights appear, extend some of them to five hundred volumes. The best known perhaps are Harper's *Franklin Square Library*, Munro's *Seaside Library*, and Lovell's *Library*.

A few examples from American catalogues, of reprints of British copyrights may be interesting. Here is one of one hundred closely printed pages (J. B. Allen's), in which we find a cheap reprint of *Chambers's Encyclopædia*, announced and described as undoubtedly the best popular encyclopedia in the market, until 'Allen's Manual Encyclopedia' shall appear. The *Library Magazine*, of which about a dozen volumes have been issued, contains a 'hash-up' of articles from every well-known English magazine, including many from our own pages. *Choice Literature* is similar in contents. The familiar *English Men of Letters* series, published in this country at two shillings and sixpence, appear at fivepence a volume; the *Elberic Library* comprises books and parts of books from one penny to fifteenpence; Ruskin's *Sesame and Lilies*, &c., appearing for fivepence. There is a reprint of Ruskin's works in fifteen volumes at a much lower figure than one of his earlier books now costs with us; while his *Sesame and Lilies*, *Queen of the World Olive*, and *Ethics of the Dust*, appear in one volume for about two shillings, or about one-tenth of what Mr Ruskin thinks it right to charge for them in England. Three firms, at least, have reprints of Ruskin's works; in its cheapest form *Modern Painters* is issued in paper covers, three volumes, at twopence each; and *Stones of Venice*, in three volumes at one shilling each. The average published price of Black or Blackmore's novels in England is six shillings a volume; you can buy them in New York at from fivepence to fifteenpence. A remonstrance from Mr Hamerton regarding a cheap reprint of his *Intellectual Life* has only led to his letter being printed as an advertisement.

Lord Tennyson has of course suffered along with other English authors, and he seems to feel it too. When lately interviewed by a correspondent of the *New York Herald* on the subject of a proposed memorial to General Gordon, he said: 'Some of your New York publishers have published nearly all of my poems, and I have never received a penny from any of them. Should they now subscribe liberally to our Gordon Memorial, I should feel as if some atonement were made.' We doubt very much if any of the New York publishers will take this hint from the poet-laureate.

Messrs Dodd, Mead, & Co. announce a series of *Tales from Many Sources*, in which all the best-known British magazines are laid under contribution. The large square pamphlet-looking books—of which the British publisher lately threatened us with an imitation—in Harper's *Franklin Square Library* now number close on five hundred volumes. Most of these are British novels, and if not paid for, it is not Messrs Harper's fault, who straightforwardly pay when it is possible to do so. The most that can be done is to pay for advance sheets; and as we know lately, the offer of two thousand pounds for an advance copy of the revised Old Testament was not successful.

The average price of an English novel or work in general literature in the *Franklin Square Library* varies from sevenpence halfpenny to twopenny. For example, *George Eliot's Lib.*, published here at two guineas, is sold in this Library for less than two shillings. *Froude's Life of Carlyle* may be had at the same cheap rate; in fact, all that is newest and best in our literature is immediately reproduced at similar rates. Of course, along with these cheap reissues, there are dearer and finer editions for those who want them. Among the most notorious of American literary parasites is a firm who publishes the well-known *Sinclair Library* of novels. This firm devotes itself mainly to the sale of English works, old and new, and we are indebted the proprietors have reaped a fortune of seven million dollars from their reprints.

Such are some of the anomalies in the trade of literature caused by the absence of an international copyright law, and of which we have only given a few specimens. It is true that we also reprint American books in this country without payment to author or publisher; but what we receive in this way is minute-mal, as compared with what we give—or what is taken from us—in return.

OCCASIONAL NOTES.

OUR FOREIGN INDEBTEDNESS FOR FOOD-SUPPLIES.

THE annual statement of the trade of the United Kingdom for 1884, recently issued, enables us to see how much we are indebted to foreign countries for many of the necessaries of life. It seems strange, at first sight, with our depressed industries and land going out of cultivation, that we should have to pay to foreigners so much for farm and dairy produce. With a population of thirty-five millions to provide for, it is plain, of course, that we cannot feed and clothe ourselves entirely from native produce. But a glance at recent import-figures suggests that we might do a little more in that way. Leaving grain out of the question in the meantime, our foreign bill is a large one. There has been an increase, too, within recent years in many of the articles of food imported. Beginning with butter and butterine, the value of the imports was twelve and a half millions of pounds sterling; of which we paid five to Holland, about three to France, and to Denmark

two millions. It would be well if the quantities and value of butter and butterine were distinguished in the Report. Bacon and hams come next, with a total value of about nine millions; oxen, bulls, cows and calves, eight and a quarter; cheese, five millions, of which commodity the United States sold us two and a half millions, and Canada a million and a half; Holland and France coming next in value. Eggs stand at about three millions, France sending us the half of this quantity, followed, though a long way behind, by Belgium and Germany. The district of Ancona, in Italy, alone furnishes about seventy-five millions of eggs for European consumption, weighing about four thousand and two hundred and seventy-five tons; and for their transport, five hundred and twenty trucks, of ten tons each, are required. More than the half of this supply reaches the London market, a week being occupied in railway transit. For fruit and vegetables, we paid France about eight hundred thousand pounds; Spain, Germany, and Holland coming next in value. For poultry, game, and rabbits we paid more than half a million; of which three hundred and eighty-five thousand pounds went to Belgium.

In the British cereal year for 1884-85, recently closed, the flour imports had reached the enormous quantity of nearly ten million packages, which has been estimated, without taking the home supply into account, would give an allowance of half a hundredweight for every man, woman, and child in the United Kingdom. With the exception of about one million packages, this supply came from the United States. We are apt to ask, when the wholesale prices of flour and mutton have been reduced twenty to twenty-five per cent in recent times, who is pocketing the profit, as there is little or no reduction to the consumer.

Perhaps one lesson from these figures is, that in order to keep and create a new market, the producer must be in touch with public needs, and adapt himself by new methods to the requirements of the market. Our splendid service of steamers has brought us next door to an ever-increasing host of powerful competitors; we must be as active, industrious, and vigilant as they are, if we would not be losers in the race.

CURIOS RECOVERY OF A LOST CHEQUE.

A short time since, a well-to-do tradesman in Leamington, Mr W—, received in the course of business a cheque for a considerable amount, drawn by a gentleman well known in the locality, payable to the order of the drawee, by whom it was indorsed. Placing the cheque loose in his pocket, Mr W— walked down to the garden, some distance from his house, where he amused and exercised himself digging with a spade, after his wont, for some little time, eventually returning to his usual business. During the evening, when making up the accounts for the day, Mr W— felt in his pocket for the cheque, intending to put it in a place of security. To his dismay, he could not, after turning out his pockets, find it. He at once searched every possible and impossible place, made inquiries of his wife, family, and assistants, but without avail; then,

through the chief, caused the police to be informed of his loss, and had hand-bills, offering a reward, circulated—in fact, took every precautionary measure that suggested itself, including the stoppage of the cheque at the local banks. The following day, no news was received from any quarter of a satisfactory character, although search was continued with unabated constancy. On the third day, interest began to slacken, and it was generally supposed that cash had been obtained for the cheque in one of the neighbouring towns. Mr W—, however, being most interested, continued his quest, leaving no stone unturned. Towards the evening of the fourth day, he, with a view to diverting his thoughts, once more began to dig with a spade over a portion of the piece of ground upon which he expended his surplus energy. A sudden idea occurred to him, and with eager haste, he commenced turning back the soil which he had dug over on the day of the loss. For some time he proceeded to work vigorously, but as the quantity previously removed diminished, his exertions somewhat flagged. At last, however, his perseverance was rewarded by the unearthing of a piece of soiled and crumpled paper, which upon being carefully spread open, revealed itself to his glistening eyes as the missing cheque.

A NEGLECTED BRANCH OF HOME INDUSTRY.

The *Chamber of Commerce Journal* remarks that the Belgian market-gardeners are indignant with their Minister of Agriculture because he has been telling them that when their vegetables reach the London market they are not fresh. Their anger has found vent in a comparison of their own enterprise with that of other nations; and it is astonishing to learn to how great an extent we are indebted to continental growers for our comestibles. It should not be astonishing, for public attention has so often been called to the lack of enterprise on the part of our own cultivators, that by this time we are pretty well acquainted with their deficiencies; but the extent of trade is so great, and the need of our farmers for remunerative crops is so pressing, that the neglect of market-gardening must ever evoke surprise. Holland, Belgium, France, Italy, all serve us with vegetables and dairy produce which could as easily, and—considering the charges of carriage—as cheaply be produced at home. The matter is of the more importance because the existence of a flourishing home trade in vegetables, &c., would create a much more active demand for manufactures. There is no reason at all why millions now sent abroad in payment for produce should not be gained by cultivators at home—no reason, that is, unless the conditions of land-tenure constitute a barrier.

PLAYING AT HORSES.

A correspondent writes to us as follows:—'Visible from my sitting-room window is a long unfenced road, that leads to my house through the home-field. It leads also to the rectory; and, by several turnings and windings, to a farmhouse behind my own, and round to a coal-house situated at the rear. In the field through which this road leads there was turned out for

the winter a mare, too young for continuous work, but old enough to have received a fair training as a "leader" in harness. At noon, one day, there entered upon the road, from the great highway beyond, a coal-wagon and pair of horses from the city adjacent, bringing a supply of coal to the house referred to. The mare had been gambolling round the field for a time; then it had laid itself down in many attitudes; and was now idly cropping choice patches of grass, fastidiously selected, when the jingle of the coal-wagon attracted it.

'I was not sufficiently observant at the time, but I am quite sure now that I must have noticed its sudden resolve to be mischievous—to indulge in some freak—to poke fun at the wagoner or his horses, or to make some feigned attack in the sheer idle naughtiness of the moment; for, with dilated nostrils, steaming mane, elevated tail, and with a plunge and scream, it was soon by the wagoner's side in a pretended fit of wild excitement. But the wagoner was not to be threatened or imposed upon, and he raised his whip in a warning way that was well understood; for the tactics of the mare were changed, and a plot or plan of a new comedy was immediately formed. Laying aside every appearance of excitement, or even of levity, the mare assumed the pated look of a hard-worked horse, and placed itself promptly, but quietly, where an additional leader would be attached; and keeping that position as accurately as if it had been in complete harness, it preceded the wagon, carefully observing the orders addressed by the wagoner to his team, turning corners cautiously, and measuring and giving just the margin and space required here and there by the vehicle, finally stopping and stepping back as the wagon was backed to the cellar door! It then scampered off to its pasture.'

THANKS

KIND friends! 'if aught that I could say,
Oh aught that I could do,
Could tell the thoughts that fill my heart,
Or speak my thanks to you—

If any scattered words of mine,
Oh seemly attitude,
Could do so much as half express
My depth of gratitude—

No choking throat should hold my tongue,
No act of courtesy,
No words of suited thankfulness
Should lack or wanting be.

But since no painted speech of mine
Can all my thanks convey,
And no complaisant act of mine
Can half my debts repay—

Oh, take my thanks:—blunt thanks, my friends,
And know that in them lies
Far more than just the utterance
Of that poor word implies

THE PROFESSIONAL SHARPER.

BY AN OLD HAND

LIKE many professions, there are in the business of a sharper many different qualities and kinds of men. There are the rough and brutal, who, finding their work unproductive, do not hesitate to resort to more felonious undertakings. There are also those who, through thick and thin, stick steadily to their trade, with a kind of conviction that it is a legitimate calling; and there are others who, more subdued and gentlemanly, go about their work with refinement and ease. The last-described specimen of the craft is the most interesting. His movements never cause alarm; he is never put out of countenance by the accident of ill-luck, and never shows a temper other than even and gentle. What sort of nature underlies his demeanour it is impossible to define; but certainly, although his actions are something cat-like, he is never so indiscreet as to show the tiger. He is a great frequenter of public-houses, and usually visits those places of resort where the respectable artisan class sojourn for an evening's entertainment. If there is a piano in the establishment, he will occasionally be seen engaged in deep and earnest converse with the player. He is known to the barman, and especially to the ladies, if there be any in the house. He pays them great deference; and generally speaks in a subdued and humble accent that has something shy in it. He is not over-neatly dressed, conveying the impression that the world is used up, and has collided against him in the process. He is clean shaved, somewhat lank, and having a ripple of pleasantness quivering on the clean upper lip. His most captivating characteristic is his blandness; he is bland to a degree—ever gentlemanly and refined in his attitudes and deportment.

As he walks leisurely and unconcernedly into the smoke-room or bar-parlour, he nods familiarly to the assembly, and at once sets the company at its ease. He remarks that 'It's warm;' or, 'Glorious weather;' or, 'Dear me, it's very wet,'

or offers an unsolicited opinion concerning the music, if there happens to be any in the room. His opinion, although differing in expression occasionally, is always sympathetic. He is never a critic—always a panegyrist. He has an extensive range of knowledge. Have they ever heard Rubinstein? No! Perhaps they have heard Halle! No! Dear me; that's singular. Still, he does not know. After all, everything's in a name, and he dares to say many an obscure player may be quite equal to any of those who have sounding reputations. It's the way of the world—most peculiar way, certainly. They would say so if they had had his experience; and then, with earnest and concentrated expression, he launches out on a sea of experience; tells harrowing tales, short and pithy, about the continent and the doings there; tells how he has had his ups and downs, and, after exciting the partially excited mind of his auditors, he asks them if they know anything of the gay capitals of the continental countries.

Strange, that anything foreign has such an attraction. He seems to know and duly appreciate the weakness. Conjuring, he tells them with a glance of mystery, is one of the chief delights of the European cities. Paris! Ever been in Paris? No! Three or four significant shakes of the head follow, in order to add the required amount of wonder to the disclosures he might make if he liked. Baden-Baden! Ever there? No! Nor Vienna, nor Monte Carlo, nor Berlin! No! Astonishing, truly. Ah, there's life there, if you like. The people live, actually live, on excitement. Every boy in the street is a wizard, and every girl a clairvoyant. That is where life is enjoyed. A short pause, during which he seems to be visiting mentally the places of his narrative, and occasionally gulping them down into oblivion with each sip of his glass. He gazes from one to the other, and becomes even blander, and encourages their queries by a glance of the utmost interest.

The company expands, and others drop into a seat and throw an inquisitive look on him.

'You do not seem to have made the very best of your travels, then?' ventures one of the party.

'Ah, my friend, if you had travelled as I have done, you would not ask such a question. You would understand how difficult it is for a man of very limited knowledge to cope with men who are versed in almost every pursuit.'

Another pause, in which the past seems to have revived, and another sip.

'They must be extremely forward in the countries you mention.'

'Forward! Bless you, gentlemen, I could show you tricks that you would never dream of being possible, that I have been taught by the children of those places. For example, this penny-piece that I hold in my hand; you see it is there' (holding it up); 'and now—*presto*, it is gone' (disappears accordingly); 'and yet, if I may take the liberty of removing this gentleman's hat' (does so), 'you find the identical penny-piece lying calmly at the bottom, as if it had lain there all its life.'

Glances of wonder, succeeded by a peal of laughter, and a titter at the gentleman with the hat, follow the execution of this feat.

The conjurer sips his glass in an unconcerned fashion, intending to convey the impression that the feat is a mere bagatelle. The curiosity of the company is excited, and will not now be held back; it must be satisfied. The professor eyes the assembly in the blandest and most encouraging manner, yet withal with a veil of mystery overhanging his features, that serves to further excite them. A trio of voices demand another example of his skill, and in almost one breath, issue instructions to the waiter to refill the gentleman's glass. He takes a sip of the newly-brought liquor and coughs slightly.

'Well, gentlemen, you see it is a little hard on a person circumstanced like myself. I am not quite so well off as I used to be, and although it is a habit of mine occasionally to oblige a company, I have my objection to doing these little things in public, because I often meet friends who knew me in my palmy days, and it is always an embarrassment to me when I am met by any of my former associates. Nevertheless, if you really desire it, gentlemen, I will not be so ungentlemanly as to stand between you and a little enjoyment, if we can dignify it by that name.'

A unanimous expression of approval follows this deprecatory little speech, and a general demand for another exhibition of his skill is made in a reassuring tone.

The professor, with a tinge of reluctance that seems to intensify the determination of the audience to have the whole programme, spreads his long lank hands, with their knuckles downwards, on the table; and in a careless manner, asks if any gentleman could favour him with a half-sheet of paper. Presently, the required article is handed to our hero, and he dexterously fashions it into a sort of cup with a long point at the base. He then produces from his pockets two peas, which he places underneath this cup, passes his hands over the top, turns them backwards on

the table, and asks one of the company to lift the cup. The cup is lifted, and—the peas are gone! He takes the cup again, places it on the table, and requests one of the audience to raise the cup. This is done, and—a large glass marble is found beneath it! The cup is carefully replaced, again lifted, and behold—a blank!

A feeling of wonder floats over the assembly, and vociferous applause proclaims their delight in the performance.

'That, gentlemen,' the professor explains with an air of indifference, 'is a trick very popular amongst the Arabs, but, like most of their tricks, is very simple. The next one is rather better. Will any gentleman, or number of gentlemen, oblige me with a loan of sixpence in pennies?'

Half-a-dozen hands are down at once into as many pockets, and the requisite amount of copper is immediately laid on the table.

'One, two, three, four, five, six. These, gentlemen, I place in this paper and screw tightly up. The paper I put under this tumbler, as you see. Will any gentleman kindly lend me his hat?—Ah! thank you. The hat I place beneath the table immediately under the glass containing the coppers, and when I say "*Presto*, hi!" begone!" you hear the pieces drop one by one into the hat through the table.'

More amazement is depicted on every face.

'Some gentleman kindly remove the glass and count the coppers, to assure himself and the company they are still there.'

A hand is reached forth and withdraws the paper, only to find it—empty.

'The paper, gentlemen, I again screw tightly up and again place beneath the glass. The pennies I have still in the hat. My business now is to transfer the coppers to their original place beneath the tumbler, which I proceed to do. You will perceive now, gentlemen, that the hat is empty; and if you kindly move over the packet, you will find that they are where they were first placed.'

The packet is again unfolded, and the penny-pieces are found, to the increased astonishment of the company, to be resting where they were originally placed.

Another sip of his glass and a short cough, and the prestidigitator puts forward his hand and inclines the pieces preparatory to transferring them to his waistcoat pocket, a practice which, amid roars of laughter, he declares he learned while sojourning in Malta not more than twelve months ago. This feat, blended with the cheeriest ripple of laughter possible, completely vanquishes the company, one of whom slaps him familiarly on the back, and remarks very emphatically on his cleverness, which he holds to be unsurpassed. Two of the assembly join in the opinion that he is a very demon, following which demonstrative appreciation there is more laughter and more eagerness. Matters wax warmer. The conjurer's practised eye observes it with satisfaction.

'Gentlemen, I have a pack of cards here.' He pauses for a couple of minutes, which time he utilises by spreading the cards in every conceivable shape—runs them up his arm, curves them round the table, and throws them about with wonderful dexterity. 'Any person take a card from the pack and I will tell him what it is.'

One of the company takes a card, looks at it, and replaces it in the pack. The professor then juggles the card upside down, and then, in an earnest voice, asks: 'You are quite sure you remember the card you selected?'

'O yes.'

'Would you be surprised to find that this is it?'—holding up a card.

'Yes, I should be very much surprised.'

'Ah, I thought so. Are you sure you can say the same about this?'—holding up another card.

'Correct, by Jove!' exclaim the company, and there is general laughter, the distinguishing part of it being that the individual who selected the card was laughed at, the joke being that he had been led into a trap.

The professor smiles blandly. 'I have here,' he resumes, after a pause, 'a small wooden case. Any gentleman may inspect it. Pass it round and examine it. Thanks. All satisfied? Thanks—O yes, it is wood; no deception whatever, I assure you. Simply, "The quickness of the hand deceives the eye." You know the phrase. Now, you will see that the case is made exactly like a cigar case, with hinges on the back so as to open and shut. I place the case thus on the table; I take the cards and shuffle, thus; I then request the company to take from the pack, say, half-a-dozen cards.—All done? How many have you? Six? Thanks. Now, have the kindness to replace them in the pack. You all remember your separate cards?—Yes; very well. Now, I take the case, which I open before you thus. You see that it is empty; whatever in it I then close it. Now it is, No. 1. The card you took from the pack is the three of spades. I open the case. Do you recognise it? Thanks.—No. 2. You will see that the case registers the ace of spades. Do you remember the card the card that you selected? Thank you.—No. 3. The case shows the ace of hearts. That yours? Thanks.—No. 4. I have here the king of hearts. Yours, you say? Much obliged.—No. 5. The card shown in the case is the knave of spades. Do you know it? Thank you.—The last card I have is the ace of diamonds. Does any one know the card?—Yours, sir? Ah, I thought so.—That completes the trick, gentlemen;' and he settles himself to another small sip, and to an additional relapse of unconcern.

This manoeuvre brings 'the house down,' and there is a clamour for more. Some of the company request that the trick be shown; to which demand the professor puts on a blandly injured air, and asks if it is a fair thing to ask for, after his humble endeavour to entertain them. 'Gentlemen, I did at one time,' he continues in a subdued voice, 'teach that trick for two shillings a head, but I put it to you whether knowledge of that sort should be sold so cheaply?'

For the next half-minute there is a jingle of coins on the table, and about twenty shillings lie before him. What man could withstand the temptation? He at length yields to their cries, and shows the wonderful card-trick, which, as it is unfolded with a due amount of mysterious comment, becomes as transparent as glass, and takes the edge off their astonishment.

There is a lull in the popularity. Does the professor see it? He is now busy with a small ginger-beer bottle, which he rolls over and over. There is a half-crown inside it. All eyes are attracted at once. Several of the company take up the bottle, and put it down with an exclamation of more wonder. He is irrepresible, they think.

'Gentlemen,' he says, 'I will give the contents of that bottle to any person who will get it out without breaking the glass.'

The company clutch it again, and pass it through another examination, and put it down hopelessly with a laugh.

Taking the bottle in his hand, the professor gives it a jerk, and the silver piece drops into his palm. 'If any one doubts my word, or that the coin is in any way manufactured for the purpose, I will do the trick with a penny. Any gentleman in the room oblige me with a penny? Thank you. I take the coin in my hand, thus; take the neck of the bottle in the other hand, and pass the coin in through the aperture before you can say "Jack Robinson." The penny rattles in the bottle to the amazement of the audience, and they seize the bottle and make frantic and useless efforts to extract the coin.

The professor now leans back and calmly surveys the company, and in the blandest language and with the most earnest and mystic demeanour, says: 'That trick I teach for a shilling, gentlemen; although in eastern climes I had ten times the sum.'

A pause ensues, during which the auditory glance at one another perplexedly. At length a voice cries in a decided tone, 'I'll have a shilling worth of that; and its possessor throws the coin away, which is at once followed by a dozen others. Strutting forth his hands, the man of business proceeds to detail the process of the deception, and how the deceit is successfully achieved.

Another lull of popularity. Astonishment has again faded. The company know his secret, and they find it is not a miracle; they are somewhat disappointed; they smoke their pipes in silence.

The professor throws a knife on the table. 'If any gentleman will kindly open that for me,' he says, 'I will pay him a sovereign.'

Some of the auditory grasp the knife and make strenuous endeavours to wrench the blade open. On it goes round the audience. Every man has his turn, but in vain. The task is hopeless. More mystery. The blank faces declare that it is impossible.

The owner says: 'Not at all, gentlemen; perfectly simple, nothing easier. Try it now.' (Throws the knife down again, and it is opened quite ordinarily.) 'Gentlemen, the secret is my own. I sell the secret for five shillings, and I throw the knife in. Is there any purchaser? I'm going away to-morrow, and if you really want a curiosity, there's your chance. Five shillings takes it. Any purchaser? None? Then, good-evening, gentlemen. I am heartily pleased to have met you. Good-evening to you all.'

Five minutes later, the man of business is entertaining a company in another 'house;' and

sitting alongside him is one of his previous audience, the foremost spokesman of the evening, to whom he will by-and-by count out half the proceeds of the evening's 'lay.'

A HOUSE DIVIDED AGAINST ITSELF.

CHAPTER XLII.

THE question which disturbed Frances, which nobody knew or cared for, was just as little likely to gain attention next day as it had been on the evening of Mr Winterbourn's death. Lady Markham returned to Nelly before breakfast; she was with her most of the day; and Markham, though he lent an apparent attention to what Frances said to him, was still far too much absorbed in his own subject to be easily moved by hers. 'Gaunt. Oh, he is all right,' he said.

'Will you speak to him, Markham? Will you warn him? Mr Ramsay says he is losing all his money; and I know, O Markham, I know that he has not much to lose.'

'Claude is a little meddler. I assure you, Fan, Gaunt knows his own affairs best.'

'No,' cried Frances, 'when I tell you, Markham, when I tell you that they are quite poor, really poor—not like you.'

'I have told you, my little dear, that I am the poorest beggar in London.'

'O Markham! and you drive about in hansoms, and smoke cigars all day.'

'Well, my dear, what would you have me do? Keep on trudging through the mud, which would waste all my time; or get on the knife-board of an omnibus? Well, these are the only alternatives. The omnibuses have their recommendation—they are fun, but after a while, society in that development palls upon the intelligent observer. What do you want me to do, Fan? Come, I have a deal on my mind, but to please you, and to make you hold your tongue, if there is anything I can do, I will try.'

'You can do everything, Markham. Warn him that he is wasting his money—that he is spending what belongs to the old people—that he is making himself wretched. Oh, don't laugh, Markham! Oh, if I were in your place I know what I should do—I would get him to go home, instead of going to—those places.'

'Which places, Fan?'

'Oh,' cried the girl, exasperated to tears, 'how can I tell?—the places you know—the places you have taken him to, Markham—places where, if the poor general knew it, or Mrs Gaunt—'

'There you are making a mistake, little Fan. The good people would think their son was in very fine company. If he tells them the names of the persons he meets, they will think—'

'Then you know they will think wrong, Markham!' she cried almost with violence, keeping herself with a most strenuous effort from an outburst of indignant weeping. He did not reply at once; and she thought he was about to consider the question on its merits, and endeavour to find out what he could do. But she was undeceived when he spoke.

'What day did you say, Fan, the funeral was to be?' he asked with the air of a man who has

escaped from an unwelcome intrusion to the real subject of his thoughts.

Sir Thomas found her alone, flushed and miserable, drying her tears with a feverish little angry hand. She was very much alone during these days when Lady Markham was so much with Nelly Winterbourn. Sir Thomas was pleased to find her, having also an object of his own. He soothed her, when he saw that she had been crying. 'Never mind me,' he said; 'but you must not let other people see that you are feeling it so much, for you cannot be supposed to take any particular interest in Winterbourn; and people will immediately suppose that you and your mother are troubled about the changes that must take place in the house.'

'I was not thinking at all of Mrs Winterbourn,' cried Frances with indignation.

'No, my dear; I knew you could not be. Don't let any one but me see you crying. Lady Markham will feel the marriage dreadfully, I know. But now is our time for our grand coup.'

'What grand coup?' the girl said with an astonished look.

'Have you forgotten what I said to you at the Priory? One of the chief objects of my life is to bring Waring back. It is intolerable to think that a man of his abilities should be banished for ever, and lost not only to his country but his kind. Even if he were working for the good of the race out there— But he is doing nothing but antiquities, so far as I can hear, and there are plenty of antiquarians good for nothing else. Frances, we must have him home.'

'Home!' she said. Her heart went back with a bound to the rooms in the Palazzo with all the green *persians* shut, and everything dark and cool. It was getting warm in London, but there were no such precautions taken; and the loggia at night, with the palm-trees waving majestically their long drooping fans, and the soft sound of the sea coming over the houses of the Marina—ah, and the happy want of thought, the pleasant vacancy, in which nothing ever happened. She drew a long breath. 'I ought not to say so, perhaps; but when you say home—'

'You think of the place where you were brought up? That is quite natural. But it would not be the same to him. He was not brought up there; he can have nothing to interest him there. Depend upon it, he must very often wish that he could pocket his pride and come back. We must try to get him back, Frances. Don't you think, my dear, that we could manage it, you and I?'

Frances shook her head, and said she did not know. 'But I should be very glad. Oh, very glad if I am to stay here,' she said.

'Of course you would be glad; and of course you are to stay here. You could not leave your poor mother by herself. And now that Markham—now that probably everything will be changed for Markham— If Markham were out of the way, it would be so much easier; for, you know, he always was the stumbling-block. She would not let Waring manage him, and she could not manage him herself.'

Frances was so far instructed in what was

going on around her, that she knew how important in Markham's history the death of Mr Winterbourn had been; but it was not a subject on which she could speak. She said, 'I am very sorry papa did not like Markham. It does not seem possible not to like Markham. But I suppose gentlemen— Oh, Sir Thomas, if he were here, I should ask papa to do something for me; but now I don't know who to ask to help me—if anything can be done.'

'Is it something I can do?'

'I think,' she said, 'any one that was kind could do it; but only not a girl. Girls are good for so little. Do you remember Captain Gaunt, who came to town a few weeks ago? Sir Thomas, I have heard that something has happened to Captain Gaunt. I don't know how to tell you. Perhaps you will think that it is not my business, but don't you think it is your friend's business, when you get into trouble? Don't you think that—that people who know you—who care a little for you—should always be ready to help?'

'That is a hard question to put to me. In the abstract, yes; but in particular cases— Is it, Captain Gaunt for whom you care a little?'

Frances hesitated a moment, and then she answered boldly: 'Yes—at least I care for his people a great deal. And he has come home from India, not very strong; and he knew nothing about—about what you call society; no more than I did. And now I hear that he is—I don't know how to tell you, Sir Thomas—losing all his money (and he has not any money) in the places where Markham goes; in the places that Markham took him to—Oh, wait till I have said everything, Sir Thomas, they are not rich people; not like any of you here. Markham says he is poor.'

'So he is, Frances.'

'Ah,' she cried with hasty contempt, 'but you don't understand. He may not have much money; but they—they live in a little house with two maids and Tom. They have no luxuries or grandeur. When they take a drive in old Luca's carriage, it is something to think about. All that is quite, quite different from you people here. Don't you see, Sir Thomas, don't you see? And Captain Gaunt has been—oh, I don't know how it is—losing his money; and he has not got any—and he is miserable—and I cannot get my one to take an interest, to tell him—to warn him, to get him to give up!—'

'Did he tell you all this himself?' said Sir Thomas gravely.

'O no, not a word. It was Mr Ramsay who told me; and when I begged him to say something, to warn him!—'

'He could not do that. There he was quite right; and you were quite wrong, if you will let me say so. It is too common a case, alas! I don't know what any one could do.'

'Oh, Sir Thomas! if you will think of the old general and his mother, who love him more than all the rest; for he is the youngest. Oh, won't you do something, try something to save him?' Frances clasped her hands, as if in prayer. She raised her eyes to his face with such an eloquence of entreaty that his heart

was touched. Not only was her whole soul in the petition for the sake of him who was in peril, but it was full of boundless confidence and trust in the man to whom she appealed. The other plea might have failed; but this last can scarcely fail to affect the mind of any individual to whom it is addressed.

Sir Thomas put his hand on her shoulder with fatherly tenderness. 'My dear little girl,' he said, 'what do you think I can do? I don't know what I can do. I am afraid I should only make things worse, were I to interfere.'

'No, no. He is not like that. He would know you were a friend. He would be thankful. And oh, how thankful, how thankful I should be!'

'Frances, do you take, then, so great an interest in this young man? Do you want me to look after him for your sake?'

She looked at him hastily with an eager 'Yes'—then paused a little, and looked again with a dawning understanding which brought the colour to her cheek. 'You mean something more than I mean,' she said, a little troubled. 'But yet, if you will be kind to George Gaunt, and try to help him, for my sake. Yes, oh, yes. Why should I refuse? I would not have asked you if I had not thought that perhaps you would do it—for me.'

'I would do a great deal for you; for your mother's daughter, much; and for poor Waring's child; and again, for yourself. But, Frances, a young man who is so weak, who falls into temptation in this way—my dear, you must let me say it—he is not a mate for such as you.'

'For me? O no. No one thought—no one ever thought'—cried Frances hastily. 'Sir Thomas, I hear mamma coming, and I do not want to trouble her, for she has so much to think of. Will you? Oh, promise me. Look for him to night; oh, look for him to night!'

'You are so sure that I can be of use?' The trust in her eyes was so plain, so enthusiastic, that he could not resist it. 'Yes, I will try. I will see what it is possible to do. And you, Frances, remember you are pledged, too, you are to do everything you can for me.'

He was patting her on the shoulder, looking down upon her with very friendly tender eyes, when Lady Markham came in. She was a little startled by the group; but though she was tired and discomposed and out of heart, she was not so preoccupied but what her quick mind caught a new suggestion from it. Sir Thomas was very rich. He had been devoted to herself, in all honour and kindness, for many years. What if Frances—? A whole train of new ideas burst into her thoughts on the moment, although she had thought as she came in, that in the present chaos and hurry of her spirits she had room for nothing more.

'You look,' she said with a smile, 'as if you were settling something. What is it? An alliance, a league.'

'Offensive and defensive,' said Sir Thomas. 'We have given each other mutual commissions, and we are great friends, as you see. But these are our little secrets, which we don't mean to tell. How is Nelly, Lady Markham? And is it all right about the will?'

'The will is the least of my cares. I could not inquire into that, as you may suppose; nor is there any need, so far as I know. Nelly is quite enough to have on one's hands, without thinking of the will. She is very nervous and very headstrong. She would have rushed away out of the house, if I had not used—almost force. She cannot bear to be under the same roof with death.'

'It was the old way. I scarcely wonder, for my part; for it was never pretended, I suppose, that there was any love in the matter.'

'O no' (Lady Markham looked at her own elderly knight and at her young daughter, and said to herself, What if Frances—?); 'there was no love. But she has always been very good, and done her duty by him—that, everybody will say.'

'Poor Nelly. That is quite true. But still I should not like, if I were such a fool as to marry a young wife, to have her do her duty to me in that way.'

'You would be very different,' said Lady Markham with a smile. 'I should not think you a fool at all; and I should think her a lucky woman.' She said this with Nelly Winterbourn's voice still ringing in her ears.

'Happily, I am not going to put it to the trial.—Now, I must go—to look after your affairs, Mrs. Frances; and remember, that you are pledged to look after mine in return.'

Lady Markham looked after him very curiously as he went away. She thought, as women so often think, that men were very strange, inscrutable—'mootly fools,' at least in one way. To think that perhaps little Frances— it would be a great match, greater than Claude Ramsay—as good in one point of view, and in other respects far better than Nelly St John's great marriage with the rich Mr Winterbourn. 'I am glad you like him so much, Frances,' she said. 'He is not young; but he has every other quality; as good as ever man was, and so considerate and kind. You may take him into your confidence fully.' She waited a moment to see if the child had anything to say; then, too wise to force or precipitate matters, went on: 'Poor Nelly gives me great anxiety, Frances. I wish the funeral were over, and all well. Her nerves are in such an excited state, one can't feel sure what she may do or say. The servants and people happily think it grief; but to see Sarah Winterbourn looking at her fill, me with fright, I can't tell why. She doesn't think it is grief. And how should it be? A dreadful, cold, always ill, repulsive man. But I hope she may be kept quiet, not to make a scandal until after the funeral at least. I don't know what she said to you, my love, that day; but you must not pay any attention to what a woman says in such an excited state. Her marriage has been unfortunate (which is a thing that may happen in any circumstances), not because Mr Winterbourn was such a good marriage, but because he was such a disagreeable man.'

Frances, who had no clue to her mother's thoughts, or to any appropriateness in this little speech, had little interest in it. She said, somewhat stiffly, that she was sorry for poor Mrs Winterbourn—but much more sorry for her own mother, who was having so much trouble and

anxiety. Lady Markham smiled upon her, and kissed her tenderly. It was a relief to her mind, in the midst of all those anxious questions, to have a new channel for her thoughts; and upon this new path she threw herself forth in the fullness of a lively imagination, leaving fact far behind, and even probability. She was indeed quite conscious of this, and voluntarily permitted herself the pleasant exercise of building a new castle in the air. Little Frances! And she said to herself there would be no drawback in such a case. It would be the finest match of the season; and no mother need fear to trust her daughter in Sir Thomas's hands.

Sir Thomas came back next morning when Lady Markham was again absent. He told Frances that he had gone to several places where he was told Captain Gaunt was likely to be found, and had seen Markham as usual 'frittering himself away,' but Gaunt had nowhere been visible. 'Some one said he had taken ill. If that is so, it is the best thing that could happen. One has some hope of getting rid of him so! But where did he live? That was the question. Markham did not know, nor any one about. That was the first thing to be discovered, Sir Thomas said. For the first time, Frances appreciated her mother's business-like arrangements for her great correspondence, which made an address-book so necessary. She found Gaunt's address there; and passed the rest of the day in anxiety, which she could confide to no one, learning for the first time those tortures of suspense which to so many women form a great part of existence. Frances thought the day would never end. It was so much the more dreadful to her that she had to shut it all up in her own bosom, and endeavour to enter into other anxieties, and sympathise with her mother's continual panic as to what Nelly Winterbourn might do. The house altogether was in a state of suppressed excitement; even the servant—or perhaps the servants most keenly of any, with their quick curiosity and curious divination of any changes in the atmosphere of a family felt the thrill of approaching revolution. Frances, with her private preoccupation was blunted to this; but when Sir Thomas arrived in the evening, it was all she could do to curb herself and keep within the limits of ordinary rule. She sprang up, indeed, when she heard his step on the stair, and went off to the further corner of the room, where she could read his face out of the dimness; and where, perhaps, he might seek her, and tell her, under some pretence: these movements were keenly noted by her mother, as was also the alert air of Sir Thomas, and his interest and activity, though he looked very grave. But Frances did not require to wait for the news she looked for so anxiously.

'Yes, I am very serious,' Sir Thomas said in answer to Lady Markham's question. 'I have news to tell you which will shock you. Your poor young friend Gaunt—Captain Gaunt—wasn't he a friend of yours?—is lying dangerously ill of fever in a poor little set of lodgings he has got. He is far too ill to know me or say anything to me; but so far as I can make out, it has something to do with losses at play.'

Lady Markham turned pale with alarm and

horror. 'Oh, I have always been afraid of this. I had a presentiment,' she cried. Then rallying a little: 'But, Sir Thomas, no one thinks now that fever is brought on by mental causes. It must be bad water or defective drainage.'

'It may be—anything. I can't tell; I am no doctor. But the fact is, the young fellow is lying delirious, raving. I heard him myself; about stakes and chances and losses, and how he will make it up to-morrow. There are other things too. He seems to have had hard lines, poor fellow, if all is true.'

Frances had rushed forward, unable to restrain herself. 'Oh, his mother, his mother—we must send for his mother,' she cried.

'I will go and see him to-morrow,' said Lady Markham. 'I had a presentiment. He has been on my mind ever since I saw him first. I blame myself for losing sight of him. But to-morrow'—

'To-morrow—to-morrow, that is what the poor fellow says.'

HOME NURSING.

BY A LADY.

INFECTION.

INFECTION, our final theme, is a subject likely to present itself for the consideration of most home-nurses, and is, moreover, one on which there exists the widest difference of opinion on the part of those who know least of the matter. I have met with mothers so ignorant as to be anxious that all their children should have a given complaint at the same time, even going so far as to put a patient suffering from measles or scarlatina to sleep with unaffected children, in the hope of their catching the disease! On the other hand, there are nervous, fussy mothers who will not allow their little ones to go to school or to parties, or to make friends with other children, for fear of problematic disease, and who seem to look upon every outsider as a source of infection. But perhaps the majority of people take a middle course, and whilst shrinking from the first plan, and dreading the second, are scarcely wiser in their incredulity as to isolation and disinfecting. There is also in the minds of many such an idea that the spreading of infectious disease—especially amongst the young—is a matter beyond control, and that it is useless to attempt to interfere with the run of what are popularly known as 'children's diseases.' To such I would specially urge the consideration of the following facts.

(1) There is absolutely no natural law compelling children to run the gamut of a series of infectious complaints. (2) There is danger more or less in all such complaints, and no constitution is bettered by the ordeal; whilst in very many cases, even with an apparently good recovery, seeds may be planted to bear bitter fruit in after-life. (3) An apparently slight case, in which the child is hardly ill, may be as fruitful a source of contagion as severer forms of the same disease; in fact, it is often the slight cases that do the most mischief; for when there is evident illness, a doctor will generally be called in, and will give preventive instructions;

whilst in light cases, many a mother will not only trust to home-doctoring, but will exercise her own judgment as to the length of quarantine.

(4) Infection is not a mere vague something which is too intangible for attack; but, on the contrary, it has definite means of propagation, which, once understood, may be fought against and overcome. (5) It is a matter of experience that even in lodging-houses, by the use of proper precautions, infection can be so arrested that the first case shall be the last.

There is an excellent work carried on in Hastings, under the name of the Sanitary Aid Association, which seeks to make these principles known amongst the poor; and so successful have been its operations, that in an experience of ten years, there has not been one case of failure. Speaking, too, from personal knowledge, I can say that there are many cases, both in schools and private families, where, by prompt and continued measures, the spread of scarlet fever even can be entirely arrested. But in order to set to work with a chance of success, it is necessary to clearly understand what infection is and in what way it is conveyed.

An infectious fever produces in the blood, and casts off in the various matters passing from the patient's body, certain germs or seeds, which, entering into another person's body, will grow and produce so much like poison as to cause the second person to be attacked with disease similar to that of the original patient. Of course, not everybody who breathes infected air is thus affected, especially if he has previously suffered from the same complaint; but it is these seeds or germs, only, which originate all infectious disease, and they come directly from the body of some sick person from which poison has escaped. Poison having been received into the blood, a period of incubation sets in, during which the affected person goes about as usual, unaware of the mischief that is at work within him. This period varies from a day or so to a fortnight, according to the nature of the disease and the patient's constitution; and is followed by the period of invasion, when there is, generally, slight chilliness, headache, sore throat, lassitude, and a desire to be alone; but sometimes this period of invasion is ushered in suddenly by violent shiverings, sickness, or overwhelming headache. In either case, the symptoms augment and increase, up to a certain point, and then, in favourable cases, gradually subside. The whole attack may occupy only a few days, or it may extend over weeks. In every case, the temperature of the body—taken with the clinical thermometer—rises above normal, especially at night, when there is frequently delirium.

In fevers characterised by a rash, its appearance is relieving, and as it dies away, the general symptoms subside. It is with this class of fever we propose to deal, and it will be simpler to take as typical, scarlet fever, which is the most difficult to deal with, on account of its gravity and of its fatal facility for spreading. In this complaint, every part of the patient's body throws off poison, not only by the breath and skin, but by every organ and special affection. Most people understand something of the danger of the peeling stage; but very few remember the peril attached to every kind of excreta and to

any sort of discharge. But, once get the idea of this all-pervading danger firmly rooted in the mind, and the remedy is almost self-suggestive; for, happily, there are within the reach of all agents which have power to destroy poisonous germs, as they leave the body, or before they can attach themselves to fresh soil. For this purpose, there are various disinfectants in use, such as Condy's or Burnett's fluid, Martin's crimson salt, or Calvert's carbolic. The doctor will probably name the special preparation he prefers, and directions for use will be found on each bottle; but it must always be remembered that disinfectants are valuable only in proportion as their use is thoroughly and systematically carried out. Many people forget that a disinfectant can only do a certain amount of work, after which it becomes used up, and is of no avail; for this reason, the crimson preparations are useful, as their change of colour points to the fact that their work is done; but the permanganate of potash, of which they are composed, is not in all respects powerful; and if used, they are generally supplemented by some form of carbolic acid, which is a most valuable agent as long as the fact of its being a strong poison is kept in view.

I have said that the doctor will probably name a disinfectant and give some general preventive instructions; but he cannot be expected to enter into those details of which the intelligent homeward nurse should make herself mistress.

First, as to the sickroom; it should, if possible, be at the top of the house, that there may be no fear of poisonous fumes ascending. If the whole of the upper floor can be given up to the use of patient and nurse, all the better; but at any rate, they should have two rooms exclusively their own, and no person who has not had the disease, whether child or adult, should sleep on the same floor, unless it is absolutely necessary. In all cases of acute fever of whatever degree, woollen hangings and carpets should be removed, though, where expense is no object, their place may be taken by washing-curtains and a crumplecloth. The contents of cupboards, wardrobes, or chests of drawers should be removed, and nothing of a woollen nature allowed to remain, except, of course, the patient's bedding, which will be much the same as for ordinary nursing, with the addition of a mackintosh sheet between the mattress and under-blanket.

Ventilation must be most carefully attended to in fever-cases, and a fire in a grate, except in the height of summer—should be kept burning day and night. It is also a good plan to pull the bed at least a foot away from the wall, that there may be a free current of air all round it.

A sheet soaked in disinfectant should be hung outside the door of the patient's room, and must be kept constantly wet. An excellent contrivance, known as 'Lacy's Isolation Sheet,' will save all trouble in this respect. It consists of an ordinary sheet, headed by a small tank, which can easily be fastened to the framework of the door, and which is so arranged as to keep the sheet constantly wet, without the drippings and mess associated with the usual methods of soaking or syringing. All particulars respecting these sheets may be obtained of the manufacturers,

24 Ringford Road, Wandsworth, S.E.; and to an amateur especially, the saving of trouble will be well worth the slight outlay.

All food should be brought to within a few feet of the sheet and left for the nurse to take, when the bearer has retired. The nurse's dress should invariably consist of some washing material, and it is well if she can avoid coming into contact with other members of the household; but should this be impossible, she should wear in the sickroom a loose cotton wrapper, which she can throw aside before leaving it; and she should also keep a pair of slippers in the second room, to change before she goes down; and her hands should have a thorough wash with carbolic soap. These directions apply specially to cases where there are other unaffected persons in the house; and if such are children, the nurse must refrain from kissing or handling them. Such a caution might seem unnecessary, but I have known more than one case in which a mother of intelligence has gone from the sickroom to the nursery, giving its inmates extra petting, to make up for enforced absence, and then has wondered that, 'in spite of all precautions,' one after another of the little ones has sickened! Thus is one reason why, as a rule, unaffected children should be removed from the house as soon as possible, subject to the doctor's orders, though, where this is impracticable, there is no need to lose heart, for, as I said before, except in special cases of delicacy, isolation and the free use of disinfectants are a pretty sure safeguard against the spread of fever, unless, as often happens, infection has been carried before the first case has come under treatment. On this account, I would strongly advise, particularly during an epidemic, that any child who appears to be out of sorts should at once be separated from his play-fellows, and if headache, sore throat, or sickness come on, a doctor should immediately be summoned.

Keeping in view what I started by saying, that every organ of the patient's body is capable of throwing off poison, it follows that everything he touches becomes infected. His bed and body linen, in spite of constant changing, become so highly charged with poison, that they need to be immediately plunged into a tub or bath of disinfecting fluid—which should be provided with a well-fitting cover—and left to thoroughly soak, after which they should be hung up to dry in the open air. Thus treated, and a fresh supply of disinfectant used for each change of linen, there will be no danger in sending it to the wash in the ordinary way. But there can hardly be greater cruelty than to send out of the house clothes charged with poison, which may spread disease right and left amongst those who have at least in their power to arrest its course.

The nurse's linen should be treated in the same way, and she should never allow her own or the patient's to lie about, as is so often done, till just before the laundress comes. In fact, it is half the battle to disinfect at once, and to keep clear of continued poison-shedding.

All cups, plates, spoons, &c., used by the patient, especially any that go down-stairs, should be placed in some disinfectant—not carbolic—before being thoroughly washed in the ordinary way.

If the use of the draw-sheet becomes necessary, it must be removed as often as soiled, and plunged at once into a special covered bath of extra strong disinfectant. The mackintosh underneath it should also be frequently sponged with disinfectant of the same extra strength, but it will need to be quickly sponged off with cold water, if the fabric is to be unimpaired.

All water used for washing or gargling should have in it some non-odorous disinfectant; for the latter purpose, Condy's remedial fluid is excellent. If the patient has a cough, or discharge from the throat, he should be supplied with a small basin, half filled with disinfectant, which will need frequent renewal; but if, as often happens in such cases, there is extreme prostration, it will be better to get a supply of small pieces of rag, to be used once, and then burned, or, if the fire is not quick, put into strong disinfectant before being destroyed. The same course must be adopted, should poulticing be necessary. If used for an abscess, these poultices will be poisoned through and through, and it is better to disinfect thoroughly before burning. It is also a good plan to use a little Condy's subject to the doctor's approval—in the water used to make the poultice. Of course, anything in the shape of discharge, whether by abscess or from throat or ear, very much increases the difficulty of nursing, and calls for such great vigilance and care in handling, that amateur nursing is only allowable when it is impossible to obtain better; and indeed, in all cases of malignant scarlet fever, the patient will have a much better chance in skilled hands, very few of the inexperienced being able to attend to the question of infection, whilst having to battle with illness, hard enough to manage by itself.

In ordinary cases, not malignant, a careful following out of the above rules will suffice; but it is advisable also to disinfect the air of the room by the use of a spray-producer, two or three times a day, in addition to a saucer of carbolic on each side of the bed. It is also well to wipe over the floor and furniture with a cloth damped in disinfectant. The debris of the room should always be burned in a brisk fire, and never put into the ordinary dust-bin.

In convalescence, the same precautions must be continued, even though the patient appears to be quite well; for peeling of the skin (desquamation) will sometimes in the slightest cases not begin till the fourth week, and this is the period of greatest danger as regards the spread of disease. The patient, if a child, will have his toys about him, and if an adult, will very likely be reading books from a circulating library and writing letters to his friends, by both of which means he is sowing infection broadcast; so that, for home-nursing, it should be an inviolable rule that no letters shall be allowed to go out of the sickroom till the doctor gives consent, and that all toys and books shall be burned when the general cleaning-up takes place.

The length of quarantine must be determined entirely by the doctor, for patients may continue to give off infection from the skin and internal organs long after any external signs have ceased; and the nurse should encourage her patient to put up with the tedium of continued isolation, rather than run the risk of spreading what, those

who know its worst forms will agree, is a terrible visitation.

* Disinfectant baths, and sometimes oiling of the skin, preclude the patient's release from quarantine; but this is a matter for the doctor's discretion. The nurse should be particular to inquire whether half-quarantine or any special precautions are to be observed after the patient has begun to mix with other people; and no child should be allowed to return to school without a certificate to the effect that he is free from the possibility of carrying infection.

As regards the final cleansing of the sickroom—if the above instructions have been carefully carried out, it will be enough to steep all the bed-clothes; to sponge bed, mattress, and pillow-ticks, and all the furniture, with strong disinfectant, and to sweep over floor, walls, and ceiling with carbolic powder, applied with a brush covered in flannel. Nothing need be destroyed beyond any unwashable articles worn by the patient during convalescence. His toys and books, sponge, and brushes—these to be burned in a brisk fire. All washable clothes, including bed linen and the nurse's garments, should receive a final disinfectant bath before being washed in the ordinary way. It is always well to ask the doctor if he considers such means sufficient; and should the nurse have reason to fear that the bed has become infected, she should not hesitate to say so, for a bed is just one of those things which is capable of holding infection for a practically unlimited time, and should there be the least doubt, it is wise to err on the safe side, and let the bed go away to be thoroughly disinfected and re-made.

Should the doctor advise fumigation of the sickroom, it may easily be done as follows: move all furniture away from the walls, spreading out or hanging up cushions, blankets, &c. Shut the register—the chimney having previously been swept—close all cracks round it, the windows or ventilators; then put an ordinary tin pail, half filled with water, in the middle of the room; lay across this a pair of tongs; place the requisite amount of sulphur according to instructions—on an old tin tray; pour over the sulphur a little spirit; place the tray on the tongs; light the spirit, and retire quickly, closing the door, and fastening up the racks all round. The fumes of the sulphur will destroy any lingering traces of infection, and the pail of water precludes the possibility of anything catching fire. The room should be left thus for twenty-four hours, and then thoroughly aired, door, window, and chimney being opened, for a couple of days; but even then the smell will continue for some little time, and any furniture or clothing had better be left in the open air as long as convenient.

If a second room has been used, it will need the milder form of disinfecting, for though only the nurse has used it, she will most likely have carried with her some fever germs, especially in bad cases.

It sometimes happens that a person who has not had the fever is obliged to nurse a patient thus affected; and in this case, she will need to exercise vigilance on her own account. She should never, if possible, approach the patient while fasting. If she can take her meals in

another room, all the better; and in waiting upon him, she should try to stand between him and the window through which air is coming in. Of course, she will endeavour to avoid catching the patient's breath, and whilst coming into close quarters with him, she should try not to swallow. After every personal attention, she should gargle in another room with some disinfectant, and thoroughly wash her hands and nails with carbolic soap. Many people who neglect these precautions get a sore throat whilst nursing the fever, and though a nurse need not unnecessarily alarm herself should she feel such symptoms, she should never neglect to mention the fact to the doctor.

Speaking of the doctor, suggests one very important consideration. I have already alluded to the fact that many people will trust to home-doctoring in slight cases of fever; and unfortunately, it has become very much the fashion to denominate such attacks scarlatina, as distinguished from scarlet fever; whilst, as a fact, the names are as identical as the diseases, scarlatina being simply the technical name for scarlet fever; and moreover, the after-effects, as well as the power of spreading infection, may be quite as grave in slight cases as in more apparently serious attacks. Again, many mothers have not the slightest hesitation in undertaking the care of what they are pleased to term 'only measles;' and I have known children to be in actual danger before there has been the shadow of alarm on the part of the home-doctor. It is a pity such people cannot study the death-rates amongst children, and see how many victims are annually sacrificed to the folly and ignorance which stamps this particular complaint as 'so simple;' for though, of course, some children who have been properly cared for all through, sink, from special causes, as a rule the reverse is the truth; and the danger lies not so much in the disease itself—which really is of a mild character—as in those complications which are liable to occur from the commencement of the attack until some time after the patient appears to have quite recovered, and which need a practised eye to discover and arrest in the very beginning.

There is also this important consideration to be borne in mind—that it is by no means always easy to decide on the nature of a given complaint; for though in books the symptoms are duly arranged within decided limits, in actual experience those limits are often entirely disregarded, so that the doctor even may not be able to immediately pronounce an opinion, even where the mother is perfectly sure—to her own thinking—of the nature of the disease; and this accounts for the fact that in medical practice it is by no means uncommon to discover that there has been scarlet fever of a previous date, by the presence of organic disease, the patient being very likely ignorant of anything more serious than an attack of measles, treated with the proverbial saffron-tea.

One great difficulty in the way of checking the spread of measles is, that it is infectious during the early stage, when there is no rash, and the child appears to have only an ordinary cold; but it cannot hurt to try isolation, and the same rules for disinfecting should be observed, though

the period of quarantine will not be so long as for scarlet fever.

It is a bad plan to put two children suffering from an infectious complaint to sleep together, the effect of which is a constant mutual poisoning. Let each patient have his own bed, and till the fever has subsided at least, keep the children separate.

In whooping-cough there is the same difficulty as with measles, for there is danger of infection before the cough has assumed the peculiar sound from which it derives its name. As soon as the nature of the complaint is thus announced, the child should be isolated, but beyond being separated from his playfellows, the only precautions needed are to supply him with a basin half filled with Condy's fluid, and to fully disinfect his handkerchiefs before sending to the wash; and if there is sudden sickness, to disinfect any article accidentally soiled.

Children often suffer more from fear than from the actual cough. 'Are I doing to shake?' was the pitiful cry of my last little patient, and in such cases, &c. is a great comfort to the sufferer to let him rest across your arm, thrown round his waist, during a paroxysm; and if ever 'spoiling' is allowable, it is when every little excitement brings on the dreaded cough. In all but the mildest cases, which are so slight as to need no medicine, I would urge the calling in of prompt medical advice, for, with delicate children, there is more or less liability to inflammation of the air-passages, and the remedial measures to be used are only fit for skilled hands. Never give a child any of the various preparations sold as specifics for whooping-cough; they mostly contain injurious drugs, and a child requiring medicine needs also watching and care beyond an amateur's. This is a specially needed caution, for many people are under the impression that the cure for whooping-cough is being out of doors, and though fresh air—especially change of air—is most desirable in convalescence, in the earlier stages, anything of the nature of damp or keen wind is enough to dip the scale on the side of bronchitis or inflammation of the lungs.

Diphtheria is a very difficult disease to manage, because, whilst highly infectious, it is almost impossible, in bad cases, to disinfect thoroughly as you go on. Scarlet fever precautions must be rigidly carried out, and the room will probably need special disinfecting—according to the doctor's orders—both during and after an attack. When the patient becomes too weak to sit up, he must be kept plentifully supplied with soft rags, which, after once using, should be thrown into strong disinfectant before being burned.

Smallpox is still, unhappily, in our midst, and though in the old days it used to be dreaded, alike for its innate horror and its almost unlimited power of spreading, it is now, I think, more easily managed than scarlet fever or diphtheria, because of the antitoxin always ready to hand. The great thing is to isolate or remove the patient at once, and to see that all members of the household needing it are re-vaccinated. I have known this plan succeed so well, that in a family of twelve children, the first patient has remained the last, in spite, too, of his having come into contact with several of the unaffected, all of whom however, had been primarily vaccinated. One

shudders to think of the terrible results that one such case would have produced, not so very many years ago; and those who refuse to let their children be vaccinated, not only lay themselves open to danger, but expose their innocent victims to the chance of suffering, which needs to be seen or felt to be rightly estimated. I venture to say that no parent with any sort of kindly feeling would neglect this simple safeguard, if he had experienced only the torture of that peculiar, indescribable back-ache, which is frequently but the earnest of worse things to come for the small-pox patient.

COLONIAL TRAINING FOR GENTLEMEN'S SONS.

RAPID as has been our advance in almost every kind of social progress during the last forty or fifty years, it is probable that no greater strides have been made in any department than in that which includes education. Yet how enormous is the opening for further progress in this direction! Probably one-half of all our social troubles is due to the present lamentable neglect of the great question of education—using the word in that wider sense which includes not ‘schooling’ merely, but all sorts of general and technical training intended to fit men and women for their special stations in life. If we look around us, we may see—in spite of much distress and many complaints as to the keenness of competition and scarcity of employment—a considerable demand for really first-class workmen and workwomen in not a few branches of industry. There is, both in this country and in our colonies, an almost unlimited demand for well-trained domestic servants and competent cooks; yet, in spite of this unsupplied demand, may be seen in every direction—in the slums and back-streets of London and other large towns, in the cottages of the poor in country villages, in our jails and workhouses, all alike—numbers of growing girls and slovenly women, who, had they been taken in hand in time, might have been trained with ease to fill efficiently these vacant posts, instead of being allowed to lead lives which are often nearly useless, and too often, lives of want and misery, if not of crime.

Then, again, there is not one of our colonies that does not stand in the most grievous need of that which is the life and soul of all countries—namely, population; yet, again, we have in England thousands upon thousands of loafers and ne'er-do-wells—let alone our paupers!—many of whom are frequently in the direst want, and nearly all of whom are now so irremediably set in the ruts of their wretched lives as to be utterly unable to profit by emigration, even if unlimited funds were forthcoming to send them out to the colonies. It is impossible to deny that, had these received proper attention when young, very much could have been done, with comparative ease, and great benefit and economy to all concerned, towards converting them into exactly the kind of men our colonies so sorely want to till their millions of acres of vacant, though fertile, land. In short, greater care is needed in nearly every branch of industry, especially to train the young to perform efficiently

those particular duties in life for which they are destined. The ‘raw material’—so to speak—we have in abundance, and it would actually cost less in the long-run to convert it into manufactured goods of the kind required, than to allow it to run to waste, as is now so largely done. The subject of ‘technical education’ for mechanics and others of a like class has been deservedly receiving much attention of late; but this short-sighted nation still requires to be made to see more clearly that technical education, of one sort or another, is required in nearly every vocation in life—as much for the son of a country squire, destined some day to become a member of parliament, as for the ragged and destitute children, many of whom might, with the greatest advantage to all concerned, be trained to become respectable domestic servants or thriving colonists.

The whole subject is a very large one, and it is not intended in the present place to do more than treat briefly of one of its minor, though still important, branches—that of a colonial training for the sons of gentleness and others of high birth and good education. Whether or not emigration is, on the whole, a desirable thing for the sons of clergymen, doctors, and the like, is a point which will not be discussed herein; it is enough to accept the fact that many such go out for better or for worse—too often, it must be admitted, for the latter, though this is in most, if not all, cases clearly due to a total want of preparation for the life of a colonist. A recent writer, who must at least be credited with a good knowledge of his subject, says, ‘From long experience, I should say that not over ten per cent. of the people above the rank of a labouring man who go to America succeed there, though the reason of this is not hard to find.’ This reason, he goes on to explain, is, that ‘the greater number go without the slightest idea as to what they are going to do, or how they are going to do it; nor have they, in many instances, either capital or practical knowledge enough to command success.’ It is the object of the present paper to point out how the one great cause of this too frequent failure may be best avoided.

The training usually undergone by young men of the middle and upper classes is of such an absurdly ridiculous kind, if intended to fit the object of it for the life of an emigrant, that one could hardly do otherwise than laugh at the whole matter, were it not clearly a case for serious commiseration. Let us select, for the sake of example, a case which is fairly typical of numberless others. We will imagine some country clergyman with perhaps a large family and an income of, say, three hundred pounds per annum—sufficient at any rate to enable him to live respectably in his comfortable rectory, but not sufficient to enable him to give all his sons a thorough training in any particular trade or profession. Under these circumstances, one at least will probably be destined for a colonial life. The father of course sees the necessity of giving all his sons a good schooling, to commence with. The one whose fortunes we are following is accordingly sent to an establishment where he obtains the usual amount of book-learning, which will include a more or less

thorough knowledge of Latin and Greek, as well as a fair acquaintance with arithmetic, geography, science, modern languages, and with that wearisome catalogue of the misdeeds of the great potentates of past ages, commonly called history. The youth leads a fairly easy genteel life; his vacations are spent in visiting school-fellows, in picnics, boating-parties, cricket-matches, and similar recreations. In time, perhaps, he is promoted to one of the larger public schools, where he will probably make many friends and pick up a good deal of polish, but will learn little or nothing that will be of use to him in his after-life in the colonies. Yet, when this young man leaves school at the age of seventeen or eighteen, his father too often fondly imagines that he has done all that was required to fit his son for a colonial life. Had the son been destined, as some of his brothers probably are, either for the church, the army, the bar, the navy, or the medical profession, the preliminary training he has already undergone would have fitted him fairly well for the further training he would have to undergo; but, as he is destined for the colonies, it may be truly said that not only has he not received a training fitting him for his future life, but he has positively received a kind of training likely to unfit him for it.

When this delicately dressed, finely polished, book-learned young man finds himself in due course in one or other of the colonies, he at once takes up his abode at some good club or hotel in one of the principal towns, calls on old acquaintances, presents his letters of introduction—if he have any—and professes himself to be on the lookout for employment. The idea of leaving the town, of going out into the country districts, and of taking service with some plodding settler, living in a rough farmhouse, and doing most of the work of the farm with his own hands, is, naturally enough, quite foreign and repulsive to his whole nature. He has probably never done a stroke of really hard manual labour in all his life—has, in fact, never been brought up to do anything of the kind. Yet, practically speaking, almost the only kind of employment the colonies can offer to new-comers is directly manual, and is usually connected with agriculture; and when the small stock of money which the emigrant brought out is exhausted, he will be compelled by necessity to take to this kind of work. If in Australia, he probably goes up into the bush or the back-country and helps to herd cattle; if in New Zealand, he may go to sheep-tending; if in the Canadian north-west, he may drift—as many have already done—into the ranks of the mounted police, or he may turn-to and work for his board for some settler living in a rude and comfortless shanty on the prairie. When this period arrives, the hardships, more or less inseparable at first from a settler's life in a new country, come upon the "greenhorn" with ten times the severity they need have done, had only his well-intentioned though mistaken parent done what all those who have any acquaintance with the subject must regard as the only rational thing to do under the circumstances—namely, to train his son with the special view of fitting him to the life for which he is destined.

But the matter does not end with the emi-

grant's feeling of mental distress at finding himself, when fresh from a comfortable home, compelled to undergo—very likely among rough and ignorant strangers—things which his previous bringing-up has rendered distasteful to him—at first, at anyrate—to work in the open fields from dark to dark, to eat the coarsest of coarsely prepared food, and to lodge in a wretched shanty, if not for a time in the open air; for, even supposing that the emigrant is a determined young fellow, well supplied with the pluck and energy of youth, that he struggles against, and in time overcomes his difficulties, still his lamentable want of experience is but partially removed. The success of his whole life as a colonist is still imperilled. He knows little or nothing of agricultural matters, has probably never handled a plough or milked a cow, does not know how to swing an axe, to put up a fence, or build the roughest of log-shanties; perhaps hardly even knows how to harness a horse. Yet, if he is ever to get on, he must know all these things; and if the luckless youngster endeavours to start farming on his own account before he has thoroughly learned them, he will probably pay for the necessary experience a very large part, if not the whole, of his very limited capital. His knowledge of Latin and Greek, his acquaintance with algebra and history, will not in any way assist him to acquire the experience he must have. The poorest and worst-educated farm-labourer, however newly arrived, occupies for the time a more desirable position in life than a freshly arrived gentleman's son of the class indicated. The manual labour, the rough life, and the coarse food are only what the former is accustomed to; while every settler would sooner employ him than the gentleman's son, because he has a practical acquaintance with his trade.

Such a picture as that now sketched is not a pleasant one to contemplate; yet it cannot be denied that thousands of well-bred young Englishmen, on first emigrating, have experienced hardships and privations quite as great as those described; and it is certain that the parents of most of these must be accused of culpable ignorance or negligence in sending out their sons under such conditions. Of those who have succumbed under the hardships, and have drifted into the large towns, only to become whiskey-drinkers and gamblers, but little need be said, though they are not a few. The writer has already stated that it is not his intention to discuss the abstract desirability of emigration for gentlemen's sons; but he cannot resist saying that, if the emigration is to be carried on under such conditions as those described, it had far better not be carried on at all. This, however, leads directly to the question, "Can nothing be done to alter this state of things?"

The only answer obviously is that, by rational means, very much could undoubtedly be done to remedy it. These means would consist for the most part in the adoption of a special course of practical instruction for those destined for a colonial career. If this be not done, the greater part of the blame for the too frequent non-success of well-educated young men in the colonies must be laid at the door of the parents and others who are responsible for their training, rather than upon the young men themselves.

It is hardly to be expected that before the age of thirteen or fourteen years any boy should exhibit such marked characteristics as would enable a parent to decide whether or not his son was fitted for a colonist's life; but after passing that age, the question can usually be answered with fair accuracy. 'At this period of life, therefore, those youths who are destined for a colonial career should be taken from the ordinary schools, and sent to others at which they would undergo a course of instruction specially planned with a view to fit them for commencing life in the colonies at, say, the age of seventeen to nineteen. It is essential that the practical nature of such an education should be its main characteristic. Whilst ordinary school-work should be in no way neglected, the pupils should gradually be accustomed, as an integral part of their education, to perform real, outdoor, manual labour. A literary master—as distinguished from a practical master—should, therefore, be provided, exactly as in an ordinary school. Side by side with his arithmetic, languages, and the like, each pupil should be taught to handle the plough; to do rough carpentering and blacksmith's work of various kinds, including the building of bridges and houses, the shoeing of horses, and the repairing of carts, farm-implements, and machinery; to do simple cookery; to take charge of and manage horses and other live-stock; and generally, to perform with his own hands most of the ordinary operations of an English farm.

In addition to the foregoing essentials, it is very desirable that the pupils should have a fairly comprehensive knowledge of the theory of farming, of the principles of geology, and of the charge of engines and other machinery. There are, of course, other things which it would be advantageous for the pupil to know something of, such as the rudiments of book-keeping, land-surveying, dam building, seamanship, and other matters mentioned in the rather alarmingly long list of necessary accomplishments given by Major-general Fielding in his valuable paper, 'Whether shall I send my son?' (*Nineteenth Century*, July 1883). It may be thought by some that the list of requirements given above is unnecessarily long; but it should be remembered that, in young countries, the 'division of labour' is not nearly so complete as in older ones. Every man is in no slight degree a 'jack-of-all-trades.' A part of each day should be devoted to each kind of instruction. At certain stated hours, one class should turn to outdoor work, another to school-work, while another might be learning how to cook. Early rising should certainly be enjoined by the rules of the establishment; and, amusing as the idea may seem at first, it would be well if, during the pleasanter portions of the year, the pupils were given some experience of camp-life. Clearly, if the object is to fit the pupils for a colonial life, the accommodation provided should be of a plain and inexpensive kind; and as the institution should be situated in the country, where rents and the expenses of living are low, and as the work done by the pupils whilst learning would to some extent benefit the institution, it is certain that the cost of such an education would be considerably less than that of ordinary schooling; while at the same time it would most effectually prepare the pupils for

their future career, instead of actually unfitting them for it.

It is quite unnecessary to enumerate other small details as to how the establishment should be conducted. Such a training as that described would undoubtedly have about it much that would amuse and fascinate youths of sixteen or seventeen years; and it may be very safely stated that lads who were too delicate to undergo such a course of training, or to whom such a life would be distasteful, would certainly fail in the colonies, and consequently, should never be sent there.

Undoubtedly, the foregoing scheme of education could be most effectively carried out by the establishment of a 'Colonial Training College' on an extensive scale, with a regular staff of teachers, and a sufficiently large extent of farm-land attached. This would of course involve the expenditure of a considerable sum of money; but if done in a rational manner, there ought to be no question of the institution being a self-supporting and remunerative concern, while the benefits it would confer upon the pupils would be very great. Much good could, however, be accomplished by the adoption of far simpler means. There are many large farmers in the eastern counties and elsewhere who might profitably utilise one of the large and rambling, though comfortable old houses—now so often filled with the families of several labourers—belonging to their 'old-hand' farms, as a school, with a competent master—perhaps the clergyman of the parish—engaged to superintend the scholastic studies of, say, twenty or thirty pupils, and another teacher to direct their practical outdoor work. The pupils should, under proper supervision, be required to take part in the actual work of the farm; they would have the chance of becoming good shots—a matter of some importance in the colonies; and they would enjoy all the other advantages of English country life. The farmer, on the other hand, ought to be able, if he managed his undertaking skilfully, to profit, in these times of agricultural depression, both by the unpaid-for labour of his pupils and by the more direct proceeds of the establishment. The scheme thus roughly sketched out is well worth a trial.

It is true that there are Agricultural Colleges of various kinds both in England and in the colonies; but very few, if any, of these exactly answer the requirements of the case. Those in this country are, very naturally, better fitted for training English farmers than colonial settlers; while youths sent to those in the colonies would have to undergo an unnecessarily early separation from home and friends, and would lose the great benefits derivable from the influence of English refinement and a sound English education. At the present time there are in England several institutions more or less nearly answering to the required description. The Agricultural School at Aspatria, near Carlisle, trains some of its pupils for the colonies on moderate terms. Accommodation for a limited number of pupils and excellent opportunities for properly training them are provided on the Eastwood Manor Estate, of seven hundred acres, near Bristol; but the terms are above the means of the class from which the majority of emigrants are drawn. An institution at Hollesley Bay, Suffolk, under the name of

'The Colonial College and Training Farms, Limited,' promises very closely to answer to the requirements of the case. It is to be regretted that the scheme for the establishment of a suitable college on an extensive tract of land which has been acquired in Dorsetshire for that express purpose, as foreshadowed in Major-general Feilding's article already alluded to, has not yet been carried out, though it has not been abandoned. The case of the ordinary English 'farm-pupil' has little or no bearing upon the matter in hand; while, of the system under which young men are placed out with settlers in the colonies to be taught farming, the best that can be said is that it usually leads to fraud.

SHARP SAYINGS.

In Ireland, a sharp fellow is said to be as 'cute as the fox of Ballybotherin, which used to read the papers every morning to find out where the hounds were to meet. It was probably an Irishman who said: 'Man is like a potato—never sure when he will get into hot-water.' But Pat has rivals in many countries, some of whom could run him close in repartee and sharp sayings.

It must have been some foreigner taking off our national reserve who described the meeting of two Englishmen on a steamer in mid-ocean. One asked: 'Going across?' 'Yes, Are you?' And there the conversation ended.—A gentleman at a foreign restaurant who had just been assisted to a bottle of wine, was thus addressed by the smiling proprietor of the establishment: 'Now, what do you think of my wine, eh? Genuine first rate stuff, isn't it?' 'O yes; as far as that goes,' replied the other, smacking his lips; 'it fairly makes one's mouth water.'—An item from a German paper says: 'The cashier of a Prussian bank has absconded with a considerable sum of money, and will, according to astronomical calculations, be seen again in four hundred and fifteen years.'

Many a boarding-house patron gets into hot-water when he lukes out the soup, says one of the American papers, which generally contain some smart sayings on various topics. Another paper commenting on the assertion that the human figure is six times the length of the feet, remarks, that the Chicago people must be about twelve feet high. With much humour and satire, we are informed how a lamentable mistake was lately made by a girl in St Louis. She married a man under the impression that he was her father's coachman, and he turned out to be a Mexican nobleman. She pronounced him a fraud, and wants to get rid of him.

'Can dogs find their way home from a distance?' is a question frequently asked. It is according to the dog. If it is one you want to get rid of, he can find his way back from Africa. If it is a good one, he is apt to get lost if he goes round the corner.—A great writer says: 'A man ought to carry a pencil and note down the thoughts of the moment.'—'Yes,' remarks a Yankee editor; 'and one short pencil devoted exclusively to that use would last some men we know about two thousand years, and then have the original point on.'

Some men, says another writer, are ever ready to offer a remedy for everything. The other day we remarked to one of these amateur apothecaries: 'An idea struck us yesterday; and before we could finish he advised us: 'Rub the part affected with arnica.'

The man who said, 'A landlady who boards her lodgers, like the rest of us, has her weak and strong points, the weak being her coffee, and her strong, the butter,' would probably be ungallant enough to agree with the following: 'The reason why a woman always adds a postscript to her letter is because she's bound to have the last word, if she has to write it herself.' Equally uncomplimentary was the man who, reading that a woman's voice can be heard for two miles by a man in a balloon, remarked that perhaps that was the reason so few men go up in a balloon.

A wit says the times are so dull that it is difficult for him even to collect his ideas. Perhaps this is the man, said to be so lazy that he has worked but once, and that was when he was labouring under a mistake. Another wag says: 'To forget a wrong is the best revenge, particularly if the other fellow is bigger than you.'—'I do not say that that man will steal,' said a witness on a trial; 'but if I was a chicken, I'd roost high when he was around.' A humorist says: 'If you think no one cares for you in this cold world, just tell your neighbours that you propose to keep hens. You will be surprised to see what an immediate interest they will manifest in you.' A philosopher declares that no thoroughly occupied man was ever miserable; but that philosopher is reminded by another that he probably never spent a forenoon among his friends trying to borrow a five-shilling piece.

'The wisest of all sayings,' said a member in a club, 'is the old Greek maxim, "Know thyself."—"Yes," remarked another; 'there's a deal of wisdom in it; "Know thyself," but never introduce a friend.' A country-woman made an amusing remark to a thirsty tourist who had emptied several cups of milk and asked for more. Bringing him a large bowl filled with milk, she said: 'One would think, sir, you had never been weaned!'—A young married man gazing at two trunks in the hall belonging to his mother-in-law, sadly observed: 'She has brought her clothes to a visit; would that she had brought her visit to a close.' As witty was the critic's comment on hearing that a lawyer had composed a poem on 'My Conscience.' 'It ought to sell well,' said he; 'the public are fond of novelties.'

Speaking of dancing, a clergyman hit the right nail on the head when he remarked 'that people usually do more harm with their tongues than with their toes.'—'What is the usual definition of conscience?' asked a man of his pastor. 'A man's rule for his neighbour's conduct is about the way it comes out practically,' was the apt reply.—'What a number of ladies there were at church this morning wearing sealskin cloaks!' exclaimed Smith's wife. 'I counted no less than twenty-seven.'

'Do you think that is the proper way to occupy one's mind while at church?' replied Smith. 'I didn't notice a single one.'

'One can scarcely be expected to notice such things, when one's asleep,' was the sharp retort.

Not very complimentary to the sex was the answer of an old bachelor to a young mother, who exclaimed: 'Shouldn't you like to have a family of rosy boys about your knees?'—'No, ma'am,' said he; 'I'd rather have a lot of yellow boys in my pocket.'

'You say your brother is younger than you, yet he looks much older.'—'Yes, he has seen a great deal of trouble; but I never married,' was the ready reply. More sarcastic is the next. 'Are you fond of tongue, sir?'—'I was always fond of tongue, madam, and like it still.'

'John, what is the best thing to feed a parrot on?' asked an elderly lady of her bachelor brother, who hated parrots. 'Arsenic!' gruffly answered John.

Rather severe are the three following comments. 'I've turned many a woman's head,' boasted a French dandy. 'Yes,' replied his hearer—'away from you!'—'That's the sort of umbrella that people appropriate,' said a gentleman to a companion one morning, showing him a very handsome one. 'Yes,' rejoined his companion quickly; 'I thought so when I saw you holding it.'—The guests having dined, the host hands round a box of cigars. 'I don't smoke myself,' he says; 'but you will find them good—my man steals more of them than any other brand I ever had.'

THE VALUE OF SUNSHINE.

'WHAT a horrible glare!' The sun will take all the colour out of the carpet; and such-like remarks, issue daily from the lips of thrifty housewives in summer. The value of sunlight is but little understood, and yet its advantages are apparent everywhere. Note the pale cheeks of the town-bred child which passes more than half its existence in the house, and which, when out of doors, the sun usually reaches through a veil-like cloud of smoke. Note, again, a geranium grown in a dimly-lighted cellar. Its leaves will be pale, if not almost white, for lack of sunlight, and it will look only what it is—a weakly, sickly plant. Transplant child and geranium into the country—roses bloom at the end of a few weeks on the cheeks of one, flowers and green leaves appear on the other. But sunlight does more than give rosy cheeks and health; it absolutely prevents disease in many cases; for, if given time enough, it kills the germs of the air which produce putrefaction. It seems to be a wonderful provision of nature that the putrefaction which is often caused by the heat of the sun, can be prevented, or even stopped after it has commenced, by exposure of the putrefying substance to direct sunlight. This fact is evidenced in sun-dried meat or fish. If the meat or fish, instead of being hung in the sun, were placed, subject to a similar heat, in the shade, it would quickly become tainted. It is clear, therefore, that the light has as important an influence in the operation as the heat. The latter dries up the juices; the former prevents putrefaction; for in sunlight, the germs which bring about that state cannot continue to live.

Many experiments have been attempted to determine the effect of sunlight on germs; but the results have been anything but satisfactory,

being rather mystifying than otherwise. A French savant, M. Duclaux, has, however, recently conducted certain experiments on the ordinary germs of the air that produce putrefaction, with some definite and therefore gratifying results. The experiments, though no doubt difficult to carry out, were very simple in their nature, and are quite within the comprehension of the ordinary reader.

M. Duclaux commenced by cultivating the microbes which are chiefly responsible for the 'turning' of milk, because a microbe that can break down a substance such as milk would, generally speaking, be very similar to the disease germ that breaks down the tissues of the body. At the germ-forming period, he introduced some into each of a number of carefully-sterilised flasks. The flasks he then stopped with wool, so that the air, but no fresh germs, could enter. The various flasks were then treated in different ways. Some were exposed to sunlight; others were kept in ordinary light—that is, not in the sun; others, again, were kept in an ordinary light, but in a temperature equal to sun-heat. The results proved the great value of sunlight. The milk in the flasks which were exposed to heat only, turned putrid almost immediately—that is to say, the germs preserved their vitality. (It had been ascertained that for three years the germs could be exposed to a tropical heat, provided there was no direct sunlight, without harm to them.) The results were very different with regard to the flasks exposed to the sunlight; in these, it was found that, after a month, the power of putrefaction of the germs decidedly diminished, and that their vitality was lowered. After two months' exposure, the noxious germs were destroyed in two out of five flasks. There the experiments stopped. It is probable, if not certain, that different varieties of germs require different periods of exposure to sunlight to be killed.

These scientific experiments are valuable as showing how mankind is benefited by sunlight. That mankind is so benefited has been acknowledged for ages by thoughtful persons, though the extent of those benefits are not so generally known or appreciated as they ought to be. Except in the hottest summer weather, sunlight should be admitted freely into houses; and never, even on the plea that otherwise the sun will put out the fire, should blinds be pulled wholly or partially down in winter. It should at the same time be borne in mind that in hygiene, fresh air ranks equal to sunlight in importance. 'Live on the sunny side of the street, for there the doctor never comes,' is a proverb which should never be forgotten, and is the outcome, not of scientific experiments, but of the experience of generations.

RAILWAY ACCIDENTS AND CASUALTIES.

DURING the twelve months ending December 31, 1884, the total number of personal accidents on all the railways and on railway premises in the United Kingdom amounted to one thousand one hundred and eighty-six persons killed and eight thousand and twenty-three injured. This of course includes passengers, railway servants,

trespassers, suicides, and all other classes, and all kinds of accidents; but the number of persons killed and injured from accidents to trains, rolling-stock, or permanent way, &c., is very much smaller, there being thirty-one passengers killed and eight hundred and sixty-four injured; and of servants of Companies or contractors, twenty-three were killed and one hundred and fifteen injured.

By accidents from other causes, but still connected with the movement of vehicles used exclusively upon railways, one hundred and four passengers were killed and six hundred and twenty-seven injured; while from the same class of accidents, five hundred and twenty-three servants of Companies or contractors were killed and two thousand two hundred and four injured. These 'accidents from other causes' include, in the case of passengers, falling between trains and platforms (twenty-nine killed and sixty-one injured); falling on to the platform, ballast, &c., when getting in and out of trains (six killed and four hundred and five injured); accidents whilst crossing the line at stations (forty-one killed and twenty-two injured); from falling out of carriages during the travelling of trains (seven killed and thirty injured, &c.). This class of accidents includes, in the case of servants, accidents during shunting and other operations while on duty, and whilst crossing or standing on the line on duty; accidents from coming in contact with bridges, &c., during the travelling of trains, &c.

During the year, sixty-five persons were killed and twenty-seven injured while passing over railways at level crossings. Of trespassers, two hundred and ninety-five were killed and one hundred and eighty-seven injured; while fifty-three persons committed suicide. Forty other persons were killed and seventy-six injured, not coming in any of the classifications given above.

In the class of accidents occurring on railway premises, but not connected with the movement of vehicles used exclusively on railways, fifty-two persons were killed and three thousand nine hundred and twenty-three injured. Out of these, six of the killed and two hundred and forty-one of the injured were passengers; seven killed and ninety-four injured were persons on business at stations; and the remainder, thirty-nine killed and three thousand five hundred and eighty-eight injured, were servants. In connection with this class of accidents, several of a very peculiar nature may be noticed. They include three passengers killed and one hundred and fourteen injured while ascending or descending steps at stations, thirty-nine injured by being struck by barrows and falling over packages, &c., on station platforms, and two killed and thirty injured from falling off platforms. In the case of servants, six were killed and nine hundred and eighty-two injured while engaged in loading and unloading or shunting wagons; three were killed and three hundred and twenty-two injured by the falling of wagon-doors, bales of goods, lamps, &c.; six were killed and two hundred and thirty-three injured from falling off platforms, ladders, &c.; from stumbling whilst walking on the line or platform, one was killed and two hundred and thirty-four were injured; while working at

cranes or capstans, three were killed and one hundred and sixty-nine injured; and one was killed and forty-nine were injured by being trampled on or kicked by horses. The occupation of a platelayer on a railway would seem to be a very dangerous one, for during the twelve months, one hundred and twenty-five servants of this class were killed and one hundred and fifty-four injured.

After reading all these particulars of killed and injured, it might be inferred that railway travelling is a dangerous mode of transit; but when the number of passengers carried is taken into consideration, it will be found that such is by no means the case. During the twelve months ending December 31, 1884, over six hundred and ninety-five million passengers were conveyed on all the railways in the United Kingdom, and, as stated before, the number of passengers killed during the same period from accidents to trains, rolling-stock, &c., was thirty-one, at the number injured, eight hundred and sixty-four, or an average, very nearly, of one killed out of every twenty-two millions carried, and one injured out of every eight hundred thousand carried.

During the year, thirty-one horses, thirty-nine oxen and cows, one hundred and thirty-two sheep, ten pigs, and ten donkeys were run over and killed. We wonder how many dogs!

'WAIT FOR ME'

STRAWALD TURNS the little stream,
Where the wagoner looks his team,
Where, between the banks of moss,
Stand the stepping-stones to cross.
O'er them comes a little maid,
Laughing, not a bit afraid,
Mother, there upon the shore,
Crossed them safely just before.

 'Tis the little lassie's plea—
 Wait for me, wait for me!

Ah, so swift the waters run,
One false step, 'twere all undone;
Little heart begins to beat,
Fearing for the little feet
Soon her fear will all be lost,
When the stepping-stones are crossed;
Three more yet on which to stand—
Two more—one more—then on land!

 'Tis the little Lassie's plea—
 Wait for me, wait for me!

Ah, for you, my laughing lass,
When the years have come to pass,
May one still be near to guide
While you cross Life's river wide.
When no helping hand is near,
None, if you should call to hear,
Think, however far away,
Mother still knows all you say;
E'en in heaven herds your plea—
 Wait for me, wait for me!

THE STORY OF LAND.

As what is comprehensively called 'the Land Question' is occupying so much thought and attention everywhere in the country just now, and seems likely to attain even greater prominence, we have thought it would be of interest to present a brief historical sketch of the system of land-tenure in Britain and of the growth and changes in the public burdens on land. It would serve no good purpose to consider the conditions of society in ancient Britain prior to and during the Roman rule, for whatever these conditions were, they were displaced by the Saxon invasion. As it is to the coming of the Saxons that we look for the beginning of the 'making of England,' so it is from the Anglo-Saxon period that we must trace the rights in and the burdens on land.*

Of the Teutonic race, which from the fifth to the seventh century overran Britain, we have Mr Green's authority for saying that 'the basis of their society was the free landholder.' They were bound together by blood-bond, which widened, with settlement, into a tie of land. *'Land with the German race seems everywhere,' says Mr Green, 'to have been the accompaniment of full freedom. The freeman was strictly the freeholder, and the exercise of his full rights as a free member of the community to which he belonged was inseparable from the possession of his "holding." Besides the freemen or *hurls*, there were the nobles or *corls*, from whom were selected the leaders in war-time and the rulers of villages in times of peace. The selection was voluntary; and the nobles had no legal privileges above the freemen, who were the actual rulers as well as the

possessors of the settlements. It was thus a race of republican landowners who dispossessed the ancient Britons, and who, as soon as the bloody work of conquest was over, settled down to occupy and till the land as they had done in their northern home. The conquered land was divided by lot among the conquerors, the freemen; and prisoners-at-war unable to pay ransom, became the serfs—ploughmen, shepherds, cowherds, &c.—of the capturer. Out of these apportioned lands, again, the kings rewarded by gifts of sections those who rendered the State signal service. Thus arose the *theqqs*, who superseded the old *corls*, and became the foundation of the English nobility in Britain.

Society, then, in the Anglo-Saxon period was composed of landed proprietors (or freemen) and slaves, and the rulers were elected by and endowed by the freemen. Neither gold nor cattle nor any other movable wealth would make a man a 'freeman.' Land was not only the basis of civil rank, but also the foundation of all personal privileges. The survival of this state of things is to be seen in our own day in the high estimation in which property in land is held, its social importance, and its political influence. And it was in such a condition of society that we trace the genesis of the taxation of privately owned land for the needs of the commonwealth. The kings subsisted on the produce of the folklands allotted to them; and when all the kingdoms of the Saxon Heptarchy merged under one sovereign, the several territories so allotted became one great royal demesne. Besides this, from every shire where folkland had been allocated to others or appropriated by townships, the king received an agreed compensation, which was called the *forum fulrum*. Taxes for special purposes were from time to time imposed by the Witenagemote, and one of these taxes was the *shipgeld*, which took the form of a levy upon every shire for the provision and equipment of ships of war in proportion to the property of the shire. But the first express tax upon land was the *Danegeld*.

* The chief authorities consulted for this article are: Green's *Short History of the English People*; Hallam's *Constitutional History of England*; the Cobden Club's *Systems of Land-tenure in Various Countries*; Dowell's *History of Taxation and Taxes in England*; Arthur Arnold's *Free Land*; and the official Statistical Abstracts.

This was levied in A.D. 991, and its object was to raise money wherewith to buy off the Danish rovers who were ranging the coasts and harrying the villages. It was imposed at first at the rate of one shilling for every *hide* of land held by freemen. A *hide* of land used to be considered one hundred acres, but is now considered to have meant one hundred and twenty acres. The rate grew, as the incursions of the Danes increased, and sometimes ran up to four shillings the *hide*. When first imposed this tax realised ten thousand pounds. This was in 991; but in 1002 the Danegeld had to provide twenty-four thousand pounds; in 1007 thirty-six thousand pounds; in 1012 forty-eight thousand pounds; and in 1018 seventy-two thousand pounds.

Although this tax was devised for the express purpose of buying off the Danes, it was retained long after the Danes had ceased to trouble. The revenue was found very useful, and it was always possible to 'expect' attacks, which would justify the levy. Still, like all taxes, it was very unpopular, and became increasingly difficult to collect, so much so, that the kings had often to gather in the money at the point of the sword, and to employ their paid soldiers as collectors. The Danegeld endured till the time of Edward the Confessor, who abolished it.

Of the system of land-tenure in the time of the Anglo-Saxons, it is to be observed that freemen had absolute right to alienate their lands by gift or sale, to dispose of them by will, and to transmit them by inheritance. There was obligation for military service in case of invasion, and there was also a law by which in some cases land reverted to the State on failure of male heirs. There was thus something like a resemblance to feudalism even before the Norman Conquest.

When the Normans came, William simply stepped into possession of the property of his royal Saxon predecessors. That property, or *demesne*, had grown to be of vast extent, and was considered to be inalienable from the Crown. The Norman kings added to it the lands which they confiscated from rebellious Englishmen. For a time, the revenue from the royal *demesne* was sufficient for the requirements of the Conqueror, supplemented as it was by the right to assess the tenants of the *demesne* on occasions of extraordinary military expeditions; to impress carriages and horses whenever and wherever required for the conveyance of the royal household and *impedimenta*; to receive supplies of provisions, &c., at prices fixed by the king's officer; and to claim a cask or two from every cargo of wine entered at any port. But by-and-by the Danegeld was reimposed—namely, in 1084, when an attack was threatened by Sweyn of Denmark. The rate this time was higher than ever—namely, six shillings per *hide* of land. This land-tax was imposed from time to time by all the Norman kings, at varying rates; and in Stephen's

time, became an annual charge of two shillings per *hide*. It can be traced on the Exchequer Rolls down to 1163.

But Norman William also introduced the feudal system, which changed the conditions of the tenure of land. Repeated revolts of the English led to the repeated confiscation of lands, which were redistributed among his Norman supporters. These allocations were made with obligations for specified military services in return, and gradually the whole of the landowners of the country were brought under the same system of vassalage. The feudal system was not completely established until the time of William Rufus, although the Doomsday Book placed all landowners as vassals either to the king or to some tenant of the king.

Under the feudal system, every vassal was bound, in return for the land he held, to assist his lord in fight; and the lords, in turn, were bound to aid the king in proportion to the extent of their estates. At first, there was no clear limit of service; but the arrangement in time became, that a knight was to be furnished for every four to five *hides* of land. Of which the annual value was twenty pounds. The term for such service became also limited to forty days annually; so the tax paid by the landowners to the state, represented by the king, was their own personal service, and that of a knight for every 'knight's fee' they held, for the term named. This was the ordinary service; but there was also special service required for special occasions, which was usually commuted into a money payment. The Norman system also established primogeniture, and removed the right to alienate land or to devise it by will. Not until the time of Henry VIII. was the power restored for the testamentary disposition of land; and not until the time of Charles II. was military tenure finally abolished by law.

The Court of Exchequer was established by William the Conqueror, and was so called because of the checkered cloth laid on the table where the accounts and money were placed for audit. It was in the reign of Henry II., and by arrangement with this Court of Exchequer, that the military obligation upon landowners was transformed into a fixed money-tax. This tax was called *scutage* (shield-money), and was at the rate of two marks, or twenty-six shillings and eightpence, for every knight's fee of land—equal to twenty pounds of annual rental. The rate was only exigible in case of war or threatened war, and varied from time to time according to circumstances. In the same reign, the peculiar obligations of the tenants of the royal *demesne* were also commuted into money payments, called *tallage*, which was assessed on different bases for town and country.

The *scutage* continued to be levied as required for more than a century, and at times was so onerous that it was provocative of continual disputes between the nobles and the king. Ultimately, in 1213, some of the nobles pleaded exhaustion by previous levies, denied liability, and refused to pay any more. Then came Magna Charta, one of the clauses of which was, that 'No *scutage* or aid shall be imposed in the kingdom unless by the common consent of the realm, except for the purpose of ransoming the king's person, making his first-born son a knight, and

marrying his eldest daughter once; and the aids (levies) for these purposes shall be reasonable in amount.' Another clause provided for the calling and constitution of the 'common counsel of the realm' for imposing scutage. After this, scutage was levied at different times down to 1322, and then disappeared.

But another form of land-tax was devised in 1194, to take the place of the Danegeld. It was called the *carucage*, because it was levied upon the *carucates* or quantity of land that could be ploughed by one plough in one season. The rate of the first carucage was two shillings the carucate; but it appears for the last time in 1224, and is thereafter replaced by a general tax on movables. This was leviable upon rents, as well as upon crops, cattle, stock-in-trade, and other possessions, and finally settled into a charge of a fifteenth and a tenth of the valuation for the year. The 'fifteenth and tenth' thus became merely a name for a compounded fixed charge upon the whole population. But in 1382, 'on account of the poverty of the country,' the landowners took the whole burden of this tax, not as a precedent, but 'for reverence of God, and for the support, aid, and relief of the poor commonalty, who appeared to be weaker and poorer than theretofore.' In the following year, the former method was returned to, and it remained in force down to 1399.

In 1404, a special tax on land was imposed by Henry IV.'s parliament on all landowners possessing land of the annual value of five hundred marks or more. It was at the rate of five per cent., and was therefore one pound in every twenty pounds of rental. In 1411, this tax was altered to one upon all landowners of not less than twenty pounds annual value, and was at the rate of six shillings and eightpence for every twenty pounds clear. In 1431, besides the re-imposition of the 'fifteenth and tenth,' the tax on the knight's fee was continued, and a tax was imposed for the first time upon land not held for knight-service—that is, upon freeholders. It was soon superseded by other subsidies not necessary to detail here. In 1450, we find a graduated income-tax granted, which included all freeholders of lands and tenements, as well as fees and profits. One or other of all of these forms of taxation existed in varying degrees down to the time of the Tudors. Under the Tudors' Subsidies' Acts, the charge upon landowners was four shillings in the pound for all freehold, according to the clear annual value.

Under the Stuarts, repeated levies of 'fifteenths and tenths' occurred, but did not bring in money quick enough, so that a poll-tax was tried by Charles I. After this, a land-tax was instituted upon a new basis. A lump sum to be raised was levied upon each county and town, and was then re-assessed upon the several occupiers of land—tenants having the power to deduct their payments from the rents.

Under the Commonwealth, the assessments were made more equitable. They were levied by the local authorities, and proportioned to the means of the taxpayers. After the Restoration, the old Tudor system was reverted to; but, proving offensive, was again abandoned; and the Commonwealth system prevailed during a great part of the reign of Charles II. It was also

used in the earlier years of the reign of William III.; but in that reign, a new system came into vogue. About 1692 a tax was levied for one year of a uniform rate of four shillings in the pound on the annual value of all lands. This was to meet the expenses of the war with France. As the assessment was not rigorous, the rate produced less than was expected, and it produced less and less as the tax was reimposed in succeeding years. In 1697, the rate was made three shillings in the pound; but the Act, in authorising it, also fixed the amount which it should yield, which led to a considerable change in the method of assessing property. The same principle was followed in succeeding years, the rate nominally varying from one, two, three, to four shillings in the pound, but always for a fixed sum, which was to be raised *pro rata* in the various counties and towns.

This principle of levying an annual fixed sum to be contributed by the land remained in force until 1798, and at first it was, as has been said, four shillings in the pound. But this amount was not permanent, and fluctuated from time to time, falling as low as two shillings, but never rising above four. In 1798, prior to the imposition of a general income-tax of ten per cent., Pitt constituted the land-tax a perpetual charge of four shillings in the pound, subject to redemption and purchase. It was a charge defined by the Act which specified the various districts, and power was given 'to persons interested in lands to buy up and become themselves entitled to an amount of rent-charge equal to the tax.' In the first year, nearly half a million was so redeemed, which was a great help to the government finances; but for some years afterwards, the terms of redemption were less favourable. Between 1800 and 1878, some £840,000 was redeemed; and in 1879, the amount remaining payable annually in respect of this land-tax was reduced to £1,075,000. Since 1798, then, this fixed but redeemable burden has remained upon land, and land has been bought and sold subject to it. This charge was quite apart from all subsequent levies upon the profits of lands under the headings of the various property and income taxes which have been in vogue down to our own time. The income-tax as at present constituted levies, under Schedule A, a tax upon the income, or rents, from all landed property including houses, of eightpence in the pound.

In 1881, the remnant of the old land-tax in Great Britain realised upon the assessments of 1798, £1,050,000; while the yield under Schedule A—that is, the profits from land in the United Kingdom—of the income-tax was £2,545,000. Land also contributed largely under the head of succession duties, which yielded £3,064,000 for probate, and £3,592,000 for legacy and succession duties, equal to £6,656,000.

In 1853, Mr Goschen stated that the special contribution by land to imperial taxation was only five and a half per cent. of the total taxes raised. At the same time, it was stated that in Holland, land paid nine per cent.; in Austria, seventeen and a half per cent.; in France, eighteen and a half per cent.; in Belgium, twenty and a half per cent.; and in Hungary, thirty-two and a half per cent. But a comparison of this sort is quite imperfect, unless we have a complete

statement of the entire taxation of each country including local burdens. In many parts of this country, the local burdens on land are very heavy, and charges are met thus which in other circumstances and in other countries would fall upon the national exchequer. In Sussex, for instance, the poor-rate alone was at one time as high as eight shillings and sevenpence-halfpenny in the pound.

It is of importance, therefore, to show here, from some official tables compiled in 1868, and which we give in a footnote, the proportions of imperial and local taxation borne by owners of real property in this country. We are also enabled to give for comparison the figures applying to seven continental countries. The first table shows the total taxation, the second the proportion thrown on property.*

In 1841-2, the total of imperial and local taxation was ninety-one and a half millions—a considerable increase; but the relative proportion, that is to say, the percentage falling upon land, remained about the same. In the estimates for the fiscal year ending March 31, 1885, the land-tax was put at £1,055,000, the house-duty at £1,880,000, and the property and income tax at £12,050,000. The actual yield from Schedule A (profits from land) in the year ending March 31, 1884, was £3,680,560, out of a total of £10,695,046. The total annual value of land assessed in the country was £65,937,323.

The figures here given show that land in the United Kingdom bears a larger share of public burdens than land in any country of Europe of which we have returns, except Belgium. Whether or not it should bear a still further proportion, we do not propose to discuss here; but what we have adduced shows that many of the arguments of a certain section of reformers are based upon inaccurate conceptions both of the previous conditions of land-tenure and of the existing position.

It is to be remembered that in English law there is no absolute ownership of land. According to Williams—an authority upon the laws of property—'no man is in law the absolute owner of lands. He can only hold an estate in them.' That estate may be copyhold, estate tail, or fee simple; but it is not absolute property, because the law can, and does, compel a man to part with lands, upon due compensation, for the public good. Cases in point are the making of railways, docks, and so forth, in which the advantage of the community overrides the private interest of the holder. In this sense, then, the land does actually belong to the State; but not, of course, in the literal sense, which is usually ascribed to nationalisation. In these remarks,

we have sought to avoid controversy, and to give only a plain statement of facts which are necessary to form just conclusions with regard to measures now being so widely discussed.

A HOUSE DIVIDED AGAINST ITSELF.

CHAPTER XIII.

LADY MARKHAM did not forget her promise. Whatever else a great lady may forget in these days, her sick people, her hospitals, she is sure never to forget. She went early to the lodgings, which were not far off, hidden in one of the quaint corners of little old lanes behind Piccadilly, where poor Gaunt was. She did not object to the desire of Frances to go with her, nor to the anxiety she showed. The man was ill; he had become a 'case'; it was natural and right that he should be an object of interest. For herself, so far as Lady Markham's thoughts were free at all, George Gaunt was much more than a case to her. A little while ago, she would have given him a large share in her thoughts, with a remorseful consciousness almost of a personal part in the injury which had been done him. But now there were so many other matters in the foreground of her mind, that this, though it gave her one sharp twinge, and an additional desire to do all that could be done for him, had yet fallen into the background. Besides, things had arrived at a climax; there was no longer any means of delivering him, no further anxiety about his daily movements; there he lay, incapable of further action. It was miserable, yet it was a relief. Markham and Markham's associates had no more power over a sick man.

Lady Markham managed her affairs always in a business-like way. She sent to inquire what was the usual hour of the doctor's visit, and timed her arrival so as to meet him and receive all the information he could give. Even the medical details of the case were not beyond Lady Markham's comprehension. She had a brief but very full consultation with the medical man in the little parlour down-stairs, and promptly issued her orders for nurses and all that could possibly be wanted for the patient. Two nurses at once—one for the day, and the other for the night; ice by the cart-load; the street to be covered with hay; any traffic that it was possible to stop, arrested. These directions Frances heard while she sat anxious and trembling in the brougham, and watched the doctor—a humble and undistinguished practitioner of the neighbourhood, stirred into excited interest by the sudden appearance of the great lady with her

* TABLE I.—TOTAL TAXATION.

Countries	Imperial	Local	Total Imperial and Local Taxes
United Kingdom	£26,395,000	£28,155,000	£50,550,000
France	60,161,000	21,347,000	81,508,000
Russia	42,878,000	5,079,000	48,557,000
Prussia	13,297,000	1,640,000	7,154,000
Holland	5,605,000	1,597,000	6,443,000
Belgium	4,840,000	1,524,000	22,160,000
Austria	20,638,000	1,524,000	22,160,000
Hungary	8,577,000		

TABLE II.—TAXATION UPON REAL PROPERTY.

Countries	Imperial	Per Cent	Local	Per Cent	Total Imperial and Local Taxes	Per Cent.
United Kingdom	£5,157,000	12.47	£20,007,000	79.54	£28,164,000	31.11
France	17,686,000	29.31	5,893,000	2.69	23,629,000	28.87
Russia	6,003,000	11.88	3,303,000	58.10	8,306,000	17.28
Prussia	2,041,000	15.39

Belgium	1,784,000	36.82	273,000	17.07	2,057,000	31.92
Austria	5,382,000	26.10	808,000	58.02	6,190,000	27.93
Hungary	3,820,000	88.69				

liberal ideas, upon the scene—hurrying away. Lady Markham then disappeared again into the house, the little trim shallow London lodging-house, with a few scrubby plants in its little balconies on the first floor, where the windows were open,* but veiled by sun-blinds. Something that sounded like incessant talking came from these windows, a sound to which Frances paid no attention at first, thinking it nothing but a conversation, though curiously carried on without break or pause. But after a while the monotony of the sound gave her a painful sensation. The street was very quiet even without the hay. Now and then a cart or carriage would come round the corner, taking a shortcut from one known locality to another. Sometimes a street cry would echo through the sunshine. A cart full of flowering plants, with a hoarse-voiced proprietor, went along in stages, stopping here and there; but through all ran the strain of talk, monologue or conversation, never interrupted. The sound affected the girl's nerves, she could not tell why. She opened the door of the brougham at last and went into the narrow little doorway of the house, where it became more distinct, a persistent dull strain of speech. All was deserted on the lower floor, the door of the sitting-room standing open, the narrow staircase leading to the sick man's rooms above. Frances felt her interest, her eager curiosity grow at every moment. She ran lightly, quickly up-stairs. The door of the front room, the room with the balconies, was ajar; and now it became evident that the sound was that of a single voice, hoarse, not always articulate, talking. Oh, the weary strain of talk, monotonous, unending—sometimes rising faintly, sometimes falling lower, never done, without a pause. That could not be raving, Frances said to herself. Oh, not raving! Cries of excitement and passion would have been comprehensible. But there was something more awful in the persistency of the dull choked voice. She said to herself it was not George Gaunt's voice: she did not know what it was. But as she put forth all these arguments to herself, trembling, she drew ever nearer and nearer to the door.

'Red—red—and red. Stick to my colour: my colour—my coat, Markham, and the ribbon. Yes, her ribbon. I say red. Play, play—all play—always: amusement: her ribbon, red. No, no; not red, black, colour death—no colour, means nothing, all nothing, Markham, play. Gain or lose—all—all: nothing kept back. Red, I say; and red—blood—blood colour. Mother, mother! no, it's black, black. No blood—no blood—no reproach. Death—makes up all—death. Black—red—black—all death colours, all death, death.' Then there was a little change in the voice. 'Constance!—India; no, no; not India. Anywhere—give up everything.—Amusement, did you say amusement? Don't say so, don't say so. Sport to you—but death, death, colour of death. Black, or red—blood, all death colours, death. Mother! don't put on black—red ribbons like hers—red. Heart's blood. Not the bullet—her little hand, little white hand—and then blood-red. Constance! Play—play—nothing left—play.'

Frances stood outside and shuddered: Was this, then, what they called raving? She shrank

within herself; her heart failed her; a sickness which took the light from her eyes, made her limbs tremble and her head swim. Oh, what sport had he been to the two—the two who were nearest to her in the world! What had they done with him, Mrs Gaunt's boy—the youngest, the favourite? There swept through the girl's mind like a bitter wind a cry against—Fate was it, or providence? Had they but let alone, had each stayed in her own place, it would have been Frances who should have met, with a fresh heart, the young man's early fancy. They would have met sincere and faithful, and loved each other, and all would have been well. But there was no Frances, there was only Constance, to throw his heart away. She seemed to see it all as in a picture—Constance with the red ribbons on her gray dress, with the smile that said it was only amusement; with the little hand, the little white hand that gave the blow. And then all play, all play, red or black, what did it matter? and the bullet; and the mother in mourning, and Markham, Constance and Markham! murderers. This was the cry that came from the bottom of the girl's heart. *Murderers!—of two; of him and of herself; of the happiness that was justly hers, which at this moment she claimed, and wildly asserted her right to have, in the clamour of her angry heart. She seemed to see it all in a moment: how he was hers; how she had given her heart to him before she ever saw him; how she could have made him happy. She would not have shrunk from India or anywhere. She would have made him happy. And Constance, for a jest, had come between; for amusement, had broken his heart. And Markham, for amusement—for amusement! had destroyed his life; and hers as well. There are moments when the gentle and simple mind becomes more terrible than any fury. She saw it all as in a picture—with one clear sudden revelation. And her heart rose against it with a sensation of wrong which was intolerable—of misery, which she could not, would not bear.

She pushed open the door, scarcely knowing what she did. The bed was pulled out from the wall, almost into the centre of the room; and behind, while this strange husky monologue of confused passion was going on unnoted, Lady Markham and the landlady stood together talking in calm undertones of the treatment to be employed. Frances' senses, all stimulated to the highest point, took in, without moaning to do so, every particular of the scene and every word that was said.

'I can do no good by staying now,' Lady Markham was saying. 'There is so little to be done at this stage. The ice to his head, that is all till the nurse comes. She will be here before one o'clock. And in the meantime, you must just watch him carefully, and if anything occurs, tell me. Be very careful to tell me everything: for the slightest symptom is important.'

'Yes, my lady; I'll take great care, my lady.'

The woman was overawed, yet excited by this unexpected visitor, who had turned the dull drama of the lodger's illness into a great, important, and exciting conflict, conducted by the highest officials against disease and death.

'As I go home, I shall call at Dr —'s—'

naming the great doctor of the moment—'who will meet the other gentleman here; and after that, if they decide on ice-baths or any other active treatment.— But there will be time to think of that. In the meantime, if anything important occurs, communicate with me at once, at Eaton Square.'

'Yes, my lady; I'll not forget nothing. My 'usband will run in a moment to let your ladyship know.'

'That will be quite right. Keep him in the house, so that he may get anything that is wanted.' Lady Markham gave her orders with the liberality of a woman who had never known any limit to the possibilities of command in this way. She went up to the bed and looked at the patient, who lay all unconscious of inspection, continuing the hoarse talk, to which she had ceased to attend, through which she had carried on her conversation in complete calm. She touched his forehead for a moment with the back of her ungloved hand, and shook her head. 'The temperature is very high,' she said. There was a semi-professional calm in all she did. Now that he was under treatment, he could be considered dispassionately as a 'case.' When she turned round and saw Frances within the door, she held up her finger. 'Look at him, if you wish, for a moment, poor fellow; but not a word,' she said. Frances, from the passion of anguish and wrong which had seized upon her, sank altogether into a confused hush of semi-remorseful feeling. Her mother at least was occupied with nothing that was not for his good.

'I told you that I mistrusted Markham,' she said as they drove away. 'He did not mean any harm. But that is his life. And I think I told you that I was afraid Constance—— Oh, my dear, a mother has a great many hard offices to undertake in her life—to make up for things which her children have done—*en gâché du cœur*, without thought.'

'*Gâché du cœur*—is that what you call it,' cried Frances, 'when you murder a man?' Her voice was choked with the passion that filled her.

'Frances! Murder. You are the last one in the world from whom I should have expected anything violent.'

'Oh,' cried the girl, flushed and wild, her eyes gleaming through an angry dew of pain, 'what word is there that is violent enough? He was happy and good, and there were—there might have been—people who could have loved him, and—made him happy. When one comes in, one who had no business there, one who— and takes him from—the others, and makes a sport of him and a toy to amuse herself, and flings him broken away. It is worse than murder—if there is anything worse than murder,' she cried.

Lady Markham could not have been more astonished if some passer-by had presented a pistol at her head. 'Frances!' she cried, and took the girl's hot hands into her own, endeavouring to soothe her, 'you speak as if she meant to do it—as if she had some interest in doing it. Frances, you must be just!'

'If I were just—if I had the power to be just, is there any punishment which could be

great enough?—His life? But it is more than his life. It is misery and torture and wretchedness, to him first, and then to—to his mother—to'— She ended as a woman, as a poor little girl, scarcely yet woman-grown, must—in an agony of tears.

All that a tender mother and that a kind woman could do, with due regard to the important business in her hands, and a glance aside to see that the coachman did not mistake Sir Joseph's much frequented door—Lady Markham did to quench this extraordinary passion, and bring back calm to Frances. She succeeded so far, that the girl, hurriedly drying her tears, retiring with shame and confusion into herself, recovered sufficient self-command to refrain from further betrayal of her feelings. In the midst of it all, though she was not unmoved by her mother's tenderness, she had a kind of fierce perception of Lady Markham's anxiety about Sir Joseph's door, and her eagerness not to lose any time in conveying her message to him, which she did rapidly in her own person, putting the footman aside, corrupting somehow by sweet words and looks the incorruptible functionary who guarded the great doctor's door. It was all for poor Gaunt's sake, and done with care for him, as anxious and urgent as if he had been her own son; and yet it was business too, which, had Frances been in a mood to see the humour of it, might have lighted the tension of her feelings. But she was in no mind for humour, a thing which passion has never any eyes for or cognisance of. 'That is all quite right. He will meet the other doctor this afternoon; and we may be now comfortable that he is in the best hands,' Lady Markham said with a sigh of satisfaction. She added: 'I suppose, of course, his parents will not hesitate about the expense?' in a faintly inquiring tone; but did not insist on any reply. Nor could Frances have given any reply. But amid the chaos of her mind, there came a consciousness of poor Mrs Gaunt's dismay, could she have known. She would have watched her son night and day; and there was not one of the little community at Bordighera—Mrs Durant, with all her little pretences; Tassie, in her young-ladyhood, who would not have shared the vigil. But the two expensive nurses, with every accessory that new-fangled science could think of—this would have frightened out of their senses the two poor parents, who would not 'hesitate about the expense,' or any expense that involved their son's life. In this point, too, the different classes could not understand each other. The idea flew through the girl's mind with a half-despairing consciousness that this, too, had something to do with the overwhelming revolution in her own mind which carried everything before it. A man of her own species would have understood Constance, he would have known Markham's reputation and ways. The pot of iron and the pot of clay could not travel together without damage to the weakest. This went vaguely through Frances' mind in the middle of her excitement, and perhaps helped to calm her. It also stilled, if it did not calm her, to see that her mother was a little afraid of her in her new development.

Lady Markham, when she returned to the

brougham after her visit to Sir Joseph, manifestly avoided the subject. She was careful not to say anything of Markham or of Constance. Her manner was anxious, deprecatory, full of conciliation. She advised Frances, with much tenderness, to go and rest a little when they got home. 'I fear you have been doing too much, my darling,' she cried, and followed her to her room with some potion in a glass.

'I am quite well,' Frances said; 'there is nothing the matter with me.'

'But, I am sure, my dearest, that you are overdone.' Her anxious and conciliatory looks were of themselves a tonic to Frances, and brought her back to herself.

Markham, when he appeared in the evening, showed unusual feeling too. He was of the crisis, it seemed, of his own life, and perhaps other sentiments had therefore an easier hold upon him. He came in looking very downcast, with none of his usual banter in him. 'Yes, I know. I have heard all about it, bless you. What else, do you think, are those fellows talking about? Poor beggar. Who, ever thought he'd have gone down like that in so short a time?—Now, mother, the only thing wanting is that you should say "I told you so." And Fan; no, Fan can do worse; she can tell me that she thought he was safe in my hands.'

'It is not my way to say I told you so, Markham; but yet'—

'You could do it, mammy, if you tried—that is well known. I'm rather glad he is ill, poor beggar; it stops the business. But there are things to pay, that is the worst.'

'Surely, if it is to a gentleman, he will forgive him,' cried Frances, 'when he knows'—

'Forgive him! Poor Gaunt would rather die. It would be as much as a man's life was worth to offer to—forgive another man. But how should the child know? That's the beauty of society and the rules of honour, Fan. You can forgive a man many things, but not a shilling you've won from him. And how is he to mend, good life! with the thought of having to pay up in the end?' Markham repeated this despondent speech several times before he went gloomily away. 'I had rather die straight off, and make no fuss. But even then, he'd have to pay up, or somebody for him. If I had known what I know now, I'd have eaten him sooner than have taken him among those fellows, who have no mercy.'

'Markham, if you would listen to me, you would give them up—you too.'

'Oh, I'—he said with his short laugh. 'They can't do much harm to me.'

'But you must change—in that as well as other things, if'—

'Ah, if,' he said, with a curious grimace; and took up his hat and went away.

Thus, Frances said to herself, his momentary penitence and her mother's pity melted away in consideration of themselves. They could not say a dozen words on any other subject, even such an urgent one as this, before their attention dropped, and they relapsed into the former question about themselves. And such a question—Markham's marriage, which depended upon Nelly Winterbourn's widowhood and the portion her rich husband left her. Markham was an English

peer, the head of a family which had been known for centuries, which even had touched the history of England here and there; yet this was the ignoble way in which he was to take the most individual step of a man's life. Her heart was full almost to bursting of these questions, which had been gradually awakening in her mind. Lady Markham when left alone turned always to the copulation of employment—of those letters to write which filled up all the interstices of her other occupations. Perhaps she was specially glad to take refuge in this assumed duty, having no desire to enter again with her daughter into any discussion of the events of the day. Frances withdrew into a distant corner. She took a book with her, and did her best to read it, feeling that anything was better than to allow herself to think, to summon up again the sound of that hoarse broken voice running on in the feverish current of disturbed thought. Was he still talking, talking, God help him! of death and blood and the two colours, and her ribbon, and the misery which was all play? Oh, the misery, causeless, unnecessary, to no good purpose, that had come merely from this—that Constance had put herself in Frances' place, that the pot of iron had thrust itself in the road of the pot of clay. But she must not think—she must not think, the girl said to herself with feverish earnestness, and tried the book again. Finding it of no avail, however, she put it down, and left her corner and came, in a moment of leisure between two letters, behind her mother's chair.

'May I ask you a question, mamma?'
'As many as you please, my dear; but Lady Markham's face bore a harassed look. 'You know, Frances, there are some to which there is no answer—which I can only ask with an aching heart, like yourself,' she said.
'This is a very simple one. It is—have I any money—of my own?'
Lady Markham turned round on her chair and looked at her daughter. 'Money,' she said. 'Are you in need of anything? Do you want money, Frances? I shall never forgive myself, if you have felt yourself neglected.'

'It is not that. I mean—have I anything of my own?'

After a little pause. 'There is a—small provision made for you by my marriage settlement,' Lady Markham said.

'And—once more—could, oh, could I have it, mamma?'

'My dear child! you must be out of your senses. How could you have it at your age—unless you were going to marry?'

This suggestion Frances rejected with the contempt it merited. 'I shall never marry,' she said; 'and there never could be a time when it would be of so much importance to me to have it as now. Oh, tell me, is there no way by which I could have it now?'

'Sir Thomas is one of our trustees. Ask him. I do not think he will let you have it, Frances. But perhaps you could tell him what you want, if you will not have confidence in me. Money is just the thing that is least easy for me. I could give you almost anything else; but money I have not. What can you want money for, a girl like you?'

Frances hesitated before she replied: 'I would

rather not tell you,' she said; 'for very likely you would not approve; but it is nothing—wrong.'

'You are very honest, my dear. I do not suppose for a moment it is anything wrong. Ask Sir Thomas,' Lady Markham said with a smile. The smile had meaning in it, which to Frances was incomprehensible. 'Sir Thomas—will refuse nothing he can in reason give—of that, I am sure.'

Sir Thomas, when he came shortly afterwards, said that he would not disturb Lady Markham. 'For I see you are busy, and I have something to say to Frances.'

'Who has also something to say to you,' Lady Markham said with a benignant smile. Her heart gave a throb of satisfaction. It was all she could do to restrain herself, not to tell the dear friend to whom she was writing that there was every prospect of a *most happy* establishment for dear Frances. And her joy was quite genuine and almost innocent, notwithstanding all she knew.

'You have written to your father?' Sir Thomas said. 'My dear Frances, I have got the most hopeful letter from him, the first I have had for years. He asks me if I know what state the Warren is in—if it is habitable? That looks like coming home, don't you think? And it is years since he has written to me before.'

Frances did not know what the Warren was; but she disliked showing her ignorance. And this idea was not so comforting to her as Sir Thomas expected. She said: 'I do not think he will come,' with downcast eyes.

But Sir Thomas was strong in his own way of thinking. He was excited and pleased by the letter. He told her again and again how he had desired this—how happy it made him to think he was about to be successful at last. 'And just at the moment when all is likely to be arranged—when Markham— You have brought me luck, Frances. Now, tell me what it was you wanted from me?'

Frances's spirits had fallen lower and lower while his rose. Her mind ranged over the new possibilities with something like despair. It would be Constance, *not* she, who would have done it, if he came—Constance, who had taken her place from her—the love that ought to have been hers—her father—and who now, on her return, would resume her place with her mother too. Ah, what would Constance do? Would she do anything for him who lay yonder in the fever, for his father and his mother, poor old people—anything to make up for the harm she had done? Her heart, burned in her agitated troubled bosom. 'It is nothing,' she said—'nothing that you would do for me. I had a great wish—but I know you would not let me do it, neither you nor my mother.'

'Tell me what it is, and we shall see.'

Frances felt her voice die away in her throat. 'We went this morning to see—to see'—

'You mean poor Gaunt. It is a sad sight, and a sad story—too sad for a young creature like you to be mixed up in. Is it anything for him, that you want me to do?'

She looked at him through those hot gathering tears which interrupt the vision of women, and blind them when they most desire to see clearly. A sense of the folly of her hope, of the impos-

sibility of making any one understand what was in her mind, overwhelmed her. 'I cannot, I cannot,' she cried. 'Oh, I know you are very kind. I wanted my own money, if I have any. But I know you will not give it me, nor think it right, nor understand what I want to do with it.'

'Have you so little trust in me?' said Sir Thomas. 'I hope, if you told me, I could understand. I cannot give you your own money, Frances; but if it were for a good—no, I will not say that—for a sensible, for a wise purpose, you should have some of mine.'

'Yours!' she cried almost with indignation. 'O no; that is not what I mean. They are nothing—nothing to you.' She paused when she had said this, and grew very pale. 'I did not mean— Sir Thomas, please do not say anything to mamma.'

He took her hand affectionately between his own. 'I do not half understand,' he said; 'but I will keep your secret, so far as I know it, my poor little girl.'

Lady Markham, at her writing table, with her back turned, went on with her correspondence all the time in high satisfaction and pleasure, saying to herself that it would be far better than Nelly Winterbourne's—that it would be the finest match of the year.

(To be continued.)

CURIOUS SUPERSTITION IN SUTHERLAND.

In many parts of the Highlands there are various superstitious practices still resorted to for the cure of disease. One of the strangest and most interesting cases of this kind may be met with in the county of Sutherland. Here, in an unfrequented spot near the foot of Strathnaver, lies a small loch, to which superstition has ascribed wonderful healing virtues. Its name has spread far and wide in the northern counties, and pilgrimages are made to it from many remote districts of Sutherland, from the adjoining counties of Caithness and Ross, and even from Inverness and the Orkney Islands. It is not known when the loch first came into repute with the sick; but it must have been when superstition had a strong hold in this country, and ignorance prevailed among the people; for this belief in the mysterious curative power of the water can be traced back through several generations. The water, and also the leaves of a plant which grows in the loch, are still used by the sick at their homes; but to derive full benefit from these, the 'patients' must make a visit to the spot.

The tradition as to the origin of this healing virtue is as follows: A woman from Ross or Inverness at one time came to Strathnaver pretending to cure all forms of disease by means of water into which she had previously thrown some pebbles, which she carried about with her. She soon secured a wide reputation in the strath on account of the miraculous cures with which she was credited. Many persons looked with covetous eyes upon the mysterious pebbles, and would fain have got possession of them; but the people dreaded to expose themselves to the supernatural power with which the woman was

supposed to be endowed, by endeavouring to deprive her of the pebbles by unfair means. At length, however, a man named Gordon, in whose house she lived, determined to possess himself of them, and formed a plot for their capture. But the woman, discovering his design, escaped in the direction of the loch. Gordon pursued. Finding that she could no longer escape her pursuer, the woman threw the pebbles far out into the loch, exclaiming in Gaelic, *Mo-nar!* (that is, 'shame!' or literally, 'my shame!'). From this exclamation the loch is said to have received the name which it still retains—Loch-mo-nar, and the pebbles are supposed to have imparted to the water its curative power.

One would suppose from this simple legend, which attaches no conditions to the manner in which patients should avail themselves of the peculiar power with which the water is imbued, that it would be an easy matter for one to test its efficacy. There are, however, many ceremonies to be observed—as strange as they are inconvenient to the unfortunate patients; though how they originated cannot be ascertained. The only condition which appears reasonable is that by which the covetous Gordon and all his descendants are for ever denied any benefit from the water. There are only four days in the year on which cures can be effected—the first Monday (old style) of February, May, August, and November; and the ceremonies must be gone through between twelve o'clock on Sunday night and sunrise on Monday morning. The practice of visiting the loch in February and November has long been discontinued, owing, doubtless, to the extremely unpleasantness of taking a midnight bath at such times.

Shortly after midnight, the patients begin to arrive in carts, attended by relatives or friends, many of the arrivals having travelled long distances during the previous Sunday. Without loss of time, the sick are transferred to the banks of the loch, and roaring fires are lit in several places. This accomplished, the patients immediately seek a cure by first throwing a piece of silver money into the loch as a kind of tribute; then, wading into the water, they plunge three times beneath the surface; and finally a few mouthfuls are swallowed by each patient. Those who are able to take their bath without assistance, may suit themselves as to the length of time they will remain in the water; but their unfortunate brethren who require to be carried in, often narrowly escape drowning, through the mistaken zeal of their friends, who are careful to give them a thorough immersion—presumably on account of these cases being of a more serious nature. Having all regained dry ground, they proceed to dress themselves, and collect around the fires which have for some time been blazing near the water's edge. The welcome warmth of the fires is supplemented with plenty of *visgheather*, and eatables of various kinds soon make their appearance. These they now proceed to discuss amid lively conversation, interspersed with many stories of former visits to the loch, and the marvellous cures which resulted.

The scene at this moment, as the midnight picnic begins, is a very weird and striking one.

The blazing fires reveal in a strong light the faces of the company, some of whom are still only half-dressed; while upon the surrounding heather and the dark water close by, is cast a peculiar and ever-changing ruddy glare. Beyond, is the blackness of night—nothing being visible except the dark outline of the neighbouring hills, whose huge forms show themselves dimly against the sky. As soon as the dawn begins to appear, the gathering breaks up, and all prepare for departure—it being a rule that they must be out of sight of the loch before the sun rises, else their trouble will have been in vain. After filling the now empty whisky bottles with water, for the use of helpless patients at home, a start is made on the homeward journey, and the scene assumes its usual aspect.

These strange proceedings have of late years been gradually falling into disuse, but even still they may be occasionally seen. At one time, scores of men and women used to visit the loch—some to try its efficacy, while others went out of mere curiosity, for the 'Loch-mo-nar night' doings always created great interest in the district. Many cures were attributed to the mysterious power of the water. It is noticeable, however, that the majority of those who sought such a cure were persons suffering from nervous complaints and disordered imaginations, to whom the excitement of a midnight plunge in the loch, preceded and followed by a long journey in the braeung air of the hills and glens, might contribute all that was necessary to restore them to health, especially when supplemented by a strong belief that a speedy cure would follow. The water gets the credit of all the cures; while, on the other hand, the failure to restore a patient's health is generally attributed to some breach of the observed conditions.

THE KNAVE OF DIAMONDS.

My name is George Lewis. I was born in Dublin; and I am a commercial traveller. My first attempt to become a begman was attended with such remarkable circumstances, that I venture to think they will be deemed worthy of record in these pages. In the autumn of 1881 I was a clerk in a lawyer's office, on a very small salary and with long hours of business. I saw no prospect of any improvement, and was becoming more discontented every day with my position, when chance threw in my way the book recording the Life of George Moore, the Napoleon of beguery, and I at once yearned to tread in his footsteps, and see more of the world and its doings than I could ever hope to do in my then secluded position. I had an elder brother living in London, in the King's Road, Chelsea, and to him I communicated my desires and my ambition. He invited me to come to London, as presenting a better field for the promotion and attainment of my wishes. I therefore left Dublin as soon as circumstances would permit, and took up my abode in the King's Road, Chelsea. I diligently perused the advertisements in the daily papers; and in about a week after my arrival in London, came across the following: 'WANTED—A Traveller to journey between London and Vienna. A knowledge of

German unnecessary. Liberal salary. Unexceptionable references given and required. Address C. R., Post-office, Charing Cross.

I wrote in reply, and stated my wishes and qualifications, giving my address at a neighbour's house. I received an answer in due course, requesting that I would be in front of the *Times* advertising office, in Queen Victoria Street, at seven p.m. on the following Monday. I kept the appointment in company with my brother, and paced up and down in front of the office for nearly an hour; but C. R. did not put in an appearance. Naturally, I felt much disappointed, and somewhat disgusted at this treatment. In two days I received a second letter, signed Charles Ross; but the letter itself was written in a different hand from the previous one. The gist of the letter was as follows. The writer expressed his regret that he had been unable to keep his appointment, in consequence of an unexpected summons to Birmingham on important business; but that he would this time meet me on the following Tuesday, in front of the Vestry Hall in the King's Road, Chelsea, as that road appeared to be my place of residence, and I should thus be put to as little trouble as possible. He requested that I would come *alone*.

The circumstances appeared somewhat suspicious, and to be enveloped in an element of unnecessary mystery. For a time, I felt disposed to ignore the communication altogether; but my brother persuaded me to probe the matter to the bottom, and said he would be a witness of the interview, but at a distance.

When the day arrived, I proceeded to the Vestry Hall; and after waiting a few minutes, was accosted by a man of gentlemanly appearance and address. He was fair in complexion, and his face was closely shaven. 'Mr Lewis,' 'Mr Ross.' The introduction was complete. He proposed that we should adjourn to a more secluded place, where we could discuss the business in private. As we walked along the King's Road, he conversed on miscellaneous topics. Presently, we arrived at an open space where bricks and mortar encumbered the ground, and half-built houses stood around, looking ghastly in the fast gathering gloom of an autumnal evening. Then my companion faced me, and thus began: 'I wish you to convey a large quantity of valuable diamonds to Vienna. You will have to make three journeys, and take thirty thousand pounds-worth each time. I will give you one hundred pounds before you start on your first journey, and one hundred and fifty on your return. Two hundred ere you start on your second journey, and two hundred and fifty on your return. And three hundred on your return from your third and last journey. You will thus receive the sum of one thousand pounds for your trouble, which I think you will admit is a liberal recompense.'

I was petrified with astonishment. At length I ventured to gasp forth a few words: 'Why do you thus place implicit confidence in an entire stranger?'

My companion replied: 'You have an honest face; but I shall not trust you, nevertheless. You will never be lost sight of. One of my colleagues will always be at hand. Your ignorance of German will prevent you from talking

of your commission. I forgot to mention that you must not carry firearms, as that might arouse suspicion.'

In a dazed manner, I murmured: 'Whence come these diamonds?'

'They are stolen,' replied my companion with the most supreme *sang-froid*.

I resolved to temporise for a while. 'In what way should I transport them?'

'See!' said my friend, unbuttoning his coat, and displaying a waistcoat, with broad stripes in the pattern. He pulled a string, and I beheld, where the stripes had been, lines or packages of tissue-paper, within which were secreted the costly gems. 'Should you divulge what I have told you,' he proceeded, 'your life would not be worth a week's purchase. Even now, we are watched by two confederates.'

I involuntarily felt grateful that I also had a friend who would report proceedings, if any violence were attempted.

'Will you turn your head for a moment? I wish to show you how speedily I can change my outward appearance.'

I complied, taking the precaution to stand as far away as possible from my mysterious friend.

In a few seconds, he exclaimed: 'You can now look this way.'

In place of my fair-complexioned, smooth-shaven companion, I now saw a swarthy man, with a black beard and moustache, while by some mechanical change in the lapsels of his coat his attire was completely different.

'Of course you run the risk of being captured with the stolen diamonds on your person, and for that risk we pay you on the liberal scale I have mentioned. But you are, I presume, completely unknown to the police, and if you proceed on your journey in a quiet, natural manner, the risk is infinitesimal.'

During this speech, I had made up my mind to assume compliance; otherwise, I felt convinced I should never leave that lonely place with life. I said I would attend to any communication, and do my best in the matter. We shook hands and parted, as he recommended that we should not be seen together more than necessary. I cordially agreed with him, and walked away at a rapid pace. I had mentally decided not to return to my proper home till after midnight, as I felt convinced I was under surveillance; so I entered the house of my friendly neighbour, and on some pretence, chatted with him till after midnight, when I crept back to my own house like a thief.

My brother strongly advised that I should leave London at once for several months, until the thieves had selected some fresh and more willing instrument for their nefarious designs. I am almost ashamed to confess that the terror of the vengeance of the desperate crew with whom I was so nearly associated, prevented me from giving information to the authorities. I left London the following morning by the early newspaper train, and remained in a quiet country village for several months, during which time I was informed that the house of my neighbour, where I had taken refuge, was constantly besieged by inquisitive beggars and persons inquiring for imaginative individuals. I chanced to come across a diamond merchant, to whom

I related the story. He said I should never have made more than one journey to Vienna. They would have paid me the first sum, and remitted the entire bulk at once, and then summarily dispensed with my services; so that, out of the first hundred pounds, I should have had to disburse the amount of my journey to Vienna and back with all the contingent expenses. But the offer of ten times that sum was intended as an overwhelming temptation, to which many hitherto honest men might succumb.

I had ceased to give attention to the subject, and was placidly pursuing my chosen duties as a commercial traveller, when the London public and the country in general were startled by a large robbery of diamonds from the Post-office in Hatton Garden. This was in April 1882. Then came the arrest of three men at Berlin, who were finally extradited by the English ambassador. On the first appearance of the thieves at a London police court, I made an effort to be present; and in the tallest of the three prisoners, I recognised the Knave of Diamonds, my old friend Charles Ross.

PRESERVED MILK. - /

WERE it necessary to endeavour to persuade the reader of the importance of milk as an article of food, we could not do better than refer him to writers upon the subject, who agree that its value cannot be over-estimated, inasmuch as 'it is capable of supporting animal life without any other food'; and as practical proof of the public belief in the statement, we would point to the glasses of milk seen now on all refreshment counters, being preferred by many to the stronger beverages sold at the same places. But this additional demand for the rich and nourishing fluid is sometimes difficult to meet. In the country, the supply at times runs short, on account of the extra demand from our large towns and cities. But this is not all. Very much milk is wasted, for it soon turns sour; and although even then it may be good for pigs, to humanity it is lost. The chief object of this paper is to throw some light upon the only substitute for fresh milk—namely, preserved or 'condensed milk,' which is not understood as it deserves to be; such objections to it being raised, as an excuse for its non-use, as: 'Surely it cannot contain all the constituent parts of milk.'—'Don't you think it is adulterated?'—'It is sold in tins, is it not, and it won't keep after it is once opened?'—'It is expensive, I believe.'—'Do you think it is really nutritious?'—'I wonder whether they are clean and particular in the process of preserving it?'

Let us endeavour to answer some of these objections. First, then, as to condensed milk containing all the constituent parts of milk. How can it be otherwise, when the milk is taken straight from the cow, and, while still warm, put through the refrigerator—the first step in condensing? This being the case, it is not robbed of its cream; butter, consequently, is rather higher in price in the neighbourhood of a milk-factory, because it is less plentiful, the cream being in the milk which is sent to the factory.

With regard to its adulteration—our own manufacturers assure us upon the label on each tin, that only the purest sugar is used in preserving it; and as there is little or no sediment either before or after we boil it, their assurance seems sound.

Then as to its keeping—the writer has kept it after it has been opened for three weeks, and even a month, and then it was pure and sweet, only a little dried by exposure to the air.

The question of expense needs but to be glanced at for us to see that condensed milk is the cheaper. A fivepenny or sixpenny (one pound) tin of preserved milk makes two quarts of good milk; and we know that fresh milk varies in price from fourpence to sixpence per quart. It makes excellent puddings, at the rate of half a one-pound tin to a quart of water; and for infants' food, directions are given with each tin.

Last, but not least, the cleanliness of its manufacture, of which we are assured by a recent visit to one of our milk-factories. We enter the great stone yard, and are shown the lifts which convey the cans of milk up into the loft, where they are weighed and their contents passed on; the empty cans being returned in similar manner. That these cans are clean we may be sure, for the farmer takes care of that for his own sake, as no milk would be accepted at the factory which was not pure; and pure it could not be unless the can which contained it was perfectly clean.

Now we follow our guide into a large room with a pavement floor. Here there are large baths of cold fresh water, in which the cans of condensed milk float until they are to be removed to fill the little cans which are being prepared for the milk. Here a continual stream of cold water keeps everything cool and clean; but of course we have no desire to remain long, as the paved flooring is overflowing with water, and the atmosphere is such as would render a prolonged stay more enjoyable when the thermometer stands at ninety in the shade rather than when it registers forty-five; so we pass on to see the making of the little cans. Here is a machine for cutting the tin into the required lengths, after it has been well wiped on both sides with a clean cloth; and there is one for cutting out the circles for the tops and bottoms. The sheet of tin is scarcely touched with the hand, the machine cutting out and at the same time throwing the shining circles into a basket, which when full is carried into the soldering-room. Here they are put together, pressed into shape, and soldered by machinery, passing so quickly before our eyes that we are dazzled by the bright flashes of the tins. Next, they are tested, each one separately, to see if they are air-tight. If not, they are sent by the examiner to the 'repairing-room' to be mended so. They are then carried by boys, on wooden trays, to the 'filling-room,' where the women sit, each with a large bright canister before her, having a tap, which she turns, holding the tin can to receive the creamy fluid. These cans are filled with great rapidity, and are then carried away on the wooden trays, to be finally soldered; thence to the labelling department; and lastly, to the packing-room, to be put up in paper and boxes

for travelling, large quantities of this milk being sent abroad.

To our question as to the return of empty tins, we are told 'it would never do; we should not know into whose hands they had been; and it would not be worth our while. As it is, we can answer for the purity of everything! We commence with the raw materials, as you have seen, even to the timber of which our packing-cases are made, which you shall see, if you like.'

We do like; and are soon watching the intricacies of cutting the slabs of wood into the required lengths for bottoms, sides, and tops or lids. But our interest is at its height when we see the great machine gently, and almost noiselessly, drive in a row of nails at once, so that with one or two turns the box is strongly made. After it is filled with tins of milk, it comes back once more, to have the lid nailed on, and is complete.

THE MONTH: SCIENCE AND ARTS.

THE meeting of the British Association at Aberdeen has proved to be in every respect a great success. The subjects discussed have been in point of general interest up to the average, and the meeting has fulfilled one of its most important uses, in giving to the public an epitome of the work done by various brain-workers during the past twelve months. Those who have not the leisure or opportunity of studying the 'Proceedings,' of our various learned societies are able, by means of the published abstracts of papers brought before this annual gathering, to learn the progress that is being made in the chief fields of research, and every reader is likely to find more than one subject in which he can take an interest. Even the utilitarian mind which has no patience with the term 'original research' unless it bears immediate commercial fruit, must acknowledge that the Association deals with matters of a highly practical and valuable nature.

In Mr W. H. Preece's paper on the Strength of Telegraph Poles, the curious fact came to light, that for the past thirty years our telegraph engineers have been misled by the textbooks in imagining that fir-poles had about double the strength which they really possess. A series of careful experiments has lately shown this to be the case, and as a consequence, stronger trees are now selected for supporting the wires. Another question dealt with by the energetic electrician to the General Post-office related to the relative merits of iron and copper wire for telegraphic purposes. A wire two hundred and seventy-eight miles long has recently been erected for experiment between Newcastle and London. This wire weighs one hundred pounds to the mile against four hundred pounds—the weight of the thicker iron wire generally used—the cost of each being about the same. The copper wire shows a decided superiority in speed of working, the relative figures being as follows: In simplex working the copper will transmit four hundred and fourteen words per minute, against three hundred and forty-five words for iron; and in

duplex working, copper two hundred and seventy, and iron two hundred and thirty-seven, words per minute. It is also proved that copper is *12*/₁₀₀ far the better conductor for telephonic purposes. With reference to the improvement that has been made in the rate of working the Wheatstone automatic apparatus, Mr Preece stated that whereas in 1877 the speed was eighty words per minute, it has now reached the extraordinary rate of four hundred and thirty words per minute.

Professor W. L. Macadam, in the course of an interesting paper on the Diatomaceous Deposits in Aberdeenshire, stated that last season some hundreds of tons of this earth had been employed by Messrs Nobel in the manufacture of dynamite—dynamite being, as our readers will remember, simply a porous earth moistened with nitroglycerine. A great future was anticipated for the district where the deposit occurs, but the industry was doomed, owing to the discovery of a far more powerful explosive in blasting-gelatine.

Professor McKendrick's paper on the Action of Cold upon Microphytes gave an account of some experiments made with a machine specially constructed for the purpose. Putrescible substances in hermetically sealed vessels were exposed for some hours to an extremely low temperature, after which they were allowed to thaw, and were kept for some time in a warm room. The substances were afterwards submitted to the searching eye of the microscope. As a result it was found that organic fluids may be exposed to a temperature of one hundred and twenty degrees below zero (Fahrenheit) for at least one hundred hours; but after being kept in a higher temperature of about eighty degrees, fermentation and putrefaction will go on in the ordinary way. Thus the hope of any practical result from sterilisation by cold is destroyed. The important point in these experiments is the certainty that fresh meat cannot be tinned and exported, as cooked meat is.

In drawing attention to the neglect of the antarctic region as a field for exploration, Admiral Sir Erasmus Ommanney gave a summary of what had already been learned regarding that far-off region, from which he thinks we may infer that the South Pole is capped by an eternal glacier. He advocates the formation of an expedition which should pass a winter in the antarctic zone, so that the conditions and phenomena may be compared with what we know about the arctic regions.

The paper upon that all-important subject Casualties at Sea was chiefly valuable for the interesting discussion which it raised. Sir James Douglass, in giving his opinion upon ships' lights as a protection against collision, considered that all such indications were only available for a short distance. What is wanted is some plain system of signalling which shall be visible for two or three miles. He wondered why no more effective alarm than a whistle was in common use, and would have a steamer use all her boiler-power in sounding a fog-horn, which should be heard for a distance of two or three miles in any weather. Incidentally it was stated that a new system of buoys had been practically arranged, and that very soon they would bear one universal language.

Want of space unfortunately prevents us giving even a brief account of many other papers brought before the British Association at its recent meeting; but we cannot refrain from pointing out the extreme interest attaching to Mr Thurn's account of his recent ascent of Mount Roraima, and still more so to Sir John Lubbock's recent researches into the ways of his humble friends the ants and bees.

It is a well-known fact that in warfare, for every bullet which finds its billet, many hundreds are fired away which do no harm to anybody. As a case in point, we may mention the circumstance that in three months of his weary captivity at Khartoum, General Gordon's troops fired away half a million cartridges without making any sensible diminution in the number of their opponents. One of the chief reasons of this waste of powder and shot is the difficulty of judging distance and correctly adjusting the rifle so that it may be elevated to the required pitch. The same difficulty holds good of course with reference to artillery, and until 'they get the range,' artillerymen cannot hope for much result from their work. With the view of meeting this difficulty, many so-called range-finders have been invented, some of them of a most complicated and cumbersome description. Two, however, have lately been introduced, one of British and the other of German origin, which present such advantages in portability and ease of working that they are likely to supersede all others; but which is the better of the two in practice remains to be proved.

The Weldon Range-finder is a little instrument the size of a watch, containing two prisms cut at different angles, and it is used in the following manner: The observer brings first one prism to his eye, and observes in it the reflected object whose distance from him he is desirous of ascertaining. He projects this object upon some other object in the distant landscape, and makes a mental note of their apparent conjunction. Then presenting the other prism to the object in the same way, he notes that the two images will not come into the same place unless he moves his position—it may be some yards ahead. When this is done, the distance he has paced is taken as a Base line, which, multiplied by fifty, will give the solution of the problem desired. This instrument has been adopted by the War department.

The other Range-finder to which we call attention is the Telemeter of Lieutenant von Ehrenberg, which is so far like that just described in being of the size of a watch, but is unlike it in every other respect. It depends for its efficiency not upon the sense of sight, but upon hearing, and is based upon the well-known circumstance, that sound takes a definite time to travel through the air, averaging three hundred and sixty yards per second. In practice, the observer notes the flash of a gun from the enemy's lines, upon which he depresses a knob on the instrument, which causes its finger to travel round the dial. When the sound of the discharge reaches his ear a few seconds later, another touch stops the hand. A glance at the dial then indicates exactly the distance which the sound-wave has travelled. It will be seen that both these instruments are simple in design

and use; but we are inclined to favour the British one, as it in no way depends upon the action of the enemy.

The sudden appearance of a new star in the Andromeda nebula represents one of those marvels of the heavens which even the cleverest astronomers can tell us very little about. The spectroscope has decided that the star is within the star-cloud, and there our knowledge of it comes to an end. The strange appearance will serve to remind the thoughtful once more of the extreme littleness of our globe when compared with the vast range of the universe; for we are reminded that although this star only became apparent just now, the event, whatever it be, happened probably more than a century ago; at least, it is estimated that the star is situated at such a distance from us, that its light travelling at about one hundred and eighty thousand miles a second, would take such a period of time to reach this earth.

Fresh subsidences in the salt districts of Cheshire, owing to the constant dissolution of the rock salt below by the pumping out of brine, have given rise to the erroneous idea that through the cracked earth the salt deposits may become contaminated with sewage. That such a thing can hardly occur will be acknowledged when it is remembered that the earth through which such matter must percolate will act as a filter and purifier. But even if any germs did find their way to the salt, they must be destroyed by the heat that is used subsequently to drive off the water by evaporation, before the product is ready for market. It is too much the fashion in these days to discover lurking sanitary dangers where none exist.

In a German technical paper, Herr Emmerig asserts that from careful observations he has made he is convinced that bees give warning of an approaching thunderstorm. Bees that are generally quiet and harmless will on such occasions become excited and irritable, attacking any one who approaches the hive, even if it be their usual attendant and familiar friend. Sometimes he has observed that when the barometer and hygrometer have foretold a coming storm, the bees have remained perfectly quiet, and no storm has come. On the other hand, the bees have often foretold by their behaviour the approach of a storm which has subsequently arrived, when the instruments have afforded no indication of it.

A house containing in one of its upper rooms a quantity of old iron, was recently struck by lightning at Neuchâtel, Switzerland, and burned to the ground. An account of the occurrence was brought before the French Academy of Science, and it was suggested that the metal in the house attracted the lightning. M. Calladon, in refusing to accept this explanation said that there was no truth in the popular supposition that a building with a metal roof, or with metal in its construction, was more liable to lightning-stroke than other buildings, provided that the metal were not in direct communication with the earth. But he suggested that the presence of the iron in the house referred to had very likely led to its destruction by fire. For it is well known that any combustible substance placed between two conducting surfaces—and in this case the mass of iron and the humid atmosphere outside

the house would represent such surfaces—would be in danger should an electrical discharge take place between them.

Artificial lithographic stones have been invented, and are manufactured at Frankfurt by M. Rosenthal. The ingredient used in their preparation is simply cement, which has, however, to go through careful manipulation before the stones are fit for the printer's use. The mode of manufacture is briefly as follows: Finely ground cement is mixed with water and allowed to harden into slabs. These slabs are next heated, and wetted with water until they crack in every direction. Once more the material is ground into fine powder, and is mixed with an equal quantity of dry cement. The mixture is now put into moulds, still in a dry state, and is subjected to very heavy pressure. Whilst still under pressure, water charged with a certain quantity of very fine cement is forced through the mass and binds its particles together.

Professor Dunnington of the University of Virginia has hit upon a way of preserving chalk diagrams and drawings made for class illustration, which may be found useful by many of our readers. Some teachers and lecturers are remarkably expert with blackboard and chalk, and we have seen sketches in differently coloured crayons so finely executed that it seemed a pity to efface them at the end of the lesson. Professor Dunnington makes his drawings in coloured chalks on unsized paper, and they are subsequently passed through a bath of very dilute varnish composed thus: Dammar varnish one part, spirits of turpentine twenty-five parts. After being hung up to dry for a few hours, the drawings so prepared can be handled without any chance of the chalk-lines rubbing away. The varnish has fixed the chalk particles firmly to the paper.

Mr S. Pichler has devised a system of raising trucks of minerals from the shaft of a mine, which is very ingenious, and of which we have lately had the opportunity of inspecting a working model. The method is based on the man-engine, which has now been in use for many years in Cornwall and other mining districts. The man-engine consists of two long beams, which extend down the whole length of the shaft, to which are attached little platforms at intervals of about six feet. The beams are governed by a seesaw attachment to the engine at the pit-bank, so that they are constantly moving up and down in reverse directions to each other. By this motion, the platforms at every stroke of the engine are made for a brief time to pause opposite one another, so that a man wishing to ascend the shaft has merely to watch his opportunity and step from platform to platform, on the right and left hand beams alternately, until he arrives at the top. He can, of course, descend to his work in the same way. In Mr Pichler's arrangement, the platforms would be large enough to accommodate a truck of coal or other mineral, and they are so contrived that on meeting one another they tip up obliquely. This tip naturally causes the truck resting on, the platform to run off to the platform which next is brought against it, and so the vehicle runs from side to side until it reaches the mouth of the shaft. This method would, if adopted, not only save much labour, but would prevent coal

being knocked into small pieces by constant change of receptacle.

A village in Switzerland more than fifty thousand feet above the sea-level, and surrounded on all sides by snow-clad mountains, with a climate where the thermometer often stands at twenty degrees Fahrenheit in the day, and below zero at night, does not seem to be quite the right place for consumptive patients to winter in. Yet, such is Davos, where, for many seasons recently, doctors have been sending their patients with the best results. These results are due to the extreme dryness and purity of the air, the dryness removing catarrh of the bronchial tubes, and the absence of organic matter in the air preventing irritation and breaking-up of lung tissue. Patients are recommended to begin their stay in the place during the summer, so that the coming autumn may acclimatise them and enable them to bear the cold of winter. The place has plenty of amusements, and the only fear is that it may become overcrowded, when its benefits must surely disappear. For further particulars of this new health-resort we refer our readers to a long account of it published in the *Times* newspaper of September 30th.

A new kind of paving material under the name of Grano-metallic Stone has recently been introduced, and is now under trial in a portion of the Strand, London. It is composed of blast-furnace slag and granite in certain proportions, which are crushed and mingled with Portland cement. A rough ballast forms the substratum of the roadway or footpath under treatment, and the new material is laid upon this after having been mixed with an alkaline solution into a paste. The process of laying is inexpensive, and the pavement is ready for traffic in ordinary weather in twelve hours. Mr Bryant, of Palace Chambers, Westminster, is the patentee.

INVENTIONS.

AN IMPROVEMENT IN SPIRIT STOVES.

Messrs H. A. Knox & Co., of Houndsditch, London, and of New York, have recently brought out a spirit stove, which, while it tallies with preceding articles of a similar kind in the means by which the light is produced, is fitted with a simple but effective mechanism by which the light can be regulated. This mechanism is of the following description: the wire-gauze elliptical disc through which the oil filters upon the wick below is surrounded by a margin of metal plate, and beneath this metal plate are fitted two crescent-shaped slides, which, moved backwards and forwards by means of little rods projecting from either side of the stove, have the power to reduce the flames to the smallest size, and, if desired, finally to extinguish them. With the 'Eclipse' Spirit Stove, baby's food, &c., can be kept warm or simmering for any length of time.

A SAFE STIRRUP.

Recognising the elements of danger which exist in the kind of stirrup that has so long been in use—notably that which results from its inability to release the foot of the rider if in the event of an accident he falls from the saddle—Mr R. Wright, of High Lodge, Richmond, Yorkshire,

has recently brought before the attention of equestrians a novel invention, and one which we should think is likely to prove a boon. One thing is aimed at in the Safety Saddle Stirrup-iron, and that is the releasing of the rider's foot immediately he falls from the saddle and before he reaches the ground. This end is attained by the following means: the bottom of the stirrup, or that part which receives the sole of the rider's boot, is set upon pivots, and thus revolves freely in harmony with any movement of his foot. A joint occurs, too, upon each of the side-arms of the stirrup, and these yield with a slight pressure; while still further 'give' is imparted to the contrivance by the rod under which the attaching strap passes being made to revolve freely. Mr Wright points out that the invention gives a more springing action, and is much easier in use, than the 'uncouth primitive iron hoop' hitherto known as a stirrup. This latter contrivance, he contends, has caused the deaths of numbers of persons, who, when they have fallen from the saddle, have been dragged along with their heads to the ground, and thus killed. As it seems impossible that this could occur when the new stirrup is used, the novelty ought to command attention.

MANGLE, WRINGER, AND TABLE COMBINED.

With the development of effective mechanical processes, the practice of 'washing at home'—and thus abolishing a ready means by which infectious diseases can be brought into a household—is rapidly spreading; and as a consequence, machines of different types are introduced into our kitchens. That these machines should, as at present, stand in their positions occupying space uselessly during six out of every seven days, is a domestic misfortune; at least, so it has apparently appeared to Messrs Thomas Linley and Sons, of Stanley Street, Sheffield, who have brought out an ingenious combination machine. On 'washing-day,' this is a mangle, and, with a little modification, a wringing-machine; while during the remaining days of the week it fills the rôle of a stout and useful kitchen table, and, as far as a hasty glance can tell, nothing but a kitchen table. The arrangement, indeed, by which the mechanical part, from being securely fixed in the wooden frame, is divested of its fly-wheel and folded down beneath the table-top, is of so effective a kind as to entirely hide it from view. Nor must it be supposed that this arrangement is obtained at the expense of strength and durability; for the rollers and other parts of this machine are made as large, as strong, and as thick as in ordinary machines.

AN INGENUOUS FISHING-FLOAT.

Bottom fishers have from time immemorial been put to a great inconvenience in the pursuance of their craft. They have been unable, when angling in anything of a breeze, to detect a 'nibble' or the 'bite' of a small fish from the movement of their floats caused by the ripples of the water. Thus many fish have been missed, and many times anglers have 'struck' at nothing. Mr A. V. Catmur, of 18 Ebury Street, London, has introduced the 'Eclipse' float, which does away with the inconvenience in question. A porcupine quill, having a small ivory

ball at the top and a cork cone at the bottom, has in the centre a loosely-running cylinder of the latter material, occupying less than the intervening space. The line passes through the ball, the cylinder, the cone, and a little eye attached to the bottom extremity of the quill. When in the upright position in the water—and it may be added that the float is 'self-cocking'—the cylinder occupies a central position between the ivory ball and the cone, it being separated from both by a small space. The entire contrivance will rise and fall upon the ripples; but a 'bite,' or tug upon the line, will draw down the quill and its ball-appendage, without affecting the cylinder. Thus, when the angler sees his float bobbing up and down, he will take no notice; but when he sees that the ivory ball descends towards the top of the cylinder, he will know that there is a fish attacking his bait and that he may 'strike.'

TWENTY-TWO TOOLS IS ONE.

A combination tool, invented by Captain Harts-horne, of the Bengal army, and which has been commended by Lord Napier of Magdala, appears to possess considerable advantages. Captain Harts-horne's implement is no child's toy, but an article which might find a fitting place slung from the saddle of a cavalry soldier or in the knapsack of a traveller. Forged from only two pieces of wrought-steel, without any brazing or welding, the implement comprises as many as twenty-two tools, and weighs two and three-quarter pounds. Combined are a hammer and a hatchet, wire-nipper, four files and a rasp, a saw, a screw-driver, a crowbar, a Bradawl, and a pair of tongs; while the instrument further comprises a pair of compasses, a twelve-inch rule, a straight-edge, and a T square. If, too, a portion of the metal is buried in a block of wood, the remaining part represents a useful little anvil; while the implement, having a known weight of two and three-quarter pounds, can be used as a poise for weighing forage, &c. The makers are Messrs Hill and Son, of 4 Haymarket, London; and the price is twenty-five shillings, eleven shillings extra being charged for a solid leather case.

A POCKET FILTER.

The idea of a filter which, carried in the pocket, can be used to convert the brackish and impure water which the soldier, tourist, &c., encounters at almost every turn, into a harmless liquid with which he can readily slake his thirst, is not a new one; but in the Maignen Patent 'Watch' and 'Soldier's Filtre Rapide' there are many valuable characteristics which are quite novel. The two forms in which the invention is manufactured differ from one another, not in the principle on which they perform their common function, but in their mechanical construction. The 'Watch' filter is shaped like the familiar portable time-piece; the 'Soldier's' is cylindrical in form. We will give a description of the latter. It consists of a frame covered with asbestos cloth, this asbestos cloth being coated with powdered carbo-calcis, which is the filtering medium, and which can be discharged—along with all the impurities it may have arrested—and replaced, the process being gone through as often as necessary. The frame is

inclosed in a cylindrical tin box measuring five inches by one and a half, which can be conveniently used as a drinking-cup. Attached to the filter is an india-rubber tube, through which the water may be drawn from a rivulet, bottle, cask, &c. The contrivance can, however, be used without this tube; while a third method of use possible is that on the principle of a siphon, water being automatically drawn impure from one vessel and discharged pure into another. The patentee is Mr P. A. Maignen, of 32 St Mary-at-Hill, Eastcheap, E.C.; and the agent, Mr Goy, of 21 Leadenhall Street, E.C.

TO PREVENT CANDLES 'GUTTERING' AND 'SLOPPING.'

Mr G. F. Thompson, of 3 New Street, Warwick, has brought out a simple and efficacious little contrivance called a 'Patent Candle Economiser,' which aims at preventing, in the first place, the waste entailed in the 'guttering' or running over of a candle; and in the second, the inconvenience and injury attending the 'slopping' or spilling of grease-drops. As is well known, both when being carried about and when placed even in a slight draught, a candle is apt to misbehave itself in the manners indicated; and it is not too much to say that this circumstance has done not a little to restrict its use, and to banish from the decks and tables of many, a form of illuminant which for softness and subdued brilliancy holds a high place. Mr Thompson's 'Economiser,' which is made of brass, is nothing more than a short piece of tubing curved in at the top in a manner to make the circumference of the upper extremity smaller than that of the lower. The contrivance is placed over the heat of the candle; and upon the wick being ignited, the melted superficial grease finds its level beneath the apex of the 'Economiser,' the curved character of which proves the means of imprisoning the liquid and preventing its running over the side. Something of the kind was, we believe, brought out a few years back; but the metal employed being lead or pewter—both of which are very heavy, and quick conductors of heat—the devices served actually to melt away the candle. Mr Thompson himself has not arrived at his present result without considerable preliminary experimentation. His first little dome-shaped contrivances were made of tin, and these served their purpose well. But he aimed at realising a further improvement, and so tried brass. At first, he made his 'Economiser' too heavy, and found that they got rather hot. The more recent samples, however, on which he rests his reputation, scarcely get hot at all, and cool as soon as the candle is extinguished.

PRESERVING VEGETABLE AND ANIMAL FOOD.

An apparatus for preserving food, constructed on strictly scientific lines, has been patented by Mr B. H. Thwaite, of 37 Victoria Street, Liverpool. Four, eight, or more small chambers, constructed to contain meat, poultry, vegetables, &c., are arranged around a vessel containing water. Beneath this vessel there is a receptacle holding a specially made oil-lamp, intended to burn pure paraffin or other hydro-carbon. Connecting tubes, fitted with valves, join the several

food-chambers with the receptacle containing the lamp; while other connecting tubes, also fitted with valves, run from the food-chambers to the water-vessel. The last-named itself carries an outlet cock. Turning to the principle on which the apparatus is constructed, it should be stated that, food having been placed in the preserving chamber, the lamp is ignited, and the valves of the two sets of connecting tubes having been opened, the outlet cock of the water-vessel is also opened. The issuing liquid occasions an aspirating action in the vessel, and, through the connecting tubes, the air is drawn from the preserving chambers. The consequent displacement is filled up by the gas products of combustion which find their way from the lamp-receptacle through the connecting tubes. As soon as the water in the vessel falls to a given level, the lamp may be extinguished and all the valves closed. The air has thus been withdrawn, and, in the gaseous products from the lamp-receptacle, a powerful antiseptic has taken its place. The result is that food can be preserved in the chambers in a perfect state—no suspicion of decomposition manifesting itself—for several months.

SONG.

Oh, three little bird, on a bramble spray '
Each flew to find him a nest.
There was one went lately over the sea;
And one flew straight for the North Countree,
But the third
Little bird,
He winged his way to the watery West,
Where one that I love sits sighing.

Oh for the withering bramble spray,
And the bird that sleeps in his nest!
There is one in a castle over the sea,
And one in a pine in the North Countree;
But the third
Little bird,
He flew straight far in the West,
Where one that I love lies dying.

Ah me, for the thorny bramble spray
And the weary bird in his nest!
There is one that dreams of the silver sea;
And one looks over the North Countree;
But the third
Little bird,
He sings o'er a grave in the silent West,
Where one that I love is lying.

PHILIP THYNE.

The Conductor of CHAMBERS'S JOURNAL begs to direct the attention of CONTRIBUTORS to the following notice:

1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.

2d. For its return in case of illegibility; postage-stamps should accompany any manuscript.

3d. To secure their safe return if illegible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

If the above rules are complied with, the Editor will do his best to insure the safe return of illegible papers.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH.

PRICE 1½d.

TIMBUCTOO.

TIMBUCTOO has now been seen for the fifth time by a European—and, so far as known, only for the fifth time. Though still the chief emporium between Northern and Central Africa, though boasting a long and distinguished past, and though, in view of the rapidity with which African exploration and colonisation are now advancing on all sides, probably destined, in no distant future, to more than reassert all its ancient importance, yet, down to the present day, this 'Queen of the Desert,' as it is sometimes called, has unaged itself in the eyes of only five Europeans.

In 1630, a French sailor named Paul Imbert, having been wrecked on the Atlantic coast, was taken prisoner by the Arabs, and sold as a slave. As such, he was taken compulsorily to Timbuctoo, whence he was transported to Morocco, and there died, before a French expedition, organised in 1632, arrived in time to deliver him. Nearly two centuries of complete disconnection between Europe and Timbuctoo next elapse before the second European, Major Laing, a native of Edinburgh, who, from the coast of Sierra Leone, had already made several successful plunges into the interior, arrived in August 1826 at Timbuctoo. The goal of his expedition, to which he had been commissioned by the English government, was the exploration of the Niger. Starting from Tripolis, he had crossed the Desert by way of Rhadames and Taat. Unhappily, about a month after reaching Timbuctoo, between that town and Arawan, Major Laing was murdered, and with him perished all the records of this enterprise. Two years afterwards, in May 1828, Timbuctoo was sighted for the third time by European eyes, and for the first time by a European who has transmitted to us an account of his visit—by the Frenchman, René Caillié. Allured by the prize of ten thousand francs offered by the Paris Geographical Society to whoever brought them evidence of having reached Timbuctoo, and impelled by his own taste for adventure, René Caillié first

acquired a fair command of the Arabian language and manners, and, feigning to be an Egyptian in quest of his native country, he pursued a toilsome march eastwards from Senegambia, till, foot-sore and wayworn, he alighted at the town of Jenni, on the Niger, whence he made a descent of the river to Kabara, the port of Timbuctoo. The fourth European in the list of Timbuctoo visitors is the distinguished German traveller, Heinrich Barth, who entered the town on the 7th September 1853, and stayed there full seven months, making a good use of his opportunity, and taking full and intelligent note of all he saw, so that, by his reports, Europe was for the first time enabled to grasp and hold a concrete, careful, and altogether trustworthy image of the city in the Great Desert, through which the economic life reciprocated between Northern and Central Africa was mainly accumulated and distributed. And now we come to Dr Oscar-Lenz, the last of the Europeans who, down to the present hour, have helped to lift the sandy curtain which hides Timbuctoo from our view. He has recently returned from a very successful African exploration, on which he was despatched in the autumn of 1879 by the German African Society. Starting from Morocco and surmounting the Atlas highlands, of which he made a special survey, Dr Lenz traversed the Desert by a new route, and arrived on July 1, 1880, at Timbuctoo, whence, bending westwards, he touched Senegambia, and followed the Senegal to its mouth at St Louis, a route likewise never before trodden by European; thus opening up two roads into the capital of the Desert, one from the north, another from the west. Dr Lenz's stay in Timbuctoo itself lasted only from the 1st to the 18th July; and his account of the Desert city is little more than a corroboration of Barth's description, which, after a lapse of twenty-six years, he found to be still essentially correct.

Timbuctoo extends in the form of a triangle on the left or northern bank of the Niger, with its base to the river, at an interval of about nine miles, and its apex to the north. It is

but little elevated above the mean level of the river, though about eight hundred feet above the level of the sea; about seventeen and a half degrees north latitude, by three and a half degrees west longitude. Entering the town from the north, you cross an unsightly tract, some thousand feet broad, exposing only the litter and rubbish of waste buildings. To the left, again, you mark the sepulchre of Faki Mahimud, which, though now outside the town, must have once been embraced within its walls. Plainly, the Timbuctoo of to-day occupies only a fraction of the area over which it extended in its flourishing days. Nor is the town girdled in by any walls or citadels, its last ramparts having been razed in 1826, under an invasion of the Fulahs, a dominant people to the south and west. The many conquests of the town, and its frequent change of masters, have, along with its physical defences, battered down all its political independence or self-consciousness, so that the inhabitants, now restricted exclusively to economic and commercial life, pay passive dues to whichever people have the ascendancy for the time being—now to the Fulahs, now to the Tuareks, the two ruling races of the surrounding lands. As regards the actual magnitude of the town, Barth counted nine hundred and fifty houses, with a population of thirteen thousand; but Dr Lenz calculated the population, which at the time of his visit was perhaps somewhat swollen by a more than usual influx of Fulahs and Tuareks, at twenty thousand.

The town consists of round thatch huts on the outskirts, relegated to the negroes, and of clay-houses, constituting the town proper, all pretty much of one description. As a specimen of the better class, take the house assigned to Dr Lenz during his stay of eighteen days. Situated in a rather broad street, it is surrounded by a court, whence a small stair leads to the first floor, which is occupied by a nice large room. Thence, mounting a few steps, you emerge on the terrace, which, again, is crowned by a structure containing a very pretty room, with one window looking to the court, and another to the terrace. The body of the house is built of clay bricks, the floors are of hardened clay, the doors and windows of wood. The windows, prettily carved, display the Moorish horseshoe form. A few simple ornaments at the gates give the finish to a fairly substantial building. Timbuctoo has no less than seven different divisions of distinctive character and name, the south-eastern one being the handsomest and the residence in particular of the rich Rhadamess merchants. The only public buildings, however, in this so exclusively commercial town are the mosques—four large and three small ones, the largest or 'Great Mosque,' two hundred and sixty-two feet by one hundred and ninety-four feet, and containing twelve naves or aisles dating as far back as 1327. It is a stately edifice, at present flanking the extreme western end of the town, though, in the more

flourishing times of Timbuctoo, it must have towered up proudly in the centre. Altogether, the town has, it must be confessed, a rather dreary aspect. The eye is not relieved by the sight of public squares, nor refreshed by the view of public gardens, nor, indeed, by hardly any refreshing green. Before the conquest of the city by Hamed-el-Mansur of Morocco, in the sixteenth century, trees are said to have been numerous in Timbuctoo; but after that event, they were all cut down for the purpose of boat-building. Add the hot south winds, which blow particularly between July and September, often accompanied by violent thunderstorms; the numerous *dugas* or depressions in the soil outside the town, especially to the south, to collect almost the only water available for drinking and cooking purposes; the Niger, close by, frequently inundating the flat land and leaving pestilential pools, and it will readily be understood how Timbuctoo is by no means unattractive all that could be desired, but apt to infect fever on its European visitors, as both B. and Dr Lenz found to their cost.

The one redeeming feature in the natural aspect of Timbuctoo is its wealth of birds and other animals. A tiny species of finch is as common there as sparrows with us; beaves of pigeons, diversified by ravens, crows, and stirlings, are constantly on the wing, while there is no lack of hawks and eagles to give them occasional chase. Numberless black storks are stalking about the *dugas*, while ostriches, horn of their ornamental feathers, are everywhere to be seen. There are, besides, plenty of humped cattle. The asses of Timbuctoo, large, and of a gray-yellow colour, with a deep black stripe along the backbone, are pretty animals, and, what is more, very hardy, and not at all particular about the quality of their food, nor even difficult to satisfy in respect to its quantity. The horses are a small race, but hardy and fleet. In the evening, you see long trains of camels, asses, and horses plodding soberly to the *dugas*, to quench their day's thirst.

The population of Timbuctoo is a congeries of motley and diverse elements, the better and most effective constituent being formed by the Morocco Arabs, who, however, in consequence of marriage, generation on generation, with negroes, are grown to be mostly of dark complexion. Another element consists of the numerous descendants of the old Sonhay negroes and the negro slaves drawn from the remotest parts of the Soudan. Other elements are the wild warlike Tuareks, of Berber stock, harsh in speech and insolent in demeanour, their faces hidden under a *litham* (blue cloth), through which only the eyes peer, their bodies jingling with armour, sword, sabre, and lance. To these have to be added the Fulahs, a fanatic but rather cultivated and handsome people, of light complexion, slightly arched nose, straight forehead, fiery glance, long black hair, and shapely limbs; wanderers from Bornu and Sokoto; Arabs from the Western Sahara, Algiers, &c.

Timbuctoo is like one great mart, wherein merchants negotiate the exchange of the products of the north with those of Southern Soudan. This emporium is under the government of the *Kahia*, whose function resembles

that of a *Bürgermeister* or mayor (inclusive of aldermen and town-council), but who wields no political authority. The office is hereditary in the family of the Er-Rami, who have been planted in Timbuctoo since the Moroccan conquest of the sixteenth century. They originally emigrated from the south of Spain to Morocco, and are hence called 'Andalusis.' A whole quarter of Fes is still named from them, and the Andalusian women have the repute of superior beauty. The present Kalua, Muhammed Er-Rami, is of decidedly negro-like appearance; of cunning yet withal good-natured physiognomy, meaning really no mischief to any one by his cunning; readily excited to laughter, and when laughing, his jetty face glitters all over. There is not a trace of fanaticism in him, and should he ever be guilty of severities against a Christian, it would only be under foreign influence. The Kalua visited Dr Lenz every evening, attended by a large retinue, and accompanied by some 'men of great learning' who always at once entered into a religious discussion with our traveller's interpreter, *Aliq Ali*. Among these 'learned men,' some were of quite light complexion, like the Moors of Morocco. The Kalua handsomely discharged the duties of hospitality to our traveller during his stay of eighteen days, sending him abundance of provision all the time. Other well-to-do people of Timbuctoo, likewise, whom Dr Lenz came to know, piled his table with a superfluity of entertainment, so that he and his party had not only no hotel bills to pay, but had always an excess of good cheer to hand over to the poorer people.

The other important personage in Timbuctoo whom Dr Lenz met was *Abdull-el-Bakay*, at the head of the *Fulaks*, an amulet-man, proud of his bath, and particularly learned, whose father had been his protected Bath, and who was so proud of his position that he did not do any harm to the present traveller, though, from fear of rousing the fanaticism of his followers, he maintained only a negative attitude towards him; and the 'sultan' or chieftain, *Eg-Fandagum*, at the head of the rival *Tuarks*, then in the ascendant, and drawing the duties levied on the imports and exports of Timbuctoo. The *Tuarks* suffer much from distemper of the eyes, caused partly by their uncleanly habits, and partly owing to the sandstorms of the desert.

Timbuctoo, as has been already stated, is a purely commercial town, and hardly grows or manufactures anything. The fine leather goods, wrought among the numerous populations to the south and west, are manufactured only in the smallest fraction for home use in the town itself. The most striking of these is a pretty leather pouch worn round the neck by a leather cord, and used for holding tobacco, steel, flint, and timber. Properly, there is no industry whatever in Timbuctoo. All its supplies come from the outside. Even its vegetables it draws immediately from the port of *Kabara*, which, built on a height close to the river, comprises one hundred and fifty to two hundred clay houses, and a population of some two thousand negroes, besides foreign merchants of Timbuctoo and *Tuat*, has two small market-places, and cultivates rice, a little cotton, and different kinds of melon, to be sold at Timbuctoo.

Besides leather-work, large and excellent straw-hats, pottery, clothes, &c., are drawn mostly from the south. The main dress of the people, the long, wide, blue *tobe*, is manufactured out of native material, dyed blue, and often adorned on both sides with silk embroidery. A *tobe* of this latter description forms a very acceptable present in the *Soudan*. The dear but excellent native manufacture is, however, being rapidly driven out of the market by the 'cheap and nasty' English material.

About five thousand camel-loads of goods come to Timbuctoo every year from the north by the two main routes of Morocco and *Rhadames*. The wares coming from the north are cloth, blue cotton, green Chinese tea, sugar, waxlights, dates, and tobacco. The kola nut, which in the *Soudan* takes the place of tea, coffee, and cocoa, is also largely imported from the lands of the *Serra Leone* coast and *Asiatic*. The exports to Europe, on the other hand, are ostrich feathers, gum, and some gold, as also ivory and negro slaves to the northern African states. Timbuctoo is especially an emporium for salt, which it receives from the beds of *Taudeni*, and sells to the people of the south. The salt is brought in plates, each a metre long, and weighing about sixty pounds. One such plate sells at a *mahad* of gold, which is equal to eight or nine thousand cowries—that is, nine to ten shillings.

The people of Timbuctoo live on the whole very comfortably in an economic sense, and Dr Lenz saw very few signs of poverty or beggary among them. They have three meals a day. The first, at nine A.M., consists of small, new-baked wheat loaves, of altogether a little over a dozen pieces of which, in eating, you are obliged to make into dishes of honey or fluid *meat*. The second meal, at three P.M., is composed of two, sometimes three, courses, supplied by kuskus, vegetables, mutton or beef, poultry and pigeon. Everything is tastefully prepared. But what are kuskus? They are made of the flour of wheat, barley, maize, or even negro millet. The meal is moistened; then, by a peculiar movement of the palm and the fingers, it is twirled off into small grains. It is next dried in the sun. The kuskus are not cooked, but steamed by being put in an earthen pot, riddled with small holes at the bottom, which is placed over another pot filled with water, and resting on the fire. Emptied into a dish, the kuskus are strewn over with saffron sauce; then flesh and vegetables are tastefully scattered over them, and they are eaten with the fingers of the right hand—though it requires some practice to carry them to the mouth without dropping any. Fish is relegated almost exclusively to the negroes, and a person has sunk very low who will eat any kind of fish. The evening meal, between nine and ten, consists generally of rice mingled with small pieces of meat. No spirituous liquors are drunk; the solid food is washed down only with water, taken from the calabashes.

It will perhaps surprise the reader to hear that the people of Timbuctoo are well up in current European news, and were quite ready to converse with Dr Lenz on the results of the last Russian war. His contemplated visit to Timbuctoo was also known there before he had yet crossed the *Atlas Mountains*. There are

schools attached to the mosques; and the great majority of the inhabitants can read and write, know large parts of the Koran by heart, and are able to dispute on it.

A HOUSE DIVIDED AGAINST ITSELF.

CHAPTER XLV.

'I FOUND him in the mood; so I thought it best to strike while the iron was hot,' Constance said. She had settled down languidly in a favourite corner, as if she had never been away. She had looked for the footstool where she knew it was to be found, and arranged the cushion as she liked it. Frances had never made herself so much at home as Constance did at once. She looked on with a calm amusement while her aunt poured out her delight, her wonder, her satisfaction in Waring's ears. She did not budge herself from her comfortable place; but she said to Frances in an under-tone: 'Don't let her go on too long. She will bore him, you know; and then he will repent. And I don't want him to repent.'

As for Frances, she saw the ground cut away entirely from under her feet, and stood sick and giddy after the first pleasure of seeing her father was over, feeling her hopes all tumble about her. Mrs Cavendish, who had been so near yielding, so much disposed to give her the help she wanted, had forgotten her petition and her altogether in the unexpected delight of seeing her brother. And here was Constance, the sight of whom perhaps might call the sick man out of his fever, who might restore life and everything, even happiness to him, if she would. But would she? Frances asked herself. Most likely, she would do nothing, and there would be no longer any room left for Frances, who was ready to do all. She would have been more than mortal if she had not looked with a certain bitterness at this new and wonderful aspect of affairs.

'I saw mamma's brougham at the door,' Constance said. 'There you must take me. Of course, this was the place for papa to come; but I must go. It would never do to let mamma think me devoid of feeling. How is she, and Markham—and everybody? I have scarcely had any news for three months. We met Algy Muncastle on the boat, and he told us something—a great deal about Nelly Winterbourn—the widow, as they call her—and about you.'

'There could be nothing to say of me.'

'Oh, but there was, though.—What a sly little thing you are, never to say a word!—Sir Thomas.—Ah, you see, I know. And I congratulate you with all my heart, Pam. He is rolling in money, and such a good kind old man. Why, he was a lover of mamma's *dans les temps*. It is delightful to think of you consoling him. And you will be as rich as a little princess, and mamma to see that all the settlements are right.'

'I don't know what you mean,' Frances said abruptly. She was so preoccupied and so impatient that she would not even allow herself to understand. She went to where her father sat talking to his sister, and stood behind his chair, putting her hand upon his arm. He did not

perhaps care for her very much. He had aunt Charlotte to think of, from whom he had been separated so long; and Constance, no doubt, had made him her own too, as she had made everybody else her own; but still he was all that Frances had, the nearest, the one that belonged to her most. To touch him like this gave her a little consolation. And he turned round and smiled at her and put his hand upon hers. This was a little comfort, but it did not last long. It was time she should return to her mother; and Constance was anxious to go, notwithstanding her fear that her father would be bored. 'I must go and see my mother, you know, papa. It would be very disrespectful not to go. And you won't want me, now you have got aunt Charlotte. Frances is going to drive me home.' She said this as if it was her sister's desire to go; but as a matter of fact, she had taken the command at once. Frances, reluctant beyond measure to return to the house, in which she felt she would no longer be wanted—which was a perverse imagination, born of her unhappiness—wretched to lose the prospect of help, which she had been beginning to let herself believe in, was yet too shy and too miserable to make any resistance. She remembered her mother's note for Mr Cavendish before she went away, and she made one last appeal to her aunt. 'You will not forget what we were talking about, aunt Charlotte?'

'Dear me,' said Mrs Cavendish, putting up her hand to her head. 'What was it, Frances? I have such a poor memory; and your father's coming, and all this unexpected happiness, have driven everything else away.'

Frances went down-stairs with a heart so heavy that it seemed to be dead in her breast. Was there no help for her, then? No help for him, the victim of Constance and of Markham, no way of softening calamity to the old people? Her temper rose as her hopes fell. All so rich, so abounding, but no one who would spare anything out of his superfluity, to help the ruined and heartbroken. O yes, she said to herself in not unnatural bitterness, the hospitals, yes; and Trotter's Buildings in Whitechapel. But for the people to whom they were bound so much more closely, the man who had sat at their tables, whom they had received and made miserable, nothing! oh, nothing! not a finger held out to save him. The little countenance that had been like a summer day, so innocent and fresh and candid, was clouded over. Pride prevented—pride, more effectual than any other defence—the outburst which in other circumstances would have relieved her heart. She sat in her corner, withdrawn as far as possible from Constance, listening dully, making little response. After several questions, her sister turned upon her with a surprise which was natural too.

'What is the matter?' she said. 'You don't talk as you used to do. Is it town that has spoiled you? Do you think I will interfere with you? Oh, you need not be at all afraid. I have enough of my own without meddling with you.'

'I don't know what I have that you could interfere with,' said Frances. 'Nothing here.'

'Do you want to quarrel with me?' Constance said.

'It is of no use to quarrel; there is nothing to quarrel about. I might have thought you would interfere when you came first. I had people there who seemed to belong to me. But here—you have the first place. Why should I quarrel? You are only coming back to your own.'

'Fan, for goodness' sake, don't speak in that dreadful tone. What have I done? If you think papa likes me best, you are mistaken. And as for the mother, don't you know her yet? Don't you know that she is nice to everybody, and cares neither for you nor me?'

'No,' cried Frances, raising herself bolt upright; 'I don't know that! How dare you say it, you who are her child? Perhaps you think no one cares—not one, though you have made an end of my home. Did you hear about George Gaunt, what you have done to him? He is lying in a brain-fever, raving, raving, talking for ever, day and night, and if he dies, Markham and you will have killed him—you and Markham, for you have been the worst. It will be murder, and you should be killed for it!' the girl cried. Her eyes blazed upon her sister in the close inclosure of the little brougham. 'You thought he did not care, either, perhaps?'

'Fan! Good heavens! I think you must be going out of your senses,' Constance cried.

Frances was not able to say any more. She was stilled by the commotion of her feelings, her heart beating so wildly in her breast, her emotion reaching the intolerable. The brougham stopped, and she sprang out and ran into the house, hurrying up-stairs to her own room. Constance, more surprised and disconcerted than she could say, came in with an air of great composure, saying a word in passing to the astonished servant at the door. She was quite amiable always to the people about her. She walked up-stairs, remarking, as she passed, a pair of new vases with palms in them, which decorated the staircase, and which she approved. She opened the drawing-room door in her pretty, languid-stately, always leisurely way.

'How are you, mamma? Frances has run up-stairs; but here am I, just come back,' she said.

Lady Markham rose from her seat with a little scream of astonishment. 'CONSTANCE! It is not possible. Who would have dreamed of seeing you!' she cried.

'O yes, it is quite possible,' said Constance when they had kissed, with a prolonged encounter of lips and cheeks. 'Surely, you did not think I could keep very long away?'

'My darling! did you get home-sick, or mammy-sick as Markham says, after all your philosophy?'

'I am so glad to see you, mamma, and looking so well. No, not home-sick, precisely, dear mother, but penetrated with the folly of staying there, where nothing was ever doing, when I might have been in the centre of everything, which is saying much the same thing, though in different words.'

'In very different words,' said Lady Markham, resuming her seat with a smile. 'I see you have not changed at all, Con—Will you have any tea? And did you leave—your home there— with as little ceremony as you left me?'

'May I help myself, mamma? Don't you trouble. It is very nice to see your pretty china, instead of Frances' old bizarre cups, which were much too good for me.—Oh, I did not leave my home. I—brought it back with me.'

'You brought—?'

'My father with me, mamma.'

'Oh!' Lady Markham said. She was too much astonished to say more.

'Perhaps it was because he got very tired of me, and thought there was no other way of getting rid of me; perhaps because he was tired of it himself. He came at last like a lamb. I did not really believe it till we were on the boat, and Algy Munceastle turned up, and I introduced him to my father. You should have seen how he staid.'

'Oh!' said Lady Markham again; and then she added faintly, 'Is—is he here?'

'You mean papa? I left him at aunt Charlotte's. In the circumstances, that seemed the best thing to do.'

Lady Markham leaned back in her chair; she had become very pale. One shock after another had reduced her strength. She closed her eyes while Constance very comfortably sipped her tea. It was not possible that she could have dreamed it or imagined it, when, on opening her eyes again, she saw Constance sitting by the tea-table with the plate of bread and butter before her. 'I have really,' she explained seriously, 'eaten nothing to-day.'

Frances, came down some time after, having bathed her eyes and smoothed her hair. It was always smooth like satin, shining in the light. She came in, in her most reserved way, ashamed of herself for her outburst of temper, and determined to be 'good,' whatever might happen. She was surprised that there was no conversation going on. Constance sat in a chair which Frances at once recognised as having been hers from the beginning of time, wondering at her own audacity in having sat in it, when she did not know. Lady Markham was still leaning back in her chair. 'Oh, it's nothing—only a little giddiness. So many strange things are happening. Did you give your uncle Cavendish my note? I suppose Frances told you, Con, how we have been upset to-day?'

'Upset,' said Constance over her bread and butter. 'I should have thought you would have been immensely pleased. It is about Sir Thomas, I suppose?'

'About Sir Thomas? Is there any news about Sir Thomas?' said Lady Markham with an elaborate innocent look. 'If so, it has not been yet confided to me.' And then she proceeded to tell to her daughter the story of Nelly Winterbourn.

'I should have thought that would all have been set right in the settlements,' Constance said.

'So it ought. But she had no one to see to the settlements—no one with a real interest in it; and it was such a magnificent match.'

'No better than Sir Thomas, mamma.'

'Ah, Sir Thomas. Is there really a story about Sir Thomas? I can only say, if it is so, that he has never confided it to me.'

'I hope no mistake will be made about the settlements in that case. And what do you suppose Markham will do?'

'What can he do? He will do nothing, Con. You know, after all, that is the rôle that suits him best. Even if all had been well, unless Nelly had asked him herself?—

'Do you think she would have minded, after all this time? But I suppose there's an end of Nelly now? Constance said regretfully.

'I am afraid so,' Lady Markham replied. And then recovering, she began to tell her daughter the news, all the news of this one and the other, which Frances had never been able to understand, which Constance entered into as one to the manner born. They left the subject of Nelly Winterbourn, and not a word was said of young Gaunt and his fever; but apart from the subjects, everything that had happened since Constance left England was discussed between them. They talked and smiled and rippled over into laughter, and passed in review the thou and friends, whose little follies and freaks both knew, and skimmed across the surface of tragedies with a consciousness that gave pungency to the amusement of the terrible depths beneath. Frances, keeping behind, not willing to show her troubled countenance, from which the traces of tears were not easily effaced, listened to this light talk with a wonder which almost reached the height of awe. Her mother at least must have many grave matters in her mind; and even on Constance, the consciousness of having stirred up all the quiescent evils in the family history, of her father in England, of the meeting which must take place between the husband and wife so long parted, all by her influence, must have a certain weight. But there they sat and talked and laughed and shot their little shafts of wit. Frances, at last feeling her heart ache too much for further repression, and that the pleasant interchange between her mother and sister exasperated instead of lightening her burdened soul, left them, and sought refuge in her room, where presently she heard their voices again as they came upstairs to dress. Constance's boxes had in the meantime arrived from the railway, and the conversation was very animated upon fashions and new adaptations and what to wear. Then the door of Constance's room was closed, and Lady Markham came tapping at that of Frances. She took the girl into her arms. 'Now,' she said, 'my dream is going to be realised, and I shall have my two girls, one on each side of me. My little Frances, are you not glad?'

'Mother,' the girl said, faltering, and stopped, not able to say any more.

Lady Markham kissed her tenderly, and smiled, as if she were content. 'Was she content? Was the happiness, now she had it, as great as she said? Was she able to be light-hearted with all these complications round her? But to these questions, who could give any answer? Presently she went to dress, shutting the door, and between her two girls, retired so many hundred, so many thousand miles away, who could tell? into herself.

In the evening, there was considerable stir and commotion in the house. Markham, warned by one of his mother's notes, came to dinner full of affectionate pleasure in Con's return, and cheerful inquiries for her. 'As yet, you have lost nothing, Con. As yet, nobody has got well into the swim. As to how the mammy

will feel with two daughters to take about, that is a mystery. If we had known, we'd have shut up little Fan in the nursery for a year more.'

'It is I that should be sent to the nursery,' said Constance. 'Three months is a long time. Algy Muncastle thought I was dead and buried. He looked at me as if he were seeing a ghost.'

'A girl might just as well be dead and buried as let half the season slip over and never appear.'

'Unless she were a widow,' said Con.

'Ah! unless she were a widow, as you say. That changes the face of affairs.' Markham made a slight involuntary retreat, when he received that blow, but no one mentioned the name of Nelly Winterbourn. It was much too serious to be taken any notice of now. In the brightness of Lady Markham's drawing-room, with all its softened lights, grave subjects were only discussed *à-la-tête*. When the company was more than two, everything took a sportive turn. Of the two visitors, however, who came in later, one was not at all disposed to follow this rule. Sir Thomas said but little to Constance, though her arrival was part of the news, which had brought him here; but he held Lady Markham's hand with an anxious look into her eyes, and as soon as he could, drew Frances aside to the distant corner in which she was fond of placing herself. 'Do you know he has come?' he cried.

'I have seen papa, Sir Thomas, if that is what you mean.'

'What else could I mean?' said Sir Thomas. 'You know how I have tried for this—What did he say? I want to know what disposition he is in. And what disposition is *she* in? Frances, you and I have a great deal to do. We have the ball at our feet. There is nobody acting in both their interests but you and I.'

There was something in Frances's eyes and in her look of mute endurance which startled him even in the midst of his enthusiasm. 'What is the matter?' he said. 'I have not forgotten our bargain. I will do much for you, if you will work for me. And you want something. Come, tell me what it is.'

She gave him a look of reproach. Had he, too, forgotten the sick and miserable, the sufferer, of whom no one thought? 'Sir Thomas,' she said, 'Constance has money; she has stopped at Paris to buy dresses. Oh, give me what is my share.'

'I remember now,' he said.

'Then you know the only thing that any one can do for me. Oh, Sir Thomas, if you could but give it me now.'

'Shall I speak to your father?' he asked.

These words Markham heard, by chance, as he passed them to fetch something his mother wanted. He returned to where she sat with a curious look in his little twinkling eyes. 'What is Sir Thomas after? Do you know what that silly story is about? They say that old fellow is after Lady Markham's daughter. It had better be put a stop to, mother. I won't have anything go amiss with little Fan.'

'Go amiss! with Sir Thomas. There is nobody he might not marry, Markham—not that anything has ever been said.'

'Let him have anybody he please except little Fan. I won't have anybody happen to Fan. She is not one that would stand it, like the rest of us. We are old stagers; we are trained for the stake; we know how to grin and bear it. But that little thing, she has never been brought up to it, and it would kill her. I won't have anything go wrong with little Fan.'

'There is nothing wrong with Frances. You are not taking away your usual sense, Markham. If that was coming, Frances would be a lucky girl.'

Markham looked at her with his eyes all pured up, nearly disappearing in the puckers round them. 'Mother,' he said, 'we know a girl who was a very lucky girl, you and I. Remember Nelly Winterbourn.'

It gave Lady Markham a shock to hear Nelly's name. 'O Markham, the less we say of her the better,' she cried.

There was another arrival while they talked—Claude Ramsay, with the flower in his coat a little rubbed by the greatcoat which he had taken off in the hall, though it was now June. 'I heard you had come back,' he said, dropping languidly into a chair by Constance. 'I thought I would come and see if it was true.'

'You see it is quite true.'

'Yes; and you are looking as well as possible. Everything seems to agree with you. Do you know I was very nearly going out to that little place in the Riviera? I got all the *reservations*, but then I heard that it got hot and the people went away.'

'You ought to have come. Don't you know it is at the back of the east wind, and there are no draughts there.'

'What an ideal place!' said Claude. 'I shall certainly go next winter, if you are going to be there.'

THE BANNATYNE CLUB.

THIS celebrated literary book-club was instituted in Edinburgh in the year 1823, its object being the selection and printing of rare and valuable historical and literary documents and works relating to Scottish affairs and antiquities. Many curious literary gems, consisting of unique manuscripts, chartularies of monastic and religious houses, early records, old Scottish poetry, memoirs, letters, diaries, &c., together with other scarce literature relating to Scottish matters, were known to be hidden away in family chests, in private repositories, and libraries, which, if properly catalogued, would afford important and profitable information on historical and other subjects, but, as then existing, were practically unattainable. Some years previously the Bannatyne Club had been formed in London, having the same objects in view; but its attention had been entirely confined to the printing of scarce old tracts or ballads relating to England; and a desire was frequently expressed by literary men for the formation of a similar club in Scotland. The prime mover in originating this proposed club was Sir Walter Scott, who, at the period referred to, was the centre of a celebrated literary circle in Edinburgh. The leading members of this circle

were well-known bibliophiles, who had devoted much time and attention to literary matters and to book-collecting. There were Thomas Thomson, advocate, 'the learned, legal, and constitutional antiquary,' David Laing, the eminent Scottish archaeologist, who from the formation of the club to its close discharged the arduous duties of honorary secretary; Robert Pitcairn, W.S.; Henry Cockburn, John Clerk, Dr John Lee, James Macdunn, advocate, Robert Dundas of Arncliffe, Archibald Constable, Patrick Fraser Tytler, and many other bibliographers and scholars, who rendered great service in starting and promoting the new club.

Considerable difficulty was at first experienced in the choice of a name for the club, and amongst those at first suggested was that of the Abbotsford; but Sir Walter 'most nobly' declined such a distinction. In a letter written to Dr Diklin by Sir Walter Scott, two days previous to the inauguration of the club, the following passage occurs: 'It will not be necessary for you to know that a fraternity is about to be established here something on the plan of the Roxburgh Club, but having Scottish antiquities chiefly in view. It is to be called the Bannatyne Club, from the celebrated George Bannatyne, who compiled by far the greatest manuscript record of old Scottish poetry.'

George Bannatyne, whose name was chosen for this the first literary book-club in Scotland, was born in the year 1515, his father being a writer in Edinburgh. George was engaged in mercantile business, and seems to have been an ardent admirer of old Scottish poetry. He even wrote verses himself; but his celebrated collection of ancient poetry is the work on which his fame rests, and for the inheritance of which his posterity ought ever to feel grateful. The circumstances under which the work was completed were somewhat remarkable. In September 1568, the plague, which then occasionally visited Scotland, broke out in Edinburgh, causing terror and alarm, and sweeping away large numbers of the population. Bannatyne, at this time only twenty-two years of age, in order if possible to avoid the plague, retired into seclusion to await its departure, but whether in Edinburgh or elsewhere has not been ascertained. To utilise his time to advantage, he had resolved to make a compilation of the old poetry of Scotland; and many valuable relics of past times were by this means saved to posterity, the manuscript transcripts being now in the Advocates' Library, Edinburgh.

The Bannatyne manuscript became a family heirloom, and as such, was held by several generations of the compiler's descendants. It was borrowed by Allan Ramsay for the purpose of selecting from its pages materials for his collection known as the *Literary Miscellany*, published in 1724; and Lord Hailes also published a small volume containing some of its treasures in 1770. Two years later, by the liberality of the third Lord Hyndford, it was finally deposited in the Advocates' Library. The volumes have since been used by numerous compilers for the purpose of making extracts, and the whole has lately been carefully transcribed and printed for the members of the Hunterian Club, an institution formed in Glasgow several years ago.

The Bannatyne Club was formed on February 15, 1823. Sir Walter Scott was its first president, and continued to occupy that office till his death in 1832. Following the plan of the Roxburgh Club, the membership was limited to thirty-one, with an annual subscription of four guineas. In course of time, however, applications for admission became so numerous that the number of members was gradually increased to one hundred, the subscription being raised to five guineas. It was arranged that the paper to be used for the books printed for the club should be made from private moulds, having an appropriate device or water-mark, by which these works could be identified.

The club pursued its labours till the year 1861, when it was brought to a termination, after having produced one hundred and sixteen works of various kinds, forming upwards of one hundred and sixty volumes. These works, issued in quarto size, were carefully and ably edited, and many were compiled with great difficulty from unique manuscripts, requiring much patience and skill in transcribing. The collection includes chartularies of the abbeys of St Andrews, Kelso, Melrose, Dunfermline, Brechin, Moray, Dryburgh, Aberbrothock, Inchaffery, &c., all being of vast interest, as affording rich historical information and excellent materials for illustrating ancient laws and national usages, names and pedigrees of old families, transmission of land, habits, and modes of life, &c. A brief reference to some of the principal works issued by the Club will at once show the nature of the whole series, and the practical value of such an institution.

The Raynmar Rolls (a term of uncertain origin) are the rolls or records of homage done by the Scottish nobility to King Edward I. in 1296. This volume has been transcribed from the original records and documents preserved in the chapter-house at Westminster and in the Tower of London, and contains the largest and most authentic enumeration of the nobility, barons, landholders, and burgesses, as well as clergy, prior to the fifteenth century.

The Discoverie and Historie of the Gold Mines in Scotland, 1619, a most singular work, which furnishes a complete and instructive history of the mining schemes which agitated the whole of Scotland in the sixteenth and seventeenth centuries.

The Black Book of Taymouth, a reproduction of 'a curious genealogical history compiled in 1598 by Mr William Bowie, and dedicated to Sir Duncan Campbell, ninth Lord of Glenulphay,' together with bonds of manrent, inventories, extracts from courtbooks, muster rolls, and original letters, from the year 1570 to 1619.

Pitcairn's *Criminal Trials*, a remarkable work, compiled from original ancient records and manuscripts, embracing an extraordinary variety of cases which engaged the attention of the Scottish tribunals from 1488 to 1624. These are illustrated by valuable historical notes, and reveal many curious pictures of the national customs, habits, and superstitions of bygone times.

The Darien Papers, being a selection of original letters and official documents relating to the establishment of a colony at Darien by the Company of Scotland trading to Africa and the

Indies, 1695-1700. The work contains a plan of the harbour at the Isthmus of Darien, and facsimile of signatures, &c.

Collection of Ancient Scottish Prophecies, in alliterative verse, a remarkably curious work, reprinted from the rare edition of 1603.

The Regalia of Scotland, a collection of interesting papers connected therewith, from 1621 to 1818.

Such are but a few specimens of the literary gems which by means of the Bannatyne Club were drawn from obscurity. Many others equally valuable and interesting might be quoted, including the famous volume of *Etchings* by Lord Eldon; and many fine specimens of rare old Scottish poetry. The portraits, engravings, and fac-similes of plans and manuscripts, illustrating many of these works, add greatly to their value as records of Scottish history and literature.

Lord Cockburn took a lively interest in the Bannatyne Club from its beginning, and in his interesting *Memoirs of his Time*, under date December 1832, thus writes regarding it: 'It has now one hundred members, paying five guineas yearly, many of them having besides contributed costly volumes; and there is as much canvassing for admission into it as for a return to parliament.'

It may be mentioned that complete sets of the books are now almost unobtainable. Only small numbers of the earlier issues were printed to supply the then limited membership, and these seldom occur for sale except when some well-known library is dispersed. Some of the public libraries, however, have managed to acquire sets more or less complete.

AT TREVENNA COTTAGE.

A STORY IN EIGHT CHAPTERS. — CHAP. II.

As Captain Avory made it a special request that Dr Mayfield should attend Mr Saverne's funeral, that gentleman consented to do so. He and the captain, together with a certain Mr Kerrison, a lawyer from Exeter, whom the doctor now met for the first time, were the only followers. But when they entered the church, they found there a tall black-veiled figure, whom Dr Mayfield had no difficulty in recognising as Mrs Preedy. She had taken a lodging in the town, and had there awaited the day of the funeral. When the captain's eyes fell on her, he gave vent to a half-smothered exclamation of annoyance. She followed the body to the grave, walking a little apart from the others; and just as the coffin was being lowered, she placed on it a beautiful wreath of exotics, which she produced from under her long black cloak. They left her standing, veiled and motionless, by the side of the grave, when they turned to depart.

Luncheon was laid at the Cottage when they got back; and after that, as Captain Avory wished it so, Dr Mayfield agreed to wait and hear the reading of the will.

'It was a great surprise to me to hear that poor Saverne was dead,' remarked Mr Kerrison

during an absence of the captain from the room.

• 'Did you not know that he was ill?' queried the doctor.

'I was not even aware that he had returned from Australia.—You must know,' added the lawyer, 'that he and I were very intimate many years ago; in fact, I acted the part of best-man at his wedding.'

'I never heard that Mr Saverne had been married.'

'Oh, but he had been, and to a very charming woman. It was the loss of her and of his child—he had only one—a few months afterwards, that drove him abroad. Although I never heard from him after he went away, I certainly thought he would not return to England without communicating the fact to me, more especially as his will was drawn up by me, and has been in my keeping ever since he left home, a dozen years ago.'

'A man in his state of health might well be excused many things.'

'Edward Saverne, as I remember him, was one of the most unlikely of men to die of any pulmonary complaint. But of course one can't foretell these things.'

At this juncture the captain returned. Lunch over, they adjourned to the drawing room to hear the will read. Here they were joined by Mrs Avory. The reading of the will did not occupy many minutes. It was a very simple document. By it the testator bequeathed everything of which he might die possessed to his cousin, Lucius Avory. The 'everything,' it now appeared, resolved itself into a policy of insurance on the testator's life for the sum of five thousand pounds.

'Poor dear Edward does not seem to have made much headway in the colonies,' remarked the captain as the lawyer refolded the document. 'He had only a matter of between three and four hundred pounds when he got back home; and what with keeping up the premium on the policy and the expenses of his illness, I fancy a twenty-pound note would about cover the balance now standing in his name at the bank.'

'While he was abroad, he remitted the money to you, did he not, for payment of the premium?' asked Mr Kerrison.

'He remitted it to his bankers in London, and they remitted it to me. I used to receive a draft every midsummer and Christmas as regularly as the time of payment came round; and just as regularly, till he returned to England, the insurance Company's receipt was forwarded by me to Australia.'

'Ah, poor fellow,' remarked Kerrison, 'he little thought when he insured his life for so large a sum, that both wife and child would so soon be taken from him!'

Captain Avory shrugged his shoulders, but did not reply.

'By the way,' said the lawyer as he was putting on his overcoat in the hall, 'who was that tall veiled woman who had a wreath on our poor friend's coffin this morning?'

'Some distant relative of his wife, I fancy,' answered the captain in his off-hand way. 'She

came once or twice to see Edward during his illness, but I never rightly understood the nature of the link between them.'

What could be Captain Avory's motive in making for the second time so deliberate a misstatement of fact? It was a question which the more Dr Mayfield pondered over, the less probability there seemed of his being able to answer it.

A few days later, Captain Avory called upon the doctor. He intended starting for London the following morning, where he had an appointment with Mr Kerrison; and he wanted a copy of the certificate of his cousin's death, in order to lodge the same with the insurance Company. The document in question was duly supplied him.

About a fortnight later, Dr Mayfield was waited upon by a stranger, who announced himself as Mr Muncester, from the Stork Insurance Office, London, adding that his object in calling was to make a few inquiries respecting the illness and death of the late Mr Edward Saverne. He was a gentlemanly, shrewd-looking man; and Dr Mayfield told him that he should be pleased to answer to the best of his ability any questions he might think fit to put to him.

He thanked the doctor, and then, having produced his note-book, he said 'Mr Saverne was insured in our office for the sum of five thousand pounds. Whenever a heavy policy falls in, we make it a point to satisfy ourselves by personal inquiries, as far as it is possible to do so, that the claim amounting upon us is a genuine one, and that we are not being made the victims of a fraud.'

'A very laudable precaution on your part,' replied the doctor blandly.

'This document was, I presume, made out by you?' said Mr Muncester, producing the certificate that had been given to Avory.

'It was.'

'How long had you professionally attended Mr Saverne at the time of his death?'

'Ever since his arrival at Boscombe, seven months ago.'

'Then, he was ill when he came here?'

'At my first interview with him I saw that he was a doomed man.'

'Mr Saverne, I presume, came here ostensibly for the benefit of his health. From what place did he come?'

'That is more than I can tell you. Both he and Captain Avory spoke vaguely of having come from some place in the north, but beyond that I know nothing.'

'Can you give me any idea as to the date of Mr Saverne's arrival in England from Australia?'

'That also is a point respecting which I am altogether ignorant.'

'I presume that Mr Saverne resided under the same roof with the Avorys from the time of their arrival here up to his death?'

'He did. They all lived together at Trevenna Cottage.'

'And their treatment of Mr Saverne was uniformly kind, and all that the circumstances of the case necessitated?'

'It was. Mrs Avory nearly wore herself out in nursing Mr Saverne.'

'By the way, Dr Mayfield, can you tell me who Captain Avory really is?'

'I know no more than the man in the moon.' 'I ask because we can't find his name in any Army List either of recent date or as far back as a dozen years ago, and he hardly looks like a naval man.'

'There are no suspicious features in the case, I trust; nothing to lead you to doubt the bona fides of the claim?' remarked the doctor presently.

'Nothing tangible, certainly; and yet I cannot say that our directory are altogether satisfied. I have had an interview with Mr Kerrison, the lawyer who had the custody of the will for so many years. It seems somewhat singular, considering on what intimate terms he and the testator appear to have been in former times, that he should have been left in ignorance of the latter's return to England. Then, again, when Captain Avory was asked the name of the vessel by which his cousin returned, he declared at once his inability to supply it. His statement was that Mr Saverne had come home quite unexpectedly, and had followed him and his wife to Buxton, at which place they were staying for a short time. When asked the name of the hotel or boarding-house at which Mr Saverne joined him and his wife, in order that we might endeavour to trace that gentleman's name in the visitors' list, he stood upon his dignity, as if his honour had been impugned, and positively declined to afford us any further information in the matter; neither would he furnish us with the name and address of the medical practitioner who attended his cousin previously to his coming under your care. There the matter rests for the present. The captain is pressing for an early settlement of his claim; but, as I said before, we are not quite satisfied, and five thousand pounds is a large sum of money. All this, of course, I tell you in the strictest confidence.'

Dr Mayfield shook his head. He had answered Mr Muncester's questions to the best of his ability, and did not see his way to assist him further. It seemed to him that the insurance Company were unduly and needlessly suspicious in the affair. What more natural than that a man in Captain Avory's position should lose his temper and refuse to answer a lot of questions which, while apparently trivial in themselves, were in reality little better than an insult when put to any one who retained a grain of self-respect? Such questions, in fact, were nothing less than an implication of fraud, and the captain was quite justified in resenting them.

Such were some of the thoughts that passed through the worthy doctor's mind as he sat gazing at Mr Muncester through his spectacles, while the latter made a few entries in his notebook.

Presently Mr Muncester put away his book with something of the air of a man who has come on a bootless errand, and then, after a little talk on ordinary topics, he proceeded to take his leave.

About three weeks had elapsed, and Dr Mayfield had ceased to think of the matter, when one day, as he was turning over the contents of his desk, he accidentally came across the

scrap of paper which Mrs Preedy had slipped into his hand when she begged of him to summon her by telegraph in time to enable her to be by her brother's side during his last moments. The sight of this paper set the doctor thinking, and caused him to ask himself again the question which he had asked several times previously: In what way was it possible to reconcile Mrs Preedy's statement that Mr Saverne was her brother with Captain Avory's statement that the relationship between them was of the most distant kind? The more the doctor puzzled over this problem the more uneasy and disquieted he became.

'What a pity it is,' he murmured, 'that I did not think about all this when Mr Muncester was here! There may be something in it, or there may be nothing. If Captain Avory's claim on the insurance Company is a genuine one, no harm could possibly have come of my speaking out; while, on the other hand, if there is anything fraudulent in connection with it, the more light that can be thrown on the transaction the better.'

Presently he called to mind that it only wanted about a week to his birthday, an anniversary which he always made a point of keeping with his sister in London; and he then and there resolved to start for town at once, where he would call on Mr Muncester and tell him all about the episode of Mr. Preedy, leaving him to act on the information in whatever way he might deem advisable. Next day, Dr Mayfield walked into the palatial offices of the Stock Insurance Company and asked to see that gentle-
man.

'What you have just told me is singular—very singular,' remarked Mr Muncester to his visitor, when the latter had brought his narrative to a close. 'And I am more obliged to you than I can say; only, I do so wish that I had known of this a little earlier. The fact is, a letter was posted to Captain Avory only three hours ago, in which he was informed that the Board had now sanctioned the settlement of his claim, and that a cheque for five thousand pounds would be waiting his acceptance here at noon on Wednesday next.'

'I am glad of that,' exclaimed the doctor with an air of relief. 'I felt sure all along that it would be so.' 'I turn out right in the end.'

Mr Muncester laughed a silent laugh. 'I am by no means so sure on that point as I was half an hour ago,' he said.

The doctor's face fell. 'You don't mean to say that what I have just told you?'—he began, and then he stopped abruptly.

'My dear sir, I don't mean to say anything at present, except this: that it is just possible that what you have now told me may serve to throw an unexpected ray of light on certain phases of the affair we have been discussing, which so far have remained in obscurity. Your information may prove valuable, or it may prove of no value whatever. In any case, I mean at once to put it to the proof.'

'May I ask what it is that you purpose doing?'

'What I purpose is, to go down to Stoneclands and hunt up Mrs Preedy.' As he spoke, he consulted a Bradshaw for a few moments, and

then glanced at the clock. 'I find there is a train from St Pancras in an hour and a half, which is timed to reach Stonehenge at ten A.M. That is the train by which I shall travel.'

• OXFORD PASS SCHOOLS.

(SMALLS.)

IN a great number of modern novels, we read—it is incidentally mentioned—that the hero, if an Oxford man, has not 'a Double First'; if a Cantab, that he was, of course, 'Senior Wrangler,' but the 'Double First' is the usual distinction, perhaps because the words are more euphonious. Probably, if all the peers and peeresses, descended from 'families founded at the Conquest' and endowed with vast estates, who appear in English fiction, had really existed, England would have had to grow to the size at least of Australia to accommodate them; and similarly, if the names of all the 'Double Firsts' who are mentioned by authors had really figured in the class lists, these latter would have swelled to dimensions which might well have astonished college tutors and made examiner despair.

But, in point of fact, 'a Double First' is not quite so common, or so easily obtained, as novelists would lead people to believe. Moreover, author—and more especially authoress—seem often to entertain very vague and hazy ideas both as to what 'a Double First' may be, and also as to how it is to be achieved. It is noticeable that a 'hero' scarcely ever gets a 'First'; he is never content with anything less than the 'Double.'

The old 'Double First' meant a first class 'in Latin, Humanioribus' (old languages) and in Mathematics, which were once the chief subjects of Honour Schools. But that is long ago. There are now, in addition to these, four other schools—Theology, Modern History, Jurisprudence, and Natural Science; while this last is again divided into three—Physics, Chemistry, and Biology. Novelists would therefore—it is humbly suggested—do well if, for the future, they would be kind enough to specify in which of these divisions their hero took his 'Double First,' and not leave their readers in doubt whether they are to consider him a classical and mathematical, or a theological and modern-historical, or a natural science man, especially as the characteristics of those who have taken their degrees in these different schools are usually very distinct.

The object of this article is to treat not of Honour Schools, but of Pass Schools. Let us begin, then, in company with the 'Fresher,' at his first 'varsity exam,' Responsions, better known as 'Small's.' This ordeal is generally undergone by the freshman in his first term. If he fails to pass, he probably has another and yet another 'shot'; for though the regulations of each college vary in strictness, yet the general rule is that undergraduates must pass Small's by the end of their first, and Mods (Moderations) by the end of their second year; while, as the former alone amidst Oxford examinations—renews three times each year, it follows that at most colleges people have a threefold chance.

The first indispensable requisite is to go through the solemn ceremony of 'putting your name down.' This process consists—unless your college tutors undertake to do the business for you—in writing up the hall of the institution, of which the proctor is a member, to the high table where he awaits the herd of undergraduates. He is assisted by a pro-proctor, and also by those faithful myrmidons called 'Buildings.' Here is to be heard the monotonous clunk of the sovereigns as they fall one by one into the soup-plate which forms their usual receptacle, while the neophyte humbly presents his 'metric paper'—that is, his certificate of matriculation—and the form on which he has had to write a list of his subjects. The extent of choice accorded, in this the first fiery furnace through which aspirants to an Oxford degree have to pass, is not great. Arithmetic, grammar, and Latin prose are obligatory on all; and in each, one paper is set. Let us imagine, then, these preliminaries over, and the day fixed for the commencement of the examination at length arrived. We will say that it is the First Term, that the day is wet, and that the time is 8.30 A.M. Behold the unhappy wights wending their way towards those dark and dismal buildings, called 'The Schools,' which are to them what the lunaticism was to the sixteenth-century heretic. All the youths are apparelled in addition to the orthodox cap and gown—in black morning-coats and white evening-ties, a fashion which fate, custom, or tradition has ordained.

The doors are opened; and after a few minutes' inevitable confusion, caused by the difficulty each man experiences on the first day of an examination in finding his own table, people settle down to their work, and no sound is to be heard but the rustling of papers and the scratching of pens. It is beautiful to see the joy and labour, as yet undampened by any memory of past defeats, with which the young beginner addresses himself to his task.

How different is the aspect of the 'old hand,' who recognises at once the dreadful fact that he is again upon his trial; and who, after a few vain attempts to cope with the easiest questions before him, abandons himself to the melancholy pleasure of inscribing his name and the date of the impending catastrophe in ink, or with his knife, on the little table at which he sits. These tables become in course of time perfect monuments of agony, and the literature to be found on them is curious and, indeed, probably unique. Deeply scored by the knife, and marked by the pens of the countless generations of victims who have made their wooden surfaces the record of their despair, they furnish a dreadful warning to their present employers of the fate which too probably awaits themselves.

As time advances and the allotted three hours wear to an end, the several aspects of the youths who sit at these tables become even more varied and interesting than those of the tables themselves. You see one gentleman, who erst with smiling contentment pursued his smooth career (on paper), now, with his pen projecting from between his pallid lips, staring wildly upwards and around, as if seeking in the air for inspiration. Another, while his hand is apparently

paralysed by doubt, has his head bent down, even until his face almost touches the printed questions which perplex his soul. But by this time the one hundred and eighty precious minutes have almost worn away, and the voice of the presiding examiner falls on the ears of the 'panicking crowd' in sounds of dreadful import: 'I must ask for your papers, gentlemen, in ten minutes.' Simple words apparently; but oh, the thrill which they occasion in the hearts of the hearers!

The gentleman with the paralysed hand immediately regains the use of that member, and commences to write as if he really hoped to overtake Time. The staring youth and the youth with his nose on his paper ply their pens with the same desperate earnestness; while occasionally some hapless being—at the back of the room—whom even the exigencies of the moment fail to inspire with ideas, can be heard to groan aloud.

It should be observed, however, that a Pass School differs from an Honour School in that, while in the latter nearly every one writes to the last moment, in the former, most men have given up their papers and departed before the last horrible instant of inevitable separation arrives. Those who in this case remain are either people insufficiently crammed, or else who have the misfortune to be slow writers. The demand for the papers has generally to be repeated again and again in tones of constantly increasing fierceness, before they are at length rendered up. 'Gentlemen, I must ask for your papers'—'I must have your papers, gentlemen, if you please'—'Gentlemen, I really must have your papers'—'Gentlemen, I must ask you to cease writing.' At last: 'I cannot take your papers, gentlemen, unless they are at once given up.' Even this intimation sometimes fails to take effect upon a stubborn few; and it becomes necessary for the examiner to go round and about the long rows of little tables himself, and perhaps literally with his own hands take the papers from the 'pictures of despair' before him. Next follows a rush back to your college, or your 'diggings,' for lunch; and then once more a gathering at the schools, where the conversation largely consists of prophecies of woe to come. Not one individual in ten ventures to say that he thinks he is 'through.'

But it would be a great mistake to suppose that the tortures of an Oxford Pass-man—or Honourman, either—or, like those of a candidate in an ordinary exam, with his paper-work. On the contrary, when this is finished, there ensues a terrible interval of waiting, more or less protracted according to the place of your name on the alphabetical list, which is followed by a most excruciating species of vivisection, known as *verd vace*. On one side of a long, green-baize-covered table, strewn with books, sit three examiners; while on the other side, facing them, is a student with ashen looks, quivering voice, and unsteady limbs. His mental sufferings are often made more intolerable by the presence of strangers, and even—will it be believed!—of ladies! Yes, the cruelty of Roman maids and matrons, who crowded to the amphitheatre to behold the agonies of striving and dying men, has its parallel in our own times in the callous

indifference to human pain with which fair visitors to Oxford flock to witness the torments of those who are being thus 'put to the question.' They have come to see the sights of the place, and this is one of them. They are heedless of the aggravation of misery their presence brings.

When our friend, having finished his *verd*, or rather having been finished by it, rushes away with despair depicted on his countenance, he still has before him a ghastly period of suspense. Unless he happens to be in the last batch of men taken, he may yet have to wait for days before he at length learns his fate. This is finally ascertained by replying to the 'Clerk of the Schools,' who is to be found therein, and by asking him if he has a *testamur* for Mr So-and-so of So-and-so. It is a duty generally, though by no means invariably, performed by deputy, and the office of the intermediary is frequently a very painful one. Thus, supposing it is asked 'Have you a *testamur* in Smalls for Mr Lastshot of John's?' there ensues an awful pause while the man of destiny, who is quite as well known to most undergraduates as the Martyrs' Memorial, turns over the packet of 'bits of blue' in his hands. 'No, sir' at last comes, in long drawn-out accents; and it forthwith becomes the melancholy task of the sympathising inquirer to repair to the trembling expectant and break to him—as gently as may be the mournful intelligence that he is 'ploughed.' It is worthy of note that, however well assured of this fact the latter may have hitherto professed himself to be, the absolute assurance of it falls upon him with none the less force. On the other hand, if the errand of the messenger employed be crowned with success, he returns at headlong speed, and rushes with a-bounding clamour into the rooms of the favourite of fortune whose *testamur* he has obtained. Other friends probably appear, and there ensues what a newspaper would term 'tumultuous applause'—hurrahing, patting on the back, and vociferous congratulation. If the chance of success has been somewhat critical, he will very possibly celebrate his triumph by giving a 'wine,' a species of conviviality which too often earns a more forcible title.

Such are some of the details attendant upon the operation of 'passing Smalls'; but it should be observed that in one important point the conditions recently existing have undergone alteration. Since Lent Term 1882, the 'new schools' which deform, or adorn, the 'High' have, for examination purposes, begun to replace the old; and those who now seek to compass the first stage towards the attainment of their degree, assemble, not, as of yore, in an open quadrangle, but within the great hall of the modern building. Thence they are admitted into vast chambers, where luxuries unknown to their predecessors await them. For, whereas the introduction into the old schools of any lighting apparatus, or of any system calculated to maintain the vital heat of the human frame, was strictly prohibited, and whereas it was therefore no unwonted sight in winter-time to see ulsters and railway-rugs resorted to in the vain endeavour to keep out the cold, future generations of Oxford-men will be granted the previously unheard-of comfort derived from the functions of hot-water pipes,

and will also not be required, henceforth, to rely for illumination solely on the light of the sun, which, by a little after four p.m. on a winter's day, is usually chiefly conspicuous by its absence.

POOR LITTLE MISS MOONSHÉE.

Picture to yourself a neat little figure, habited in a rustling brown silk gown, point-lace cap and collar, and black mittens; a small elderly lady with mild wandering blue eyes, and a tremulous mouth, whose uncertain glance and shinking manner spoke of some terrible shock sustained by the nervous system in days gone by. Such was Miss Moonshée when I first made her acquaintance.

I was the daughter of a Melbourne merchant, and born and brought up in that city; but at the date of my story (1872), we had removed to Richmond, a suburb of the Victorian capital. A strong active girl of seventeen, I was daily in the habit of walking up to town to attend classes at a school in — Street. During my walk to and from Melbourne, I was more than once struck by the appearance of one of the cottages which I passed. It was a neat little place, painted white, with green veranda posts. The windows which faced the road were full of rare geraniums and ferns; and the trimly kept garden-plot was planted with all manner of fragrant old-fashioned flowers and herbs. It was the lady of the cottage, however, who, even more than her pleasant surroundings, interested me. When the sun shone, she was always to be seen, dressed in the fashion I have already described, seated under the veranda in a low chair busily engaged in netting. Like Penelope's web, her task seemed endless, and she seldom raised her eyes from her work, which engrossed all her attention. An old Irishwoman, who was continually hovering about, either weeding or watering the garden, appeared to be her only domestic; but I was soon to become better acquainted with both lady and servant.

One hot January afternoon I was plodding slowly homewards, my mind full of a certain stiff German exercise required by Herr H—— on the morrow. In my preoccupation, I was in the act of passing the white cottage with the green veranda posts without looking, as I usually did, to see if the old lady was in her accustomed place, when a cry of unmistakable anguish from the interior arrested my steps. To unlatch the garden-gate and hurry up to the front door was the work of a moment. There, however, I paused, undecided whether to knock and offer my services, or retrace my steps. While I hesitated, the door was opened from within, and the old Irishwoman presented herself, beckoning me to enter. Silently I followed her into a prettily furnished sitting-room, bright with pictures, books, and flowers. This much I took in at the first glance; my second rested on the evident cause of the old Irishwoman's distress—the pale inanimate form of her mistress, which lay stretched

on a couch near the window. The poor lady was in a dead-faint, a phase of indisposition sufficiently alarming to her faithful domestic, who, in an agony of tears, asked if it was any use to send for the doctor.

Now, I had had considerable experience in the treatment of fainting-fits, my mother being unfortunately subject to frequent lapses into unconsciousness, from which, acting under the doctor's orders, I had generally been successful in recovering her. I therefore spoke tearfully to old Mally—she had told me her name—and at once set about applying the restoratives to the invalid that I had found so useful on former occasions. In a short time we had the satisfaction of seeing the poor lady open her eyes and fix a bewildered look on her maid, who was on her knees by the couch. Her glance then rested on me with a puzzled expression.

'You have been ill,' I explained gently; 'and Mally and I have been trying to make you better.'

'It is very good of you to take so much trouble with a foolish old woman, my dear,' she replied in a weak voice; and the ghost of a smile flitted over her pallid face.

'Ould and foolish!' indignantly repeated Mally, furtively drying her eyes on her apron, and turning a beaming face towards her mistress. 'Sure, it's joking you are, Miss Kathleen. And what would Master Shane say, did he hear you miscalling his sweet Kerry rose?'

The old Irishwoman's words had a wonderful effect on the invalid. A faint pink flush suffused her cheeks, her eyes shone, so that for the moment she looked almost pretty. The change, however, was but fleeting. The colour quickly faded, her eyes resumed their usual expression; and murmuring something to the effect, that one is always fair to those who love one, she closed her eyes, as if to shut out some disagreeable recollection. Presently, she said, in a low entreating voice: 'Oh, Shane darling, why do you linger? Old age is creeping on, and I am weary of waiting—oh, so weary!' And as she spoke, the tears trickled slowly down her thin cheeks.

I was glad when the entrance of the maid with the tea-things roused her. Desiring Mally to place the tray on a small table beside her, the little lady sat up, and insisted on pouring out a cup of tea for me, apologising, while handing me the bread and butter, for what she called her rudeness. 'I was overcome with old memories, my dear, so I hope you will excuse me.' The tea was strong, and under its stimulating influence my hostess became quite talkative. She told me her name was Kathleen Moonshée; that she was by birth a native of County Kerry, Ireland, but had been for more than thirty years resident in Victoria. 'But I have never quite liked the colony, my dear,' she said in her gentle way; 'and Mally and I would have left it long ago, but for a reason of our own. There is a friend, a very dear friend, who has promised to join us some day soon, it may be to-day; and her eyes brightened. 'I cannot tell for certain, however. But when he does come, we shall all go home together to the cool green Kerry meadows and

its beautiful lakes.—You have heard, I daresay, of the lakes of Killarney?’

I admitted I had read of them, but begged her to describe them, which she did in a rather rambling fashion, stopping frequently to inquire if she were wearying me. At last the clock warned me that it was getting late, and I rose to go.

‘Am I to have the pleasure of seeing you again?’ asked Miss Moonshoe, as she took my proffered hand. ‘Mally and I are not very entertaining; but we should be delighted to see you, if you care to come.’

‘I shall be very pleased to come,’ I replied; and shaking her hand heartily, took my leave, being followed to the gate by the old Irish woman, calling down blessings on my head.

When I told the story of my adventure at home, at the same time declaring my intention of paying Miss Moonshoe an early visit, my father laughed, and patted me on the cheek. ‘Please yourself, Polly,’ he said, ‘but I am inclined to think your new friend is neither more nor less than a harmless lunatic.’

My father’s opinion of Miss Moonshoe did not greatly astonish me. There was decidedly something peculiar about her; but, argued I, that is no reason why I should not fulfil my promise. So it came about that two days later I again found myself in the little lady’s parlour. This visit proved the forerunner of many more, until, from an occasional caller at the white cottage with the green veranda posts, I became the daily visitor and intimate friend of its mistress. I had learned to love poor little Miss Moonshoe with a protecting fondness, such as the young and strong sometimes entertain for the old and weak. Moreover, to me she seemed the embodiment of that old-world refinement, that assertive young colonial as I was, I could thoroughly appreciate. And she clung to me, this gentle Irish lady, looking eagerly for my coming, and following me with wistful glances, when I took my leave. She spoke but seldom of her past, and although alluding at times to her long-expected friend, seemed, on the whole, to prefer drawing me on to talk of my school friends and studies. Then, on a Saturday afternoon, she would warble pensive Irish ballads to her harp, in a wonderfully clear true voice, the sound of which always drew old Mally from the kitchen. I was accustomed on those occasions to sing *The waird o’ the Green* to a piano accompaniment; and when Mally’s national enthusiasm was sufficiently stirred by its irresistible passion and pathos, to dash into a jig, thereby setting the old woman capering like a true daughter of Erin.

Mally invariably apologised to her mistress for ‘shakin’ her legs,’ as she termed the antics she indulged in; then, bestowing an admiring glance on me, usually added insinuatingly: ‘Sure, miss, nobody as hadn’t a drop of the real old blood could lift the tune as you do.’

‘You think she has Kerry blood in her veins, Mally?’ Miss Moonshoe would say with a smile.

‘Sorra a doubt of it; and if Master Shane heard her play *The Rocky Roads to Dublin*, he’d say the same.’

The little lady’s face always reddened at the mention of the foregoing name, and I noticed

that immediately afterwards she became restless, making frequent excursions to the window, from which she returned sighing heavily. I had long ago identified ‘Master Shane’ with the dear friend whose advent she anticipated. ‘Some old lover,’ I said to myself, ‘knocking about the world, but still confidently expected by the faithful heart, that believed in vows long since forgotten by the wanderer.’ Was this how matters stood, or was the much-talked-of friend a phantom of poor little Miss Moonshoe’s weak brain?

I put the question rather abruptly to old Mally one day when engaged in interviewing her parrot in the kitchen. ‘Who is Mr Shane? And do you really expect him?’

The old Irishwoman’s face went as white as the table napkin she was ironing. ‘What put it into your pretty head to ask?’ she inquired coaxingly, but with a suspicious glance.

‘Well, Mally, I have thought more than once that, as the Scotch say, he is lang o’ cumm’.

‘You may well say “lang,” miss,’ returned old Mally tearfully. ‘Tisn’t in this world Miss Kathleen will ever set eyes on him.’

‘You don’t mean to say he is dead!’ I exclaimed.

The old woman nodded mournfully; then asked in a whisper if I were quite sure her mistress was asleep. Yes; I was quite sure; she had dozed off while I was playing one of my simple lullabies; and when I stole from the room, had fallen into a profound slumber.

‘The saints send her dreams of Master Shane,’ proudly ejaculated Mally, who, like her mistress, belonged to the old school, ‘for ‘tis the only comfort she has.’

‘But Mr Shane, who was he?’ I put in eagerly.

‘One of the ould O’Connells, of course. Kins they were before the Conquest, miss, and from first to last an open-handed race. And by reason of that same generosity, Master Shane, when he came of age found, that saving the ould Hall and two hundred acres of bog, sorra a foot of the great estates of his ancestors belonged to him.

—And now, miss, I’ll tell you the whole story, for it’s you deserves to be treated like a friend of the family, so kind you’ve been to my poor lady.’ There was a solemn look on her wrinkled face as she made the promise; and without further preamble, old Mally related her tale, somewhat as follows.

‘Miss Kathleen and Master Shane were cousins, and reared together at the Hall by Miss O’Connell, their aunt, for they were orphans. Fine children they were; and they grew up among the kindly Kerry folks, who loved them for their own sakes, as well as for the good blood that showed itself so plainly in both. For hadn’t Miss Kathleen the bloom of the rose, the eye of the dove, and the sweetest temper in Ireland? And wasn’t Master Shane tall and handsome, with curly black hair, the eye of the hawk, and the bound bearing of the O’Connells? Sure, they were, made for each other, everybody said; and so they seemed to think, the young master being barely one-and-twenty, and his cousin but eighteen when they were betrothed. Wirra! but sorrow was at hand. Miss O’Connell the aunt died; and her income,

that had kept them all comfortable, died with her; so, as I said before, except the odd half-a-bit of wet bog, and a trifle of money in the bank, Master Shane was left penniless. As for Miss Kathleen, her sweet face was her fortune.

"Well, miss, the poor young master was nigh desperate; he couldn't tear himself away from his cousin; and if he married her, there was little but starvation before them. 'Twas no lity hard on the young creature; but the darker things looked, the closer they clung to one another; and however despondent he might be, the master had always a smile for Miss Kathleen; while she, God bless her, loved the very ground he walked on. I had nursed them both, so it was quite natural they should confide in old Mally."

"Och, but it was a black day when Master Shane made up his mind to seek his fortune in Australia. 'Twas young Edward Doyle put it into his head to emigrate. He was the second son of Squire Doyle of Killibeg Castle; and having a bit of money, he thought would make it more by sheep-raising in Victoria. Miss Ellen, his sister, the best of the county, and a great friend of Miss Kathleen's, was wild to go with him; and the long and short of it was, Master Shane, Miss Kathleen, and the two young Doyles made up their minds to try their luck together in the far-away land."

"Sure, 'twas hard to leave Kerry, where I'd been born and reared; but 'twould have been harder to bid good-bye to my darlings; so I up and said I would go with them, if they would but take me. "Of course we'll take you, Mally," says Master Shane in his joking way. "We're four giddy young creatures; and it's a good decent body like yourself we need to keep us in order."

"So it was, 'till I, and before three months had elapsed, we had left old Ireland and sailed for Melbourne in a big emigrant ship. Ah, weary me! but there was sweatheating, gallop aboard. All the gentlemen were head and ears in love with my young ladies. But Miss Kathleen had no eyes save for her cousin; and Miss Ellen flouted them all to their faces, all but a young English officer, who had a smile now and again from her - just to keep up his heart, she said."

"We took close on five months to make the voyage; and pleased all on board were when the anchor was dropped in Hobson's Bay. Melbourne was a small place in the year we landed, more like a village than the great city of to-day. But the young folks were in high spirits, ready to make the best of everything, even the duty inn they were forced to put up at the first night ashore. Next day, the gentlemen hired a small four-roomed cabin, into which we moved, and where the young things were as happy as the day was long. It had been arranged that Miss Kathleen's wedding was not to take place until Master Shane and young Doyle had built their house on the land allotted to them somewhere in the Western District; the ladies remaining in Melbourne under old Mally's cheerful supervision."

"The night before they left, I was cooking the supper in the kitchen, when Master Shane called me into the parlour. The young Doyles were out, and he and Miss Kathleen were sitting

together on the sofa. Her head was hidden on his shoulder, and she was crying bitterly; while he, poor boy, a troubled look on his handsome face, was trying to comfort her; but 'twasn't a bit of use. "Shane," she sobbed, "'tis the first time we've been parted, and my heart tells me we shall never meet again."

"Mally," says the master despairingly, "what can I say to comfort her?" Then a sudden thought striking him, he turned to his cousin, with a smile, and "Mavourneen," says he, "you haven't forgotten the odd story we read long ago of the brave Sir Roland, who sounded his horn in the Pass of Roncesvalles in the Pyrenees, when he was sore beset by the Moors, and how Charlemagne the great emperor heard the sound where he was hunting, more than a hundred miles away?" She said she remembered the tale. "Well," says he, "am not I your own true knight, ashore?" And although I haven't a horn like the gallant Sir Roland, I have something just as good—a stout stockman's whip. So, if danger befall, I'll just fetch a sounding smack with the lash, and here in this cabin you'll hear the noise."

"He was smiling all the time he was speaking; but Miss Kathleen took it seriously. "You won't forget," says she. "Sure and I won't," says he, "if you'll promise not to fret till you hear the sound of the lash."—"I promise," says she; and with that Miss Ellen and her brother came in at the front door, and I went back to the kitchen."

"Well, miss, Master Shane and his friend started next day with half-a-dozen men and four wagons. "You'll take care of Miss Kathleen," said the poor boy wistfully when bidding me good-bye; "and should anything happen to me, you'll never desert her, will you, Mally?"—"Can you doubt it?" said I. "But what should happen to one as is prayed for by a pure saint like my young lady?"—"What, indeed," muttered he; and then he wrung my hand, and hurried off to take his last kiss from the sweet lips he loved so well, little thinking 'twas the very last on this side the grave."

"So we were left alone, the two young ladies and myself, in the little cabin in Melbourne. Miss Kathleen kept her word, and didn't fret, though many a time her heart was full. She just went quietly about the house, thinking of her cousin and no other else. 'Twould have been a dull time but for Miss Ellen Doyle. She was the one to be always singing, joking, or laughing, and the days sped rapidly until the ninth after the young gentlemen had set out on their journey. 'Twas a Friday night—I remember it well, for sorrow a bit of fish could I get for the dinner that day; and Miss Ellen laughed when I came back with a small one, and says she, "We shan't dine on fish, Mally; we'll just wait till tea-time. And so they did. Passing nine o'clock, they would have me into the parlour. "For, Mally," says Miss Ellen, "we want you to tell us one of your capital stories. Let it be about Kerry." We were sitting round the table, our knitting in our hands. I was between the young ladies, and had just opened my mouth to say that the story I meant to give them was called the Banshee of Gobkullin, when, without a bit of

warning, my darling Miss Kathleen gave a sudden start—"The stock whip!" she cried, "I heard it distinctly!" Miss Kathleen trembled like an aspen leaf; and calling to mind Master Shane's words, my heart sank within me. She lay back in her chair without a sign of life, her fair young face convulsed with such a look of terror as I never saw before or since.

'We got her into bed, and then Miss Ellen ran out for a doctor; and chancing to meet Mr Webb, the surgeon of the ship that carried us to Melbourne, brought him back with her. He was both kind and skilful, and did his best for my stricken darling; but he told us plump and plain that her case was a mortal bad one. 'Twas brain-fever she had; and for weeks she lay 'twixt life and death, raving ever and always of her cousin and the danger he was in.

'The fever was at its height, when, late one night, young Edward Doyle knocked at the door Ocho! but he had the bad news to tell Master Shane, the last and best of his race, was dead, murdered by the blood-thirsty blacks. It was on the ninth evening after they had left Melbourne that the savages set upon them, taking them at unawares as they sat round their camp-fire. But a volley from the white men's pistols sent the blacks back into the bush howling like fiends. Then it was that the master, vowing vengeance on the savages, plunged into the wood in hot pursuit of them. The others followed, but in the darkness lost sight of him; nor did they find the poor boy till daybreak. He was lying under a tree quite dead, the blood slowly oozing from a deep wound in his side. He had flung away his empty pistol; but his right hand still gripped the heavy whip with which he had seemingly defended himself against his enemies. They buried him where he fell, under the shade of a blue-gum, with only a rude cross at his head, to mark where the last of the O'Connells lay.

'Such was the sad tale young Doyle told us, the tears running down his face the while, for he loved Master Shane like a brother, and his heart ached for Miss Kathleen. The doctor shook his head when he heard the story. 'Twould be a merciful thing, he said, provided his patient did recover, that all recollection of the past should have faded from her mind.

'She did recover, poor darling, but very slowly. At first, we thought her memory was entirely gone. By degrees, however, she began to remember, and by-and-by asked for her cousin. To please her, we said he had gone on a long journey up-country; and when we found she believed it, Mr Webb told us to keep up the delusion.

'Well, miss, there isn't much more to tell. Miss Ellen Doyle married the English officer who was so sweet on her during the voyage out, and went with him to Tasmania. About the same time, Squire Doyle's eldest son having been killed in the hunting-field, Master Edward was written for by his father. But before he went, he had this cottage built and furnished for Miss Kathleen; and he and Mrs Major Gayworthy—Miss Ellen Doyle that was—settled a small pension on my mistress, that keeps her in comfort. Here we've lived for over thirty years; and except for the longing she has to see her cousin, it hasn't been altogether an unhappy

time for my poor lady. I used to worry myself, thinking how lonesome she'd feel if I were taken first. But since she's come to know and love you, miss, I've been quite easy; for should anything happen to old Mally, I know you'll never see her at a loss.'

The old Irishwoman had told her tale with emotion. Nor could I for the moment help crediting the supernatural element in the story. But at this moment Miss Moonshie's voice was heard calling me by name, and I hurried to the sitting-room. Never had I seen her more animated. Her eyes were sparkling, her cheeks crimson, and she smiled gaily as I entered. 'My dear,' she cried, 'I have had such a sweet dream, all about the dear friend you have often heard me mention—my cousin Shane. But I must show you his likeness.' And with fingers that trembled sadly, the poor lady opened a locket she always wore, disclosing the miniature of a fine-looking youth, with a pleasant expression on his frank open countenance.

'Is he not handsome?' she inquired, gazing fondly on the smiling face.

'He is indeed,' I returned, feeling the tears gathering in my eyes.

'Dear Shane, what a deal he must have gone through! But he is really coming to-night, ah! yes, and then how happy we shall be. I may not tell you my dream to-day; she added with a little laugh; but to-morrow, you will look in to-morrow before you go to church? Then, my dear, you shall know all.'

I gave the desired promise; and shortly after, bent my steps homewards, meditating on poor little Miss Moonshie's sad history and harmless delusion. The morrow found me an hour before church-time at her door. It was opened by Mally. 'Miss Kathleen has overslept herself,' she said; 'but I'll just tap and ask if she won't see you in bed.'

Repeated knocks at her mistress's door eliciting no response, the old Irishwoman turned the handle and peeped in. 'She's sound asleep, poor darling,' she whispered. 'Just cast your eyes on her, miss, and see how pleased she looks.'

I did so. The expression on her face was indeed a happy one; but there was that about it which caused me to step quickly forward and lay my hand lightly on the brow of the sleeper. It was icy cold! Yes; he had come for her at last, the long-expected lover. For, gazing on the placid countenance of the dead, who could doubt but a vision of the beloved one had gladdened the soul of the sleeper, and left its impress on her smiling face, ere death had claimed its prey!

'Twould be a sin to wish her back, so happy she looks,' wailed poor old Mally.—'But oh, Miss Kathleen, darling, why didn't you take me with you!'

The separation was but of brief duration. The faithful old Irishwoman soon followed poor little Miss Moonshie to the grave; and a white marble cross in a corner of the Melbourne Cemetery marks the spot where mistress and maid sleep their last sleep.

LOUIS PASTEUR.

ON the façade of a little house in the Rue des Tanneurs at Dôle may be seen a plate bearing, in letters of gold, the following inscription: 'Here was born LOUIS PASTEUR, December 27, 1822.' It was placed there in the presence of the living man, as he was borne in a triumphal procession along the streets of the old town where he had spent his early days. 'England has ceased to stone and burn her prophets,' says Froude in his *Life of Carlyle*; 'she is contented to pay them some moderate homage, and leaves the final decorating work to future generations.' In Germany and France, the final decorating work is less grudgingly awarded. The crowns with oak leaves are not only given to actors and prima donnas, and still less to politicians, but they are worn by men of science, to whom the word 'success' bears a different meaning from that which is commonly given to it amongst ourselves. With them, success does not mean money or fame; it means the attainment of that knowledge which shall be of lasting benefit to humanity.

Pasteur's parents were of humble origin, and poor. His father, an old soldier, decorated on the field of battle, took up the trade of a tanner when, the war over, he returned to France, and was obliged to work very hard to keep the wolf from the door. Nevertheless, he found time every evening to superintend the lessons of his son, who at an early age was sent to college, and of whom he was determined to make an educated man. The boy, however, was no infant prodigy; and it is reported of him that he did not always take the shortest road either to or from school. He was fonder of drawing than anything else, and whenever he could escape from his books, would amuse himself by taking portraits of his neighbours. An old lady at Arbois was heard to regret, as time went on, this wasted talent, and to say: 'What a pity he should have buried himself in chemistry, for he might have made his fortune as a painter!' In due time, however, the passion for work, afterwards so imperative, was

born within him. He left Arbois for Besançon, and there received the degree of *bachelier des lettres*. He was immediately appointed tutor in the same college; and in the intervals of his duties he followed the course of mathematics necessary to prepare him for the scientific examinations of the *Ecole Normale*. There, at the first examination, he passed fourteenth on the list. But this did not satisfy him: he began a new year of preparation, settling himself to work in a silent corner of Paris. He then came out fourth; and in 1843, he was enabled, in the great school where he was destined to take so distinguished a place, to follow out to his heart's content his passion for chemistry.

At this time, two professors as different as possible both in manner and system of teaching, exercised an equal influence over their pupils. Dumas, at the Sorbonne, polished and grave, was accustomed to dwell on general principles; Balard, at the *Ecole Normale*, vivacious and enthusiastic, overwhelmed his audience with the multitude of facts, and did not always give his words time to follow his thoughts. One day, as he was showing potash in the lecture-room to the students, he exclaimed with fervour: 'Potash—which—potash then—potash in short—which I now present to you.'

The rules of the *Ecole Normale* might well be copied in many other educational institutions; they leave much to the student himself, who has free access to the laboratories and the library, where he may consult all the scientific journals and reviews. Presupposing the earnest purpose of the individual, this system greatly develops the spirit of research; but to Pasteur were lacking many of the advantages enjoyed by the present day students, for, although he was made 'dean' at an incredibly early age, and intrusted with the scientific studies at the *Ecole Normale Supérieure*, he had no laboratory; and when he petitioned the Minister of Public Instruction for one, the reply was worthy of the period when science was at a discount, when Claude Bernard lived in a small damp garret, and Berthelot was

nothing more than an assistant in the Collège de France. The reply was this: 'There is no clause in the budget to grant you fifteen hundred francs a year to defray the expenses of experiments.'

Pasteur, whose only thought was to learn, to question, and to study, did not hesitate to establish a laboratory—a very modest one, however—at his own expense; and there was probably born within him that scientific imagination which has been lately somewhat mistily described as a preconceived idea. He was too simple to arrogate to himself any unusual or peculiar method of discovery; but he used to say that nothing could be done without preconceived ideas; and Professor Tynall commenting on the words, insists that they are far from meaning ideas without antecedents: using his own poetic vein, he remarks that the lays are gone for ever when angels whispered into the hearkening human ear secrets which had no root in man's previous knowledge or experience; and that the only revelation now open to the wise arises from 'intending the mind' on acquired knowledge. At the time when Pasteur undertook his investigations on the diseases of silkworms, he had never seen a silkworm; but the preconceived ideas he brought to bear upon the subject were the vintage of garnered facts.

Remaining as Balard's assistant at the Ecole Normale, although he had been offered the professorship of Physics in the Lycée of Tournon, Pasteur began the study of crystals; and the manner in which he—still so young a student—explained away the difficulties which had appeared insurmountable to the great investigator Mitscherlich, immediately attracted the attention of the Academy. When, some time later, Drot brought the inquirers together, Mitscherlich said: 'I had studied with so much care and perseverance, in their smallest details, the two salts which formed the subject of my note to the Academy, that if you have established what I was unable to discover, you must have been guided to your result by a preconceived idea.' And this was absolutely the case, for the result was reached by simple common-sense; and the wonder is, not that a searcher of such penetration as Pasteur should have discovered a difference in the facets of otherwise analogous crystals, but that an investigator so powerful and so experienced as Mitscherlich should have missed it. But besides the discovery that certain crystals supposed to be identical are not really so, Pasteur went on to further and exceedingly curious conclusions. He satisfied himself of the distinction between minerals or artificial products and the products which are extracted from vegetables. Such conclusions—supported, it is needless to say, by the most careful experiments—are sure to arrest the attention of a large class of people, who, dreading materialism, are ready to welcome any generalisation which separates

the living from the inanimate world; and even should they be considered somewhat insecure, the studies from which they were drawn are known to be sound, and must endure for ever, however theory may change and inference fade away.

Pasteur was now led by force of circumstance to relinquish a line of research which still possesses for him an invincible attraction. By a sudden turn, he was thrown unexpectedly upon the subject of fermentation; and fermentation led to the study of diseases; but he still laments that he never had time to retrace his steps. At the time when Pasteur was nominated dean of the Faculty of Sciences at Lille, fermentation was but little understood. The yeast-plant had been discovered; and a German manufacturer of chemicals had noticed that common commercial tartrate of lime fermented on being dissolved and exposed to a moderate heat. His solution, he described, which was at first limpid and pure, became turbid, and this was owing to the multiplication of a microscopic organism. Pasteur recognised in this little organism a living ferment, and became assured that ferments are in all cases living things; the substances formerly regarded as ferments being in reality the food of ferments. But whence come these minute organisms? It was impossible for Pasteur to accept the theory of spontaneous generation, so enthusiastically supported by Pouchet and others. One by one he explained the fallible nature of their experiments, and proved, by his own, that not a single circumstance had yet appeared to justify the assertion that microscopic organisms come into the world without germs or without parents like themselves. He speedily brought the most scientific men to his own conclusions. M. Fleurens, permanent secretary of the Academy of Sciences, delivered his opinion before the whole Academy in the following words: 'As long as my opinion was not formed, I had nothing to say; now it is formed, and I can speak. The experiments are decisive. If spontaneous generation be a fact, what is necessary for the production of animalcula? Air and putrescible liquids. Now, Pasteur puts air and putrescible liquids together, and nothing is produced. Spontaneous generation, then, has no existence. Those who still doubt, have failed to grasp the question.'

Pasteur had now the key to many problems. He traced all the maladies of wine to a specific organism which acted as a ferment, and could be destroyed at a temperature of one hundred and twenty-two degrees Fahrenheit without injury to the wine. It was the same thing with beer: the causes of deterioration are identically the same; and the heating of bottled beer as a means of preservation is now largely practised, especially in Europe and in America.

Pasteur's next investigations were directed to the diseases of silkworms. In the year 1849, an epidemic threatened to destroy the whole silkworm commerce of France. The symptoms were variable, and would break out sometimes

in the eggs, sometimes in the 'worms,' sometimes during the processes of moulting. Innumerable remedies were tried without success, and the cultivators were in despair. Pasteur was persuaded to leave for a time the experiments which had been so fruitful, and to advance with hesitation on an unknown road; but the misery of the population of certain departments in the south of France decided him to accept the offer made him by his old master Dumas, who had been nominated Reporter of the Commission set on foot to determine the best means of combating the epidemic. Pasteur started for Alais, where the plague was raging, and had not been there many hours when he was able to show to several members of the Agricultural Committee some infinitely small bodies in certain worms. He found them in the eggs, the worms, and the moths; but, curiously enough, not always in those which showed signs of disease. Other observers had already suggested a possible connection between the malady and these little bodies, but had failed to follow out the investigation. Pasteur affirmed that here was the disease, and—twenty days after his arrival—that it was only in the moths that search should be made for them; that the germ of the malady might be present in the eggs and escape detection; in the worm also it might elude microscopic examination; but that in the moth it reached a development so distinct as to render the recognition immediate. From healthy moths, healthy eggs were sure to come; from healthy eggs, healthy worms; from healthy worms, fine cocoons; so that the problem presented to France of its silk husbandry reduced itself to the separation of the healthy from the unhealthy moths, the rejection of the latter, and the exclusive employment of the eggs of the former. This was the substance of the note which Pasteur presented to the Committee of Alais. He soon settled the question of contagion, upon which opinions were much divided. He gave healthy worms leaves over which infected worms had passed, and found, by this means, he could communicate the disease to as many worms as he chose. It therefore became no longer possible to doubt that pébrine was a contagious disease. The simple method by which Pasteur insured the cultivator against a recurrence of the epidemic is now universally adopted. As soon as her eggs are laid, the moth is crushed in a mortar and mixed with a little water; the mixture is examined by the microscope, and should a germ of the disease be found, the eggs are immediately destroyed, with everything belonging to them. Workshops are met with everywhere at the time of the cultivation, in which women and young girls are steadily employed, under strict supervision, in pounding and examining the moths, setting aside those eggs which are perfectly healthy, and destroying the rest.

Pasteur returned to Paris crowned with success; but he had overtaxed his strength, and was seized with paralysis. Seeing, as he thought, the near approach of death, he insisted upon dictating a last note on his important studies; but the end was not yet, and there were many more triumphs in store for him.

Advancing in his discoveries on living ferments, he drew nearer and nearer to a know-

ledge of the causes of contagious diseases; but he rather drew back from this special inquiry. The ancient medical theory of parasites and living contagia was revived, and Pasteur's own researches on fermentation had much to do with it. He could no longer maintain the part of mere spectator, and taking up the investigations of Davaine, Rayer, and Rôch, he approached the study of the terrible cattle-plague, which for so many years had eluded all research. No doubt could be entertained of the parasitic nature of the disease, to which all animals were subject excepting birds. And here Pasteur stepped in with what Tyndall calls a 'hand specimen' of his genius. The temperature which prohibits the multiplication of the poisonous parasite is forty-four degrees; the temperature of the blood of birds is forty-two degrees—it is therefore close upon that which destroys infection, and might well be the cause of their immunity. Pasteur then made the following experiment. He placed the feet of a fowl in cold water, thereby considerably lowering the temperature. He then inoculated it, and in four-and-twenty hours it was dead. The argument was clinched by inoculating a chicken with the fever to come to a head, and then removing the patient, wrapped in cotton-wool, to a warm chamber, where it rapidly recovered; proving that the career of the parasite was brought to an end. The experiment is conclusive, and is full of suggestiveness as regards the treatment of fever in man. The next step was the consequence of long dwelling on the mystery of vaccination. Since most diseases are in their nature non-recurrent, why should there not, he argued, be found for each of them a preventive disease, which, being similar, but not so virulent, should act as a safeguard? Pasteur found that lengthened contact with free air weakens the contagion, or the microscopic parasites; they are living things, demanding certain elements of life, as do other living things, and they may so use up that which the body contains as essential to their growth, that it may be impossible to produce a second crop. Even a less vigorous parasite may suffice to exhaust the soil, and then a highly virulent one may be introduced, and will prove powerless. This is the whole secret of Jenner's discovery; but he employed it only in a single disease, leaving the field to Pasteur, who grasped at once the nature and extent of the discovery, and applied it with results which have appeared almost miraculous.

In 1881, Pasteur communicated to the Academy his discovery, that by repeated 'cultivations' of a poisonous parasite, much of its virulence could be destroyed—that, in fact, it might be rendered benign; and though much applause followed his exposition, some of his colleagues could not help suggesting that there was a little romance in the theory. The President of the Society of Agriculture at Melun invited Pasteur to make a public experiment of splenic fever vaccination. He accepted; and on May 5, 1881, an immense concourse of interested spectators assembled to watch the result. A flock of sheep was divided into two groups; those in the one were vaccinated, those in the other were left alone. A number of cows were similarly treated. After fourteen days, all the animals were inoculated with a

virulent kind of cattle-disease; and three days subsequently, twenty-one sheep which had not been protected by vaccination were dead, and the remaining ones were dying. The vaccinated sheep had hardly suffered at all. It was the same thing with the cows. A burst of enthusiasm followed these marvellous results; and although every new discovery is sure to be opposed, the significant fact remains that Pasteur is overwhelmed with applications for vaccine.

Pasteur is now over sixty years of age, but he still continues his researches with unabated energy; the last have reference to the most terrible malady of all—to hydrophobia, concerning which we may have something to say by-and-by. The immense possibilities which his discoveries are constantly revealing leave hardly any prospect too wide for fulfilment.

A HOUSE DIVIDED AGAINST ITSELF.

CHAPTER XLVI.

FRANCES slept very little all night; her mind was jarred and sore almost at every point. The day with all its strange experiences, and still more strange suggestions, had left her in a giddy round of the unreal, in which there seemed no ground to stand upon. Nelly Winterbourn was the first prodigy in that round of wonders. Why, with that immovable tragic face, had she intimated to Lady Markham the tenure upon which she held her fortune? Why had it been received as something conclusive on all sides? There is an end of Nelly. But why? And then came her mission to her aunt, the impression that had been made on her mind—the hope that had dawned on Frances; and then the event which swept both hope and impression away, and the bitter end that seemed to come to everything in the reappearance of Constance. Was it that she was jealous of Constance? Frances asked herself in the silence of the night, with noiseless bitter tears. The throbbing of her heart was all pain; life had become pain, and nothing more. Was it that she was jealous—*jealous* of her sister? It seemed to Frances that her heart was being wrung, pressed till the life came out of it in great drops under some giant's hands. She said to herself, No, no. It was only that Constance came in her careless grace, and the place was hers, wherever she came; and all Frances had done, or was trying to do, came to nought. Was that jealousy? She lay awake through the long hours of the summer night, seeing the early dawn grow blue, and then warm and lighten into the light of day. And then all the elements of chaos round her, which whirled and whirled and left no honest footing, came to a pause and disappeared, and one thing real, one fact remained—George Gaunt in his fever, lying rapt from all common life, taking no note of night or day. Perhaps the tide might be turning now for death or life, for this was once more the day that might be the crisis. The other matters blended into a phantasmagoria,

of which Frances could not tell which part was false and which true, or if anything was true; but here was reality beyond dispute. She thought of the pale light stealing into his room, blinding the ineffectual candles; of his weary head on the pillow growing visible; of the long endless watch; and far away among the mountains, of the old people waiting and praying, and wondering what news the morning would bring them. This thought stung Frances into a keen life and energy, and took from her all reflection upon matters so abstract as that question whether or not she was jealous of Constance. What did it matter? so long as he could be brought back from the gates of death and the edge of the grave, so long as the father and mother could be saved from that awful and murderous blow. She got up hastily long before any one was stirring. There are moments when all our ineffectual thinkings, and even futile efforts, end in a sudden determination that the thing must be done, and revelations of how to do it. She got up with a little tremor upon her, such as a great inventor might have when he saw at last his way clearly, or a poet when he has caught the spark of celestial fire. Is there any machine that was ever invented, or even any power so divine as the right way to save a life and deliver a soul? Frances' little frame was all tingling, but it made her mind clear and firm. She asked herself how she could have thought of any other but this way.

It was very early in the morning when she set out. If it had not been London, in which no dew fell, the paths would have been wet with dew; even in London, there was a magical something in the air which breathed of the morning, and which not all the housemaids' brooms and tradesmen's carts in the world could dispel. Frances walked along in the silence, along the long silent line of the Park, where there was nobody save a little early school-mistress, or perhaps a belated man about town, surprised by the morning, with red eyes and furtive looks, in the overcoat which hid his evening clothes, hurrying home to break the breadth of the sunshine, the soft morning light, which was neither too warm nor dazzling, but warmed gently, sweetly to the heart. Her trouble had departed from her in the resolution she had taken. She was very grave, not knowing whether death or life, sorrow or hope, might be in the air, but composed, because, whatever it was, it must now come, all being done that man could do. She did not hasten, but walked slowly, knowing how early she was, how astonished her aunt's servants would be to see her, unattended, walking up to the door. 'I will arise and go to my father.' Wherever these words can be said, there is a peace in them, a sense of safety at least. There are, alas, many cases in which, with human fathers, they cannot be said; but Wailing, whatever his faults might be, had not forfeited his child's confidence, and he would understand. To all human aches and miseries, to be understood is the one comfort above all others. Those to whom she had appealed before, had been sorry; they had been astonished; they had gazed at her with troubled eyes. But her father would understand. This was the chief thing and the best. She went along under the

trees, which were still fresh and green, through the scenes which, a little while later, would be a fair with all the movements, the comedies, the tragedies, the confusions and complications of life. But now they lay like a part of the fair silent country, like the paths in a wood, like the glades in a park, all silent and mute, birds in the branches, dew upon the grass—a place where Town had abdicated, where Nature reigned.

Waring was an early riser, accustomed to the early hours of a primitive people. It was a curious experience to him to come down through a closed-up and silent house, where the sunshine came in between the chinks of the shutters, and all was as it had been in the confusion of the night. A frightened maid-servant came before him to open the study, which his brother-in-law Cavendish had occupied till a late hour. Traces of the lawyer's vigil were still apparent enough—his waste-paper basket full of fragments; the little tray standing in the corner, which even when holding nothing more than soda-water and claret, suggests dissipation in the morning. Waring was jarred by all this unpreparedness. He thought with a sigh of the bookroom in the Palazzo all open to the sweet morning air, before the sun had come round that way; and when he stepped out upon the little iron balcony attached to the window and looked out upon other backs of houses, all crowding round, the recollection of the blue seas, the waving palms, the great peaks, all carved against the brilliant sky, made him turn back in disgust. The mean London walls of yellow brick, the narrow houses, the little windows, all blinded with white blinds and curtains, so near that he could almost touch them—'However, it will not be like this at the Warren,' he said to himself. He was no longer in the mood in which he had left Bordighera; but yet, having left, he was ready to acknowledge that Bordighera was impossible. It had continued from year to year—it might have continued for ever, with Frances ignorant of all that had gone before; but the thread of life once broken, could be knitted again no more. He acknowledged this to himself; and then he found that in acknowledging it, he had brought himself face to face with all the gravest problems of his life. He had held them at arm's-length for years; but now they had to be decided, and there was no alternative. He must meet them; he must look them in the face. And here, too, he must look in the face. Life once more had come to a point at which neither habit nor the past could help him. All over again, as if he were a boy coming of age, it would have to be decided what it should be.

Waring was not at all surprised by the appearance of Frances fresh with the morning air about her. It seemed quite natural to him. He had forgotten all about the London streets, and how far it was from one point to another. He thought she had gained much in her short absence from him; perhaps in learning how to act for herself, to think for herself, which she had acquired since she left him; for he was entirely unaware, and even quite incapable of being instructed, that Frances had lived her little life as far apart from him, and been as independent of him while sitting by his side at

Bordighera, as she could have been at the other end of the world. But he was impressed by the steady light of resolution, the cause of which was as yet unknown to him, which was shining in her eyes. She told him her story at once, without the little explanations that had been necessary to the others. When she said (George Gaunt, he knew all that there was to say. The only thing that it was expedient to conceal was Markham's part in the catastrophe, which was, after all, not at all clear to Frances; and as Waring was not acquainted with Markham's reputation, there was no suggestion in his mind of the name that was wanting to explain how the young officer, knowing nobody, had found entrance into the society which had ruined him. Frances told her tale in few words. She was magnanimous, and said nothing of Constance on the one hand, any more of Markham on the other. She told her father of the condition in which the young man lay, of his constant mutterings, so painful to hear, the Red and Black that came up, over and over again, in his distracted thoughts—the distracting burden that awaited him if he ever got free of that circle of confusion and pain—of the old people in Switzerland waiting for the daily news, not coming to him as they wished, because of that one dread yet vulgar difficulty which only she understood. 'Manina says, of course they would not hesitate at the expense. O no, no! they would not hesitate. But how can I make her understand? and we know!'

'How could she understand?' he said with a pale smile, which Frances knew. 'She has never hesitated.' It was all that jarred even upon her excited nerves and mind. The situation was so much more clear to him than to the others, to whom young Gaunt was a stranger. And Waring was in his nature something of a Quixote to those who took him on the generous side. He listened—he understood; he remembered all that had gone on under his eyes. The young fellow had gone to London in desperation, unsettled, and wounded by the woman to whom he had given his love—and he had fallen into the first snare that presented itself. It was weak, it was miserable; but it was not more than a man could understand. When Frances found that at last her object was attained, the unlikelihood that it ever should have been attained, overwhelmed her even in the moment of victory. She clasped her arms round her father's arm, and laid down her head upon it, and, to his great surprise, burst into a passion of tears. 'What is the matter? What has happened? Have I said anything to hurt you?' he cried, half touched, half vexed, not knowing what it was, smoothing her smooth hair half tenderly, half reluctantly, with his disengaged hand.

'Oh, it is nothing, nothing! It is my folly; it is—happiness. I have tried to tell them all, and no one would understand. But one's father—one's father is like no one else,' cried Frances, with her cheek upon his sleeve.

Waring was altogether penetrated by these simple words, and by the childish action, which reminded him of the time when the little forlorn child he had carried away with him had no one but him in the world. 'My dear,' he said, 'it makes me happy that you think so. I have

been rather a failure, I fear, in most things; but if you think so, I can't have been a failure all round.' His heart grew very soft over his little girl. He was in a new world, though it was the old one. His sister, whom he had not seen for so long, had half disgusted him with her violent partisanship, though his was the party she upheld so, strongly. And Constance, who had no hold of habitual union upon him, had exhibited all her faults to his eyes. But his little girl was still his little girl, and believed in her father. It brought a softening of all the ice and snow about his heart.

They walked together through the many streets to inquire for poor Gaunt; and were admitted with shakings of the head and downcast looks. He had passed a very disturbed night, though at present he seemed to sleep. The nurse who had been up all night, and was much depressed, was afraid that there were symptoms of a 'change.' 'I think the parents should be sent for, sir,' she said, addressing herself at once to Waring. These attendants did not mind what they said over the uneasy bed. 'He don't know what we are saying, any more than the bed he lies on.—Look at him, miss, and tell me if you don't think there is a change?' Frances held fast by her father's arm. She was more diffident in his presence than she had been before. The sufferer's gaunt face was flushed, his lips moved, though, in his weakness, his words were not audible. The other nurse, who had come to relieve her colleague, and who was fresh and unwearied, was far more hopeful. But she, too, thought that 'a change' might be approaching, and that it would be well to summon the friends. She went down-stairs with them to talk it over a little more. 'It seems to me that he takes more notice than we are aware of,' she said. 'The ways of sick folks are that wonderful, we don't understand, not the half of them; seems to me that you have a kind of an influence, miss. Last night he changed after you were here, and took me for his mamma, and asked me what I meant, said something about a Miss Una that was true, and a false Jessie or something. I wonder if your name is Miss Una, miss?' This inquiry was made while Waring was writing a telegram to the parents. Frances, who was not very quick, could only wonder for a long time who Una was and Jessie. It was not till evening, nearly twelve hours after, that there suddenly came into her mind the false Duessa of the poet. And then the question remained, who was Una, and who Duessa? a question to which she could find no reply.

Frances remained with her father the greater part of the day. When she found that what she desired was to be done, there fell a strange kind of lull into her being, which strangely took away her strength, so that she scarcely felt herself able to hold up her head. She began to be aware that she had neither slept by night nor had any peace by day, and that a fever of the mind had been stealing upon her, a sort of reflection of the other fever, in which her patient was enveloped as in a living shroud. She was scarcely able to stand, and yet she could not rest. Had she not put force upon herself, she would have been sending to and fro all day, creeping thither on limbs that

would not support her, to know how he was, or if the change had yet appeared. She had not feared for his life before, having no tradition of death in her mind; but now an alarm grew upon her that any moment might see the blow fall, and that the parents might come in vain. It was while she stood at one of the windows of Mrs Cavendish's gloomy drawing-room, watching for the return of one of her messengers, that she saw her mother's well-known brongham drive up to the door. She turned round with a little cry of 'Mamma' to where her father was sitting, in one of the seldom used chairs. Mrs Cavendish, who would not leave him for many minutes, was hovering by, wearing his fastidious mind with unnecessary solicitude, and a suggestion of questions which he neither could nor wished to answer. She flung up her arms when she heard Frances' cry. 'Your mother! Oh, has she dared!—Edward, go away, and let me meet her. She will not get much out of me.'

'Do you think I am going to fly from my wife?' Waring said. He rose up very tremulous, yet with a certain dignity. 'In that case, I should not have come here.'

'But, Edward, you are not prepared. O Edward, be guided by me. If you get into that woman's hands!—'

'Hush!' he said; 'her daughter is here! Then, with a smile: 'When a lady comes to see me, I hope I can receive her still as a gentleman should, whoever she may be.'

The door opened, and Lady Markham came in. She was very pale, yet flushed from moment to moment. She, who had usually such perfect self-command, betrayed her agitation by little movements, by the clapping and unclapping of her hands, by a hurried, slightly audible breathing. She stood for a moment without advancing, the door closing behind her, facing the agitated group. Frances, following an instinctive impulse, went hastily towards her mother, as a maid of honour in an emergency might hurry to take her place behind the Queen. Mrs Cavendish on her side, with a similar impulse, drew nearer to her brother—the way was cleared between the two, once lovers, now antagonists. The pause was but for a moment. Lady Markham, after that hesitation, came forward. She said: 'Edward, I should be wanting in my duty, if I did not come to welcome you home.'

'Home!' he said, with a curious smile. 'Then he, too, came forward a little. 'I accept your advances in the same spirit, Adelaide.' She was holding out her hands to him with a little appeal, looking at him with eyes that sunk and rose again, an emotion that was restrained by her age, by her matronly person, by the dignity of the woman, which could not be quenched by any flood of feeling. He took her hands in his with a strange timidity, hesitating, as if there might be something more, then let them drop, and they stood once more apart.

'I have to thank you, too,' she said, 'for bringing Constance back to me safe and well; and what is more, Edward, for that child.' She put out her hand to Frances, and drew her close, so that the girl could feel the agitation in her mother's whole person, and knew that, weak as she was, she was a support to the other,

who was so much stronger. 'I owe you more thanks still for her—that she never had been taught to think any harm of her mother, that she came back to me as innocent and true as she went away.'

'If you found her so, Adelaide, it was to her own praise, rather than mine.'

'Nay,' she said with a tremulous smile, 'I have not to learn now that the father of my children was fit to be trusted with a girl's mind—more, perhaps, than their mother—and the world together.' She shook off this subject, which was too germane to the whole matter, with a little tremulous movement of her head and hands. 'We must not enter on that,' she said. 'Though I am only a woman of the world, it might be too much for me. Discussion must be for another time. But we may be friends.'

'So far as I am concerned.'

'And I too, Edward. There are things even we might consult about—without prejudice, as the lawyers say—for the children's good.'

'Whatever you wish my advice upon?'

'Yes, that is perhaps the way to put it,' Lady Markham said, after a pause which looked like disappointment, and with an agitated smile. 'Will you be so friendly, then,' she added, 'as to dine at my house with the girls and me? No one you dislike will be there. Sir Thomas, who is in great excitement about your arrival; and perhaps Claude Ramsay, whom Constance has come back to marry.'

'Then she has settled that?'

'I think so; yet no doubt would like him to be seen by you. I hope you will come,' she said, looking up at him with a smile.

'It will be very strange,' he said, 'to dine as a guest at your table.'

'Yes, Edward; but everything is strange. We are so much older now than we were. We can afford, perhaps, to disagree, and yet to be friends.'

'I will come if it will give you any pleasure,' he said.

'Certainly, it will give me pleasure.' She had been standing all the time, not having even been offered a seat, an omission which neither he nor she had discovered. He did it now, placing with great politeness a chair for her; but she did not sit down.

'For the first time, perhaps it is enough,' she said. 'And Charlotte thinks it more than enough. Good-bye, Edward. If you will believe me, I am—truly glad to see you, and I hope we may be friends.'

She half raised her clasped hands again. This time he took them in both his, and leaning towards her, kissed her on the forehead. Frances felt the tremor that ran through her mother's frame. 'Good-bye,' she said, 'till this evening.' Only the girl knew why Lady Markham hurried from the room. She stopped in the hall below to regain her self-command and arrange her bonnet. 'It is so long since we have met,' she said, 'it upsets me. Can you wonder, Frances? The woman in the end always feels it most. And then there are so many things to upset me just now. Constance and Markham—say nothing of Markham; do not mention his name—and even you?'

'There is nothing about me to annoy you, mamma.'

Lady Markham smiled with a face that was near crying. She gave a little tap with her finger upon Frances' cheek, and then she hurried away.

A CHAT ABOUT IRONCLADS.

If the immortal Nelson could rise from his tomb in St. Paul's Cathedral and go on board Her Majesty's ship *Invincible*, he might reasonably be excused for thinking he was in a different world from that which he left some eighty years ago. Probably the only familiar sights to him would be an anchor or a stray coil of rope; he might well rack his brains to know what the other things on board were intended for. Turrets, eighty-one ton guns with their automatic and hydraulic fittings, electric machines, herculean engines, Whitehead torpedoes with their submerged firing apparatus, pneumatic telegraphs, telephones, electric lights, rocket torpedoes, torpedo steamboats, watertight docks and compartments, strange machine-guns, and many other equally incomprehensible things he would see crowded together in one immense, heavily armoured floating citadel, called, what would seem in mockery to him, a ship.

But without speculating on the probable feelings of the great naval hero, any visitor to Portsmouth can judge for himself as to the vast change which has taken place within the last thirty or forty years in the structure of ships of war. Let us walk through the dockyards and glance at the unwieldy forms of the modern ironclads building there, and then look out on the harbour and see the hulks of the many stately old line-of-battle ships riding at anchor, remnants of former fleets whose thunder has struck terror into the hearts of thousands of enemies—then the fact of this change will be at once apparent.

A modern ironclad is an enormous piece of complicated mechanism. In order to protect this mechanism from hostile shot, the greater part of it is placed under water and covered by a thick steel deck; the remainder above water being protected by vast armour-plates varying from eight to twenty-four inches in thickness. From the exterior, an ironclad is by no means a thing of beauty; one writer has described it as 'a cross between a cooking apparatus and a railway station;' but in place of this ingenuous parallel, imagine a low flat-looking mass on the water; from the centre rises a huge funnel, on either side of which are a turret and a superstructure running to the bow and stern; two short pole masts, with platforms on the top for machine-guns, complete an object calculated to bring tears to the eyes of the veteran sailor who remembers the days of the grand old line-of-battle ship, with its tall tapering masts and white sails glistening in the sun. A stranger going on board one of our newest types of ironclads would lose himself and the intricacies and apparent confusion of the numerous engines, passages, and compartments; it is a long time, in fact, before even the sailors find their way about these new ships, and the Admiralty allow a new ironclad to remain three months in harbour on first commissioning before going to sea, in order that the men may become acquainted with the uses of the several fittings on board, each ironclad that is built now being in many ways an improvement on its predecessor.

Those who have not been on board a modern ironclad can form no idea of the massiveness and solidity of the various fittings; the enormous guns, the rows of shot and shell, the huge bolts, bars, and beams seem to be meant for the use of giants, not men. Although crowded together in a comparatively small space, everything is in perfect order, and ready at any moment to be used for offensive or defensive purposes. It is not, perhaps, generally known that the captain of a man-of-war is ordered to keep his ship properly prepared for battle as well in time of peace as of war. Every evening before dark the quarters are cleared and every arrangement made for night-battle, to prevent surprise by a better prepared enemy. When at anchor in a harbour, especially at night, the ship is always prepared to repel any attempts of an enemy to board or attack with torpedoes or fireships. In addition to the daily and weekly drills and exercises, once every three months the crew are exercised at night-quarters, the time of course being kept secret by the captain, so that no preparations can be made beforehand, the exercise being intended to represent a surprise. In the dead of night, when only the officers of the watch and the sentries posted in the various parts of the ship are awake, the notes of a bugle vibrate between the decks; immediately, as if by magic, everything becomes alive; men are seen scrambling out of their hammocks, and lights flash in all directions; the huge shells are lifted by hydraulic power from the magazines, placed on trucks, and wheeled by means of railways to the turrets; men run here and there with rifles, boarding-pikes, axes, cases of powder and ammunition; others are engaged laying fire-hose along the decks, others closing the watertight doors; while far down below, the engineers, stokers, and firemen are busy getting up steam for working the electric-light engines, turrets, &c. At the torpedo port, the trained torpedo-men are placing the Whiteheads in their tubes; others are preparing cases of gun-cotton for boom-torpedoes. In ten minutes, however, all is again silent and each man stands at his station ready for action. The captain, followed by his principal officers, now walks round the quarters and inspects all the arrangements for battle, after which various exercises are gone through. A bugle sounds, and numbers of men rush away to certain parts of the ship to repel imaginary boarders; another bugle, and a large party immediately commence to work the pumps; another low, long blast is a warning that the ship is about to ram an enemy, and every man on board stretches himself flat on the decks until the shock of the (supposed) collision takes place. After a number of exercises have been gone through, the guns are secured, arms and stores returned to their places, the men tumble into their hammocks again, and are soon fast asleep.

It would be interesting to glance at some of the principal offensive and defensive capabilities of a modern ironclad. The first-class line-of-battle ship of fifty years ago carried as many as a hundred and thirty, what would be called in the present day, very light guns; in contrast to this we read in a naval paper that Her Majesty's armour-plated barbette ram *Benbow*, now building on the Thames, is designed to

carry *two* guns weighing a hundred and ten tons each. These enormous weapons are forty-three feet eight inches long, and are capable of sending a shot weighing three-quarters of a ton to a distance of seven miles. The effect of a shell from one of these guns piercing the armour of a ship and bursting would be very disastrous, and there are few if any ships whose armour, when fairly hit at a moderate distance, could withstand such a blow. At the same time, an enemy would probably be steaming past at the rate of fourteen or fifteen knots, and with only two guns, it is difficult to say how many hits would be scored; and a ship may be hit many times before a vital part is affected. The wisdom, therefore, of placing guns of such immense size on board a ship is doubtful, and it is a question whether four guns of half the weight would not do more execution. A time when the *Benbow* would show to advantage would be when opposing forts. There is no masonry or stonework in the world, except perhaps the Pyramids, that could stand long before the fire of such a ship. A stone fort under these circumstances becomes a trap for the destruction of all within it. Armoured forts, or earthworks, are the only species of land fortifications capable of withstanding the fire of guns of the above description.

Guns, however, although terrible in effect, are now supplemented by other and more deadly means of offence. Foremost amongst these stands the Whitehead or Fish Torpedo. This infernal machine can be discharged from tubes in the side of a ship to a distance of a thousand yards under water at a speed of twenty-five miles per hour. Armed with its charge of gun-cotton it rushes forth on its mission; and, if successful in striking the ship against which it is aimed, explodes, and rends a large hole in her side, through which the water pours in huge quantities. In order to protect a man-of-war from this danger, she can be surrounded at short notice with thick wire-nettings, hanging from projecting side-spars, against which the torpedo explodes with harmless effect. These nettings are, however, principally intended for use when ships are at anchor in harbour at night; they could not well be employed in action with an enemy, as they offer such resistance to the water as to reduce the speed of the ship by four or five knots, and so encumber her as to render her liable to be rammed by a more active opponent.

All large ironclads now have two or three torpedo boats. These craft are constructed of steel one-sixteenth of an inch thick, and steam at a speed of sixteen knots, some of the larger kind reaching twenty or twenty-one knots an hour. Carrying two Whiteheads, they are valuable auxiliaries to the parent ship; their rapid movements, together with their dangerous freight, distracting the attention of an enemy.

Machine-guns, however, form a very effective remedy for them; a single torpedo boat attacking an ironclad would, directly she got within range, be riddled with Gardner and Nordenfelt shot, and sunk in about fifteen seconds. It is only when three or four approach in various directions, or during night attacks, that they become really dangerous. The electric search-lights, with which most large men-of-war are now provided, will show a torpedo boat at the distance, of a mile

on the darkest night; but there is of course always a chance of their getting close enough to a ship to discharge a torpedo before they are discovered. The Italians are now building boats which they term torpedo-hunters. They are to have great speed, and are intended to chase torpedo boats, and destroy them by means of light machine-guns, of which they carry two or three varieties.

The bow of many of our ironclads is constructed for the purpose of ramming (running down and sinking) an antagonist. To use a ram requires great speed and facilities for turning and manoeuvring quickly; for the latter purposes, short ships are better than long ones. It would be a comparatively easy thing for a ship steaming fourteen knots to ram another that could only steam ten; a small ship might also out-mancuvre and ram a long one; but it would be extremely difficult, in fact almost impossible, for a ship to ram another vessel of equal speed and length. To secure facilities in turning and manoeuvring, all our modern ships are built as short as possible, and have two screws, each worked by entirely separate sets of engines, so that one can go ahead whilst the other goes astern. If one set of engines is disabled, the other can still work independently, and a fair speed be maintained. We always think that two ships at close quarters, trying to ram one another, must be like a game at chess, requiring the closest observation of your opponent's movements and the keenest judgment for your own, a wrong move being fatal to either.

People often wonder what would be the results of a great naval battle at the present time. Would many ships be destroyed? Would the loss of life be great? Let us try to describe shortly a few of the probable features of a fight between two fleets of modern ironclads. Although two hostile fleets might approach one another in some tactical formation, this could not be adhered to for any length of time, and the battle would soon become a series of independent duels between individual ships. This is at once apparent when we consider that most if not all of the ships would have ram, and it would therefore be highly necessary for a captain to have perfect control over the movements of his ship, to prevent her being rammed by an enemy. At the outset of the action, the torpedo boats would probably take a very active part, and until exterminated, which they certainly would be in time, would engage great attention, and be effective in sinking a few ships. It may be safely concluded that every ship would be steaming fast during the action, this being necessary to avoid being rammed, to get into favourable positions for discharging torpedoes, and to elude the fire of an enemy. Heavy-gun fire would of course be maintained from the commencement of the action, and those ships whose engines got disabled from this cause would speedily be rammed; and at this point we consider that great loss of life would take place, for the reason that the boats of a ship, being always exposed to machine-gun fire, would at an early stage of the action be riddled and shattered with shot; and in the incredibly short time in which a ship sinks after being rammed, it would be impossible for the crew to improvise other means to save themselves from drowning. No steps

seem yet to have been taken by our Admiralty with a view of providing for this contingency. It has been suggested that a Hospital Ship, bearing the Geneva cross, should accompany a fleet into action, to receive the wounded. We would make a further suggestion—namely, that this ship should be provided with fast-steaming boats, peculiarly marked to show their pacific nature, which should proceed to the assistance of the crew of a sinking ship; by this means numbers of the men might be saved who would otherwise certainly be drowned. It is not probable that the loss of life from gun-fire would be large, as a great part of the crew of an ironclad would be under water, the rest being inside the armoured portions of the ship. Few ships would be able to get into favourable positions for discharging Whitehead torpedoes from their tubes; even if they did so, the course of one of these machines is so erratic when discharged from a ship in motion, that it would in nearly every case miss its mark. The time for the use of Whiteheads would be from the torpedo boats at the commencement of the fight.

To sum up, it is the opinion of many naval men of authority that a modern naval battle would only occupy about half the time of a fight in the old Trafalgar days; that half the ships employed would be sunk, and that most of the remainder would be so battered as to be unfit for further service for months to come.

AT TREVENNA COTTAGE.

A STORY IN EIGHT CHAPTERS.—CHAP. III.

At the very time that Mr Muncaster was speeding northward on his self-imposed errand, two letters fraught with import, both of them addressed to Trevenna Cottage, were being borne on the wings of steam in an opposite direction. In those days, the evening mail from London was due in Boscombe Regis about eight o'clock, the last stage of its journey being by road.

It was now late autumn, and the weather was broken and stormy. In the tiny drawing-room at Trevenna Cottage, rendered cheerful by lamplight and firelight, sat Captain Avory and his wife, the latter busy over some kind of needle-work, but not so busy that her eyes could not find time to glance now and again at her husband's troubled face, as he sat on the opposite side of the fireplace, his meerschaum between his lips, and his shippers on his feet, for the captain abjured ceremony at home when there was no company. After a time he rose, and crossing to the window, he drew aside the curtain and peered out; but it was too dark to discern even the outlines of the laurels on the lawn.

'What can have become of that plaguy post-man?' he cried petulantly. 'He is never to his time in this dog-hole of a place.'

'It struck eight just five minutes ago,' was the quiet answer, 'so that he is not so very late after all. Besides, he may have nothing for us to-night.'

'You always were a Job's comforter,' he answered bitterly. 'But look here! If I don't hear something definite, either to-night or to-morrow morning, from those beggarly insurance

people, I'll wait no longer, but go up to town at once and favour them with a piece of my mind.'

'I would not do anything so rash and ill-advised, if I were you. I would just write them a quiet but firm reminder that all your preparations for going abroad are completed, and ask them to favour you with the date on which you may expect to hear finally from them.'

'That's all very well, Louisa; but I never could take things so coolly as you,' was the captain's querulous rejoinder as he resumed his seat by the fire. 'Look what a continual state of suspense I'm in. I can neither eat nor sleep. If this sort of thing goes on much longer, I shall end by becoming afraid of my own shadow.'

'You worry yourself without occasion.' To my mind, everything is going on charmingly. These affairs always take time. I wish you would go down to the billiard-room at the *Crown* and amuse yourself there for an hour or two. The change would do you good.'

'I couldn't handle a cue to-night were it to save my life. Every nerve in my body seems on the flutter.'

'Try a little cognac,' suggested Mrs Avory sweetly.

'The old remedy,' he answered with a shrug. 'But I suppose there's no other.'

His hand was on the bell, when suddenly both he and his wife started and glanced at each other. They had heard the creaking of the garden gate. A moment later came the sound of heavy footsteps on the gravel, and then the postman's knock resounded through the cottage. Mrs Avory's busy fingers seemed turned to stone. The captain held his breath like a man in deep water. They heard the front door open and shut, they heard the postman's retreating foot-steps, and then, in came Susan, carrying a couple of letters on a salver.

The captain made a clutch at them. One of them he let drop unconcernedly on the table; over the other his fingers closed instinctively. His first glance at the envelope had revealed to him the monogram of the Stork Insurance Company. Mrs Avory was intent on her work again. Servants have sharp eyes, and it would not do to let Susan suspect that there was anything unusual in the wind.

'News at last,' said the captain, not without a tremor in his voice, as the door closed behind the girl. 'Good or bad, eh, Lou? Are we saved or are we doomed to everlasting smash?'

'Open it, dear,' was all that his wife said as she blinked at him rapidly with her white eyelashes.

He tore open the envelope, and his eyes traversed the few lines in the inclosure at lightning speed.

'Saved, saved!' he cried in a hoarse voice as he dashed down the letter and sprang to his feet. 'It's all right, Lou—all right! The cheque's to be ready for me at noon on Wednesday next.' He began to pace the room with rapid strides, one hand buried deep in his pocket, while he tugged excitedly with the fingers of the other at the ends of his sandy moustache.

Mrs Avory reached quietly across the table and possessed herself of the letter. She gave

vent to a low sigh of relief when she had finished reading it. The golden apple, the fruit of so many desires, the object of so much scheming and of so many machinations, was at last about to drop into the hands of her husband and herself. An immense weight seemed to have been suddenly lifted off her heart.

Her husband stopped in his walk and confronted her. 'The servants are under notice, are they not?' he asked.

'They are under a week's notice, and have been for the last month. They can be sent away at any time.'

'That's all right, then. Our boxes had better be packed and sent to London to the cloak-room at the terminus by the first train on Tuesday. You, and I will travel up by the last train on the same day. On Wednesday I shall receive the cheque, which I shall at once get cashed, and on Thursday morning we shall be in Paris. Two days later, we shall be safe across the Spanish frontier, where all Scotland Yard couldn't lay a finger on us.' His eyes sparkled, his cheeks were flushed. He turned away with a laugh and a snap of his fingers, and resumed his pacing to and fro.

'There is another letter, Lucius, which you have not yet opened,' remarked Mrs Avory presently.

'Some beggarly tradesman's account,' answered the captain with a sneer. 'There will be more than one of them dished next Wednesday when they find the nest empty and the birds flown. I should like to be by and see the fun when they make the discovery. It's about time we made tracks, Lou; our credit here wouldn't have stretched out much longer.'

He took up the second letter and glanced at the superscription. The writing seemed familiar to him, but just then he could not call to mind whose it was. He tore open the envelope without a misgiving. But the instant his eyes fell on the writing inside, before he had time to read even a line of it, he knew from whom it had come. His face turned as white as the paper in his hands, while the room and everything in it seemed to swim before him. Pulling himself together by an immense effort, he drew closer to the lamp, and began to read the letter with eyes that seemed to devour the next line before they had fully taken in the sense of the one that preceded it. The letter ran as under:

LONDON, *Dufour's Hotel*,
October 8.

DEAR LUCIUS—You will be surprised to learn that I am here in the Great Babylon, and I am almost as much surprised at it myself. I landed on Tuesday, and am devoting a few days to sight-seeing before hunting you up. I will defer till we meet all explanations as to the reasons for my sudden return. You are such an erratic being, that I had to obtain your address from my bankers, before feeling sure where a letter would find you. I purpose leaving London by the 4.15 p.m. train on Monday next for Boscombe Regis. I am told that I must book to Mumpston Junction, and that I shall have to do the remaining distance by road. Perhaps you can contrive to meet me at the junction; but if it's at all inconvenient, don't bother. I shall no doubt be

able to hire a trap at the station. Remember me to your wife, who, as well as yourself, is, I trust, in the best of health.—Hoping to see you both very shortly, believe me, your affectionate cousin,
EDWARD SAVERNE.

Lucius Avory's heart withered within him long before he reached the end of the letter. He let it drop from his nerveless fingers, and sinking into the nearest chair with a groan, he buried his face in his hands. All the golden fabric of fraud which he and his wife had built up with so much labour and cunning, as at the touch of an enchanter's wand had fallen in ruins around them. The avenger was on their foot-steps, and soon would overtake them; before them loomed a future at whose blackness his soul shrank aghast.

Her husband's exclamation startled Mrs Avory. Up to that moment she had not been heeding him, her thoughts being busy trying to pierce the vista which a perusal of the first letter had opened before her mind's eye. She stared at him for a moment in silent wonder. What could possibly have changed him so suddenly? She reached over for the letter. Her quick brain took in the contents and all that they implied almost at a glance. What little colour there was in her face died out of it, and she bit her thin under lip with her sharp white teeth, in her effort to keep down the sudden rush of emotion; her hand trembled perceptibly as she replaced the letter on the table. She glanced across at her husband. His elbows were resting on the table and his face was hidden by his hands. 'Lucius, look up; try to be a man,' said Mrs Avory after a few moments, in a tone of some asperity.

He lifted a face that seemed to have suddenly grown several years older, so lined and haggard did it look. 'We are ruined, ruined! Nothing can save us,' he groaned.

'I am not so sure on that point as you seem to be,' answered his wife coldly. 'In any case, let us face the difficulty. Let us consider it; let us try whether we cannot discover some loophole of escape. Come what may, it is useless to whine like a whipped cur.'

The taunt stung him. He stifled the exclamation that rose to his lips and scowled savagely at his wife.

'I admit that the situation looks all but hopeless, but desperate diseases require desperate remedies,' resumed Mrs Avory. 'It is certainly a remarkable coincidence which brings this man here, under this roof, at this particular time. He writes that he will be here on Monday evening; had he delayed his visit till Wednesday evening, it would not have greatly mattered. By that time, he would have found the Cottage empty and all trace of us lost.'

'Why not write to him and get him to postpone his visit?' broke in the captain eagerly. 'Could you not tell him that I'm down with some bad kind of fever; and that it would be dangerous for him to come?'

Mrs Avory considered for a minute, and then shook her head. 'No; that would hardly do, I think. You know the kind of man Edward is. If he were told there was illness or danger, he would be only the more likely to rush down

by the first train, thinking that he might possibly be of service. And even if we were to put forward some minor excuse, with the view of postponing his visit, that would not be unattended with danger. The chances are that, a few days hence, when he has grown tired of London, if he does not come here, he will make his way to Exeter with the view of looking up Mr Kerrison—and where should we be in that case, *cher ami*!'

The captain shivered, but had nothing to urge in reply.

'No, Edward Saverne must come here, to Trevenna Cottage, at the time he proposes to come. You must meet him at the junction, and drive him back in the trap yourself. There is one small point in our favour—it will be quite dark by the time he arrives.'

'And after that?' queried the captain savagely. 'What about next morning? You may perhaps remember that Ned was always an early riser. He will be out of doors by six o'clock, and by breakfast-time half the folk in Boscombe will know his name and all about him. And where shall we be in that case?'

'Let me think,' replied Mrs Avory, and that more as if speaking to herself than to her husband. He lay back in his chair, gnawing the end of his moustache and watching her with gloomy, furtive eyes. He had had ample proof in times gone by of his wife's ability to extricate herself and him from difficulties of various kinds, and it seemed to him just possible that, desperate as was their present strait, her quick-working brain might, even at the eleventh hour, discover some loophole of escape.

She was going on with her needle-work again, but her eyelids were blinking rapidly, and, as her husband knew, it was a sign that she was trying to work out some difficult problem in her mind. There was no sound save the ticking of the little clock on the chimney-piece, and an occasional burst of rain and wind against the casement outside. A quarter of an hour passed without a word being spoken. At length Mrs Avory looked up. 'I think I see a way; but it is a way beset with difficulties,' she murmured, and at the same moment a strange, cold light flashed into her coldly luminous eyes.

The captain leaned forward eagerly, while a deep flush mounted to his cheeks. 'You do! What is it? You were always clever, Lou,' he exclaimed.

She glanced round, as if to make sure that no one was within hearing, then she said in a voice that was scarcely raised above a whisper: 'You remember Hooge's and what you told me, months ago, about it?'

He stared at her for a moment; then he said: 'Of course I do; but what of that?'

'The first thing to-morrow you must endeavour to find Bosy Groot.'

The shade of perplexity deepened on his face. 'Bosy Groot!' he exclaimed. 'I don't understand.'

'Hush!' said his wife with a sudden lifting of her finger, as a discreet tap sounded on the door. Next moment Susan entered with bedroom candles.

As a rule, the tenants of Trevenna Cottage

kept early hours; but to-night the lamp in the little drawing-room was not extinguished till long after midnight.

SOME QUAIN T JUDGMENTS.

EVERY one, of course, is familiar with the judgment delivered by King Solomon in the case of the two mothers. Extraordinary as it must have at first appeared to those who heard it, it had, nevertheless, the effect of bringing out the truth, and making manifest which of the rival claimants was the genuine one. Scattered about in the various histories and records of men and nations are to be found many other decisions of despotic kings and princes, unrestrained by the iron hand of statute law and precedent, which seem equally quaint, and yet were equally effective in bringing about the desired result. The case in which Portia appeared as counsel is no fiction of Shakspeare's, though she herself may be. The main facts of the singular bond and its attempted enforcement, and the consequent trial and judgment, as related in *The Merchant of Venice*, are fairly well-authenticated matters of history.

There is a story related of a judgment given by Pedro the Cruel of Spain imbued with very much the same spirit as the one delivered in the court at Venice. A slater was engaged in repairing the roof of a house, and while so engaged, through some false step or some other accident, lost his balance and rolled down the slanting side of the roof, and fell over the edge into the street below. Just at this moment—unfortunately for himself, though fortunately for the slater—a man was passing along the street just in front of the house whose roof was being repaired. Upon him the slater fell, knocking him to the ground with such force that he eventually died of the injuries he received; while the slater does not seem to have been much the worse for his fall, being saved from any violent concussion with the hard pavement by the interposition of the body of the unfortunate wayfarer. The dead man's son brought an action against the slater, asking that he might receive punishment for killing his father, and be made to pay to him, the son, damages to compensate him for his loss. The king, before whom the matter was laid, inquired into it, and satisfied himself that the slater was in no way to be blamed, his fall and its fatal consequence being purely accidental. In delivering his judgment, he said that it was natural that the son should desire some satisfaction for the death of his father at the hands of the man who had killed him, and that this he was ready to order him. The slater must go and stand exactly in the position where the deceased man had been at the time of the accident; and the son might mount on to the roof of the house and throw himself thence on to the slater, and so mete out to him the same treatment as had been meted out to his, the plaintiff's, father. The son, however, like Shylock, declined to run the risks incidental to carrying out the judgment.

The Emperor Claud was appealed to by a young man, who complained that his mother had disowned him, saying that he was no son of hers, and in no way entitled to any share of the family

property. The emperor investigated the matter, and came to the conclusion that, though there was no way of quite conclusively proving that the young man was the son of the woman, there was yet, practically, no doubt about it. He ordered the woman to be brought before him, and said to her: 'Do you still deny that this man is your son?' The relationship was persistently denied. 'Well, then,' said Claud, 'if he is not your son, he shall be your husband. I order that you be immediately married to him.' This unexpected command reawakened in her the maternal feeling; and confessing her perjury, she fully acknowledged the young man as her son.

It is related of the Sultan Soliman II. that, upon his return to Constantinople after the conquest of Belgrade, a poor woman came to him, complaining that her cottage had been broken open by some of his soldiers, who had carried away all her goods while she was asleep. Soliman smiled, and told her she must have been sleeping hard if she had not heard the noise the men must have made in carrying away her property. 'It is true, my lord,' she boldly replied, 'that I slept soundly, because I believed your Highness was watching over me.' The sultan, though he felt the force of her rebuke, nevertheless admired her reply, and took steps for the restoration of her property and the punishment of her spoilers, giving her as well twenty pieces of gold.

Scaliger relates that a gentleman of high position, named Macaire, one of the bodyguard of King Charles V. of France, having some grudge against one of his comrades, Aubry de Montdidier, meeting him one day in the forest of Bondy, near Paris, accompanied only by his dog, treacherously murdered him, and buried his body. What the dog was doing while his master was being murdered, Scaliger does not tell us; but it appears to have been temporarily absent, probably hunting. When it returned, it found out the spot where its master's body was buried, and lay down on the grave, and kept watch over it till the pangs of hunger drove it in quest of food. It trotted off into Paris to the kitchen of one of Montdidier's most intimate friends, where it was well known, and hospitably received. Food was offered to it; and when the poor animal had satisfied its hunger, it set off again for its master's grave in the forest of Bondy. Next day, the same conduct was repeated, and for several days afterwards. At last the curiosity of one of the servants who fed the dog was aroused as to the cause of its daily visits, and he resolved to follow it. He traced it to the forest, and saw it lie down on a spot where the earth appeared to have been recently disturbed. The dog, seeing the man approach, began to howl in a melancholy way, as though it were trying to inspire pity. The appearance of the ground and the dog's singular conduct led to a search being made, when the body of Montdidier was discovered. The dog subsequently attached itself to the owner of the kitchen where it had gone daily for food; and it was noticed that every time it met Macaire, who moved in the same society as his new master, it flew at him, and would have worried him, if it had not been pulled away by those who were at hand. This behaviour of the dog caused some suspicion to

grow up against Macaire. Charles V., hearing of the matter, wished to inquire into the truth of it, and gave orders that Macaire and the dog should both come before him. Immediately the dog saw Macaire, it again flew at him with its accustomed fury. The king severely questioned Macaire as to what he knew of Montdidier's death, and exhorted him to tell the truth. Macaire denied all knowledge of it. Charles then decreed that Macaire and the dog should meet in single combat; the man being furnished with a thick staff; and a barrel with one end knocked out being provided as a place of shelter for the dog, in case it should be hard pressed. The duel commenced. The dog began by bounding about, just outside the reach of the staff, till it saw its opportunity. Then it made a furious spring and caught Macaire by the throat and dragged him to the ground. The unfortunate man, finding he could not free himself, cried for mercy, and confessed his crime. He was thereupon delivered from the dog, but only to be given into the custody of the law, by whose sentence he was afterwards executed.

The Duke of Ososne is celebrated for the many quaint judgments and decisions delivered by him while viceroy of Naples. Some of them seem actuated rather by a spirit of pleasantry than by one of justice. One day the duke had to choose a galley-slave who should be liberated in honour of some great festival. He went on board one of the galleys, and standing in front of the first bench of rowers, six in number, he began to question them all as to what had brought them there. The first one contented himself by calling God as a witness to his innocence, and protesting that he was there for no reason at all. The second said his punishment and disgrace were the work of his enemies and not the consequence of any crime. The third protested that a crying injustice had been done him by his being sent there without any trial. The fourth said that the lord of his village had become enamoured of his wife and had caused him to be sent there out of the way. The fifth declared that he came from the hamlet of Somma, and that he had been implicated in a robbery there, in which he really had had no part at all, and that all his neighbours would bear witness to his honesty. The sixth, who had observed that all these excuses and justifications did not seem to please the duke, took a different tone. 'Your Excellency,' he said, 'I come from Naples; and though the town is a large one, I do not believe that it contains a greater scoundrel than myself. They have been merciful to me in only sending me to the galleys.'

The viceroy looked at the man keenly for some moments, and then, turning to those in attendance upon him, said: 'Let this scoundrel be released from his chains; he will corrupt all those honest men.' Then he presented him with some money to provide himself with clothing, and besought him to try to live a better life in the future.

Two days afterwards, another prisoner was to be liberated, and the duke again proceeded to the galleys to select one. Information as to what had happened on the previous occasion had reached the slaves in the galley which the duke boarded, and they believed that the best way of getting their liberty was to blacken themselves

as much as possible, seeing that that course had succeeded so well before. Of all the three hundred in the galley there was not one who did not confess that he was soiled with the vilest crimes, and had richly deserved wheel or gallows.

'This is strange,' said the duke, 'to see so many people with souls so black. Their punishment is the health of the state, which they would infect by their bad example. What crimes would they not commit if they were at liberty! I shall order them all to be still more vigorously guarded,' which he did; freeing only a monk, because he ingenuously said that the chains of the galley were less oppressive than those of the monastery. His punishment was the penalty of a double apostasy of which he had been guilty.

'Well,' said the duke, 'return to your monastery, since there you undergo a severer punishment.'

A rich old merchant, seventy years of age, named Morelli, boasted that he had gained the whole of his fortune without leaving Naples. He had never been away from it, he said, for five-and-forty years, and he vowed he would never go beyond sight of its walls. The Duke of Ososne heard of the old man's speeches, and sent to him one of his officers forbidding him, on the part of the king, to leave the kingdom on pain of forfeiting a fine of a thousand crowns. Morelli received the prohibition with mockery, and jested about it with his friends. To leave the kingdom was the last thing in the world he should think of doing. Had he not said that nothing could induce him to travel out of sight of his beloved Naples? Soon, however, he began to feel a curiosity as to what could have prompted this command of the king's, and he began to torment himself by all sorts of vague guesses and reflections, till the matter took such hold of his thoughts that it threw him into a nervous and miserable condition, and even prevented him from sleeping. At last, to deliver himself from a state of inquietude which he could no longer bear, and to satisfy his longing to do that which had been forbidden him, he sent a thousand crowns to the viceroy, and passed over the Neapolitan border into the Papal States. He stayed there only one night and then returned to Naples. The viceroy, upon hearing of his return, distributed half of the thousand crowns among Neapolitan hospitals, and returned the rest to Morelli, saying that this would suffice to teach the public how fools were punished.

About the same time there was in Naples another rich merchant named Ferronelli, noted for his avarice. This man had had the misfortune to lose an embroidered purse containing fifty gold ducats and fifty Spanish pistoles, together with a ring worth a thousand crowns. This loss was a cause of great grief to Ferronelli; and he sent a crier through Naples proclaiming that any one finding the purse and restoring it and its contents to the owner should be rewarded with the fifty pistoles. A poor old widow found it, and brought it to Ferronelli. As soon as he saw it and its rich contents, he felt tempted to cozen the old woman out of the greater part of the promised reward. The temptation was too strong for the avaricious man to resist; and while he was counting over the pistoles, he dexterously pushed out of sight thirty of them, and said to

the widow: 'I promised the fifty pistols that were inside the purse to the finder; but I see you have already taken thirty of them. Here are the other twenty.'

The old woman protested that she had not taken a single coin; but it was in vain. Ferronelli insisted that she had already appropriated thirty of the pistols, and must, therefore, now be contented with the balance of twenty. The old woman was obliged to yield, and went away with what she could get, which was indeed a large sum for her.

Talking matters over, however, with her friends afterwards, she was advised to lay the affair before the viceroxy and to beseech his interference. The merchant was summoned before the viceroxy, and gave his account of the matter.

The duke, when he had heard Ferronelli's story, replied: 'It is not likely that the old woman should have abstracted part of the money in the purse, as, if she had been dishonestly inclined, she might have taken the whole. This purse cannot, therefore, be yours; for yours, you say, contained fifty pistols, and this one does not. In my opinion, you ought to be punished for having appropriated what does not belong to you.'

'My lord,' urged Ferronelli, 'I recognise the purse perfectly. I know the embroidery; besides, there are my ring and my fifty ducats in it. I beseech your Excellency not to allow me to be deprived of what is rightfully mine.'

'You must be deceiving yourself,' replied the viceroxy. 'Does not the Mint turn out all ducats alike, and is it not possible that the jeweller should have made more than one ring like yours, and that there should be more than one purse embroidered in the same fashion as yours? The essential point is that your purse contained fifty pistols, while this one does not.'

Then addressing himself to the widow, he said: 'Go, my good woman; take the purse; you are fairly entitled to it.'

One example more of this viceroxy's method of dispensing justice, and we will conclude. There was in Naples a young Spanish exquisite, one Bertrand Solus. One day, while he was lounging about in one of the busier parts of the city, a porter, carrying a bundle of wood on his shoulder, tried to make his way through the crowd. Solus was directly in his path, and the porter called out to him several times, 'Make way, please,' without producing any effect. He then attempted to pass him as best he could; but, unfortunately, the wood came in contact with the young man's velvet dress and gave it an ugly rent. Highly indignant, he laid an information against the porter, and asked that he might be punished. The viceroxy—having inquired privately into the circumstances before going into court—told the porter that he was to pretend to be dumb, and was to reply by signs only to anything that might be said to him. When the viceroxy took his seat on the bench, Solus laid his complaint before him, and asked for judgment against the porter. The viceroxy turned to the porter and asked him what he had to say in reply to the charge. The porter only shook his head, and made signs with his hands.

'What judgment do you want me to give against a dumb man?' asked the viceroxy of Solus.

'Oh, your Excellency, the man is an impostor. I beseech you not to believe that he is dumb. Before he ran against me, I distinctly heard him cry out, "Make way!"'

'Then,' replied the viceroxy, 'if you heard him ask you to make way for him, why did you not? The fault of the accident was entirely with yourself; and you must pay this poor man compensation for the trouble you have given him in bringing him here.'

TRACING A STOLEN BANK-NOTE.

SOME years ago I was resident in New York. One day a gentleman, who announced himself as the British consul at that port, entered my father's office, saying that he wished to speak with Mr M——.

'That is my name,' I replied.

'Pardon me,' said the consul; 'but I was under the impression that the Mr M—— whom I am desirous of seeing was an older man than you are.'

'Ah, it is my father, then, whom you want. Unfortunately, he is, and has been, for some days past confined to the house by indisposition. Can you communicate to me the nature of your business, and it may be in my power to attend to it, in his absence?'

'I am obliged to you,' said the consul. 'Well,' he added, after some slight hesitation, 'I should like to speak with you in private for a few minutes, if convenient.'

'Certainly,' and having shown the old gentleman into an inner room, I requested him to be seated, and waited for him to broach the matter concerning which he had sought the interview.

Without preface, the consul took out from a pocket-book a twenty-pound Bank of England note, handed it to me, and said: 'I believe this note passed through your father's hands about two months ago.'

'Very possibly,' I replied, rather surprised at the question. 'But I can ascertain for a certainty in a moment.' Then, summoning a junior clerk, I desired him to bring me the rough cash-book. On looking over its pages, I soon came across an entry regarding a Bank of England note, the amount, date, and number of which corresponded with those of the one before me.

'I find,' I said, 'that this note was in my father's possession at the time you mention.—But may I ask the object of your making the inquiry?'

'It is this. Some fourteen months since, this note was abstracted from a letter posted at Glasgow for Aberdeen. Nothing was heard of the stolen money until five weeks ago, when the note was stopped, on being paid into the Bank of England by a firm of private bankers. They stated that it had been received by one of their customers in the ordinary course of business. The customer, when applied to, said that it had been re-issued to him by a Mr M—— of New York. I have therefore been instructed by my government to trace, if possible, the note

during the period it was in this country. Can you inform me from whom your father had it?' 'Easily,' I said, referring to the book before me. 'It was bought of a Mr White, who has an Exchange Office in Wall Street. But I fear,' I added, 'you will find it very difficult, if not quite impracticable, to carry the matter further; since it is the usage with brokers to buy English bank-notes offered for sale without asking any questions, being aware that, even if they have been stolen, "the innocent holder" can legally enforce the cashing of them.'

'That is true. I agree with you that it is most unlikely that Mr White will be able to let me know who was the person from whom he bought the note; however, I shall call upon him without delay, since it is just possible that he may have it in his power to afford the information I seek.' Then, after thanking me for my courtesy in the matter, the consul took his leave; and I presumed that I should hear nothing more of the affair.

However, some months later, I was lunching at Delmonico's one day, when the consul entered the room. Recognising me, he came over to the table at which I was seated and took a chair beside me. In the course of conversation, he said: 'You recollect the circumstance of my calling upon you, some little time ago, with respect to a stolen Bank of England note?'

'Perfectly.'

'Well, after all, I was successful in tracing the note.'

'How was that?' I inquired.

'I will tell you. When I left your office, I went to that of Mr White. He referred to his books, and found that he had changed the note for the manager of one of the agencies of the Central Railroad Company. I then called upon that gentleman. He had no recollection of the individual from whom he had received the money; and, disappointed, I was leaving the establishment, when a clerk interposed, and addressing his employer, he said: "Mr Suydam, we had the note in question from a man who bought a through-ticket for Chicago. He came in to inquire what was the fare to that city. I told him. He said that he would go by our line, but that he must first change some English money at a broker's. I informed him that this was quite unnecessary, as I would take it in payment of his ticket, at the current rate of exchange. To his suggestion he agreed; and thus the note came into our hands. Why I remember so clearly the transaction is, that the man's name was a rather unusual one—Blenkron, and I had to ask him how he spelt it. Mr Blenkron mentioned incidentally that he was going West, to fill a situation in a large manufacturing establishment; but he did not say the nature of the business, nor the name of the firm which had engaged his services."

'Furnished with these particulars,' continued the consul, 'I met the difficulty of putting myself in communication with the man in this way. I wrote to him, stating the information I sought, and addressed my letter to him at the *Poste Restante*, Chicago. At the same time, I caused advertisements to be inserted in two of the leading daily newspapers in that city, notifying Mr Blenkron, that there was a letter for him at

the head post-office. Well, some days afterwards I had a reply to my communication, informing me that the writer had received the bank-note from an uncle in Bombay, whose address he gave me. This information I forwarded to the postal authorities in England, on whom, of course, devolved the duty of pursuing all further inquiries with respect to the matter; and for some little time thereafter I heard nothing more about the business. However, subsequently, I learned the sequel of it. The Mr Blenkron, resident in Bombay, when communicated with, stated that the note had been sent to him by a merchant in Glasgow. That merchant had received it from a tradesman in the same place; that individual, in his turn, had taken it from a clerk in one of the branch post-offices in that city, in payment of his account. Thus, finally, the theft of the money having been brought home to the clerk in question, he was duly tried, and convicted of the offence.'

This was the consul's story, which struck me as a rather curious one. It is said, with justice, that the strength of a chain is simply the strength of its weakest link. In this case, some of the links of the chain of circumstances which had rendered it possible to trace the people through whose hands the stolen bank-note had passed, had been of the slightest, and had threatened on more than one occasion to part. Yet, by a concurrence of purely fortuitous events, they had not done so; but, on the contrary, the chain had held together so strongly as to bring an offender to justice, after so long a period had elapsed since the commission of the crime, that the criminal doubtless supposed himself quite safe from detection.

OCCASIONAL NOTES.

AUSTRALASIAN TRADE.

At the first meeting of the Australasian Trade Section of the London Chamber of Commerce, Alderman Sir William M'Arthur referred to the great importance of the trade represented by the Section. Its yearly total had now reached one hundred and fifteen million pounds, and in it some three millions of colonists were concerned; whereas in Canada, with its four and a half millions of people, the trade was not quite fifty million pounds, though it should be borne in mind that Canada, being the senior colony, was largely supplied from its own home productions with many articles which the younger Australasian colonies imported from the mother-country. This showed how important were our commercial relations with those colonies. He pointed out that while the United States of America—whither, until quite lately, emigration had largely flowed—only bought the productions of the United Kingdom to the amount of ten shillings per head, Canada and other colonies to the extent of three pounds per head, the value taken by Australia was at the rate of six pounds per head. On the other hand, we were large importers from Australia, the principal staple being wool, which we received to the extent of one million bales, weighing three hundred pounds each, in a year. Large quantities of Australian gold were brought into this country, the value having been as high as

twelve millions a year, though it had gradually fallen to six millions. We were continuing to look to Australia for an increasing portion of our food-supply, the total cereal export from South Australia alone being eight hundred thousand tons. A growing trade in dead-meat had also been created, both in beef and mutton, and as many as twenty-five thousand carcases of sheep were brought by one vessel. One Australian industry which should be more largely developed was that of wine. The wine of Australia was remarkably good; but there was a serious drawback to material progress in the trade—namely, the duties now charged on importation into this country. The shilling duty on every gallon of colonial or foreign wines only applied to those up to the strength of twenty-six degrees; whereas the natural wines of Australia ranged as high as twenty-eight and thirty degrees, and consequently they were at a serious disadvantage in competing with others.

ENGLISH CALICOES IN CHINA.

The English Consul-general in his last Report about the trade of Shanghai takes notice of the increasing trade in American cottons during 1884. The greatest increase is in the item of sheetings, the chief markets for which are the colder districts of northern and north-western China, where these are used for clothing or tent-coverings. Lancashire, however, is beginning to awaken to the necessity of furnishing a more suitable material, which is coming to be favourably known in this region. The consul at Chinkiang says that there are fewer complaints than formerly of the sizing of English goods, but that English goods are far less durable than American, though costing only half the money. The sizing process has undoubtedly been throughout China a wide distrust of foreign cottons. He says that English cottons are too fragile, and American too dear to suit the thrifty, practical Chinese peasant. For the import to be proportionate to the huge market open, an article as soft, as durable, and nearly as cheap as the native cottons, must be made. American drills and sheetings are very popular for their stoutness and strength, and are worn by all who can afford to pay a high price. Inner garments are made from the cheaper English cottons; but clerks, scholars, and the lower-middle class, together with a few farmers, buy the cheap English goods. Those engaged in outdoor labour—an immense multitude—wear native Chinese cottons, which outwear three or four English fabrics. The satisfaction of the demands of these customers should be the aim of our manufacturers at home.

The Reports from Hankow and Newchwang show that English textiles are barely holding their ground. The consul at Newchwang remarks that English cotton goods are far cheaper than either American or Chinese; but, owing to their bad quality, are far less economical in the end. If our manufacturers wish to retain their hold in this market, they must devote more attention to the purity and durability of the goods they turn out. Another consul repeats that what is wanted is a cloth similar to the strong native cotton cloths of China, and for which our manufacturers would find an illimitable market.

PAPER RAILWAYS.

No use seems at first sight more extraordinary for paper than that of a material for railway wheels. As a building material it is becoming common in America, being especially valuable on account of its lightness for the upper portions of large buildings; indeed, an immense dome has been constructed of it with much success. Of course, to call the material 'paper' is somewhat misleading, the substance used for these purposes being merely the pulp after subjection to enormous pressure. Paper railway wheels have, as has been previously stated, been severely tested in America, and not found wanting. It is nevertheless somewhat of a surprise to learn that what may be called a paper railway is shortly to be laid down in Russia. According to *Gazetani*, an American Company has been established in the environs of St Petersburg, having a large factory devoted to this special manufacture, by the authorisation of the Russian Ministry of Finance. The Company is about to lay down a line with paper rails and wheels between the capital and Warstow. We should imagine that there would be far less vibration and noise on lines of compressed paper than on lines of metal, with a consequent increased comfort to travellers. The qualities of this compressed paper are lightness and great tensile strength combined with much durability. The new material might be introduced with advantage into the manufacture of vehicles.

N E M E S I S.

When he and she were ten and eight,
His little wife was she,
And both were quite content to wait
Till he a man should be.
They played together as they grew;
A truant lad was he—
They'd quarrel when the clock was two,
And make it up at three!

At fifteen he on girlish toys
Looks down with scornful mien;
And she disdains to play with boys
At feminine thirteen.
His matrimonial views are cool,
At love he gaily mocks;
She boasts a dearest friend at school,
And dally lengthening frocks!

When twenty sees him quite a man,
His bliss has one ally
She laughs at him behind her fan,
And calls him such a boy.
For she has lovers now galore,
Who smile and favour crave;
And he who tyrannised of yore,
Is now her humblest slave!

They now are middle-aged; 'tis said
His chin a beard now covers;
And strange to say, she's not yet wed,
In spite of all her lovers!
But vain for her to sigh for him,
For so the story tells—
Grown weary of caprice and whim,
He's married some one else!

PAINLESS DEATHS.

BY AN ANALYTICAL CHEMIST.

IN our every-day experience, the question is frequently asked us, 'What is the least painful method of killing my pet dog?' (or cat, or other animal); and from what we have heard from others, we are glad to be able to state that nowadays the question is a common one. Glad! not because we rejoice at the general destruction of dumb animals, but because we are gratified to see a very widespread desire among a large proportion of the people to destroy, when compelled by necessity to do so, as humanely and as gently as possible.

A short while ago, had one of the lower animals rendered itself sufficiently obnoxious to deserve death, or, from other causes, was ordained to die, the only thought worthy of the consideration of the destroyer was the choice of the readiest weapon with which the deed might be done. To some extent the same remark would be at the present time true of the bulk of the uneducated classes; but thanks to the spread of education, and the feelings of tenderness and gentleness engenders, so cruel a fashion is gradually dying out.

Let us suppose, for the sake of making the subject clearer, that we have a pet dog which must be destroyed; and let us take the doomed creature to different classes of persons, and request them to suggest the best means for its destruction. Let us in the first instance take it to that specimen of humanity—or inhumanity, if you please—which, for the sake of distinction, has been called 'a rough,' and ask his advice. He will, in all probability, suggest two methods, which have been very largely used, and still are to some extent—namely, hanging or drowning, and he will perhaps assure you that it will be but a few struggles, and then all will be over. Next, take it to a sportsman, and you will be told to shoot it; take it to an apothecary, and you will be told to use a very active poison—

strychnine, perhaps, or corrosive sublimate, or white arsenic, or prussic acid; take it to a doctor, and perhaps he may tell you the same, or he may tell you to give chloroform first, and drown or otherwise kill the animal while under its influence.

Not one of these methods can we indorse, and we speak from experience, having witnessed the death of many animals under each of these methods, even when applied in the most skilful manner. Drowning is a barbarous and cruel method. The head must be forcibly submerged in water; and who that has seen the struggles and heard the cries of a half-drowned animal, should it for a moment get one breath of air, can say that its death was unattended with great and violent pain. Can any one who has witnessed the convulsive struggles—the sudden drawing up of the lower limbs towards the throat, the stifled cry, the bursting eyeballs of an animal when killed by hanging, say its death was a painless one? As for the strong-poison treatment, in our opinion it is worse than the two just mentioned, for not only is the suffering most acute, but it is enormously prolonged. Many a poor thing have I seen subjected to what was called skilful treatment in this way, and seldom have I experienced more sickening feelings than when watching the agonies of the dying creature. Many a stout and stern heart have I known on such occasions to resolve that they would not look upon such sights again. No; the death by strong poisons is very, very far from being a humane method. Shooting is too slow and uncertain, and ought to be had recourse to only under exceptional circumstances, when no other methods are applicable.

The Society for the Prevention of Cruelty to Animals is very watchful in regard to the humane destruction of animals, and punishes any offender for cruel treatment.

There is one other method, seldom recommended because it is somewhat difficult of application, but which is nevertheless largely employed, and deserves more general recognition. It is the

one suggested by Dr Richardson, and used every week for the destruction of cart-loads of wandering and worthless dogs which find their way to the Home for Lost Dogs at Battersea, and consists in killing chiefly by means of the gas known to chemists as carbonic oxide. Under the influence of this gas, the animal sinks into an insensible sleep, from which it never wakes, and without the least sign of pain. It is the form of death so frequently chosen by French suicides, and unwarily has found many a victim in the weary wayfarer who has laid himself to sleep on the warm bank on the leeward side of a burning limekiln.

Its application does not necessitate so much additional trouble and skill as to make it impracticable or unpopular. The animal has only to be placed in an air-tight chamber connected by a pipe with another chamber in which a charcoal fire is lighted. The products of combustion pass along the pipe to the chamber in which the animal is confined, and before long it dies, to all external appearances, a painless death. The quantity of carbonic oxide gas necessary for the destruction of an animal is very small. Le Blanc found that animals could live in an atmosphere containing twenty-five per cent. of carbonic acid, but died in one containing one and a half per cent. of carbonic oxide, and that recovery was more difficult in the latter case. It is therefore evident that but a very small quantity of this gas is sufficient to cause death.

Dr Richardson, in his lecture before the Society of Arts, has given full details of the method he employs. The process was first tried last May, and since that time, from two hundred to two hundred and fifty dogs per week have been destroyed. It need hardly be added that this humane method deserves to be widely known.

To carry on this work of destruction on so large a scale, Dr Richardson has devised a more elaborate apparatus than that referred to above. His 'lethal' chamber consists of a double-cased box, made of well-seasoned timber, the opening between the casings being closely packed with sawdust. One side has a door through which the cage containing the doomed animals is passed. When the door is closed, carbonic oxide gas, together with the vapour of chloroform and carbon disulphide, proceeds from stoves into the chamber until there is sufficient to cause the death of every one of the confined animals. To ascertain when the whole have ceased to breathe, use is made of a long trumpet-shaped stethoscope made of bamboo; and so delicate is it, that the continued breathing of a single animal, even among a great number, can be detected. As soon as the breathing has completely ceased, no more gas is admitted. No more humane method could possibly be devised.

But Dr Richardson goes a step further, and points out that the method can be applied to animals which are killed to supply us with food; that the flesh of animals so killed is in no way altered, and that the blood can be drawn as completely after as before the animal has been narcotised. It has not yet been applied to oxen and horses, the necessarily larger size of the lethal chamber being in itself a difficulty. Moreover, large animals require a higher percentage

of gas to produce in them narcotic effects. Dr Richardson hopes to make electricity practically useful in killing the larger animals.

The physiological effect of carbonic oxide has long been supposed by chemists to depend on the formation of a compound of carbonic oxide with the hæmoglobin or matter in the red corpuscles of the blood, by which the latter is prevented from exercising its function as an absorbent of oxygen. But whatever its action may be, one thing is certain, that it is a really humane method of killing animals, and on this account we think its application will receive that attention it so richly deserves.

A HOUSE DIVIDED AGAINST ITSELF.

CHAPTER XLIII.

THE dinner, it need scarcely be said, was a strange one. Except in Constance, who was perfectly cool, and Claude, who was more concerned about a possible draught from a window than anything else, there was much agitation in the rest of the party. Lady Markham was nervously cordial, anxious to talk and to make everything 'go'—which, indeed, she would have done far more effectually had she been able to retain her usual cheerful and benign composure. But there are some things which are scarcely possible even to the most accomplished woman of the world. How to place the guests, even, had been a trouble to her, almost too great to be faced. To place her husband by her side was more than she could bear, and where else could it be appropriate to place him, unless opposite to her, where the master of the house should sit? The difficulty was solved loosely by placing Constance there, and her father beside her. He sat between his daughters; while Ramsey and Sir Thomas were on either side of his wife. Under such circumstances, it was impossible that the conversation could be other than formal, with outbursts of somewhat conventional vivacity from Sir Thomas, supported by anxious responses from Lady Markham. Frances took refuge in saying nothing at all. And Waring sat like a ghost, with a smile on his face, in which there was a sort of pathetic humour, dashed with something that was half desecration. To be sitting there at all was wonderful indeed, and to be listening to the small talk of a London dinner-table, with all its little discussions, its talk of plays and pictures and people, its scraps of political life behind the scenes, its esoteric revelations on all subjects, was more wonderful still. He had half forgotten it, and to come thus at a single step into the midst of it all, and hear this babble floating on the air which was charged with so many tragic elements, was more wonderful still. To think that they should all be looking at each other across the flowers and the crystal, and knowing what questions were to be solved between them, yet talking and expecting others to talk of the new tenor and the last scandal! It seemed to the stranger out of the wilds, who had been banished from society so long, that it was a thing incredible, when he was thus thrown into it again. There were allusions to many things which he did not understand. There was something, for instance,

about Nelly Winterbourn which called forth a startling response from Lady Markham. 'You must not,' she said, 'say anything about poor Nelly in this house. From my heart, I am sorry and grieved for her; but in the circumstances, what can any one do? The least said, the better, especially here.' The pause after this was minute but marked, and Waring asked Constance: 'Who is Nelly Winterbourn?'

'She is a young widow, papa. It was thought her husband had left her a large fortune; but he has left it to her on the condition that she should not marry again.'

'Is that why she is not to be spoken of in this house?' said Waring, growing red. This explanation had been asked and given in an undertone. He thought it referred to the circumstances in which his own marriage had taken place—Lady Markham being a young widow with a large jointure; and that this was the reason why the other was not to be mentioned; and it gave him a hot sense of offence, restrained by the politeness which is exercised in society, but not always when the offenders are one's wife and children. It turned the tide of softened thoughts back upon his heart, and increased to fierceness the decision with which he listened to all the trifles that floated uppermost. When the ladies left the room, he did not meet the questioning, almost timid look that Lady Markham threw upon him. He saw it, indeed, but he would not respond to it. That allusion had spoiled all the rest.

In the little interval after dinner, Claude Ramsay did his best to make himself agreeable. 'I am very glad to see you back, sir,' he said. 'I told Lady Markham it was the right thing. When a girl has a father, it's always odd that he shouldn't appear.'

'Oh, you told Lady Markham that it was—the right thing?'

'A coincidence, wasn't it? when you were on your way,' said Claude, perceiving the mistake he had made. 'You know, sir,' he added with a little hesitation, 'that it has all been made up for a long time between Constance and me.'

'Yes? What has all been made up? I understand that my daughter came out to me to—'

'Oh!' said Claude, interrupting hurriedly, 'it is that that has all been made up. Constance has been very nice about it,' he continued. 'She has been making a study of the Riviera, and collecting all sorts of *renseignements*, for the most cases, it is necessary for me to winter abroad.'

'That was what she was doing there—her object, I suppose?' said Waring with a grim smile.

'Besides the pleasure of visiting you, sir,' said Claude, with what he felt to be great tact. 'She seems to have done a great deal of exploring, and she tells me she has found just the right site for the villa—and all the *renseignements*,' he added. 'To have been on the spot, and studied the aspect, and how the winds blow, is such a great thing; and to be near your place too,' he said politely, by an after-thought.

'Which I hope is to be your place no more,' Waring, said, Sir Thomas. 'Your own place is very empty, and craving for you all the time.'

'It is too fine a question to say what is my own place,' he said with that pale indignant smile. 'Things are seldom made any clearer by an absence of a dozen years.'

'A great deal clearer—the mists blow away, and the hot fumes. Come, Waring, say you are glad you have come home.'

'I suppose,' said Claude, 'you find it really too hot for summer on that coast. What would you say was the end of the season? May? Just when London begins to be possible, and most people have come to town.'

'Is not that one of the *renseignements* Constance has given you?' Waring asked with a short laugh; but he made no reply to the other questions. And then there was a lull of the inevitable politics before the gentlemen went up-stairs. Lady Markham had been threatened with what in France is called an *attaque des nerfs*, when she reached the shelter of the drawing-room. She was a little hysterical, hardly able to get the better of the sobbing which assailed her. Constance stood apart, and looked on with a little surprise. 'You know, mamma,' she said reflectively, 'an effort is the only thing. With an effort, you can stop it.'

Frances was differently affected by this emotion. She, who had never learned to be familiar, stole behind her mother's chair and made her breast a pillow for Lady Markham's head, a breast in which the heart was beating now high, now low, with excitement and despondency. She did not say anything; but there is sometimes comfort in a touch. It helped Lady Markham to subdue the unvoiced spasm. She held close for a moment the arms which were over her shoulders, and she replied to Constance: 'Yes, that is true. I am ashamed of myself. I ought to know better—at my age.'

'It has gone off on the whole very well,' Constance said. And then she retired to a sofa and took up a book.

Lady Markham held Frances' hands in hers for a moment or two longer, then drew her towards her and kissed her, still without a word. They had drawn nearer to each other in that silent encounter than in all that had passed before. Lady Markham's heart was full of many commotions; the past was rising up around her with all its agitating recollections. She looked back, and saw, oh, so clearly in that pale light which can never alter, the scenes that ought never to have been, the words that ought never to have been said, the faults, the mistakes—those things which were fixed there for ever, not to be forgotten. Could they ever be forgotten? Could any post-script be put to the finished story? Or was this strange parting, this one that scarcely desired on either side, into which the separated Two, who ought to have been One, seemed to have been driven without any will of their own—was it to be mere useless additional pain, and no more?

The ladies were all very peacefully employed when the gentlemen came up-stairs. Lady Markham turned round as usual from her writing-table to receive them with a smile. Constance laid down her book. Frances, from her usual dim corner, lifted up her eyes to watch them as they came in. They stood in the middle of the room for a minute, and talked to each other

according to the embarrassed usage of Englishmen, and then they distributed themselves. Sir Thomas fell to Frances' share. He turned to her eagerly, and took her hand and pressed it warmly. 'We have done it,' he said in an excited whisper. 'So far, all is victorious; but still there is a great deal more to do.'

'I think it is (Constance that has done it,' Frances said.

'She has worked for us—without meaning it—no doubt; but I am not going to give up the credit to Constance; and there is still a great deal to do. You must not lay down your arms, my dear. You and I, we have the ball at our feet, but there is a great deal still to do.'

Frances made no reply. The corner which she had chosen for herself was almost concealed behind a screen which parted the room in two. The other group made a picture far enough withdrawn to gain perspective. Waring stood near his wife, who from time to time gave him a look, half watchful, half wistful, and sometimes made a remark, to which he gave a brief reply. His attitude and hers told a story; but it was a confused and uncertain one, of which the end was all darkness. They were together, but fortuitously, without any will of their own; and between them was a gulf fixed. Which would cross it, or was it possible that it ever could be crossed at all? The room was very silent, for the conversation was not lively between Constance and Claude on the sofa; and Sir Thomas was silent, watching too. All was so quiet, indeed, that every sound was audible without; but there was no expectation of any interruption, nobody looked for anything, there was a perfect indifference to outside sounds. So much so, that for a moment the ladies were scarcely startled by the familiar noise, so constantly heard, of Markham's hansom drawing up at the door. It could not be Markham; he was out of the way, disposed of till next morning. But Lady Markham, with that presentiment which springs up most strongly when every avenue by which harm can come seems stopped, started, then rose to her feet with alarm. 'It can't surely be— Oh, what has brought him here!' she cried, and looked at Claude, to bid him, with her eyes, rush to meet him, stop him, keep him from coming in. But Claude did not understand her eyes.

As for Waring, seeing that something had gone wrong in the programme, but not guessing what it was, he accepted her movement as a dismissal, and quietly joined his daughter and his friend behind the screen. The two men got behind it altogether, showing only where their heads passed its line; and the light was not bright in that corner, and the new-comer was full of his own affairs. For it was Markham, who came in rapidly, stopped by no wise agent, or suggestion of expediency. He came into the room dressed in light morning-clothes, greenish, grayish, yellowish, like the colour of his sandy hair and complexion. He came in with his face puckered up and twitching, as it did when he was excited. His mother, Constance, Claude, sunk in the corner of the sofa, were all he saw; and he took no notice of Claude. He crossed that little opening amid the fashionably crowded

furniture, and went and placed himself in front of the fireplace, which was full at this season of flowers, not of fire. From that point of vantage he greeted them with his usual laugh, but broken and embarrassed. 'Well, mother—well, Con; you thought you were clear of me for to-night.'

'I did not expect you, Markham. Is anything—has anything—?'

'Gone wrong?' he said. 'No—I don't know that anything has gone wrong. That depends on how you look at it. I've been in the country all day.'

'Yes, Markham; so I know.'

'But not where I was going,' he said. His laugh broke out again, quite irrelevant and inappropriate. 'I've seen Nelly,' he said.

'Markham!' his mother, cried, with a tone of wonder, disapproval, indignation, such as had never been heard in her voice before, through all that had been said and understood concerning Markham and Nelly Winterbourn. She had sunk into her chair, but now rose again in distress and anxiety. 'Oh! she cried, "how could you" how could you? I thought you had some true feeling. O Markham, how unworthy of you now to vex and compromise that poor girl!'

He made no answer for a moment, but moistened his lips, with a sound that seemed like a ghost of the habitual chuckle. 'Yes,' he said, 'I know you made it all up that the chapter was closed now, but I never said so, mother. Nelly's where she was before, when we hadn't the courage to do anything. Only worse—shamed and put in bondage by that miserable beggar's will. And you all took it for granted that there was an end between her and me. I was waiting to marry her when she was free and rich, you all thought; but I wasn't bound, to be sure, nor the sort of man to think of it twice when I knew she would be poor.'

'Markham! no one ever said, nobody thought—'

'Oh, I know very well what people thought—and said too, for that matter,' said Markham. 'I hope a fellow like me knows Society well enough for that. A pair of old staggers like Nelly and me, of course we knew what everybody said. Well, mammy, you're mistaken this time, that's all. There's nothing to be taken for granted in this world. Nelly's game, and so am I. As soon as it's what you call decent, and the craps business done with—for she has always done her duty by him, the fellow, as everybody knows—'

'Markham!' his mother cried almost with a shriek—'what, it is ruin, destruction. I must speak to Nelly—run both to her and you.'

He laughed. 'Or else the other thing—salvation, you know. Anyhow, Nelly's game for it, and so am I.'

There suddenly glided into the light at this moment a little figure, white, rapid, noiseless, and caught Markham's arm in both hers. 'O Markham! O Markham!' cried Frances, 'I am so glad! I never believed it, I always knew it. I am so glad!' and began to cry, clinging to his arm.

Markham's puckered countenance twitched and puckered more and more. His chuckle sounded over her hair like a sob. 'Look Here,' he said.

'Here's the little one approves. She's the one to judge, the sort of still small voice—eh, mother? Come; I've got far better than I deserve; I've got little Fan on my side.'

Lady Markham wrung her hands with an impatience which partly arose from her own better instincts. The words which she wanted would not come to her lips. 'The child, what can she know!' she cried, and could say no more.

'Stand by me, little Fan,' said Markham, holding his little sister close to him—'Mother, it's not a small thing that could part you and me; that is what I feel, nothing else. For the rest, we'll take the Priory, Nelly and I, and be very jolly upon nothing. Mother, you didn't think in your heart that your son was a base little beggar, no better than Winterbourn?'

Lady Markham made no reply. She sank down in her chair and covered her face with her hands. In the climax of so many emotions, she was overwhelmed. She could not stand up against Markham, in her husband's presence, with everything hanging in the balance, she could say nothing. The worldly wisdom she had learned melted away from her. Her heart was stirred to its depths, and the conventional bonds restrained it no more. A kind of sweet bitterness—a sense of desolation, yet hope of secret approval, yet opposition, disabled her altogether. One or two convulsive sobs shook her frame. She was able to say nothing, nothing, and was silent, covering her face with her hands.

Waring had seen Markham come in with angry displeasure. He had listened with that keen curiosity of antagonism which is almost as warm as the interest of love, to hear what he had to say. Sir Thomas, standing by his side, threw in a word or two to explain, seeing an opportunity in this new development of affairs. But nothing was really altered until Frances rose. Her father watched her with a poignant anxiety, wonder, excitement. When she threw herself upon her brother's arm, and, all alone in her youth, gave him her approval, the effect upon the mind of the father was very strange. He frowned and turned away, then came back and looked again. His daughter, his little white-spotted child, thrown upon the shoulder of the young man whom he had believed he hated, his wife's son, who had been always in his way. It was intolerable. He must spring forward, he thought, and pluck her away. But Markham's stifled cry of emotion and happiness somehow arrested Waring. He looked again, and there was something tender, pathetic, in the group. He began to perceive dimly how it was. Markham was making a resolution which for a man of his kind was heroic, and the little sister, the child, his own child, of his training, not of the world, had gone in her innocence and consecrated it with her approval. The approval of little Frances! And Markham had the heart to feel that in that approval there was something beyond and above everything else that could be said to him. Waring, too, like his wife, was in a condition of mind which offered no defence against the first touch of nature which was strong enough to reach him. He was open not to every-day reasoning, but to the sudden pick of a keen

unhabitual feeling. A sudden impulse came upon him in this softened, excited mood. Had he paused to think, he would have turned his back upon this scene and hurried away, to be out of the contagion. But fortunately, he did not pause to think. He went forward quickly, laying his hand upon the back of the chair in which Lady Markham sat, struggling for calm—and confronted his old antagonist, his boy-enemy of former times, who recognised him suddenly, with a gasp of astonishment. 'Markham,' he said, 'if I understand rightly, you are acting like a true and honourable man. Perhaps I have not done you justice, hitherto. Your mother does not seem able to say anything. I believe in my little girl's instinct. If it will do you any good, you have my approval too.'

Markham's slackened arm dropped to his side, though Frances embraced it still. His very jaw dropped in the amazement, almost consternation of this sudden appearance. 'Sir!' he stammered, 'your—your—support—your—friendship would be all I could—' And here his voice failed him, and he said no more.

Then Waring went a step further by an unaccountable impulse, which afterwards he could not understand. He held out one hand, still holding with the other the back of Lady Markham's chair. 'I know what the loss will be to you mother,' he said; 'but perhaps—perhaps, if she pleases, that may be made up too.'

She removed her hands suddenly and looked up at him. There was not a particle of colour in her cheek. The hurrying of her heart patched her open lips. The two men clasped hands over her, and she saw them through a mist, for a moment side by side.

At this moment of extreme agitation and excitement, Lady Markham's butler suddenly opened the drawing-room door. He came in with that solemnity of countenance with which, in his class, it is thought proper to name all that is preliminary to death. 'If you please, my lady,' he said, 'there's a man below has come to say that the fever's come to a crisis, and that there's a change.'

'You mean Captain Gaunt,' cried Lady Markham, rising with a half-stupified look. She was so much worn by these divers emotions, that she did not see where she went.

'Captain Gaunt!' said Constance with a low cry.

(To be concluded.)

'OLD FOLKS WILL SERVE YOU BEST.'

We once heard of a boy who described his aunt as 'past thirty, but still active,' and certainly mental and bodily activity are not attributed to the sex if they want to earn a livelihood much after that period. The matter of premature superannuation affects both sexes, however, and we cannot do better than make as a text of our discourse the following wise saw, culled from a volume of epigrams lately published by the poet William Allingham.

Old folks, though weak, will serve you best; of late,
Conscience in work is gone quite out of date.

Never were words more appropriately spoken, and never was the truth they convey more

painfully brought home to our minds than in the present day! Not only in the humbler walks of life, where the breadwinner's chances depend mainly upon sinews and muscle, but in superior callings, where experience and tested aptitude should be the first requisites, qualities with which bodily prowess has nothing to do, we find the same premium put upon inexperience and incapacity. The man of fifty, from the admiral down to the city clerk, who, without any fault of his own, is compelled to seek employment, is set aside simply because he happens not to be ten or fifteen years younger. One might suppose, indeed, that at fifty a human being's intellectual faculties in the natural order of things fail him altogether, and that, like the unfortunate Immortals in *Goethe's Traces* who were despised at eighty, he is 'held incapable of any employment of trust or profit.'

The case of women is hardly till. A woman's youth, from a business point of view, is short-lived indeed. Working women may be past thirty but still active, for all employers care! Female assistants must be younger than that wonderful boy's aunt, for instance, since we rarely by any chance find any but quite young women behind a counter. Older ones could do the necessary work as well, and even better. They are, however, less ornamental, and contribute less to the agreeable aspect of the place. But the question arises, unless these superannuated shopwomen marry, what becomes of them? What is the future of these discarded ones 'past thirty, but still active'? We are driven into the belief that as the openings for them are fewer even than their contemporaries of the other sex, large numbers drift away on the sea of misery and destitution.

Rich ladies, the wealthy spinsters, who, as we are told, are to constitute such a force in English society fifty years hence, will hardly spend their money better than in supporting their own and business houses for which the qualification should be 'past thirty, but still active.'

Here, also, is a hint for our Postmaster-general. Why should female clerks in the postal service consist of pert girls so hardly out of their teens? Here is an occupation for women till eyesight and bodily strength begin to fail, and this is not often the case till they have attained their fiftieth or even sixtieth year. Many women, indeed, can achieve as much mental and bodily work at sixty-five as in the heyday of youth.

The short-sightedness of this undue deference paid to youth is self-evident. Perhaps in no age was youth so self-asserting, arrogant, and wanting in respect, as now. Our young men and young women, especially those who have had exceptional advantages in the matter of education and culture, wholly fail to realise their proper place in society, and what they owe to their fore-runners and elders; so true are these wise words of Goethe: 'There is one thing no one brings with him into the world, and it is a thing on which everything else depends; that thing by means of which every man that is born into the world becomes truly manly—namely, Reverence.'

Our German neighbours, indeed, have a proverb, which, cruelly ironic as it sounds, is not

without truth: *Jugend hat keine Tugend* (Youth has no virtue); and true it is that, for certain virtues, it would be unreasonable to look to youth; yet these are some of the very qualities most needed in the conduct of human affairs, such as experience, disinterestedness, assiduity—in short, that conscience in work which our poet tells us is out of date.

A certain measure of indifference, selfishness, insensibility to the interests of others, general indifference, is inseparable from that period of existence, when all is expectation and looking forward. Duty, in the larger sense of the word, the measure of justice one human being is bound to deal out to another in the least as well as the most trifling transaction, the sense of responsibility only age can give—these are lessons of life not to be learned at once. Later on, during those brief years allotted to both sexes, by custom and general opinion, as their prime, men, no more than women, are likely to do their work better than when, from a business point of view, they are set aside as incapable. On the contrary, the daily discharge of routine duties, however irksome, will be easier to those who have learned, perhaps by bitter experience, the value of time, of money, and of conscience. Granting that a man or woman of sixty may not be able to get through so much work in the same time as those half their age, is not the conscience put into the work to be taken into consideration? True enough it is, as our poet says:

Conscience in work is quite grown out of date.

Never were wages so high, never expectations of work-people so exalted as now, and never was it more difficult to get any piece of manual work efficiently done. The job is got through somehow, paid for, and there is an end of the matter.

Old servants, too, are rapidly running out of date. The time-honoured retainers of former years are now replaced by pretty girls and smart young men, who stay with each employer just till they can improve their position, and no more; whereas serving-folks who have grown gray in their masters' service, naturally have their interests at heart, and prevent that spoliation in the kitchen which goes well-nigh to ruin so many families.

Youth has charms. 'A pretty girl is the poetry of the work-a-day world,' says one of our novelists. Unfortunately, the greater part of human affairs has to do with bare prose; and for the daily transactions of business, bright eyes, rosy cheeks, and a slim figure, are less necessary than steadiness, rectitude, and unswerving devotion to work-a-day duty.

AT TREVENNA COTTAGE.

A STORY IN EIGHT CHAPTERS.—CHAP. IV.

NOTWITHSTANDING their late vigil, Captain Avory and his wife were up betimes next morning, and had breakfasted by nine o'clock. Then Susan was sent to the *Crown Hotel* for a fly, which presently drove up to the gate. Then the captain and his wife appeared, equipped to encounter the weather, which was still broken and stormy, and were driven away. But when the fly had climbed the slope on which the scattered houses

of Boscombe are built, and had reached the high-road which skirts its summit, the captain alighted. His road lay one way, and that of his wife the other. Mrs. Ivory's destination was Alvebury, a small town some half-dozen miles away, at which place there was no one to whom she was known. Her object in going there was to post her husband's reply to his cousin's letter. It would scarcely have been judicious to post at the Boscombe office a letter addressed to 'Edward Saverne, Esq.,' seeing that every one in the place was aware that a gentleman of that name had died and been buried there only a few weeks previously.

Captain Ivory's answer to his cousin's letter was written from his wife's dictation. It was couched in judiciously affectionate terms, and expressed the writer's pleasure at the prospect of meeting again his long-absent relative. The captain then went on to say that he would not fail to meet his cousin at Mumpdon Junction at the time stated, but should anything meanwhile intervene to delay his journey, he was required to send a telegram informing the captain on what day and by what train he might be looked for.

When husband and wife parted at the point where their roads diverged, the captain turned up the collar of his waterproof, pulled his hat more firmly over his brow, and set his face eastward. He had the wind and rain in his teeth as he walked, and at another time he would have felt the discomforts of the weather keenly; but this morning he had in other food for his thoughts. He was bound on an errand such as none but a desperate man would think of undertaking. So long as the influence of his wife's presence was upon him, so long as the magnanimity of her stronger will made itself felt, the task before him, although beset with dangers and difficulties, had yet seemed feasible and full of promise; but now that he was left to himself, his hopes and his courage at once sank to zero. Just then, he felt as if he would gladly have given all that he had ever possessed if he could have put back the hand of time--if he could have been again as he was twelve months ago, before his wife's voice had whispered the first syllable of temptation in his ear. Ah! how readily he had yielded to it. What a golden vista her words had conjured up! Of his own free will, he had woven the net which by mesh around him, till now there only remained one last desperate chance of escape. Fool, fool that he had been!

With such and other bitter thoughts gnawing at his heartstrings, he trudged doggedly forward, the whips of rain lashing his face unrelieved. When he had gone about a couple of miles, the road began to trend downwards. He was nearing one end of the long irregular stretch of cliff fronting the bay, in the midst of whose green luxuriant lap bask the white villas of Boscombe Regis. So far, he had encountered no one, except a country carrier jogging slowly along on his hooded cart, and two drenched, woe-begone tramps. For this he was thankful; the fewer people he met by the way the better. But now that he was nearing his destination, a new fear gripped him like a vice. What if the man he was going in

search of was not at home, and was nowhere to be found! The thought turned him sick and dizzy, and he was obliged to come to a stand for a few moments, with his hand resting against the trunk of a tree. If Bosy Groote had one of his wandering fits on him--and what more likely?--then would Mrs. Ivory's cunningly elaborated scheme collapse as at a breath, leaving behind it nothing save ruin black and irretrievable.

He took a flask of brandy from his pocket, and administered to himself a liberal dose of its contents. It brought back a little colour to his pinched features, and nerved him with a sort of dogged courage to face whatever the next half-hour might have in store for him.

Still deeper dipped the road, while the growth of timber on either hand broadened out into a gloomy plantation, through whose intricacies nothing could be discerned. Another quarter of a mile, as the captain was aware, would have brought him to the end of the plantation and on a level with the shore. After about a mile of this level sandy road, with the sea full in view on the right, it began to climb again and wind its way over the shoulder of the easternmost of the two headlands which shut in Boscombe Bay. On the other side of this headland, and almost in its shadow when the sun was drawing toward the west, lay the little fishing hamlet of Cowdray.

But not so far as this would Captain Ivory's footsteps take him to-day. While still in the deepest shadow of the plantation, he slackened his pace, and keeping his eyes on the hedge of blackberry bushes which bordered the road on the right, he went slowly forward till he apparently found the sign for which he was looking. What that sign was, was best known to himself; in any case, his face brightened a little; and having first given a glance up the road, then down it, and seeing no one coming either way, he pushed through a small gap in the prickly hedge, and proceeded to thread the mazes of the plantation with the air of a man to whom they were not altogether unfamiliar. Five minutes' walking brought him to the further edge of the wood and in full view of a broad reach of sandy shore, with the gray, heaving waters of the Channel widening out beyond till they lost themselves in the lam-bitten horizon.

But Captain Ivory had no eyes this morning save for one object, and that object was the ruinous and blackened remains of what had once been a two-storied dwelling, which stood at a point where the trees had gone down to meet the sands, or it might be where the sands had crept up to meet the trees. The house was roofless except one corner of it, and only one chimney was left standing. But when from that chimney the captain saw a thin spiral of smoke slowly crawling, his heart gave a great throbbing of relief. It was the sign and signal that Bosy Groote was at home, and he felt as if one-half of his errand were already accomplished. As Captain Ivory picked his way, first along the sand, and then over a scattered heap of stones which had once formed part of the boundary-wall of the house, he became aware of the sound of music. 'It's Bosy with his fiddle,' he muttered. After pausing

for a moment to listen, he crossed a paved courtyard, the pavement of which was now buried inches deep under the ever-shifting sand; and unceremoniously opening a door made of boards roughly nailed together, he halted on the threshold and surveyed the scene before him.

The room into which he now peered had originally been the kitchen of the burned-out house, and was the only part that was left with a roof on it; but even here the intermediate flooring between the upper and the lower stories had been burned away, so that when you looked up, you saw nothing above you but half-charred rafters and the slates of the roof. That this roof was by no means weather-proof was proved by three or four patches of rain-water on different parts of the floor. The wide old-fashioned window, in which not a single pane was left, was roughly boarded up, except a space of a few inches at the top. Such daylight as there was in the place found its way through this aperture. The room was furnished, it furnished it could be called, in the simplest possible style. A couple of three-legged stools, an empty cask for a table, a low rough pallet in one corner covered with a bag of straw and a couple of horse-pans, a frying-pan, a kettle, and a tin teapot, together with a plate and mug of the same ware, comprised the whole of the visible effects. The fireplace was low and wide; but the grate had been torn away years ago, and its place was now filled by a dozen or so of loose bricks, in the midst of which smouldered a few dying embers.

The sole occupant of this wretched domicile was a man who was sitting cross-legged on the pallet in the corner playing the fiddle, and whose age might have been anything between thirty and fifty. As he sat there, he looked like a man who at the least would stand six feet in height, so broad were his shoulders, so long and muscular his arms. But when he stood up it was seen that, large as his body was, his lower extremities were those of a dwarf. To add to the incongruity of his appearance, his shrunken legs bowed out below the knees, as if unable to sustain the weight above them, and when he walked, or rather waddled, he turned his feet inward. He had a large head, and a long thin face seamed and lined through much exposure to the weather. He had a long vulturine nose, the end of which came to within a quarter of an inch of his mouth. His eyes were as keen and rapacious as those of some bird of prey. His long black hair hung in tangled locks round his shoulders, and his head was crowned with a high conical hat of soft black felt, much the worse for wear.

At the moment of Avory's entrance, this singular being was scraping away at some nightmare improvisation of his own, which seemed to have neither beginning, middle, nor end; but which, lacking all method though it did, was not devoid of a certain weird originality. He looked up and nodded as the captain's figure darkened the doorway.

'How do, cap'en?'

'How do you do, Bosy? How's the world using you by this time?'

'About as well as I'm using it, cap'en, I reckon; and that ain't no great shakes.'

'Well, cease that caterwauling, there's a good

fellow. I've a matter of business to talk to you about.'

'Caterwauling? Oh! It's a little thing of my own, cap'en, as sweet as early dewdrops, and as pathetic as the howling of a bull-calf.' As he spoke, he put away the fiddle on a shelf behind him and slid to the ground. 'Be seated, my noble prince,' he said, indicating one of the stools with a wave of his arm. With that, he stirred up the dying embers; and seating himself on the other stool, he crossed one crooked leg over the knee of the other and glanced up keenly at his visitor.

Captain Avory's first proceeding was to bring out his flask—it held a quart—and place it on the head of the empty cask. Bosy's eyes sparkled, and he snatched his lips involuntarily. The captain's next proceeding was to produce a small canvas bag, half full of gold; this, after a preliminary clunk, he placed beside the flask. At sight of this, Bosy's eyes seemed to strike fire. Next he brought out his meerschaum and tobacco-pouch, and having filled the former, he passed the pouch to Bosy, who produced a short black pipe from his waistcoat pocket and proceeded to follow his visitor's example. No sooner were the pipes fairly under way, than the captain helped Bosy and himself to a liberal supply of brandy. Bosy drank his undiluted, out of the tin punikin. 'It's good enough for me without water,' he said, as again he snatched his lips.

'Now for business,' said the captain.

'Ay, now for business,' responded Bosy, drawing his stool a little nearer that of the other.

It is not needful to set down all that passed at the interview between these two strangely assorted companions; what resulted from it we shall learn later on.

Hoogies—how it came by its name no one seemed to know—might with reason be termed the ancestral home of Bosy, or Ambrose Groote, seeing that it had been built by his great-great-grandfather a century and a half ago, and that each succeeding generation had made it their home. Once, it is true, there had been fifty or sixty acres of land attached to the house, but that had got into other hands long ago. Then, the Grootes had always kept up a connection with the fishing trade, and time out of mind had owned two or three of the Cawdry snacks. But, more than all else, they had been noted smugglers at a time when smuggling was a lucrative and semi-respectable profession. It was Bosy's father who first squandered the property, which had come down to him from three generations of thrifty ancestors. He was a lazy, drunken ne'er-do-weel, who attended every race within a circuit of fifty miles, and was fleeced by men as unscrupulous as himself, but far more cunning. At length the last fishing-boat had to be sold to pay creditors who would no longer be denied; and after that, Marvel Groote had seem to have gone rapidly from bad to worse. There were dark whispers afloat respecting a pedlar who had been seen going towards Hoogies in the dusk of an autumn evening and who from that hour had disappeared. It was even said that the fever which little Bosy Groote had about this time—he was then five or six years old—which left him with a warp of the mind from which he never recovered,

had its origin in a terrible fright—that, in fact, the child waking up in the middle of the night, had seen his father dragging the pedlar's body down-stairs to its ready-made grave in the garden. But it could scarcely have been anything more than surmise on the part of those who whispered this strange story to each other. In any case, a year or two later, Marvel Groote brought matters to a characteristic climax by setting fire to the house in one of his drunken fits and making it at the same time his own funeral pyre. After that, Bosy and his mother disappeared, and as years passed away, their names and very existence were almost forgotten.

A quarter of a century had come and gone when Bosy Groote found his way back alone to the ruined home of his youth. The place had an uncanny reputation, and had never been rebuilt. The soil had gradually encroached on it till what had formerly been a smiling garden, was now as waste and barren as the rest of the shore. Cottagers from the neighbouring village who wanted to build a pigsty or inclose a patch of ground had made a free use of the materials which were here ready to their hands; and there is little doubt that had not Bosy returned, the whole house would have disappeared piecemeal in the course of a few more years. Such as it was, however, Bosy now made it his home.

Five years had passed since his return. How he lived, no one seemed to know or care. He had no friends, was intimate with no one, and, so far as was known, no foot but his own ever crossed his threshold. In summer, when the weather was fine and the days long, he would wander about the country side with his fiddle, playing at merry-makings and junketings of various kinds, and be rewarded by sixpence here or a shilling there, together with as much to eat and drink as he wanted, and now and then with permission to sleep in a barn or outhouse. Bosy, in fact, was a familiar figure within a circuit of twenty miles round Boscombe. It was generally held that he was not quite right in his mind, though in what particular he differed from other people no one seemed able clearly to define. Others there were who held that he was just as sane as his neighbours, and that it was only to serve his own ends that he rather encouraged the idea of his being mentally deficient. Be this as it may, every one looked upon Bosy as being thoroughly harmless—although, curious to relate, little children seemed to have some instinctive dread of him, and always ran to their mothers the moment they set eyes on him.

Occasionally during the winter, Bosy would disappear from his usual haunts for three or four months together, and no one ever knew what became of him at such times. If questioned, he would say: 'I've just come back from a visit to the man in the moon. He and I are old cronies. I play to him, and he sings to me; only he has such a queer, cracked voice, that it makes me nearly die of laughing to hear him. But I'm glad to get back again, for it's mortal cold up there, I can tell you.'

It only now remains to be explained how Captain Avory and Bosy Groote came to be on such intimate terms. When the captain was a boy, he spent a year at a school at Boscombe Regis; but this was a fact which he now kept

carefully to himself. One day, when out walking, accompanied by his master's Newfoundland dog, he had come across a poor decrepit, half-witted lad who was being buffeted and cuffed by half-a-dozen boys bigger than himself. Young Avory had at once taken sides with the weaker; and by threatening to set his dog on the lad's tormentors, had effectually scared them away. Bosy Groote had never forgotten this service; and when the two men met more than thirty years later, they mutually recognised each other. More than once since then, the captain had found his way to Hoogies.

The flask was nearly empty, and they had refilled their pipes more than once before the captain and Bosy brought their talk to an end. When they had arranged all preliminaries to their satisfaction, the captain opened the canvas bag and proceeded to count out ten bright new sovereigns into his companion's long lean hand. 'There will be ten more for you,' he said, 'as soon as what we have to do is fairly completed.'

The moment Bosy's fingers closed on the gold, he gave utterance to a peculiar half-idiotic chuckle, which even startled the captain for a moment.

'By Jove!' he muttered, 'I should not like to be here alone with him at night if he thought I had much money about me—Don't forget,' he said as he rose, 'that you are to be at the Cottage not a minute later than eight o'clock on Monday evening next. It will be quite dark at that time, but should any one be about, wait till he is gone before you open the garden gate. Miss Avory will be prepared to receive you, and will give you some supper. I shall not reach the Cottage till about half past nine. You clearly understand?'

'Of course I understand, my noble prince; I ain't neither deaf nor stupid. I'll be there to the time, never fear—What a lark it will be, though, for the poor gentleman. Ho, ho, ho! I can't help laughing; it will be such fun for all of us, but specially for him!'

(To be concluded)

THE MONTH: SCIENCE AND ARTS

The Canadian Pacific Railway is now completed, and on the 8th November the first through-train from Montreal arrived at Vancouver. The line is two thousand eight hundred miles long, and the average speed, including stoppages, was twenty-four miles per hour. With the advantages open to travellers by the construction of this railway, it will before long be possible to travel from Liverpool to the Pacific in ten days.

The Madrid Commission appointed to investigate the question of the efficacy of inoculation as a remedy against cholera—a question which has raised such fierce discussions in Spain for and against the originator of the operation, Dr Ferran—has issued its verdict. The Commission is of opinion that the inoculations cannot be considered innocuous, and that the epidemic is actually propagated by them. Nor is it demonstrated by the results that the inoculations secure immunity from cholera. Moreover, the person

inoculated is for the first few days rendered more susceptible to contract any other form of disease. This adverse verdict will be a sore disappointment to those who believed that an antidote to a most terrible disease had at last been found.

From experiments lately carried out in the Aquarium at the Inventions Exhibition respecting the sleep of fishes, it appears that sleep is common to certain fish, and that all take rest at intervals. Roach, perch, gudgeon, tench, and some others rest periodically; and among marine fish, dory, conger-eel, dogfish, and all flat-fish seem to have the same instinct. Others seem to be ever wakeful, although they rest occasionally. The pike is an example of these latter. This fresh-water shark, though he may seize himself motionless for hours together and appear to be lethargic and lazy, is nevertheless always wakeful, and on the lookout for the wherewithal to satisfy his voracious appetite. At the Brighton Aquarium, not long ago, we observed how in one tank a beautiful company of silvery herrings were sailing unceasingly round a central rock. We were informed that the busy crowd rested, suspended in the water, directly the lights were extinguished every night.

All old sailors know that the best ropes that can be made are those produced from Manila hemp-fibre, and they also know that lives will often depend upon the trustworthiness of such a rope. Hitherto, no inferior fibre was known that could be mixed with true Manila without ready detection. But unscrupulous dealers have discovered in a fibre known as Sisal hemp—which comes from Sisal, Yucatan, in the Gulf of Mexico—an adulterant which, while resembling true Manila hemp, has the advantage of being much cheaper. A fact, too, with which they do not care to concern themselves, is that the new material possesses only half the strength of that which in other respects it imitates so well.

Messrs Frost, well-known rope-manufacturers, have recently pointed out that a ready test exists for detecting rope which has been thus sophisticated, a test of such a simple nature, that any one can make it without special apparatus. Taking three pieces of rope—one of pure Manila, one of Sisal, and one of the two fibres mixed together—they separate the untwisted threads, and roll each into a little ball between the palms of the hands. The three little woolly balls are now burned on an iron shovel, with the result that the pile of ash which each leaves is quite different from the other. The Manila hemp gives a grayish-black ash; the Sisal, a whitish gray; while the adulterated rope furnishes a residue in which each tone of colour is readily distinguishable. This simple and ready test of such a really important article of commerce will, it is hoped, make shipowners and those of whom they buy their ropes both more careful of the quality of the goods supplied.

The old adage, 'Do not speak to the man at the wheel,' which appears on most steam-vessels, may now possibly have to be supplemented by another to the effect that umbrellas must not be brought near the compass needle. On a recent occasion, such an apparently innocent instrument seriously interfered with the correct working of a

ship's compass. Upon examination by experts, the umbrella was found to be powerfully magnetised. Its owner had probably stood with it at some time near a working dynamo-machine, and magnetic induction had done the rest. We may remind our readers of a fact not generally known, that the steel parts of watches are often affected in the same way if their owners bring them near such machines, and a correct time-keeper can be rendered quite untrueworthy in that manner.

The explosion of the one hundred and forty tons of dynamite which were used to destroy Flood Rock—the great obstruction in New York Harbour—was successfully carried out last month. The shock lasted forty seconds, and was accompanied by a huge mountain of water, which rose to a height of two hundred feet above the spot where the mine was laid. Although the tremor caused by the shock was felt for many miles, it occasioned no damage to property. "And people can take some comfort from this last circumstance," it shows that the villainous threat which have been made to destroy our city—by dynamite—were simply impossible of realisation. In the case before it, the work of preparation occupied the time and labour of skilled engineers for ten years, while of course they had the command and assistance of the authorities; so all the difficult Criminal attempts would have to be made under far different conditions.

Mr Joseph Thompson's expedition to the New South-western month ago, which was hardly completed at the time, has just terminated, and he has returned to England, having accomplished his mission with the greatest success. It will be remembered that he went out under the auspices of the African Trading Company to secure a good will of the native, and then, when he had opened up a large district to the civilisation of commerce with Britain. The traveller spent well of the prospects of a good trade route, and which he has explored, and he is of the opinion that the country is densely populated, not by naked savages, but by Mohammedan tribes. He humorously describes them as having a passion for voluminous wrapping—'people who take fourteen yards of cloth to make a pair of trousers, and quite as many for a turban. The country is not unhealthy, and is extremely fertile.

In the middle of last month, a shower of fine sand fell in various parts of Italy and Sicily. The chief of one of the Italian observatories reports that the phenomenon was accompanied by a strong south-west wind. The shower of dust obscured the view of the neighbouring mountains, and the plants were all covered with an abundant reddish-yellow layer of sand. In the *Times*, the phenomenon is described at length as a 'shower of meteoric sand,' but there is no proof given that the falling particles had their origin beyond the confines of the earth.

The telephone system of automatically transporting goods from one place to another by the agency of electricity, which was invented by the late Prof. Sir Fleeming Jenkin, has now assumed practical shape; for a roadway on this principle was opened last month at Ebbw Vale, in Glamorgan. The line is a double one, and consists of horizontally laid steel rods supported at intervals on T-shaped poles eighteen feet high. The cross-piece of the T is eight feet long, and one of the steel

rod rests at either end. Trough-shaped buckets, each holding about two hundredweights, are suspended on light frames furnished with grooved wheels which run on the steel rods. A team of ten such buckets is driven by an electro motor, and the duty of the present system is to convey clay from the pit to a siding, whence it is carried in trucks to some cement works. The opening of this novel mode of conveyance aroused much interest. It is said to work well, but in several minor details can be improved.

The use of automatic sprinklers for the extinction of fires seems now to be attracting very general attention among owners of mills and warehouses. According to Professor Sylvanus Thompson, of the Fitchburg Technical College, one English firm alone has fitted up no fewer than twenty thousand of these contrivances in different parts of the country. Mr Thompson gave it as his opinion that as insurance rates rise with the risk, it will in many cases pay better to put up sprinkler, than to insure. We may remind our readers that these sprinklers are immediately put in action by any sudden rise in the temperature of the apartment where they are placed. An instrument is attached to the time when water can do the best service, that is to say, at the very first outbreak.

The question of the possibility of heating steam boilers, and also of particularly the boilers of marine engines, by means of liquid fuel, has, as we have our former column limited, attracted very much of the attention of engineers. In Russia, the problem has been already solved, both in the case of railway and marine engines, and of the latter which can be seen at the Imperial Society's recent exhibition of that kind. In Britain, remarkable experiments have been made in this direction without obtaining any practical result, but a lengthy reading of the report of the hundred-ton boiler, the *Hydrotank*, has been fitted with the more satisfactory apparatus, which is found to work in the most satisfactory manner. The apparatus consists of a coil of pipe conveying superheated steam from the boiler, with a smaller pipe within it at its point of delivery, for the reception of the liquid fuel, which flows from tanks on deck. The flash of steam carries the petroleum forward in the form of spray into a combustion chamber which occupies the place of the ordinary furnace. The *Hydrotank* formerly carried two hundred and forty tons of coal, and her consumption of that fuel was estimated at nine tons per day. This bulky fuel is now superseded by oil. The advantage of the latter over the former is obvious so far as saving of space is concerned. Early in November, the *Hydrotank* reached Granton from London, when it was found that the consumption of oil on the voyage had been little over eight gallons per hour, costing about one pound per day, which, when compared with the cost of coal, is one-seventh. It may be added that in addition to the saving in coal, a corresponding saving in labour was effected, two firemen doing the duty of five.

The Midland Railway Company are about to try the experiment of substituting steel sleepers for the wooden ones hitherto in use, and with that object, have ordered a sample lot of five thousand, which will be made in Belgium. It

appears that none of our British firms possessed the necessary plant to carry out such an order, except at a price that was far in excess of that demanded by the Belgian firm, which already has made steel sleepers for use in that country.

The street tramways of Birmingham are about to be remodelled, and the town-council have unanimously decided to adopt the cable system of traction. This system has already been extensively applied in America; but as yet we are able to point to only one example of it in this country—namely, on Highbury Hill, London, where it continues to work satisfactorily.

An essay upon Paper and the Industries connected with it, which was recently read before the Académie des Sciences by M. Bouteau, contained some remarkable statistics. In the United States alone, paper is made to the amount of half a million tons annually, while at the beginning of the century none at all was made in that country. In Europe, that amount is just doubled. The value of the raw material on this side of the Atlantic is worth twenty millions sterling. There are also some wonderful figures given as to the number of steel pens and lead used in these days, are in such demand among civilised nations.

A New York journal tells us of a traveller who recently brought from certain Peruvian sepulchres a collection of petrified human eyes, which he handed to a jeweller to be set in gold and arranged as a necklace. The workmen while executing the order became ill one after the other, and their indisposition was supposed to be due to the mineral poisons used in the embalming process. The whole story is rather a ghastly one, and we are glad to see that Prof. de Flower, of the British Natural History Museum, has destroyed its most repulsive feature. He says that the objects referred to are not human eyes, but the dried crystalline lenses of the eyes of a species of cuttle fish which were used as ornaments by the ancient inhabitants of South America, and are often found in their graves.

It seems but the other day that our troops were armed with the Snider rifle, the phenomenon of which was such a marked improvement upon that of the old muzzle-loader. But the Snider was soon replaced by the Martini-Henry, and now even that wonderful weapon is to be superseded by a new army service rifle. In the new arm the diameter of the bore is reduced, the weight of the bullet is reduced also by as much as one-fifth, while the powder-charge remains as before. By these and other means, the muzzle velocity of the bullet will be greatly increased, and the trajectory lowered, while the recoil will be less, and the general accuracy of shooting much improved. It is not yet decided whether a detachable magazine, which would practically turn the weapon into a repeating rifle, is to be added.

In one of those ingenious romances by Jules Verne in which science is so pleasantly blended with fiction, a submarine bent is described. This boat travels on or under the water at the will of its captain, sinks or rises to the surface, and is used for the destruction of other vessels, should occasion arise. The romance has become a reality.

The Nordenfolt submarine boat, recently publicly tried in Sweden, will do nearly all that was credited to its imaginary prototype. Such a vessel armed with torpedoes and able to creep beneath the vessels of a hostile fleet totally unperceived, is a possibility almost too terrible to contemplate. Its invention, however, need not be deplored, for it brings us nearer to that time when instincts of self-preservation will compel every nation to seek arbitration rather than war.

The Telegraph Construction and Maintenance Company are now carrying out an experiment on our east coast which may in its results be of the greatest commercial importance not only to ourselves but to other nationalities. They have demonstrated the possibility of holding constant communication by telephone with a light-ship moored ten miles away. Such light-ships are plentiful enough on our east coasts, where they guard vessels from running aground on the immutable sandbanks which abound there. Signals from such light-vessels are made when any ship runs aground, and there are never wanting hardy men who will launch their boats from the coast when such signals are seen or heard. But it is obvious that if each floating beacon were in electrical communication with the mainland, the exact place of a ship in distress could at once be telephoned, and much time in that way saved. Having practically demonstrated to them that the thing is possible, the authorities will surely lose no time in arranging that every light-ship on our coasts shall be in electrical communication with the shore.

It has been calculated that the Kimberley diamond region has produced since the year 1870 more diamonds than were yielded by all the mines in the world during two centuries preceding that date. The selling price since 1882 has been reduced nearly one half, and it is generally admitted that over-production is responsible for this. People who have capital locked up in the form of these costly gems have reason, therefore, to be anxious about their reduction in value. There is also the possibility that science will point out how carbon can be artificially produced in its precious form, so as to become the veritable diamond. Indeed, the problem has been already solved, but the gems produced have been very small, and the cost of getting them far out of proportion to their market value.

Our American friends are fond of the colossal in every way. Their last work, which they facetiously call the eighth wonder of the world, takes the form of a huge model elephant, compared with which the largest known specimen of the living animal is but a pigmy. The erection was at first intended for an hotel; but the idea has degenerated into a mere show-place, which in the hands of a Company is to attract sightseers. With a length of one hundred and fifty feet, and a height of nearly one hundred feet, the edifice presents features of engineering skill which are well worthy of remark. Built of timber, the structure is covered with a skin of tin-plate. The entire weight of the building, if it may be called so, is one hundred thousand tons. It is situated on Coney Island.

The longest conduit ever made will be represented by the pipe which it is proposed to lay

down from Baku to Batoum. Its duty will be to carry petroleum from the one place to the other, a distance of five hundred and thirty miles.

INVENTIONS.*

A NEW LIFE-BUOY.

A LIFE-BUOY possessing several most novel and useful features has recently been brought before the public. The body of the invention is a large circular copper case, in shape similar to the familiar cork and canvas life-buoys. In order that its utility shall not be destroyed by the accidental presence of a crack or puncture, this circular copper case is divided into eight watertight compartments. There is a recess in the metal containing a spirit-flask and a whistle. At opposite sides of the buoy, the two ends of a chain are attached, and the buoy thus formed, which is pendulous about three feet, is intended as a foothold for the 'man overboard.' An attached loop of rope and a metal ring are for the purpose of suspending the buoy, in readiness for use, over the vessel's side, and also, when it has been called into practical requirement, of hoisting it with its human burden upon deck. But the feature of the 'Whitby' Buoy upon which it may mainly rest its chief claim to usefulness and novelty is its illuminant. On opposite points on the outside of the invention are metal tubes, through which run tubes having above a length of about a couple of feet, and having small canisters attached immediately below. These canisters contain quantities of calcium, which, as it may be necessary to explain to the less scientific of our readers, is a yellowish white metal intermediate between lead and gold in hardness, and present in chalk, stucco, and other compounds of lime. When calcium is placed in contact with water, the latter rapidly decomposes, with the result that lime is formed, and hydrogen escapes. Owing to the construction of the canisters, when the buoy is thrown into the sea, the water comes in contact with the chemical, and flames are at once produced automatically at the summit of the tubes. The calcium contained in the canisters is sufficient to produce an illuminant capable of burning for one hour. It should be mentioned that the buoy is furnished with supplementary hand-lights, and that flags, upon staffs of a foot or so in length, are in readiness to be attached to the ends of the metal tubes. Though the contrivance is primarily constructed with a view, to be used by one individual, it possesses a buoyancy capable of sustaining two or more men upon the surface of the water.

One of the chief advantages possessed by the buoy is the easy method by which it admits of being hoisted on board with its living freight. Preceding contrivances have necessitated the lowering of a boat, a feat which, in a very high sea, is attended with great difficulty and danger, and which sometimes is actually impossible. The various means by which any one overboard in possession of the life-buoy can, with his flags, his lights, and his whistle, effect the end which is so

* These inventions, and others that may follow, are not all necessarily recent.

desirable, and indicate his whereabouts, must commend themselves to every one. The 'Whitby' Life-buoy is being supplied by Messrs J. W. Gray and Son, of 115 Leadenhall Street, London, to the royal navy, and bids fair to supersede the old service-buoy.

The invention was recently formally put to trial from the royal yacht *Osborne*, in the presence of the Prince of Wales, Lord Charles Beresford, and a distinguished gathering, when the results were such as to give general satisfaction. Lord Charles reports that it is 'vastly superior to the service-buoy,' and that he 'never saw anything more perfect.'

A 'WASHABLE' WALL-PAPER.

Messrs Storey, Bros. & Co. of Lancaster have brought out a novelty which would seem to possess no little utility. It is a fabric for covering walls, to which the name of 'Tectorium' has been given. While it possesses an artistic appearance, it can be repeatedly and thoroughly washed with soap and water without suffering any injury, being entirely impervious to damp. It is very durable, as cheap as ordinary wall-paper, and can be applied in the usual way; while inasmuch as it checks the threads of damp into a room, it can lay claim to hygienic qualities. It has always been possible to clean, by diverse means, the articles of domestic furniture; and the only structural portions of a room which one has not been able thoroughly to wash have been the walls. With the new material in use, the walls may be scoured as freely as the floor, and the consequent advantages in the case of hospitals, schools, and other buildings, in which perfect cleanliness is so essential, will be considerable.

A WINDOW FIRE-ESCAPE APPARATUS.

What seems to be a useful mechanism for affording a means of escape, independent of outside aid, from the window of a house whose lower parts are enveloped in flames, has been patented by Mr H. Hargreaves, of 92 Osborne Road, Forestgate, London, E. The appliance—which is intended to be stowed beneath the dressing-table that usually stands before the window of a bedroom—consists of a vessel or bag capable of holding several persons, a stout iron framework partially covered with a stretch of canvas and an apparatus for paying out and receiving in two stout ropes. This apparatus is fixed inside the room just below the window-sill, and consists of an axle having at one extremity a pinch-handle, and carrying two rope-reels controlled by a powerful hand-brake. Upon a fire occurring, the dressing-table is removed; the iron framework is turned upon its hinges through the open window so as to be at right angles to the wall of the building; and the bag—to either side of which the ropes are attached—is hoisted through the sash and dropped through the projecting iron frame, immediately before the stretch of canvas. Thus the apparatus is in readiness for use; and we are told that the operations up to this point need not have occupied eight seconds. The individual who has constituted himself, or herself, the operator now assists the escaping persons on to the canvas

platform and into the pendent bag. No difficulty is encountered here, young children, aged persons, and invalids being able to enter the vessel with readiness. The first contingent in, the operator manipulates the brake and lowers the bag to the ground; raising it again, when it has discharged its occupants, by means of the pinch-handle. If there still remain any persons in the burning house besides the operator, he again proceeds to lower them in the manner described. Afterwards, he has to busy himself with his own safety, for effecting which, special facilities are afforded. He has done with the gear previously manipulated, and now turns his attention to two independent ropes, coiled on reels in the bag itself. The ends he hooks on to the non-framework, and afterwards entering the bag, and lowering himself to the ground by means of a small brake attached to the reels. We are assured that even young children of either sex can be readily instructed to use the apparatus with ease and perfect safety.

A NEW SYSTEM OF DREDGING.

A novel system of dredging, but one which seems likely to supersede former imperfect methods, has been devised recently. A vessel propelled by hydraulic power is employed, the time selected for operation being an ebb-tide, and from this vessel specially devised telescopic tubes project beneath. Water is forced through these under immense pressure, and in powerful jets or streams enters the accumulations of sand, mud, &c.—known as 'silt'—which it is desired to remove from the bed of the channel. The silt at once rises, and in accordance with one of the laws of hydraulics, is held in suspension, and carried along by the tide. The inventor of the new system Mr B. H. Thwaite, of 37 Victoria Street, Liverpool—says that as the vessel is gradually propelled through the water, enormous accumulations of silt can be disturbed and removed in a mere fraction of the time required by the usual dredging operations.

HOW TO BECOME A PATENTEE.

By an Amending Act, passed on the fourteenth of August of this year, some slight changes were introduced in the procedure of obtaining a patent. Under the principal Act, complete specifications had to be sent in within nine months of making application for a patent, and had to be accepted within twelve months of the same time. By the payment of a small fee to the Comptroller, that official may now, if he think right, extend the two periods by one month and three months respectively; and where such extension is allowed, an extension of four months is allowed for sealing the patent. Under the old Act, the period was fifteen months. It will be seen, therefore, that a patent must be sealed within nineteen months of making the application, which otherwise becomes void. Previous to the passing of the Amending Act, provisional specifications and drawings were open to the public; but they are now neither open to public inspection nor are they published. Inventors who abandon their applications, do not, therefore, by their attempt to obtain a patent, let the world into their secrets, as was formerly the case. It appears that doubts

arose whether, under the principal Act, persons, one of whom only was the inventor, could jointly obtain letters-patent. By the Amending Act it is declared that it has been and is lawful to grant such patents under the principal Act.

MECHANICAL SUBSTITUTE FOR A HORSE.

Some time ago, a gentleman who was prevented, by physical disqualification, from continuing the exercise on horseback which had always been so beneficial to his health, was possessed with the singular notion that it would be possible to construct a machine which, when seated upon, could be made to evolve the same action as a galloping horse. The inventor made his machine; it answered its purpose to his complete satisfaction; and the device having been patented, it has recently been manufactured and brought before the public. Whimsical as is the purpose of the machine, it has upon trial been commended by many medical authorities, and won no little favour. The 'rider' seats himself upon an ordinary leather saddle, his feet being in fixed stirrups, and his hands grasping a handle attached to a metal projection. The saddle is firmly attached to a small wooden platform below by means of metal connections. This platform is suspended by leather straps from the topmost extremities of four semicircular steel springs, which are firmly attached at the bottom to the metal foundation of the machine. Seated upon the saddle, the operator can be swayed about in all directions. Beneath the platform are four padded buffers—corresponding to the horse's feet—and by the weight and motion of the operator's body, these buffers strike or bump, at each depression, upon the foundation below, so that, with a little practice, an automatic imitation of horse-exercise can be produced. The movement can be made either very easy or very violent. By the full use of the handle, a good muscular action is said to be given to the chest and limbs. For invalids and all of a weak bodily constitution, the machine is strongly recommended. It is adjustable for the use of persons of different stature and weight; and for those condemned to sedentary employment, its daily use is said to be attended with beneficial results. The Automatic Horse-exercising Machine is manufactured by the Western Mechanical Company, Exeter.

OCCASIONAL NOTES.

PASTEUR'S SUCCESSFUL TREATMENT OF HYDROPHOBIA.

A DISEASE which is perhaps more awful than Asiatic cholera has at last, there is every reason to believe, been conquered by science. M. Pasteur, who has devoted his life to the development of the Germ theory of disease, and who, by close study of the effects of inoculation on the lower animals, has saved many thousands of sheep from that terrible scourge called splenic fever, has at last demonstrated that hydrophobia in man can be cured by similar means, and two cures have already been actually accomplished.

At the Academy of Medicine, Paris, M. Pasteur has given a statement of his researches and experiments regarding hydrophobic virus, with a view to its being utilised for the purposes

of preventive inoculation. Only after having experimented on hundreds of dogs and rabbits, has he succeeded in obtaining the virus, inoculation with which is not only a means of preventing the disease among dogs, but a remedy, if taken in time, for hydrophobia in those who have been bitten. It was necessary also to perform experiments not only on animals but on men. This was a serious matter. M. Pasteur some time ago stated that he had experimented with success on a man in a hospital, but that he did not then wish to say anything of the results, as a single case did not seem to him sufficiently conclusive. However, M. Pasteur has now spoken of a second case, which was conclusive, and of a third which was in the course of treatment. A boy twelve years of age, named Meister, had come from Alsace with his mother. He had been bitten fourteen times. Inspection of the dog which had bitten him left no doubt that it had suffered from hydrophobia. M. Pasteur took the celebrated Dr. Viduan, along with a professor of the School of Medicine, to see Meister. The two doctors stated that he was doomed to a painful death and might be experimented upon. The treatment thoroughly succeeded, and Meister is in perfect health. When the treatment began, he had been bitten sixty hours, and had travelled from Alsace to Paris. A shepherd boy of fifteen, named Judith, bitten in a fortnight ago, had been a week under treatment, and M. Pasteur was confident of curing him.

As to the origin of hydrophobia, M. Pasteur always says that nobody in the world can explain primal causes. As to its cure, his theory, he remarked, will require study by the profession in order to be made practical; but he emphatically stated that a cure for hydrophobia had been found.

This news is all the more welcome to us, for it comes at a time when in this country an extraordinary increase of the number of cases of rabies in dogs is reported. In South London, one veterinary surgeon alone has during the past six months had at least one case of rabies to deal with weekly; while during the same period the London coroners have had more requests to hold on deaths from hydrophobia than they have known for many years previously. As rabies in dogs is conveyed by one animal to another by biting, and as hydrophobia in man is produced in the same way, it is obvious that a general law that all animals should wear a muzzle would very quickly stamp out the dread disease. This, however, would be punishing the great majority of innocent dogs for the infinitesimal minority of tainted ones, though in Judland, some years back, the disease, which had assumed alarming proportions, was successfully arrested by a law which compelled all owners to chain or lock up their dogs, while the unfortunate which had no home were mercilessly killed.

UTILISATION OF WASTE FISH-PRODUCTS.

Amongst the schemes for the utilisation of what are now regarded as waste products in connection with our fisheries, is a comprehensive one promoted by Mr. Nordenfelt, of gun-making celebrity, and which many of the visitors at the Aberdeen meeting of the British Association had

an opportunity of testing in a practical way. Already, there is a factory at work in Aberdeen for the realisation of this project; and it is proposed to extend operations to fishing districts in England; Scotland, and Ireland. Sir Spencer Walpole estimates that in connection with her-
ring-curing alone we annually throw away thirty thousand tons of fish-refuse.

At the public luncheon in connection with the British Association, there was a demonstration of what could be done in the utilisation of what are now waste fish-products. Those who were present were treated to some extraordinary dishes. There were fish-extracts after the manner of Liebig, from which, with the aid of vegetables, soups were prepared. When it was explained that some of these extracts were derived from whale's flesh, the soups were regarded with some suspicion, but without reason, for they were as fresh and savoury to the palate as could be desired. Other novelties were extracts made from lobsters, crabs, mussels, &c. In the preparation of tinned lobsters, there is a great deal of waste, the flesh from the tail and claws only being preserved. An excellent extract can, however, be made from what was formerly regarded as offal, which has the same fine taste and flavour as the flesh of the lobster. The crab may be treated in the same way.

In order to show further how cheapness and utility may go hand in hand, it is intended to establish Family Kitchens, where a wholesome meal of potatoes and fish may be enjoyed for that coin.

The idea of the promoters of this new departure seems to be that every part of the fish can be utilised. The whale's flesh will be made to yield oil, extract of food, glue, meat tincture for dogs, and guano. The bones will yield oil, gelatine, and bone-meal; the entrails, glue and guano. From the blood will be drawn albumen; and the skins and skin will be tanned into leather. From cod and ling will be produced the usual dried fish, or an extract, and glue and guano.

INDIAN TEA.

A continental newspaper remarks, that the increasing favour Indian tea enjoys in England and her colonies is causing considerable anxiety to the producers of Chinese tea and to the European tea-firms established in China. Calcutta alone exported last year 62,773,187 pounds of tea to England, as against 58,830,478 pounds in 1883, and 51,579,704 pounds in 1882; whilst the Australian and New Zealand markets received in 1884, 1,029,463 pounds of Indian tea, as against 696,479 pounds in 1883. It is true that this latter figure exhibits a considerable falling-off as compared with the year 1882; but at present, Australia has also begun to give the preference to the teas of India, the quality of which surpasses by far the average produce of China, as does likewise that of the teas of Ceylon, for which there is also a prosperous future in store. The successes obtained by Natal in the cultivation of tea give rise to the supposition that South Africa will within a short time provide itself with home-grown tea. The total exportation of the largest Chinese tea-port, Foochow, amounted during the past season to 77,431,997 pounds, as against 81,100,875 pounds during the

same period in the preceding year. [The total exports of tea from China to the United Kingdom, 1875-83, have been over one hundred and forty millions of pounds annually.] At Hankow, Canton, Shanghai, and Macao, the proportion will probably be the same, or nearly so. The decrease in the exportation of tea from the whole of China, as compared with the preceding year, will amount to about ten millions, and this diminution is essentially to be attributed to the deterioration of the quality of Chinese tea. The sorts of tea produced in the province of Fukien, which were formerly very highly esteemed, are principally those which have deteriorated the most.

The cultivation of tea on Chinese methods was first tried by the Indian government in 1834, and the most profitable growth is a hybrid between the indigenous and Chinese varieties. Assam supplies about seventy per cent. of the total yield, and the industry is almost entirely in the hands of Europeans.

These statements are amply borne out by a reference to the state of our retail trade in Indian tea. A recent number of the *Gleaner* says that Indian tea is gaining favour with the retail trade, who are evidently turning their attention more to Assam than to China growths, owing to the taste which is spreading amongst consumers for teas of undoubted strength and quality. Useful China teas are to be had suitable to the requirements of the home-trade, but they are generally weaker than Indian. A sample of Natal-grown tea sold for more, in London, lately, than a similar sample from Ceylon.

FOOD-ADULTERATION

The Annual Report of the Local Government Board for last year shows that there are now two hundred and sixty public analysts, appointed in various parts of the country under the Sale of Food Act, to guard the interests of consumers. About twenty-three thousand analyses of samples of food were made. In connection with the grocery trade, out of five hundred and fifty-one samples of flour examined, only six were found adulterated. Spirits, butter, and coffee seem to lend themselves most easily to adulteration. Of two thousand one hundred and thirty-eight samples of spirits examined, there were about five hundred cases of adulteration; in the case of eighteen hundred and thirty-two samples of butter, there were three hundred and seventy-three; and of thirteen hundred and thirty-eight samples of coffee, two hundred and seventy-two. In the case of jam, out of two hundred and eleven samples, twenty-four were adulterated; and of seven hundred and seventy samples of mustard, eighty-two contained foreign admixtures. The Report is severe on the sale of butterine as genuine butter. 'The sale of imitations of butter is apparently on the increase, and there is no doubt that they are generally purchased as butter. We have no information as to actual injury being caused to health by the consumption of butterine, which is mainly composed of beef or pork fat, though it is stated to be less easily digested than real butter. The practice, however, of selling it in substitution for and at the price of genuine butter is not only a fraud on the buyer, but is exceedingly

harmful to the English and Irish dairy-trade. Coffee continues to be one of the chief subjects of adulteration, the mixture sold as such frequently consisting of one-fourth part of coffee added to three-fourths of chicory. No attempt is made to adulterate sugar, apparently, for the three hundred and twelve samples analysed were all found to be genuine.

FRUIT-GROWING IN THE FENS.

A contemporary remarks that the quantity of fruit which has this year been grown in the neighbourhood of Wisbech is enormous, a considerable portion of the crop having found its way to London for the purpose of conversion into jam. Upon a farm of some hundred and forty acres, the growth of strawberries for preserving has this season been a speciality; and it is said that for two or three weeks as much as ten tons-weight was the periodical consignment to London of this one fruit alone. The gooseberry crop has also been a good one, the berries being raised upon bushes planted beneath pear or plum trees, in order to keep them green, which is their most marketable condition. Many farms of considerable extent, which only a year or two ago produced corn at a loss, now grow fruit at a profit; and the increased area under the latter description of crop may easily be estimated, when it is stated that hundreds of Londoners of the class which supplies the hop districts with pickers, have been imported into Wisbech during the past two months. Taken as a whole, the crop of currants, strawberries, gooseberries, plums, and other preserving fruits has this year been an exceptionally heavy one in that district, and consumers of jam are likely to have a good time.

ANOTHER USE FOR CHLORAL HYDRATE.

In addition to the use of chloral as an opiate, mentioned in article 'Curiosities of Poisons' (*Journal*, No. 92), a medical correspondent kindly points out that it is also a very powerful preservative of animal tissues. It has the property of checking the decomposition of a great number of albuminous substances, such as milk and meat, and is consequently largely used by medical men for the preservation of anatomical structures, and for their preparation for the microscope. Ten grains to the ounce (liquid measure) of water is the ordinary strength used; and to preserve any very large anatomical specimen, two or three ounces may be used of the chloral, to be dissolved in water sufficient to cover the material. Personne recommends its use with glycerine for the preservation of anatomical specimens.

UNSWEETENED PRESERVED MILK.

In connection with the subject of 'Preserved Milk,' the manufacture of which we have already described (*Journal*, No. 96), it may be well to state, that unsweetened preserved milk may also be had. For those who do not want thirty or forty per cent. of cane-sugar in their preserved milk, good ordinary milk may be had which has simply been concentrated by careful evaporation at a very low temperature to one-fourth of its bulk. One quart of the liquid condensed milk mixed with three quarts of water will produce

four quarts of ordinary fresh milk. It is claimed for this preparation that it will keep good in any climate: it is used in some of the London hospitals, and was of service to the sick and wounded during the Soulan campaign, some of the nurses preferring it for this purpose to the sweetened milk. Mr Gail Borden of White Plains, New York, has the honour of originating the industry of 'plain condensed milk,' and 'preserved milk' to which sugar has been added. He introduced his plain condensed milk in 1851, and ten years afterwards his preserved milk was largely used by the American army in the field. The manufacture was introduced to Switzerland in 1865, and now condensing factories are established in England, Ireland, Denmark, Norway, Bavaria, and other countries.

ONLY A SONG

It was only a simple ballad,
Sung to a careless throng;
There were none that knew the singer,
And few that heeded the song.
Yet the singer's voice was tender
And sweet as with love untold;
Surely those hearts were hardened,
That it left so proud and cold.

She sang of the wondrous glory
That touches the woods in spring,
Of the birds that sing in the trees,
Of the happy birds low warbling
The requiem of the day,
And the quiet hush of the valleys
In the dusk of the gloaming gray.

And one in a distant corner,
A woman, worn with strife,
Heard in that song a message
From the spring-time of her life.
Fair forms rose up before her,
From the mist of vanished years,
She sat in a happy blindness,
Her eyes were veiled in tears.

Then when the song was ended,
And hushed the last sweet tone,
The listener rose up softly,
And went on her way alone.
Once more to her life of labour
She passed; but her heart was strong;
And she prayed, 'God bless the singer!
And oh, thank God for the song!'

FLORENCE TYLER.

The Conductor of CHAMBERS'S JOURNAL begs to direct the attention of CONTRIBUTORS to the following notice.

1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.

2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3d. To secure the safe return of ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

If the above rules are complied with, the Editor will do his best to insure the safe return of ineligible papers.

POOR JACK.

IN a great nation such as ours, essentially maritime, it is astounding how few there are who have any acquaintance with the manners and customs of the sailors of our mercantile marine. Our ships on every sea, some perchance steaming onwards with the distressing glare of a scorching tropical sun at noonday falling vertically on the devoted heads of their crews, their stokers fainting by reason of the intense heat and utter stagnation of the atmosphere; others, their canvas straining and timbers creaking in fierce conflict with the ice-cold blasts of the gales of the polar seas; or throughout the long dreary night and short days of dense fog, all hands with every sense alert, in dread anticipation lest at any moment some massive iceberg should drift across their path, carrying destruction upon them.

These pioneers of civilisation, not unworthy descendants of the hardy Norsemen who first turned in furrows the waters of the German Ocean with their rude keels, are as much strangers to the dwellers in our country towns and hamlets as the inhabitants of the interior of Africa or Swift's Lilliputians. The novelist represents them as men full to the brim with nautical phrases, given to lurching up their trousers and pulling their forelocks; men incapable of talking on any theme like a rational being, their jaws always revolving some choice piece of hard tobacco, in order to extract its dark juice, which they expectorate wherever they may be. The painter holds forth Jack to the world with his nether limbs encased in garments evolved from the painter's inner consciousness; while, on the other hand, his manly breast is exposed to all the winds that blow. In both cases he is totally misrepresented. This may be due to the fact that the sailor of the royal navy is always seen in his uniform. His jaunty hat with streamers flying in the wind, his painfully clean knife lanyard, his peculiarly shaped ungentlemanlike,

his rolling gut, and bronzed countenance, all conspire to impress the mind of the average landsman with the feeling that this is the real Simon Pure. He has all the outward and visible signs of a toiler of the deep, without which, as the advertisements have it, none are genuine. Would that the sailors of our vast merchant navy could assimilate in these respects with their more fortunate brethren of the sister service. Nothing, however, can be more dissimilar than the dress and deportment of the two classes. They are as far apart as the poles of the universe.

To the man-of-war's man is assigned the guardianship of our commerce. He is supported by the money of the nation; his officers are gentlemen, who vie with each other in their zealous efforts to keep him presentable and of good morals. He is rarely overburdened with work, and that which he has is of a very light character. His food is well cooked by trained men, and scrupulously clean. He is not compelled to draw rations which he does not care to eat. The value of these rations is placed to his account at a specified price, thus enabling him to supply himself with more pleasing fare when in port. During the greater part of his life he is swinging to moorings in some snug harbour, taking at times a pleasure-trip to sea just for the benefit of his health and 'to keep his hand in.' If all, he has good medical advice ready to hand. On returning home, he is granted leave of absence to display himself to his admiring town-folk. When age creeps upon him, he is pensioned off with something to live upon, while at his death, if he should wish it, he is granted a funeral with naval honours. This is the *beau idéal* of a sailor's life. To a youth wishing to adopt a seafaring life, we unhesitatingly say that the royal navy is to be preferred to the merchant service.

Now, let us turn to the latter picture—the very scannest life one could follow. And yet, without 'Poor Jack,' commerce would be at a stand-still. Of what use would be the products

of our looms and factories, of what avail our industries of coal and iron, if we had no hardy mariners to carry our textile fabrics, our coal, and our iron, across the stormy ocean, bringing back more rare and more valuable necessities, together with the luxuries which render the lowly cottage home of the present day equal in point of comfort to the ancient baronial hall?

Cromwell, when he framed the Navigation Laws, struck at the root of Holland's supremacy as a carrier on the high seas. Great Britain at once assumed the sceptre, which she has wielded ever since. The Lord Protector, with great wisdom foresaw that the British nation had been ordained by her insular position to carry commerce into the most remote parts of the earth. Unless she were mistress of the seas, the occupation of her people would be limited to the tillage of the soil. We should be compelled to depend on the precarious results of toil-some agriculture. Our sailors have carried our religion and our advanced civilisation at the same time as our articles of merchandise. They have brought back with them the arts and sciences peculiar to other nations. They have been, although perhaps unwittingly, prime factors in doing good to our own people and to all mankind. They conduct our overflowing population in safety to new and more inviting shores, to found cities and states, which shall hereafter make their voices heard with no uncertain sound in the great councils of the world. Notwithstanding all this, the merchant sailor is scarcely known outside of his own circle. He has helped to swell the banking account of many a shipowner, yet but scant justice has been meted out to him. He is, as a class, deteriorating both physically and morally, and it is fairly within the limits of probability that the genuine merchant sailor will, unless some alteration takes place, soon be almost as rare as the mastodon.

Why is this? We cannot believe that there is anything of necessity demoralising in the life of a seafarer. The ocean with its ever changing aspect; the wondrous phenomena of the atmosphere; the gorgeous sunsets and azure vault of the heavens above him, studded with myriads of effulgent stars, afford him subjects for elevated feeling. Nor can it be affirmed that life on the ocean is prejudicial to health; nowhere is there such an unlimited supply of fresh air and ozone. It is, however, a lamentable but indisputable fact that our merchant sailors are sadly altering for the worse. We have shown that this cannot be attributed to any evils inherent in the life itself; it must therefore be due to remediable external influences, over which Poor Jack may or may not have control. He is sliding down a steep social plane, attaining a greater velocity as he descends. His naval confrère, however, has moved onwards both in personal comforts and moral qualities in one unbroken march of improvement.

What are the causes acting so injuriously to the merchant seaman? Can any feasible remedies be proposed? These are the questions which force themselves upon our attention, and call for our careful consideration. In our opinion, the sailor of himself can do but little to arrest his downward progress. Circumstances are too

strong for him. It would appear that it is to the shipowners to whom we must look to arrest the degeneracy of the British seaman. The principal causes of his deterioration are the introduction of steamships; the abolition of compulsory apprenticeship; want of kindred feeling between the shipowner and his employees; the almost complete absence of any home influence whatever while on shore; drunken habits; and last, but not least, the bad accommodation on board ship.

The introduction of steam as a motive-power on the deep sea effected a complete revolution in the condition of the merchant seaman. The old collier craft of the North Sea were swept away. These vessels constituted a splendid nursery of seamen, merchant and naval. They were family ships, wherein the sailors had an interest in their welfare. Now, a single steamship is owned by many people. It may so happen that the mill rector in some out-of-the-way country parsonage is indirectly, in his capacity of shareholder in some single ship Company, the cause of great suffering to his fellow-man at sea. Sailors cannot be trained in steamships, which in most instances have only rudimentary masts. The stately tea-clipper with her lofty spars, graceful line, and immense spread of canvas, has disappeared. It would break the heart of the old-time clipper-sailor if he were to see these straight-stemmed, ungraceful steamers which have taken over the trade. Even the route is changed since his day; although it is possible, if the trying quarantine regulations recommended by the Sanitary Congress be adopted, it would pay the shipowner better to adopt the old Cape route, in preference to that of the Suez Canal. Our ships are too valuable to be needlessly delayed at the behest of any foreign power. Everything is now made of iron or steel, and, as far as possible, worked by steam. This is the iron age in reality. The iron has entered into the seaman's soul. Stokers have been brought in who were drawn from a lower class than that from which sailors came; these rough, uncouth men have reacted on the sailor with whom they mess. Moreover, in steamers it is sufficient if the man before the mast know how to steer; this can be easily acquired, and his other duties call for no more skill; he is simply a hewer of wood and drawer of water. Hence sailors of the old type are becoming few and far between.

It was formerly compulsory on all owners to carry a certain number of youths as apprentices to the nautical profession; but shipowners petitioned against this, and compulsory apprenticeship was abolished. An apprentice would usually be of the lower-middle class. His parents had to pay a premium with him, and he was bound to serve an apprenticeship of seven years; at the end of which time he was, as a rule, eligible for a junior officer's post, when occasion offered. Now, but few ships carry apprentices; while in steamers it is out of the question. It is true that we have reformatory and other training-ships for boys partly to supply the deficit. But, we ask, why should the mercantile marine be deemed just the place to send refuse gathered from the criminal classes? The falling-off in apprentices also led to the introduction

of foreigners in great numbers, till, at the present date, probably more than half the crews of ships flying the British flag are aliens. We remember three large ships lost a little while ago the crews of which were almost without exception Scandinavians. In two ships well known to us, one hailing from Liverpool, the other from London, not a man on board of either was a subject of Her Britannic Majesty. These foreigners are mostly Scandinavians and Russians. They are excellent seamen, but certainly not the elite of their race. In many cases they are deserters from their own country's ships. They are untidy in their habits, too often addicted to drunkenness, and far inferior in morality to the apprentices whom they have supplanted. Their recklessness vitiates in the eye of the shipowner is their excessive quietness.

In the present state of shipowning, the employers and employed are rarely brought into personal contact. The men are treated as inferior kinds of machines, to be used when requisite, but not of sufficient value to return when the exigency is satisfied. In many cases, when the ship gets in, Jack is sent about his business. If Poor Jack should require money in a foreign port, or even in British India, the rate of exchange is sure to tell against him. He is not allowed to draw much. The captain, however, kindly agrees with a so-called bumpoat man, or purveyor of small stores, to pay for whatever his crew may buy. Now, money is what Jack wishes for. The trader will advance him one rupee if he is allowed to call it two; thus Jack receives, say, five rupees, and becomes a debtor to the trader for ten.

When Jack gets home, his troubles assume another form. In this respect he is, however, thanks to the Board of Trade, far better off than formerly. We cannot bestow too much praise on that department for their paternal care of him in the face of vested interests. The sailor can now, if he chooses, proceed to his home at once. The Board of Trade has proper officials who attend to his accounts, and, by means of the post-office, remit his money to him. There are many sailors who have no relatives; they either lodge at the Sailors' Home or at private lodgings.

With respect to Sailors' Homes, it is a very better than boarding-houses, they are capable of great improvement. The influence of home is conspicuous by its absence.

A great deal of the drunkenness of sailors appears to be caused by the enforced abstinence from alcoholic drink during a long passage, and the sudden return to beer and spirits when they arrive in port. The landman who is in the habit of taking his wine or beer at regular intervals is able to drink freely without showing it; while Poor Jack is madly inebriated with a relatively small quantity. He then becomes the stupid prey of the hawks and decoy-birds which hover round him while on shore. He resembles the flying-fish, which escapes the dangers of its natural element, only to fall easily into others.

At sea, the accommodation is simply abominable. Let us take, by way of example, one of the finest Australian clippers sailing from the port of London. See her at her loading berth, a triumph of the ship-builder's art. Surely a large ship with no expense spared in her fittings,

has well-appointed quarters for her sailors. She has cow-houses and sheep-pens on most approved principles; but the misery of the sailor's resting-place is indescribable. It is under a small deck, tight forward, called the topgallant forecabin, comparable only to a dungeon. The huge chain cable leads through this space which is to be the home of the crew. The bunks are three tiers high, so that the lower bunk is but six inches from the floor. The windlass is also inside, and when, on heaving up anchor, the chain comes in covered with slimy fetid mud, which falls off in great flakes on the floor, the whole place is covered with the pestiferous ooze of Father Thames. His dripping oil-clothes form many rivulets, as he is compelled to hang them up by the side of his bed. The cow and the pig are furnished with the necessary comfort; the higher animal, man, is not deemed worthy of such attention. The death of a cow appears in the profit-and-loss account; the diseases contracted by bad housing of seamen do not appear. It is a true saying that 'Cleanliness is next to godliness.' How, then, can we expect our men to be moral, when they are herded together with less decency than the brute beasts on board? The cooks, to whom the preparation of very indifferent food is intrusted, have little or no training, as any one is deemed fit for this post in a merchant-ship. Three days a week, when the temperature is perhaps ninety degrees in the shade, the scalding hot pea-soup makes its appearance with unalting regularity. The so-called pudding—a simple compound of flour and water unassisted by either fruit or sweet—might be deemed the production of some fallen race; housewives would not recognise it. No condiments of any kind are served out. The tea is boiled in a greasy caldron. All things are unsightly.

We would wish especially to point out that the foregoing remarks do not apply to our large lines of Atlantic steamers, which are becoming every day more after the man-of-war pattern.

Plimsoll did good work for our sailors; much more remains to be done. We hear of commissions on the Housing of the Poor; they might well have extended their inquiries to Poor Jack. His case is a strong one, and only requires the light of public opinion to be thrown on it.

A HOUSE DIVIDED AGAINST ITSELF.

BY MRS OLIPHANT.

CHAPTER XIV.

It had seemed to Frances, as it appears naturally to all who have little experience, that a man who was so ill as Captain Gault must get better or get worse without any of the lingering suspense which accompanies a less violent complaint; but, naturally, Lady Markham was wiser, and entertained no such delusions. When it had gone on for a week, it already seemed to Frances as if he had been ill for a year, as if there never had been any subject of interest in the world but the lingering course of the malady, which waxed from less to more, from days of quiet to hours of active delirium. The business-

like nurses, always so cool and calm, with their professional reports, gave the foolish girl a chill to her heart, thinking, as she did, of the anxiety that would have filled, not the house alone in which he lay, but all the little community, had he been ill at home. Perhaps it was better for him that he was not ill at home, that the changes in his state were watched by clear eyes, not made dim by tears or oversharpened by anxiety, but which took him very calmly, as a case interesting, no doubt, but only in a scientific sense.

After a few days, Lady Markham herself wrote to his mother a very kind letter, full of detail, describing everything which she had done, and how she had taken Captain Gaunt entirely into her own hands. 'I thought it better not to lose any time,' she said; 'and you may assure yourself that everything has been done for him that could have been done, had you yourself been here. I have acted exactly as I should have done for my own son in the circumstances;' and she proceeded to explain the treatment, in a manner which was far too full of knowledge for poor Mrs Gaunt's understanding, who could scarcely read the letter for tears. The best nurses, the best doctor, the most anxious care, Lady Markham's own personal supervision, so that nothing should be neglected. The two old parents held their little counsel over this letter with full hearts. It had been Mrs Gaunt's first intention to start at once, to get to her boy as fast as express trains could carry her; but then they began to look at each other, to falter forth broken words about expense. Two nurses, the best doctor in London—and then the mother's rapid journey, the old general left alone. How was she to do it, so anxious, so unaccustomed as she was? They decided, with many doubts and terrors, with great self-denial, and many a sick flutter of questionings as to which was best, to remain. Lady Markham had promised them news every day of their boy, and a telegram at once if there was 'any change'—those awful words, that slay the very soul. Even the poor mother decided that in these circumstances it would be 'self-indulgence' to go; and from henceforward, the old people lived upon the post-hours, lived in awful anticipation of a telegram announcing a 'change.' Frances was their daily correspondent. She had gone to look at him, she always said, though the nurses would not permit her to stay. He was no worse. But till another week, there could be no change; then she would write that the critical day had passed—that there was still no change, and would not be again for a week; but that he was no worse. No worse—this was the poor fare upon which General Gaunt and his wife lived in their little Swiss *pension*, where it was so cheap. They gave up even their additional candle, and economised that poor little bit of expenditure; they gave up their wine; they made none of the little excursions which had been their delight. Even with all these economies, how were they to provide the expenses which were running on—the dear London lodgings, the nurses, the boundless outgoings, which it was understood they would not grudge. Grudge! No; not all the money in the world, if it could save their Georgy. But where—where

were they to get this money? Whence was it to come?

This Frances knew, but no one else. And she, too, knew that the lodgings and the nurses and the doctors were so far from being all. The poor girl spent the days much as they did, in agonised questions and considerations. If she could but get her money, her own money, whatever it was. Later, for her own use, what would it matter? She could work, she could take care of children, it did not matter what she did: but to save him, to save them. She had learned so much, however, about life and the world in which she lived, as to know that were her object known, it would be treated as the supremest folly. Wild ideas of Jews, of finding somebody who would lend her what she wanted, as young men do in novels, rose in her mind, and were dismissed, and returned again. But she was not a young man; she was only a girl, and knew not what to do, nor where to go. Not even the very alphabet of such knowledge was hers. While this was going on, she was taken, all abstracted as she was, into Society—to the solemn heavinesses of dinner-parties; to dances even, in which her gravity and self-absorption were construed to mean very different things. Lady Markham had never said a word to any one of the idea which had sprung into her own mind full grown at sight of Sir Thomas holding in fatherly kindness her little girl's hands. She had never said a word, oh, not a word. How such a wild and extraordinary rumour had got about, she could not imagine. But the wags of Society and its modes of information are insatiable—a glance, a smile, are enough. And what so natural as this to bring a veil of gravity over even a *débutante* in her first season. Lucky little girl, some people said; poor little thing, some others. No wonder she was so serious; and her mother, that successful general—her mother, that triumphant match-maker, radiant, in spite, people said, of the very uncomfortable state of affairs about Markham, and the fact that, in the absence of her executor, Nelly Winterbourn knew nothing as yet as to how she was 'left.'

Thus the weeks went past in great suspense for all. Markham had recovered, it need scarcely be said, from his fit of remorse; and he, perhaps, was the one to whom the uncertainties were a relief rather than an oppression. Mrs Winterbourn had retired into the country, to wait the arrival of the all-important functionary who had possession of her husband's will, and to pass decorously the first profundity of her mourning. Naturally, Society knew everything about Nelly; how, under the infliction of Sarah Winterbourn's society, she was quite as well as could be expected; how she was behaving herself beautifully in her retirement, seeing nobody, doing just what it was right to do. Nelly had always managed to retain the approval of Society, whatever she did. In the best circles, it was now a subject of indignant remark that Sarah Winterbourn should take it upon herself to keep watch like a dragon over the widow. For Nelly's provision was right, and the widow was what the men now called her, though women are not addicted to that form of nomenclature. But Sarah Winterbourn was universally condemned.

Now that the poor girl had completed her time of bondage, and conducted herself so perfectly, why could not that dragon leave her alone? Markham made no remark upon the subject; but his mother, who understood him so well, believed he was glad that Sarah Winterbourn should be there, making all visits unseemly. Lady Markham thought he was glad of the pause altogether, of the impossibility of doing anything; and that he was allowed to go on without any disturbance in his usual way. She had herself made one visit to Nelly, and reported, when she came home, that notwithstanding the presence of Sarah, Nelly's natural brightness was beginning to appear, and that soon she would be as *espiègle* as ever. That was Lady Markham's view of the subject; and there was no doubt that she spoke with perfect knowledge.

It was very surprising, accordingly, to the ladies, when, some days after this, Lady Markham's butler came up-stairs to say that Mrs Winterbourn was at the door, and had sent to inquire whether his mistress was at home and alone before coming up-stairs. 'Of course I am at home,' said Lady Markham; 'I am always at home to Mrs Winterbourn. But to no one else, remember, while she is here.' When the man went away with his message, Lady Markham had a moment of hesitation. 'You may stay,' she said to Frances, 'as you were present before and saw her in her trouble. But I wonder what has brought her to town? She did not intend to come to town till the end of the season. She must have something to tell me.—O Nelly, how are you, dear?' she cried, going forward and taking the young widow in her arms. Nelly was in rapture from top to toe. As she had always done what was right, what people expected from her, she continued to do so till the end. A little rim of white was under the edge of her close black bonnet with its long veil. Her cuffs were white and hem-stitched in the old-fashioned *deep* way. Nothing, in short, could be more *deep* than Nelly's costume altogether. She was a very pattern for widows; and it was very becoming, as that dress seldom fails to be. It would have been natural to expect in Nelly's countenance some consciousness of this, as well as perhaps a something at the corners of her mouth which should show that, as Lady Markham said, she would soon be as *espiègle* as ever. But there was nothing of this in her face. She seemed to have stiffened with her crape. She suffered Lady Markham's embraces rather than returned fit. She did not take any notice of Frances. She walked across the room, sweeping with her long dress, with her long veil like an ensign of woe, and sat down with her back to the light. But for a minute or more she said nothing, and listened to Lady Markham's questions without even a movement in reply.

'What is the matter, my dear? Is it something you have to tell me, or have you only got tired of the country?' Lady Markham said, with a look of alarm beginning to appear in her face.

'I am tired of the country,' said Mrs Winterbourn; 'but I am also tired of everything else, so that does not matter much.—Lady Markham, I have come to tell you a great piece of news.

My trustee and Mr Winterbourn's executor, who has been at the other end of the world, has come home.'

'Yes, Nelly?' Lady Markham's look of alarm grew more and more marked. 'You make me very anxious,' she cried. 'I am sure something has happened that you did not foresee.'

'Oh, nothing has happened—that I ought not to have foreseen. I always wondered why Sarah Winterbourn stuck to me so. The will has been opened and read, and I know how it all is now. I rushed to tell you, as you have been so kind.'

'Dear Nelly!' Lady Markham said, not knowing, in the growing perturbation of her mind, what else to say.

'Mr Winterbourn has been very liberal to me. He has left me everything he can leave, away from his heir-at-law. Nothing that is entailed, of course; but there is not very much under the entail. They tell me I will be one of the richest women—a wealthy widow.'

'My dear Nelly, I am so very glad; but I am not surprised. Mr Winterbourn had a great sense of justice. He could not do less for you than that.'

'But Lady Markham, you have not heard all.' It was not like Nelly Winterbourn to speak in such measured tones. There was not the faintest sign of the *espiègle* in her tone. Frances, roused by the astonished, alarmed look in her mother's face, drew a little nearer almost involuntarily, notwithstanding her abstraction in anxieties of her own.

'Nelly, do you mind Frances being here?'

'Oh, I wish her to be here! It will do her good. If she is going to do—the same as I did, she ought to know.' She made a pause again; Lady Markham meanwhile growing pale with fright and panic, though she did not know what there could be to fear.

'There are some people who had begun to think that I was not so well "left" as was expected,' she said; 'but they were mistaken. I am very well "left." I am to have the house in Grosvenor Square, and the Knoll, and all the plate and carriages, and three parts or so of Mr Winterbourn's fortune—so long as I remain Mr Winterbourn's widow. He was, as you say, a just man.'

'There was a pause. But for something in the air which tingled after Nelly's voice had ceased, the listeners would scarcely have been conscious that anything more than ordinary had been said. Lady Markham said 'Nelly?' in a breathless interrogative tone—alarmed by that thrill in the air, rather than by the words, which were so simple in their sound.'

'O yes; he had a great sense of justice. So long as I remain Mrs Winterbourn, I am to have all that. It was his, and I was his, and the property is to be kept together.—Don't you see, Lady Markham?—Sarah knew it, and I might have known, had I thought. He had a great respect for the name of Winterbourn—not much, perhaps, for anything else.' She paused a little; then added: 'That's all. I wished you to know.'

'O my dear,' cried Lady Markham, 'is it possible—is it possible? You—debarred from marrying, debarred from everything—at your age!'

'Oh, I can do anything I please,' cried Nelly.

'I can go to the bad if I please. He does not say so long as I behave myself—only so long as I remain the widow Winterbourn. I told you they would all call me so.—Well, they can do it! That's what I am to be all my life—the widow Winterbourn.'

'Nelly—O Nelly,' cried Lady Markham, throwing her arms round her visitor. 'Oh, my poor child! And how can I tell—how am I to tell—?'

'You can tell everybody, if you please,' said Mrs Winterbourn, freeing herself from the clasp-
ing arms and rising up in her stiff escape. 'He had a great sense of justice. He doesn't say I'm to wear weeds all my life. I think I mean to come back to Grosvenor Square on Monday, and perhaps give a ball or two, and some dinners, to celebrate—for I have come into my fortune, don't you see?' she said with an unmoved face.

'Hush, dear—hush! You must not talk like that,' Lady Markham said, holding her arm.

'Why not? Justice is justice, whether for him or me. I was such a fool as to be wretched when he was dying, because— But it appears that there was no love lost—no love and no faith lost. He did not believe in me, any more than I believed in him. I outwitted him when he was living, and he outwits me when he is dead.—Do you hear, Frances?—that is how things go. If you do as I did, as I hear you are going to do— Oh, do it if you please; I will never interfere. But make up your mind to it—he will have his revenge on you—or justice; it is all the same thing.—Good-bye, Lady Markham. I hope you will countenance me at my first ball—for now I have come into my fortune, I mean to enjoy myself. Don't you think these things are rather becoming? I mean to wear them out. They will make a sensation at my parties,' she said, and for the first time laughed aloud.

'This is just the first wounded feeling,' said Lady Markham. 'O Nelly, you must not fly in the face of Society. You have always been so good.—No, no; let us think it over. Perhaps we can find a way out of it. There is bound to be a flaw somewhere.'

'Good-bye,' said Nelly. 'I have not fixed on the day for my first At Home; but the invitations will be out directly. Good-bye, Frances. You must come—and Sir Thomas. It will be a fine lesson for Sir Thomas.' She walked across the room to the door, and there stood for a moment, looking back. She looked taller, almost grand in still fury and despair with her immovable face. But as she stood there, a faint softening came to the marble. 'Tell Geoffrey gently,' she said, and went away. They could hear the soft sweep of her black robes retiring down the stairs, and then the door opening, the clang of the carriage.

Lady Markham had dropped into a chair in her dismay, and sat with her hands clasped and her eyes wide open, listening to these sounds, as if they might throw some light on the situation. The consequences which might follow from Nelly's freedom had been heavy on her heart; and it was possible that by-and-by the strange news might bring the usual comfort; but in the meantime, consternation overwhelmed her.

'As long as she remains his widow!' she said to herself in a tone of horror, as the tension of her nerves yielded and the carriage drove away. 'And how am I to tell him—gently; how am I to tell him gently?' she cried. It was as if a great catastrophe had overwhelmed the house.

In an hour or so, however, Lady Markham recovered her energy, and began to think whether there might be any way out of it. 'I will tell you,' she cried suddenly; 'there is your uncle Cavendish, Frances. He is a great lawyer. If any man can find a flaw in the will, he will do it.' She rang the bell at once, and ordered the carriage. 'But, O dear,' she said, 'I forgot. Lady Melhora is coming about Trotter's Buildings, the place in Whitechapel. I cannot go. Whatever may happen, I cannot go to-day. But, my dear, you have never taken any part as yet; you need not stay for this meeting; and besides, you are a favourite in Portland Place; you are the best person to go. You can tell your uncle Cavendish— Stop; I will write a note,' Lady Markham cried. That was always the most satisfactory plan in every case. She sent her daughter to get ready for going out; and she herself dashed off in two minutes four sheets of the clearest statement, a *procès* of the whole case. Mr Cavendish, like most people, liked Lady Markham; he did not share his wife's prejudices; and Frances was a favourite. Surely, moved by these two influences combined, he would bestir himself and find a flaw in the will!

In less than half an hour from the time of Mrs Winterbourn's departure, Frances found herself alone in the brougham, going towards Portland Place. Her mind was not absorbed in Nelly Winterbourn. She was not old enough, or sufficiently used to the ways of Society, to appreciate the tragedy in this case. Nelly's horror at the moment of her husband's death she had understood; but Nelly's tragic solemnity now struck her as with a jarring note. Indeed, Frances had never learnt to think of money as she ought. And yet, how anxious she was about money! How her thoughts returned as soon as she felt herself alone and free to pursue them, to the question which devoured her heart. It was a relief to her to be thus free, thus alone and silent, that she might think of it. If she could but have driven on and on for a hundred miles or so, to think of it, to find a solution for her problem! But even a single mile was something; for before she had got through the long line of Piccadilly, a sudden inspiration came to her mind. The one person in the world whom she could ask for help was the person whom she was on her way to see—her aunt Cavendish, who was rich, with whom she was a favourite, who was on the other side, ready to sympathise with all that belonged to the life of Boringhara, in opposition to Eaton Square. Nelly Winterbourn and her troubles fled like shadows from Frances' mind. To be truly disinterested, to be always mindful of other people's interests, it is well to have as few as possible of one's own.

Mrs Cavendish received her, as always, with a sort of combative tenderness, as if in competition for her favour with some powerful

adversary unseen. There was in her a constant readiness to outbid that adversary, to offer more than she did, of which Frances was usually uncomfortably conscious, but which to-day stimulated her like a cordial. 'I suppose you are being taken to all sorts of places?' she said. 'I wish I had not given up society so much; but when the season is over, and the fine people are all in the country, then you will see that we have not forgotten you.—Has Sir Thomas come with you, Frances? I supposed, perhaps, you had come to tell me?'—

'Sir Thomas?' Frances said with much surprise; but she was too much occupied with concerns more interesting to ask what her aunt could mean. 'Oh, aunt Charlotte,' she said, 'I have come to speak to you of something I am very, very much interested about.' In all sincerity, she had forgotten the original scope of her mission, and only remembered her own anxiety. And then she told her story—how Captain Gaunt, the son of her old friend, the youngest, the one that was best beloved, had come to town—how he had made friends who were not—*mine*—who made him play and lose money—though he had no money.

'Of course, my dear, I know—Lord Markham and his set.'

At this Frances coloured high. 'It was not Markham. Markham has found out for me. It was some—*fellows* who had no mercy, he said.'

'O yes; they are all the same set. I am very sorry that an innocent girl like you should be in any way mixed up with such people. Whether Lord Markham plucks the pigeon him-*self*, or gets some of his friends to do it'—

'Aunt Charlotte, now you take away my last hope; for Markham is my brother; and I will never, never ask any one to help me who speaks so of my brother—he is always so kind, so kind to me.'

'I don't see what opportunity he has ever had to be kind to you,' said Mrs. Cavendish.

But Frances in her disappointment would not listen. She turned away her head, to get rid, so far as was possible, of the blinding tears—those tears which would come in spite of her, notwithstanding all the efforts she could make. 'I had a little hope in you,' Frances said; 'but now I have none, none. My mother sees him every day; if he lives, she will have saved his life. But I cannot ask her for what I want. I cannot ask her for more—she has done so much. And now, you make it impossible for me to ask you!'

If Frances had studied how to move her aunt best, she could not have hit upon a more effectual way. 'My dear child,' cried Mrs. Cavendish, hurrying to her, drawing her into her arms, 'what is it, what is it that moves you so much? Of whom are you speaking? His life? Whose life is in danger? And what is it you want? If you think I, your father's only sister, will do less for you than Lady Markham does—! Tell me, my dear, tell me what is it you want?'

Then Frances continued her story. How young Gaunt was ill of a brain-fever, and raved about his losses, and the black and red, and of his

mother in mourning (with an additional ache in her heart, Frances suppressed all mention of Constance), and how *she* understood, though nobody else did, that the Gaunts were not rich, that even the illness itself would tax all their resources, and that the money, the debts to pay, would run them, and break their hearts. 'I don't say he has not been wrong, aunt Charlotte—oh, I suppose he has been very wrong!—but *here* he is lying: and oh, how pitiful it is to hear him! and the old general, who was so proud of him; and Mrs. Gaunt, dear Mrs. Gaunt, who always was so good to me!'

'Frances, my child—I am not a hard-hearted woman, though you seem to think so—I can understand all that. I am very, very sorry for the poor mother; and for the young man even, who has been led astray; but I don't see what you can do.'

'What!' cried Frances, her eyes flashing through her tears—'for their son, who is the same as a brother—for them, whom I have always known, who have helped to bring me up?—Oh, you don't know how people live where there are only a few of them, where there is no society, if you say that. If he had been ill there, at home, we should all have nursed him, every one. We should have thought of nothing else. We should have cooked for him, or gone errands, or done anything. Perhaps, those women are better; I don't know. But to tell me that you don't know what I could do. Oh,' cried the girl, springing to her feet, throwing up her hands, 'if I had the money, if I had only the money, I know what I would do!'

Mrs. Cavendish was a woman who did not spend money, who had everything she wanted, who thought little of what wealth could procure; but she was the Quixote in her heart which so many women are where great things are in question, though not in small. 'Money?' with a faint quaver of alarm in her voice. 'My dear, if it was anything that was feasible, anything that was right, and you wanted it very much—the money might be found,' she said. The position, however, was too strange to be mastered in a moment, and difficulties rose as she spoke.—'A young man. People might suppose— And then Sir Thomas—what would Sir Thomas think?'

'That is why I came to you; for he will not give me my own money—if I have any money. Aunt Charlotte, if you will give it me now, I will pay you back as soon as I am of age. Oh, I don't want to take it from you—I want— If everything could be paid before he is better, before he knows—if we could hide it, so that the general and his mother should never find out. That would be worst of all, if they were to find out—it would break their hearts. Oh, aunt Charlotte, she thinks there is no one like him. She loves him so; more than—more than any one here—and to find out all that would break her heart.'

Mrs. Cavendish rose too, and stood up with her face turned towards the door. 'I can't tell what is the matter with me,' she said; 'I can scarcely hear what you are saying. I wonder if I am going to be ill, or what it is. I thought just then I heard a voice. Surely there is some one at the door. I am sure I heard a

voice— Oh, a voice you ought to know, if it was true. Frances—I will think of all that after—just now— He must be dead, or else he is here!

Frances, who thought of no possibility of death save to one, caught her aunt's arm with a cry. The great house was very still—soft carpets everywhere—the distant sound of a closing door scarcely penetrating from below. Yet there was something, that faint human stir which is more subtle than sound. They stood and waited, the elder woman penetrated by sudden excitement and alarm, she could not tell why; the girl indifferent, yet ready for any wonder in the susceptibility of her anxious state. As they stood, not knowing what they expected, the door opened slowly, and there suddenly stood in the opening, like two people in a dream—Constance, smiling, drawing after her a taller figure. Frances, with a start of amazement, threw from her her aunt's arm, which she held, and calling 'Father!' threw herself into Waring's arms.

THE GORSE.

In spring, many a waste common and heath is bright with the showy, golden flowers of the gorse. If we pluck and examine one of these flowers, we shall find that in all essential points it is similar to that of the pea. The gorse, in fact, belongs to the great natural order of plants which includes the peas, the vetches, the clovers, and a host of other well-known flowers. Now, this pea tribe is interesting to the scientific botanist because of the many modifications which have occurred in past time among the different species belonging to it. Perhaps the most common of these modifications is the conversion of leaves into tendrils, by aid of which, plants like the peas and the vetches climb some distance from the ground, and so gain light and air which would have been excluded in a lower position.

The gorse affords us an excellent instance of modification in another direction. Any one who examines the gorse carefully cannot fail to be struck with its entire want of leaves; it is simply one mass of thorns and spines. The question at once suggests itself, has the plant always been possessed of these organs, or was there a time when it was clothed with leaves, like ordinary plants? We shall be better able to answer that question by considering for a few moments one or two other plants of a prickly character. Let us take the bramble and the hawthorn. It is quite apparent at first sight that there is a difference between the prickles of the bramble and those of the hawthorn, and this difference is proved by further examination. If the thorn of a bramble be pressed laterally with the thumb, the branch being meanwhile held firmly in the hand, it breaks away from the stem quite easily, leaving a smooth scar behind; but if the prickle of a hawthorn be treated in the same manner, it snaps abruptly, leaving a jagged rupture, and showing that it was connected with the internal

wood of the stem. The truth is that the thorn of the bramble is a modified hair, while that of the hawthorn is an arrested or aborted branch. Here, then, is a difference in origin between organs serving the same purpose—namely, protecting from browsing animals the tender green shoots and leaves.

But the gorse has gone a step further, for not only have the branches been modified into thorns, but the leaves themselves have been modified into spines. If a few of the seeds of the gorse be planted in a spot where they can be observed, it will be found that the plant, instead of coming up ready-armed with spines, as might be expected, comes up with the characteristic three-lobed leaf of the clovers, and continual observation will show in an interesting manner the gradual conversion of these leaves into spines. Now, what does this mean? Its coming up with ordinary leaves points to a period in its history when it was wholly clothed with these leaves. The plant was, however, exposed to so many dangers, that, to insure its existence, part of the branches and leaves were modified into prickles, to protect it against browsing animals; and in process of time, the struggle became so fierce, that all the foliage leaves had to be converted into these defensive organs. This change was necessarily very gradual, and worked out only in the course of ages. The metamorphosis is, however, so complete, that the original leaves are now produced only at a very early stage in the life of the individual plant—a stage which corresponds to a remote period in the history of the race.

The gorse, however, could not make this change without making many others. Leaves are not useless appendages; on the contrary, they perform important functions. If we strip the thin skin from the lower surface of an ivy leaf, and put it under a microscope, we shall find it crowded with countless little mouth-like openings, technically known as 'stomata.' These mouths open and shut according to the state of the weather, and it is by means of them that communication is maintained between the internal parts of the leaf and the air. Many persons think that plants derive all their sustenance from the ground, the fact being that they get a very large portion of it from the air. Air contains carbonic acid gas. When air is admitted by these stomata into the interstices of the cells in the interior of leaves, their green colouring matter has the power, under the action of sunlight, of breaking up the carbonic acid gas into its constituent elements of carbon and oxygen; the carbon being fixed or retained in the body of the plant, and the oxygen being freely returned into the air. In this way the plant gets a great part of its food. Now, stomata are nearly always confined to leaves, and they are generally found on the under surface of these appendages. The reason of this is that, being on the under surface, they escape the fierce heat of the sun, and so act freely and regularly. In some plants, however, such as the leek, whose leaves grow

perpendicularly, and whose surfaces are therefore equally exposed, the stomata are spread indifferently over each side. In water-plants, again, whose leaves float on the surface of the water, the stomata are confined almost entirely to the upper surface—a remarkable exception to the general rule. But the gorse has no leaves. What, then, has become of its stomata? If a moderately young plant be examined, a very unusual feature will be noticed. In most plants as large as the gorse, the green colouring is confined to the leaves; but in the gorse, we find that the whole plant—spines, thorns, and stem—is green. The conversion of foliage leaves into defensive organs has necessitated this change. A spine does not give such a large spread of surface as a leaf; and if the stomata of the gorse were confined wholly to the spines, the plant would soon lose that hard, woolly, resisting character which makes its defences so formidable. Consequently, spine, thorn, and stem are green, and one and all are crowded with the little mouth-like organs found only on the leaves of ordinary plants. The loss of surface involved by the change of leaves into spines is thus compensated, and the plant getting in this way sufficient food-material, is able, by its strong, hardy character, to take a good position in the struggle for existence. Doubtless, these two changes of which we have been speaking went on side by side, the range of the stomata gradually extending as the leaves were more and more perfectly modified into spines.

A habit very valuable to the plant seems to have been acquired and perfected simultaneously with the development of spines, and that is the power of forcibly ejecting its seeds. In hot summer weather, it is no unusual thing to hear, in the neighbourhood of a gorse-clad common, the sharp crackling noise of the pods as they open and shoot the seeds on all sides. By this method of seed-dissemination, gorse plants gradually extend themselves, and so grow in vast compact masses, often covering large areas. This mode of growth is of great advantage to the plants. It adds to the effectiveness of their defensive organs; and by its density, and consequent shade, prevents any but a few favoured plants from growing in the same soil. In the flowering season, too, it increases the general attractiveness, the combined brilliancy of countless blossoms being much more likely, by their splendour, to allure fertilising insects, than the display of a single plant.

These few points on which we have touched do not by any means exhaust the noticeable features of the gorse, but they serve to show how interesting a plant it is. We have seen that it has not always been what it is now. By tracing the development of the individual plant, we get a glimpse of the gorse in bygone times, and see—faintly if may be, but no less surely—the many changes through which it has passed. How successful these modifications have been, how beneficial they are to the plant, every common and heath testifies. Wherever the gorse is seen, it is green and flourishing. Being destitute of leaves, it holds forth no attraction either to browsing mammals or nuzzling rodents; and should either of these be tempted to attack its tender green stems, it keeps, both alike at

bay with its array of formidable spines. The gorse, in short, is one of many plants which have derived inestimable advantages from judicious modification.

AT TREVENNA COTTAGE.

BY T. W. SPEIGHT.

A STORY IN EIGHT CHAPTERS.—CHAP. I.

It is generally conceded that there are few prettier places on the south-west coast of England than Boscombe Regis, and that is no scant praise. It is little more than a scattered hamlet, with a few old-fashioned houses of the better kind and a score or so of detached villas, built on the slope of a hill and fronting the sea. As yet, to the annual shoal of Cockney excursionists, Boscombe Regis is a *terra incognita*, for which happy immunity it is doubtless indebted to the fact of its being a dozen miles from the nearest railway station. Still, those who live there all the year round are by no means so buried alive and shut out from the great world—especially during the summer and autumn months—as some people might imagine. If the boarding-houses, like the visitors, are not very numerous, it can be safely averred that they are select and somewhat exclusive; and many families who find Boscombe Regis agree both with their constitutions and their pockets, have a happy knack of coming year after year, in which case it need scarcely be said that the oftener they find their way there the more welcome they are made. But not even during the depth of winter is Boscombe entirely cut off from the world and left to stagnate alone. Its air is so balmy, its temperature so equable, and it is so sheltered and shut in from cold winds, that many people of delicate health find it suits them between October and March better than any other locality, and consequently make it their headquarters during the period in question.

One of the prettiest, if one of the smallest, of the Boscombe villas is entitled Trevenna Cottage. It is a white two-storied house, festooned with creepers of various kinds, and standing in its own grounds, half-way up the slope of the hill. From the terrace in front of it there is a splendid view of the bay and of the high yellow headlands which shut it in like two protecting arms.

When old Mrs Devington, who had lived at the Cottage for twenty years, died, her nephew, who inherited her property, and who was a busy London man, at once advertised it as being to let furnished. Not long did it remain empty. One sunny afternoon, within a couple of months of the old lady's death, a fly from Munpton Junction brought two gentlemen and a lady, who at once proceeded to take possession of Trevenna Cottage. Several boxes of luggage were brought by the local carrier later on.

The new occupants of the Cottage proved to be a certain Captain Avory, his wife, and a relative of theirs—a gentleman in an advanced stage of pulmonary disease. In the course of

the forenoon following his arrival, Captain Avory inquired his way to the house of Dr Mayfield, the elder of the two medical practitioners of which Boscombe Regis could boast, and handed his card to the servant who answered his ring. At this time, Dr Mayfield was close on sixty years of age. He was a good-hearted, simple-minded practitioner of the old school, clinging to the methods of treatment which were in vogue when he first started in life. Having some private means of his own, he could afford to take life in the easy-going fashion which best suited him, and more than once he had been known to turn over a lucrative patient to his brother-practitioner, who was burdened with an expensive wife and a numerous family.

When Dr Mayfield entered the room into which Captain Avory had been ushered, that gentleman at once introduced himself as the new occupant of Trevenna Cottage.

'If you will call when next you are that way, I shall feel obliged,' he said. 'It is a cousin of mine whom I am desirous that you should see. A sad case, poor fellow! Consumption in an aggravated form, so I have been given to understand. Since he returned from Australia, the climate of which did not suit him, he has been living in the north of England. His lungs were always delicate; and last winter, having had the misfortune to be snowed up for about twenty hours in the drift of a Scotch railway, we have now before us the deplorable result. The medical man who has been attending him since the beginning of his illness has ordered him here as—I am afraid to think—a last resource.'

'If his lungs are naturally delicate,' said the doctor, 'I should have thought that the Australian climate would be far more likely to suit him than that of England.'

Captain Avory shook his head. 'Edward is not of a communicative disposition. I can give you no particulars. I only judge that the climate did not agree with him, from a few casual remarks which he has let drop from time to time.'

Dr Mayfield promised to call at Trevenna Cottage in the course of the afternoon, and with that the captain went his way.

It can scarcely be said that the doctor was very favourably impressed by Captain Avory; and yet, when he came to think over their interview, he was at a loss to specify even to himself what was the particular trait or feature about his visitor which rendered him objectionable; but that he was objectionable to him he could not deny. The captain was a slightly built, florid-complexioned man of forty-five or fifty years of age, partially bald, such hair as he had left at the sides of his head being carefully brushed forward so as to droop in a limp wisp in front of each of his rather large ears. He had a boldly curved aquiline nose, and a sandy moustache, through the rift of which his long sharp teeth gleamed whenever he smiled, which he had a knack of doing very often. It was when he smiled that the doctor liked him least. He affected a certain jaunty juvenility of manner which had not the air of being quite natural. It might have suited him when he was a quarter of a century younger, but at

fifty years of age it seemed somewhat out of place.

Dr Mayfield called at Trevenna Cottage in the course of the day, where he was received by the captain, who introduced him in the first place to Mrs Avory, and secondly to his cousin, the doctor's patient that was to be, Mr Edward Saverne. Mrs Avory, a small-featured, rather fragile-looking woman, although considerably younger than her husband, must yet have seen her fortieth birthday. She was quiet in all her movements, and had one of those low, almost caressing voices which sound so soothingly in the ears of the sick. She had long white eyelashes, which gave her a somewhat peculiar appearance; and the moment she began to talk to any one, her eyes began to blink and kept on blinking as long as she continued talking. She had thin firm-set lip; which rarely subsided into a smile; and despite the fragility of her appearance, and her low pleasant tones, she gave one the impression of being a woman of indomitable will—a will before which that of her husband would be as a reed shaken by the wind. There can be little doubt, in fact, that Mrs Avory was the virtual head of the household at Trevenna Cottage.

In our thoughts we generally associate that dire disease, consumption, with the young—with those who are still in the spring-time of life; but when Dr Mayfield entered Mr Saverne's room, he perceived that his patient was a man of forty, or even a year or two more than that. A dark-haired, dark-bearded, sallow-faced man he was, with hollow cheeks, and deep-set eyes, in which smouldered a sort of sullen fire. He was coughing as the doctor entered the room, and his cough told half the tale. Mayfield at once stood beside him, and when he was alone, he proceeded to put a few brief questions to him, which he answered readily enough, but with an air of indifference, as though both questions and answers were already familiar to him.

'I think, for my own satisfaction, and providing you have no objection, that I should like to sound your chest to-morrow,' the doctor said.

'I had much rather you did nothing of the kind,' he answered, with a sort of weary petulance. 'My chest has been sounded twice already. Why go through the process a third time? You know better than I can tell you that I am a doomed man. Pray, let me linger out my few remaining days as quietly as may be. I shan't be here long to trouble any one.'

The doctor's heart echoed his words: doomed he was indeed.

Captain Avory joined his visitor at the garden gate and walked with him down the lane. 'I am afraid you find my cousin in a very, poor way, doctor?' he said.

'I should certainly have preferred to find him better in health than he is.'

'Ah, I fear poor dear Edward is not long for this world,' he remarked with a sigh.

'We are none of us long for this world, if it comes to that,' replied the doctor tartly. There was something in the captain's manner rather than in his words which irritated him, and yet he could not have told why.

Captain Avory changed the subject abruptly,

and after a little talk on indifferent topics, the two men parted at the corner of the lane.

After this, Dr Mayfield called at Trevenna Cottage almost daily, and for a time it seemed as if the soft balmy air of Boscombe, ozonised by the breath of the great Atlantic, was effecting a radical improvement in his patient's condition; and yet he knew but too well that such improvement could be but temporary. For the first month or so the sick man's appetite grew better, his eyes looked brighter, and his cheeks a trifle less hollow. 'I never feel chilled here, as I used to do so often at St—, at the place I was last at in the north,' he said more than once. Dr Mayfield remarked to himself, as a somewhat curious fact, that neither he nor the captain nor Mrs Avory ever by any chance mentioned the name of the place from which they had come; it was always alluded to vaguely as 'the north.'

Every fine day for some weeks Mr Saverne was wheeled out in a Bath-chair with Captain Avory in attendance. He liked to be drawn up and down the stretch of firm yellow sands at the head of the bay. But after a time there came a longish spell of bad weather; and when the fine weather returned, Mr Saverne was surprised, although the doctor was not, to find how much more quickly his outdoor exercise, gentle though it was, tired him, than it had done previously. A little while longer, and the Bath-chair had to be discarded; and all that the sick man could do was to have his couch wheeled out on the terrace and there recline in the sun for a little while during the warmest part of the day. The end was drawing perceptibly nearer.

One forenoon, while Mr Saverne was still strong enough to get out in the Bath-chair, Dr Mayfield encountered him as he was being drawn along by Timothy Bunce; but this time, for a wonder, he was not accompanied by Captain Avory, but by a person of the opposite sex. Bunce stopped instinctively as the doctor drew near, and he in his turn came to a stand. After a few words had passed between them, Mr Saverne said with a nod of his head: 'This is my—I mean, a relative of mine, Mrs Preedy, who has made a long journey on purpose to see me.—Mama, this gentleman is Dr Mayfield, who is doing his best to patch me up for a little while.'

Mrs Preedy and the doctor bowed; and then the latter went on to make a few remarks about Boscombe, and how beneficial its climate often proved to people in delicate health. Mrs Preedy listened and smiled faintly, but, like her relative, she was apparently a person of few words. She was a woman whose age might be judged to be nearer forty than thirty. In person she was tall, gaunt, and angular. She had a prominent nose and high cheek-bones, and she was what is generally termed 'hard-featured.' She looked like a woman who had been scholared by much trouble, and whom nothing now could greatly move. She was dressed entirely in black, but her garments were not those of a person in affluent circumstances.

After a little desultory talk, chiefly on the doctor's side, the latter raised his hat, and the little procession moved slowly on its way. Next day, when he called at the Cottage, Dr Mayfield

saw nothing of Mrs Preedy, nor did any one there mention her name.

No sick man could have been more assiduously waited upon than was Mr Saverne. Mrs Avory was indefatigable in her attentions; she was continually hovering around him, and for ever trying to anticipate his slightest wish. In fact, the doctor somehow got the idea into his head that there were times when Mr Saverne would fain have dispensed with such continuous attentions, that he would like to have been left more to himself, and that now and then Mrs Avory's persistent kindness worried him into an irritability which was anything but beneficial to him. Be that as it may, Mrs Avory's demeanour never varied, nor apparently was any expense spared to gratify the whims or fancies of the sick man.

After a time, it seemed to Dr Mayfield that Mrs Avory was considerably overtaxing her strength—this was after Mr Saverne had become much worse; and he hinted as much to her, and suggested the advisability of obtaining the services of a trained nurse, so as to relieve herself in some measure. But she only shook her head, and set those firm lips of hers still more firmly. 'I could not reconcile it to my conscience,' she said, 'to allow dear Edward to be waited upon by a hired nurse, while I have health and strength to attend to him myself. No, Dr Mayfield; you must just allow me to go on in my own way. It will be time enough to claim assistance when I break down.'

It was quite evident from the first that Mr Saverne was a man of reserved and uncommunicative disposition. Yet occasionally, when not pressed for time, Dr Mayfield would sit down by him for a little while and attempt to draw him into conversation by starting some topic which he thought would be likely to interest him. But nothing seemed to interest him except very faintly, and before long the genial, chatty old man would have to give up the effort as hopeless. Just about that time, the doctor had a nephew who was on the point of going out to settle in Australia, and it seemed to him that Mr Saverne, after his long residence in that country, might be able to furnish him with some information which would be of service to his young relative. But when the subject was broached, he saw that he had unwittingly touched a sore point. A faint flush came into the sick man's cheeks. 'If you don't mind, doctor, I would rather not talk about Australia,' he said; 'my experiences in that country were not of a pleasant kind, and I don't care to have them revived in my memory.'

Dr Mayfield hastened to apologise.

But if Mr Saverne was reticent and uncommunicative in his intercourse with his medical attendant, he was equally so, as far as could be judged, in his relations with the captain and Mrs Avory. When it was necessary for him to speak to them or to answer some question of theirs, what he had to say was couched in the fewest possible words. He seemed to accept all their attentions and all their efforts to render him comfortable as if they were no more than his due, and entirely as a matter of course. For Captain Avory he appeared to have conceived an especial dislike. More than once the doctor

noticed his eyes follow the retreating form of that gentleman with a strange sullen gleam in them, as though he were nursing some deep-rooted feeling of animosity against him.

Simple-minded and unsuspicious as Dr Mayfield was by nature, he yet had a feeling that within the four walls of Trevenna Cottage lay hidden a mystery of some kind, the key to which he knew not where to look for.

By-and-by it came to pass that the sick man could no longer get out of doors, although he could still sit up for a couple of hours daily, propped up with pillows in an easy-chair. The end was drawing near with rapid strides, and he knew it; but no one ever heard him give utterance to the slightest murmur or complaint of any kind. Mrs Avory was now compelled to call in some one to assist her. The person she selected was not a trained nurse, but a middle-aged woman from a neighbouring village, who had had the charge of an invalid gentleman for several years, and was consequently at home in a sickroom.

It was no surprise to Dr Mayfield when, on making his usual call one morning, he found that Mrs Preedy had arrived since his last visit. She was sitting by Mr Saverne's side as he went in, holding one of the invalid's hands in both of hers; but she at once rose, bowed, and left the room. He found her waiting for him in the garden at the termination of his visit.

'He is worse—much worse than I expected to find him,' she said abruptly as the doctor drew near.

'Everything is being done for him that can be done. He lacks for nothing.'

'O yes, I know all that. I am not complaining,' she replied with something like a sob in her voice. 'Then after a moment or two she said: 'I have a little favour to ask of you, Dr Mayfield.'

'Anything that I can do for you, Mrs Preedy, I shall be happy to do.'

'It is only to beg of you to let me know—to send me a telegram—before the end comes, so that I may be in time to see him once again in this world.'

'But surely the captain or Mrs Avory'—

'No, no; it is no use trusting to them,' she interrupted. 'They would not send for me; they would rather I did not see him again.—Here is my address,' she added as she slipped a scrap of paper into his hand. 'You will send me a telegram, will you not, so that I may be in time?'

'I will; I promise.'

'Oh, thank you—thank you!' she cried; and with that her hard face softened and her eyes became suffused with tears. 'He is my brother, and he has always been very dear to me,' she added simply. 'But that is a secret which I ought not to have told you; only, I know that with you it will be quite safe.'

What new phase of mystery was here! The doctor went his way thoroughly puzzled.

Mr Saverne became weaker day by day. On calling one morning and stepping quietly into his room, Dr Mayfield found him asleep. Mrs Dempster, the nurse, was sitting by his side. While the doctor was gazing at his wan and wasted features, the dying man began to move

uneasily and to mutter in his sleep. 'Florrie, my darling Florrie, why don't you come to me?' he said. Then after a pause: 'They keep you from me—they won't let you come near me—wretches that they are!'

'Does he often talk in his sleep?' inquired the doctor of the nurse.

Before the woman could answer, Mrs Avory answered for her. She had entered the room in her usual noiseless fashion. 'It is only during the last few days that he has begun to ramble in his sleep,' she replied, blinking rapidly with her eyes.

'Who is the "Florrie," if I may ask, to whom he was alluding just now?'

'That is more than any of us know. We never heard him mention her name till the other evening, when he was asleep. Captain Avory's opinion is that the person dear Edward alludes to must be some one he knew in Australia. Certainly, we are not acquainted with any one of that name in England.'

On making his customary call about a week later, Dr Mayfield saw that the end was now very near. After leaving the bedroom, he sought the captain and Mrs Avory, who were just finishing breakfast. 'If there is any one—any relatives or friends,' he said, 'who would like to see Mr Saverne before it is too late, I think it would be advisable to summon them without delay.'

They looked at each other for a moment, and then the captain said: 'Thank you, doctor, for telling us; but I don't think it will be needful to summon any one—in fact, I may tell you that there is no one to summon. We are dear Edward's only near relatives; and as for friends—I opine that he left most of them behind in Australia.'

'Mrs Preedy?' the doctor ventured to suggest.

The captain frowned. 'Mrs Preedy is only a very distant relation,' he answered; 'and as she was here so short a time ago, I see no necessity for her to come again. Besides, she is very poor, and can ill afford so long a journey. I shall of course inform her when all is over.'

The doctor bowed, bade the pair good-morning, and went.

Mrs Preedy only a distant relative! Why, she herself had told him that she was Mr Saverne's sister, and, somehow, he felt that he would take her word in preference to that of the captain. He had given her his promise that he would summon her when it became necessary to do so, and the time was now come. He walked at once to the post-office and despatched the following telegram: 'If you wish to see Mr S. alive, you must come without delay.' Mrs Preedy's address was No. 5 Town Row, Stonelands, Derbyshire.

It may be mentioned here that although there was no access by railway to Boscombe Regis, a telegraphic wire had been laid down some years previously between that place and Mumpton Junction, a dozen miles away.

When Dr Mayfield called at the Cottage next forenoon, he found Mrs Preedy already there. Evidently she must have traveled all night. She thanked him with a look. Neither the captain nor Mrs Avory appeared to have the

slightest suspicion that her arrival at that particular time was the result of anything more than a coincidence.

A few hours later, Mr Saverne passed quietly away.

• IRISH STEP-DANCING.

DANCING is a favourite pastime amongst the Irish peasants, and there is no lack of dancing-masters, who make their living by teaching the 'steps.' Indeed, even people of position learn 'step-dancing,' such as jigs, reels, and hornpipes. Very pretty steps they are, and far more difficult to learn and dance correctly and well than the ordinary waltz or polka, which, after all, have but one step, the chief thing being to dance that one step gracefully and smoothly. In a jig, there are as many as twenty different steps, and each single step has what is termed 'its double,' a somewhat similar step, but more complicated than the single. To dance even five steps of the jig with their double requires, independently of the perfection only attained by practice, constant repetition and great exertion. To dance twenty steps and their double—in all about forty—straight through, would be almost impossible; besides, it would occupy too much time. Yet a different jig, apparently, could be danced by one person several times during the same evening, by doing, say, five steps each time. But you must begin a jig by dancing the 'rising' steps—this rule never changing. The steps in a reel are not unlike those in the jig, but are much less tiring.

Some months ago, a very good dancing-master came to our village in Ireland, and some friends of ours got private lessons in the 'steps' from him during the day, the evenings of course being devoted to the working-class. 'Marvin' was a young man, not more than eight-and-twenty, I should think, and he had been for many years teaching the steps. The son of a respectable farmer, and having a wonderful taste for music and dancing, he could not settle to farmwork or any trade, and much against his parents' wishes, determined on being a teacher of dancing. Accordingly, he was 'bound' to a dancing-master; and when he had learned enough to enable him to teach, and so. He went from village to village, staying from one to three months in each, just as he found he had pupils and it paid. The court-house or national school was generally given to him, for one seldom can get a large room in villages; and besides, beyond a trifle to the keeper, there is little expense attending. Marvin varied his fees according to those he taught and also according to the size of the village; a smaller sum being accepted from the labourer than the shopkeeper or farmer—a shilling and one-and-sixpence being accepted weekly from the former for each one; while two-and-sixpence, and even three shillings, were paid by the latter.

Marvin told me that, on an average, he derived an income of two hundred pounds a year by teaching the 'steps.' Belonging to the better class of Irish dancing-masters, Marvin had a fiddler, a blind man, who accompanied him on his rounds; but he did not pay him—'benefits' being organised to do this; two and three pounds, sometimes even more, according to the number

present, being collected at such a time. Notice of a 'benefit' for the fiddler is generally given some nights before.

We learned six steps of the jig, and their double: a 'slip' jig, a four-hand reel, and three steps of the Highland fling. For my part, I had almost too many to practise. These and others, such as the 'Moneen Jig,' 'Irish Jig,' 'High Call Cap,' 'the Garden of Daisies,' 'the Blackbird,' 'the Priest and his Boots,' 'St. Patrick's Day,' come under the title of 'steps;' our waltzes and polkas, &c., being termed 'circular dances;' while the quadrilles are called 'sets.' These are now much indulged in by shop-people and the better class of farmers, being considered by them more like what the 'ladies and gentlemen' do. Knowing their 'steps' is looked upon by the peasantry as a necessary part of their education, quite as much as to read or write—and I have often heard them express contempt for a girl or 'boy' who, to use their own words, 'has no dance'—therefore, parents who can ill afford it, will do without necessities even to have their children taught their steps when a dancing-master comes their way.

Marvin was most amusing in some of his expressions, particularly when he tried to use a French word. For instance, in connection with the reel, the word *chassez* was frequently used by him; and until one got accustomed to his pronunciation of it—*Shass-her!* it was perhaps a trifle puzzling. On one occasion, I remember he asked how we polished our floor for dancing. I said with French chalk and spermaceti. He seemed puzzled; but asked for pen and paper to write the mixture down, in case he should forget it. I gave both to him; but again he seemed perplexed, and once more asked the names, and how to spell them, which I did, going twice over 'spermaceti.' At last he asked me to write, remarking that he was not able to write, only to speak the French language!

There are many kinds of dancing 'benefits.' Marvin had two during the ten weeks he spent in our village—both for the fiddler. The dancing-school is of course held in the evening, when the day's work is over—half-past six to nine or ten o'clock being the usual hours. On benefit nights they dance till much later. On such a night, when all the company have assembled, the fiddler or dancing-master, whichever one the benefit is for, goes round with a plate or, more generally, his hat; and each person present willingly gives a trifle. Sometimes, if the collection is good and the person so 'benefited' is, as the people express it, a 'decent man,' he will go out and buy porter and cakes (biscuits) as refreshments for the 'lad's.' The men don't require such attention, or perhaps, to speak more to the point, don't get it. There is a story told of a dancing-master in our village, who, when about concluding his lessons for the evening, was interrupted by the entrance of a young farmer, whose hob-nailed brogues made a woful clatter. Advancing towards the dancing-master, he said he came to learn his steps. 'Tis late in the day ye are, I'm thinkin', replied the master. 'Me classes are about bein' closed, an' I am now teachin' me pupils *grace* [we presume he meant grace] in their movements.'

I have known several cases where poor people wanting to thatch their cabin, perhaps, or to buy

a pig without any means to do so, will organise a benefit, and thus obtain the necessary money. For this purpose, a written notice will be carried round to the neighbours. Sometimes they may just be told 'Pat Murphy' wants money to set the praties, and he will hold a benefit on Friday (or, more generally, Sunday) night. Perhaps fifty neighbours will come. Of course, so many could not possibly come into a small cabin at once; but they always take it in turn to 'put the floor'—for in step-dancing, only a certain number can dance at a time. These people will dance away all night, subscribe their mite, and never eat or drink anything, because, naturally, such poor people could not provide food for so many. It is not unusual for the neighbours each to bring some victuals with them, such as bread, tea, and sugar; and these will be divided and distributed as far as they will go.

Another kind of benefit for the same purpose is got up by raffling—a goat, a turkey, or a concertina, perhaps a donkey, being the most general things to raffle. The winner will sometimes provide refreshments, often 'put up' a band and raffle to do so. The music is, of course, very pretty, and is, when played on the piano, very tiring to the fingers to keep up for any length of time, till you get accustomed to it. In the 'High Call Cup,' the men beat time in one part to the music with their feet, while in another part they do so by clapping their hands; and the general effect is very pretty.

To dance the steps really well, one must be nimble and active. I remember seeing a number of the peasants, who, to try and perfect themselves in their 'dance,' danced on the road near some trees, and constantly held on to some of the low branches, to enable them to jump high and use their feet to advantage. There is a story told of a certain mayor who did not know how to dance; and as there was to be the customary ball on St Patrick's night at the vice-regal court, at which he was, as is usual, to dance with Her Excellency, he hired a private-room, and when his shop was closed at night, went there, where a dancing-master put him to teach him his steps, unknown, as he hoped, to any one. Unfortunately, it leaked out, and some people annoyed the poor mayor sorely by standing outside the window and saying: 'Right foot, left foot, hay foot, straw foot. Fair, thin, an' Paddy 'tis you as can soon put the floor.' The origin of hay foot, straw foot, was, that when, as is sometimes the case, the right foot or hand was not known from the left, a dancing-master often tied a wisp of hay on one foot and of straw on the other, and thus forcibly impressed the difference.

Many dancing-masters can teach the steps and play the fiddle at the same time; such belong to the poorer class, and make their living as much by playing at wedding-feasts or 'live wakes' as by teaching the steps. The meaning of a 'live wake' may not be so generally known as is the usual term of 'wake.' The actual meaning is the same—that is, both kinds of wake are held with the same idea, a 'keeping of the last night together.' A 'wake' is of course the last respect or compliment, so to speak, that can be shown a dead friend before he is laid to rest. A 'live wake' is held the night before people emigrate,

and is the scene of much mirth and dancing, so that the last night spent in the old country may be remembered by those who seldom if ever return. The friends coming to these live wakes generally bring food with them, because the cabin is bare in every sense previous to the departure of its occupants. The fiddler seals his hat round and makes his collection. At a wedding-feast, a musician and dancing-master combined will get three and four pounds, and there may be two or three fiddlers.

I remember, when driving, seeing one on the road whom I knew. Poor old 'Shamnoon' (Johnny) had his hat off, and with his pocket-handkerchief wiped his streaming face. I stopped to speak and ask the old man whether he was bent, 'To the weddin', sir, yer honour, of Bill Flaherty's daughter; an' the road is long an' the baggage heavy; an' 'tis late I'll be, I'm afear'd.' So I bade him sit beside the coachman, and he should get a 'lift.' Some day afterward, he called to express his gratitude, playing the 'Fox hunter's Galop' while he spoke, and telling me he earned three pounds by being in time to perform and put the dancers right in their 'sets.'

In concluding these remarks, I must add that for my part I think dancing-masters ought to be encouraged in our circle, because there really is something to learn, in fact, real hard work in the 'steps,' and very few of us who, though able to glide gracefully *à la tons temps* to the strains of Laidde's band, could 'foot the floor' in such perfect time, to the music of perhaps a penny whistle, as do the Irish peasants in the many difficult steps of an Irish jig.

LIFE-LINKS OF HISTORY.

THE ages of history are often linked together in a very remarkable way by the lives of individual men. A striking instance of this will appear in the facts we are about to relate. There was a man living a few years since in a village in Lancashire whose life wanted but one link to connect it with the period of the Commonwealth. That link was supplied by his father, who was born in 1637, one year before the death of the great Protector, Cromwell, and lived through the reigns of Charles II., James II., William and Mary, Anne, George I., and to the twenty-fifth year of the reign of George II. He married in his early days a young woman who had been nurse in the ancient family of the Chethams of Taiton Tower, near Bolton. She died, and for some years William Horrocks, for such was the name of the subject of our narrative, remained a widower; but in 1741, when eighty-four years old, he married his housekeeper, a buxom dame of twenty-six. As may be supposed, his marriage excited considerable attention, and among those who took great interest in it were the Chetham family, with whom his former wife had been a great favourite, and who greatly respected the now aged bridegroom. He and his bride were summoned to the Hall, where they were shown much kindness; their portraits were painted; and they were dismissed to their home laden with wedding presents. The portraits of the couple were placed in the gallery of the Hall, where they remained till they came into the

possession of a lady near Manchester, a relative of the Chethams family, with other portraits of its members. What changes had occurred during that man's life, living as he did till 1752, when he died at the advanced age of ninety-five! He had witnessed the decadence of the Stuart dynasty; the reign of William and Mary had come to a close; Anne had for a few years revived the rule of the Stuart race; the House of Brunswick had been called to the vacant throne, and far into the reign of the second sovereign of that family had the old man's life been prolonged.

The fruit of his second marriage was a son, James Horrocks, who was born in 1741, in the seventeenth year of the reign of George II., and who lived to see the events that transpired during the latter part of that reign, and those which followed far on into the reign of our present illustrious Queen, as he was living till 1833, and was then a hale old man, one hundred years of age. Shortly after that time, he passed away, and now lies gathered to his fathers in the village graveyard of the parish where he spent his days. Thus these two lives connect the times in which we live with that of the great Protector, extending as they do over a period of one hundred and eighty-six years. It may be interesting to our readers to state, as showing the physical contour and healthful vigour of this man, that he was, even when he had attained his hundredth year, of noble stature and appearance; his venerable countenance expressed a benevolent mind, and his silvery locks were truly a crown of honour. He stood nearly six feet high when he raised himself to an erect posture, and was by no means deficient in mental capacity. His conversation was, for his age, lively, and not wanting in humour. On one occasion, not long before his decease, he said to his daughter, a stout old woman: 'I wonder what I shall dream next. I dreamed last night I was going to be married again, and who knows but I could find some lady that would have me yet.'

His son-in-law, with whom he lived, was an old gray-headed man, and not near so quick in intellect as his more aged father-in-law, who often had, as he said, to 'muzzle him,' when it was desired to communicate or explain to him any circumstance that had transpired. His physical powers were shown in a remarkable exploit in the year 1833. It was winter, and an election of a member of parliament was to take place for South Lancashire at Newton, fifteen miles from Bolton. Walking to the latter place, three miles from his home, he travelled by rail to the former; but, missing the train when he wanted to return, he walked the distance to Bolton, and thence to his abode, a journey of eighteen miles—no little achievement for a man ninety years of age.

Reference has been made to the portraits of his father and mother, which were painted at the instance of the Chethams. These came into the possession of the old man in a singular way. There was a sale of the property at the Hall, which the family had inhabited, and he repaired to it for the purpose of purchasing them, but found they had been removed, and were, with the portraits of that family, in the possession of the lady above mentioned. He therefore went to her and expressed his desire to have them.

The lady was so much taken with the man, and touched by his wish to become their possessor, that she, though parting with them reluctantly, presented them to the old man, and they were taken home by him with a gladdened and grateful heart. He retained them as precious heirlooms to the day of his death.

There may be other instances in which the lives of two individuals have extended over an equal space with this father and son; but we have not met with any which, considering all the circumstances surrounding them, have been so truly remarkable; forming life-links of the past with the present; covering the whole period from the Cromwellian to the Victorian age, from the Commonwealth to the time in which we ourselves live.

A DANGEROUS POINT ON THE EAST COAST OF AFRICA.

It has long since come to be recognised as an imperative necessity that wherever, along the coast or out in the ocean, the presence of an exposed or semi-exposed reef or shoal represents a danger to passing ships, the perilous point should be indicated by a lighthouse, a light-ship, or a buoy; and this in face of the circumstance that these safeguards can often only be provided at enormous cost. Now, we think it will be news to many people to learn that there is a point on the great maritime high-road on which the Suez Canal occurs, where navigation is attended with great dangers—where, in fact, a number of lives, and much valuable shipping and cargo, are annually lost—but where the lighthouses which would indicate the danger are not to be found. Passing through the Suez Canal and the Red Sea, one enters the Gulf of Aden, the opening of which is at Cape Guardafui, where the coast of Africa turns sharply to the south, and the Indian Ocean is fairly entered. About eighty miles below Cape Guardafui occurs Ras Hafun, a prominent headland, connected with the mainland by a narrow strip of sand. Vessels coming from the East steer a course to 'make' the coast between the two headlands. But there is no light on either; the lead-line, owing to the great depth of the water even against the very cliffs, is of little guidance; and navigation, as a consequence, often becomes a matter of mere guesswork. One will naturally inquire: Why are there no lights on these two headlands to guide the navigator? The answer is brief, but eminently to the point. Because both Cape Guardafui and Ras Hafun are in the hands of an uncivilised people. The latter belongs to the Mijertheyn tribe; and the former is under the sovereignty of the Sultan of the northern Somali. A traveller has spoken of these latter people as being 'extremely violent and quarrelsome in their disposition, notorious for cheating and lying,' and as pursuing for the most part a wandering, pastoral life. Where is the wonder that such a race should not only themselves abstain from putting up guiding lights to passing vessels, but should be ill disposed to allow a stranger to do the work for them? As a matter of fact, it will probably be an outside nation which will ultimately carry out the enterprise; and circumstances point unmistakably to England, it is thought, as being that nation.

As things at present exist, the hardy but savage inhabitants of this portion of Africa derive absolute profit from the wrecks which occur off the coast, as the remnants of cargo, timber, and rigging washed up upon the beach represent valuable perquisites. There can be no doubt that a very determined effort must be made on the part of England—as the nation which has the greatest stake in the water highway which leads to India—to come to such terms with the natives as will admit of the erection and maintenance of beacons on the two dangerous headlands, and indeed on any neighbouring points that may require to be made easily distinguishable to the mariner. This view of the question is taken by Sir Travers Twiss in a paper 'On International Conventions for the Maintenance of Sea-lights,' which he recently read at the twelfth annual conference of the Association for the Reform and Codification of the Law of Nations, held at Hamburg. He gave it as his opinion that it is within the range of practical probability that both the Mijerthyen and the Somali tribes may be found to be amenable to motives of self-interest, if they are approached with due caution. 'The first step,' he justly says, 'should be to wean them from the habit of regarding the goods of the shipwrecked mariner as providential spoil of the sea; the second step may then be attempted—namely, to induce them to welcome a light tower, by offering to them a subsidy which shall more than compensate their chiefs for the annual loss of revenue which may ensue to them upon the cessation of wrecks upon their coast.' After stating that England is very much to be expected to take the lead in such negotiations with the natives of the coast, Sir Travers declares that she cannot, however, be expected, if she should succeed with her negotiations, to undertake the task of erecting and maintaining the necessary lights without the co-operation of other nations, who have a like, although not an equal interest with her in the safety of the navigation of the Gulf of Aden?

It appears that in accordance with what may be called the common law of Europe, Great Britain would not be entitled to levy dues on passing vessels on account of lights not within her own territory; but Sir Travers Twiss thinks that an international convention might give her such a right. In conclusion, we may endorse a suggestion that Sir Travers has thrown out. 'Until,' he says, 'a common understanding can be arrived at upon a subject of such general interest to humanity, it may be possible to keep a steam light-vessel stationed off Cape Guardafui, notwithstanding the violence of the monsoon; and the light of that vessel would serve as a rounding light for vessels coming from the southward.' This is a really good idea, and we trust, if it proves practical, that it will be carried out.

SALMON SOLD FOR ONE CENT EACH.

Recent advices from New Westminster, in British Columbia, describe the big run of salmon which occurs every fourth year in the Fraser River. 'The "canneries" which are running,' says a Canadian newspaper, 'are said to be taxed to their utmost capacity to pack the vast

quantities of fish which are being caught, as they were coming by hundreds of thousands. No such large and extensive run of salmon has been known before. The total average pack promised to be twenty thousand cases to each cannery engaged; making the total probable pack of the Fraser River canneries for this season from one hundred and twenty to one hundred and thirty thousand cases. On the 1st of August, Ewen's cannery did the biggest day's packing ever done on the Fraser River, canning a total of fourteen hundred cases in one day. The canneries have been paying their fishermen from three to five cents a fish; but owing to the plentiful supply, salmon have been offered and sold for one cent each, the proprietors being willing to accept such a small price rather than throw the fish overboard.'

A MIDSUMMER NIGHT'S DREAM.

We had heard the night-birds calling in the thickets far away,
While the shades of eve were falling, while the twilight gathered gray,
And the scented gales of gloaming wafted secrets from the sea,
And the first pale star was gleaming in a golden mystery.

Then a holy calm enwrapt us, and a blissful silence fell;
Far away the doves were 'planning, dioned the beetle in the dell
Ah! the words that are not uttered, like the songs that are not sung,
Are more musical in cadence than are known to mortal tongue.

Had we eaten of the lotus, or was this a land of spells,
Thus an isle of ancient fable where a great Egean inter dwells?
Nay! it is fair but that we dream of; and we dream a little while,
As the wanderer in the desert dreameth of the distant Nile.

All that bygone time we dreamt of, when the earth was fresh and young,
And great Pan beside the river piped the rustling reels among
There were naiads in the streamlets, there were dryads in the trees,
And the apples still hung golden in the fair Hesperides.

We are wiser; we have banished from their haunts the gods of old;
All that wondrous faith has vanished with the outlived Age of Gold;
Yet, when moonlight winds are blowing, lovers' voices, blending low,
Murmur still the same old story Fauns whispered long ago.

Yonder moon is growing paler; soon within the reddening sky,
Shall the star of morning vanish as the Sun-god draweth nigh,
And the visions that are born in the sweet silence of the night,
Like mist armies on the hillsides, from his darts shall take their flight. J. W.

LORD TOLLEMACHE'S COTTAGE-FARMS.

BY A SPECIAL REPORTER.

THE present condition of British agriculture is an anxious one for all concerned, the landlords, the farmer, the labourers, and the nation as a whole. Everywhere, the old system is in process of modification, and all sorts of experiments are being suggested and tried. In the multitude of counsellors there is both wisdom and folly. Some advocate the re-creation of the old yeomen; others are eager to foster peasant proprietors; others, again, urge co-operation among the labourers. Doubtless, all these methods of dealing with the soil will be tried; and it is well that they should; for only actual trial, over a sufficiently long period, will prove or disprove the fitness of the methods. The present phase of agricultural depression is not confined to England; it is more or less acute throughout Europe; America has its own special share of it; Asia and Africa and Australasia are by no means free from it. This universality of affliction is a grim consolation to British farmers, and it ought to give them courage to bear the trials of a most exceptional period.

Agricultural reformation being unavoidable, it is wise to accept it in a cheerful and hopeful spirit. Bad as the actual state of things is, it might be worse; dark as the immediate future seems to landlords and farmers, it is not wholly indicative of ruin, if both will come to a friendly understanding. While many are vainly contending for the continuance of the old system of tenancy, cultivation, and labour, some have embraced the new order of things with satisfaction to themselves and those associated with them.

Conspicuous among the English landlords who are adapting themselves to the times is Lord Tollemache of Peckforton Castle, Cheshire. He has in his own way solved one of the problems of the hour—that of satisfying the agricultural labourer, for the experiments of Lord Tollemache

have gone on for many years. By the courtesy of his lordship the writer was permitted to visit his cottage-farms, to question the labourers and their wives, to judge from reports and visible facts how the experiments have ended. They are in every respect most encouraging. The landlord is satisfied, the farmers are satisfied, the labourer is satisfied. While dread and perplexity pervade the shires, the happy dwellers upon Lord Tollemache's estates are at peace. Every large farm is occupied; and in case of a vacancy, there are numerous applications. Every labourer's cottage is tenanted; and the obtaining of one is the great object of those living outside. The contrast between these cottages and the ordinary dwelling of the English farm-labourer is striking.

They are mostly built in pairs, and stand each upon about half a rood of garden-land. The windows are large, the structures are substantial, the sanitary details excellent. The living-room is a sort of parlour-kitchen, home-like to a degree, and fitted with all sorts of conveniences for domesticity. Behind, are a scullery and a pantry. There are three bedrooms, one down stairs and two above, which are wholesome and comfortable. Few artisans even of the better class have such homes in our best-built cities. In the rear is a yard for coals, and a large oven for baking the family bread. Regarding this, much was heard in praise from the housewives. Still further in the rear is an outhouse for a cow and a calf; also a capital piggery. These buildings are so constructed as to facilitate dairy operations as much as possible. Adjacent to the dwelling is a little croft of land of about three acres. At the time of the writer's visit, a goodly haystack adorned a corner of each croft, showing that the grass-crop had been a good one. In each croft, a cow was feeding upon a pasture which the autumn had not much thinned. Although many of the cows did not appear to be of a very illustrious race, they were in capital condition and are good milkers. No doubt the breeds will be improved as time goes on, for 'advance' is the standing order of the community.

As far as possible, each cottage-farm has its pasture adjacent. But where the symmetry of the large farms prevents this, or where it is beneficial to the tenants to be associated in a larger pasture, modifications are made. On one part of the estate were three cows in a triangular meadow. Their owners 'bone' and fertilise the land in common; they also mow and make the hay in the same manner. From inquiry, it appeared that this joint system was rather objected to by the labourers; each likes to be lord of his own little place and to keep neighbours on the other side of the hedge. But though feelings run in this unsocial groove, the associated tenants fully appreciate the advantages that Lord Tollemache offers to them. Not one would have given up his cow and pasture; on the contrary, all were grateful for the privileges they enjoyed. In the neighbourhood of the castle many cows are pastured in the park. These variations in the cottage-farm system show its flexibility to all the conditions. The primary object is to give every labourer the opportunity to keep a cow; and that object is attained. The rent of cottage and three acres of land is ten pounds per annum.

The labourer and his wife are not heavily burdened by the work of their little farm. Both are skilled in dairy operations; if they have a family, the care of the cow and pigs adds but little to the toil of life. There were no evidences of over-worked men; and the vivacity of the women and children proved that they were living pleasantly. As an average, the labourer pays his entire rent-charge out of the profits of his farm. Besides, he has ample supplies of dairy produce and bacon. The generality of cottagers make butter of their surplus milk; it is of a good quality, though inferior to the delicate butter made by the Dutch and Danish small farmers. In time this stigma ought to be removed, as there is no reason for the inferiority save want of care. The cattle and the pastures of these Cheshire dairymen are superior to those of Holland and Denmark. If the rising generation were taught the art of butter-making by an expert from some of the agricultural colleges, and if prizes were given by Lord Tollemache for first-class butter, the improvement of quality would soon add to the income of the cottagers. Small industries of this kind can only hope for high success on quality.

Some few small farmers convert their milk into cheese, which is the special product of the district. But the ordinary Cheshire cheese is of great size, and many small farms must combine to make them profitably. And the makes of this sort have no chance to rank high. Cheshire cheese, unless of the super-excellent kind, has not the reputation that it formerly had. In their struggle with adverse times, many farmers have gone in for quantity, and have attempted to compete with common American makes, instead of working on the old system. This foolish attempt has done much harm to cheese-makers in general; and bitter are the complaints heard in every dairy and market-place that Cheshire cheese is falling out of esteem. It will be further injured by the introduction of the poorly made cheeses of small farmers.

In establishing cottage-farmers upon his estates,

Lord Tollemache had three ends in view. The first was, to satisfy the natural and praiseworthy desire of the labourers to have a cow, and land to maintain it. The second was, to train the rising generation of labourers' children in dairying and agricultural pursuits from infancy. That can only be done when the household is engaged in the tending of animals and the cultivation of the soil. The offspring of rural labourers, who have no home but a hovel in a village or in the grimy suburb of a manufacturing town, are rather repelled from rustic pursuits than won to them. Cut off from intercourse with farm-life, owning nothing that depends upon their care, either in garden, field, or stall, the labourer's family as they grow up go into the ranks of town artisans or those of the rudest toilers. The spectacle of their father's continued drudgery at low wages, his discontent with a hard lot that is without hope of amelioration, repel them from following the paternal occupation. In another fifty years, the country would be denuded of labourers, if the alarming migration to the towns went on at the same ratio as during the past fifty years. But that is not the whole mischief—the labourer is deteriorating. Complaints are heard on every side that farm-servants are not so useful as their parents were. They are careless, restless, eager for amusement; and higher wages but intensify their failings. This is an *ex parte* judgment, it is true; and as farmers have got into the habit of thinking dismally upon all things connected with their business, they may paint the labourer in darker colours than he deserves. Still, no one doubts that our rural toilers are different from their sires; and it is the duty of great landowners to prevent the deterioration and discontent of a class that plays so indispensable a part in the national welfare.

Lord Tollemache has intervened to save the old English labourer from extinction, and he has the satisfaction of having done it admirably well. The labourers upon his extensive Cheshire estates are markedly superior to those of their class in most counties. Their wives are robust, their children unusually intelligent, and the social atmosphere of the neighbourhood is exhilarating. In every house visited, the furniture was good and excellently cared for. Neatness and cleanliness were evidently habitual; and from these habitations will proceed a race of farm boys and girls that will add to the moral and material prosperity of England.

Public-houses are to be found in the hamlets, but they receive little custom from the cottagers, and are closed during Sunday. Encouraged in thrift, the community waste very little upon drink. When the labourer has finished his day's work, he has always some little job to do about his farm. His interests and ambitions fence him off from vice. When he finds time to smoke his evening pipe, he leans upon his garden gate and looks at the boundaries of hiscroft, wishing that they might be expanded. He would like another acre or two, another cow, and a few more pigs. He is winning at the game of life, and is encouraged to go on.

It is just upon this point that Lord Tollemache and his cottage-farmers are divided in opinion. The labourer wants more land, believing that he could manage an extra acre or two with very little

more exertion. Lord Tollemache thinks that three acres are quite as much as the labourer can control, and that if the holdings were to be enlarged, the scheme would be liable to miscarry. And his lordship is perhaps right. Under the present system, the labourer stands firmly upon his little enterprise. If his cow dies, he is not ruined, merely impoverished for a time. If the hay-crop is a failure, he simply makes no profit for a season. Backed up by his weekly wages, he can pull through difficulties inherent in his farming venture. In proportion as he extended his scale of operations, he would extend his risks of disaster. Further, if the labourer were to embark upon larger undertakings, he would be less efficient as an employee. No man can serve two masters, even though one of them be himself. If the labourer's farm were extended to six acres, his mind would be dwelling upon his own cattle and crops instead of those of his master; and the extra toil would prevent him from doing his work as well as at present. Of course, labourers with growing families of half-a-dozen handy children might get on very well. But it is necessary to deal with average conditions in cottage-farming as in all other things in building up a system. For the labourer, as a labourer, the three-acre farm is both the maximum and minimum, the 'happy mean' of our agricultural method. As he is, the labourer has all that a man in his position can obtain—a comfortable refined home, a pleasant and facile means to employ his leisure and savings, neither too much work nor too little; and last and greatest, the opportunity to bring up his family healthfully, usefully, and happily.

The third object Lord Tollemache had in view in establishing cottage-farms was the supply of high class labourers for his large tenant-farmers. This has been done; and it is the proud boast of the neighbourhood that the labourers on the Tollemache estates are unexcelled in England. As the district is exclusively devoted to dairying, the labourers need to be smart and capable in handling cattle, quick to observe any symptoms of sickness among them, and so adapted to their dumb charges as to obtain the highest results in tending them. Many of the large farms milk sixty to seventy cows, and make one cheese, weighing from seventy to ninety pounds, per day. Milking is, therefore, a most important operation, and must be done quickly to be done well. On some of the farms the labourer's wives assist at this, for which they receive payment in coin, food, and milk. Some labourers are partly fed by their employers. The wages are from sixteen to seventeen shillings a week on a yearly average; and with the other emoluments in kind, bring up the pay to something near twenty shillings a week. Add to this the profits of the cottage-farm and the earnings of wives and children, and it will be seen that the Tollemache labourers are among the most fortunate of their class. A process of natural selection has gone on until they have become the élite of their craftsmen. When death or other cause makes a vacancy in their ranks, there is an eager rush from the outside to get the coveted cottage-farm and all the other advantages connected with it. Not only is the pay of the labourers exceptionally good, the work is easy to a degree unknown to other dairy districts.

Lord Tollemache is a reformer of the all round sort, and the proofs of it are as striking in the large farm-steadings as in the cottages.

In many parts of Cheshire, the old-style farm still exists. The stockyard beleaguered with litter, from which trickle unsavoury and unsightly streams at all seasons. A hideous mass of manure fills the centre or a corner; untidiness, clumsiness, and squalor are the rule. These unpleasant objects form the foreground of the picture, visible from the farm-kitchen or parlour. Dirt and disorder prevail. Lord Tollemache has indeed changed all that. His farmhouses resemble manor-houses, hunting-boxes, squire-like homesteads, anything but the ancient Cheshire farmer's home. Where the manure-heap once stood is now a beautiful green grass plot, fit for tennis or other similar games. The house is fronted by a garden, filled with flowers of every kind, and tended with loving care by the women of the house. Within it are the comforts, the elegances, and the refinements that one finds in the villas of St John's Wood or other æsthetic middle-class tenements. Only in some of the wealthy farmers' houses in America has the writer seen so many charming things as in the Tollemache cheese-makers' dwellings. Exteriorly and interiorly, a transformation has taken place that is hard to realise as having happened in half a generation.

The milking of seventy cows is an interesting sight; and those who perform the work in these splendid dairy-farms are marvellously apt. In a very short space of time the work is done, and the fragrant fluid is taken to the dairy, where all the devices for saving labour are at hand. Nowhere were evidences seen of those rude labours which exhaust the dairymaid. Machinery spares the muscles, science tells the truth of temperatures, steam cleanses the utensils, and pumps convey it whither by underground conduits to the factory. The manufacture of the gigantic Cheshire cheeses is carried on with a quietude and ease that is delightful to witness. No worry, no wasteful bustling; order, precision, exactitude prevail.

Men and women, masters and employees, are singularly different from those who made the famous Cheshire cheeses a while ago. There is a smartness about them that is not rural; they have a width in their thinking that is foreign to the native Cheshire mind; yet they are all children of the soil. They are not living under exceptional circumstances, but have to compete for existence. Cattle-plagues, from the desolating rinderpest to the last lingering troubles of foot-and-mouth disease, have impoverished them enormously. American cheese has hammered down prices to desperation. Spurious butters have kept profits at a low ebb for years; and now milk is down to sevenpence per gallon. Yet Lord Tollemache's tenants are not in arrears; no farms are to let; and if a vacancy happens, it is sought for by scores of farmers, who wait for a chance to come on the ground. Good management, not patronage-philanthropy, is the explanation of Lord Tollemache's success in dealing with his tenants and labouring cottagers.

To each of his tenants, Lord Tollemache gives a lease of twenty-one years at a fixed rent. In case the tenant may wish to vacate his farm,

he is free to do so at any time. But his lordship cannot dismiss the tenant before the expiry of the lease, except for violation of its terms. This compact is the basis upon which the whole system rests. It gives the tenant security against disturbance. He goes into his work with a whole heart. The cottage-farmer becomes possible under such a system; for his employer being secured of his farm, he is secured of his employment; and can apply his savings to his own little undertaking without fear of disturbance.

It may be said that cottage-farms are more likely to succeed in a dairy district than in a purely arable one, and that Lord Tollenache's system is not applicable to the country as a whole. Perhaps not; but at any rate it is easy for other landlords to make experiments of the same kind under different conditions. Success and failure can only be ascertained by practical methods; and from what has been done in Cheshire and other counties, enough is known to make a *prima facie* case for cottage-farming.

A HOUSE DIVIDED AGAINST ITSELF.

BY MRS OLIPHANT.

CHAPTER XLVIII.

LADY MARKHAM was a woman, everybody knew, who never hesitated when she knew a thing to be her duty, especially in all that concerned hospitals and the sick. She appeared by George Cannt's bedside in the middle of what seemed to him a terrible, long, endless night. It was not yet midnight, indeed; but they do not reckon by hours in the darkness through which he was drifting, through which there flashed upon his eyes confused gleams of scenes that were like scenes upon a stage all surrounded by darkness. The change had come. One of the nurses, the depressed one, thought it was for death; the other, possessed by the excitement of that great struggle, in which sometimes it appears that one human creature can visibly help another to hold the last span of soil on which human foot can stand, stood by the bed, almost carried away by what to her was like the frenzy of battle to a soldier, watching to see where she could strike a blow at the adversary, or drag the champion a hair's-breadth further on the side of victory. There appeared to him at that moment two forms floating in the air—both white, bright, with the light upon them, radiant as with some glory of their own to the gaze of fever. He remembered them afterwards as if they had floated out of the chamber, disembodied, two faces, nothing more; and then all again was night. 'He's talked a deal about his mother, poor gentleman. He'll never live to see his mother,' said the melancholy attendant, shaking her head. 'Hush,' said the other under her breath. 'Don't you know we can't tell what he hears and what he don't hear?' Lady Markham was of this opinion too. She called the doleful woman with her outside the door, and left the last battle to be fought out. Frances stood on the other side of the bed. How she came there, why she was allowed to come, neither she nor any one knew. She stood looking at

him with an awe in her young soul which silenced every other feeling. Nelly Winterbourn had been afraid of death, of seeing or coming near it. But Frances was not afraid. She stood, forgetting everything, with her head thrown back, her eyes expanded, her heart dilating and swelling in her bosom. She seemed to herself to be struggling too, gasping with his efforts for breath, helping him oh, if she could help him!—saying her simple prayers involuntarily, sometimes aloud. Over and over again, in the confusion and darkness and hurrying of the last battle, there would come to him a glimpse of that face. It floated over him, the light all concentrated in it—then rolling clouds and gloom.

It was nearly morning when the doctor came. 'Still living?'—'Alive; but that is all,' was the brief interchange outside the door. He would have been surprised, had he had any time for extraneous emotions, to see on the other side of the patient's bed, softly winnowing the air with a large fan, a girl in evening dress, pearls gleaming upon her white neck, standing rapt and half-unconscious in the midst of the unwonted scene. But the doctor had no time to be surprised. He went through his examination in that silence which sickens the very heart of the lookers-on. Then he said briefly: 'It all depends now on the strength whether we can pull him through. The fever is gone; but he is as weak as water. Keep him in life twelve hours longer, and he'll do.'

Twelve hours!—one whole long lingering endless summer day. Lady Markham, with her own affairs at such a crisis, had not hesitated. She came in now, having got a change of dress, and sent the weary nurse, who had stood over him all night, away. Blessed be fashion, when its fads are for angels' work! Noiselessly into the room came with her, clean, fresh, and cool, everything that could restore. The morning light came softly in, the air from the open windows. Freshness and hope were in her face. She gave her daughter a look, a smile. 'He may be weak, but he has never given in,' she said. Reinforcements upon the field of battle. In a few hours, which were as a year, the hopeful nurse was back again refreshed. And thus the endless day went on. Noon, and still he lived. Markham walked about the little street with his pockets full of small moneys, buying off every costermonger or wandering street vendor of small-wares, boldly interfering with the liberty of the subject, stopping indignant cabs, and carts half paralysed with slow astonishment. It was scarcely necessary, for the patient's brain was not yet sufficiently clear to be sensitive to noises; but it was something to do for him. A whole cycle of wonder had gone round, but there was no time to think of it in the absorbing interest of this. Waring had employed his wife's son to clear off those debts, which, if the old general ever knew of them, would add stings to sorrow—which, if the young man mended, would be a crushing weight round his neck. Waring had done this without a word or look that inferred that Markham was to blame. The age of miracles had come back; but, as would happen, perhaps, if that age had come back, no one had time or

thought to give to the prodigies, for the profound interest which no wonder could equal, the fight between death and life, the sudden revelation in common life of all the mysteries that make humanity what it is—the love which made a little worldling triumphant over every base suggestion—the pity that carried a woman out of herself and her own complicated affairs, to stand by another woman's son in the last mortal crisis—the nature which suspended life in every one of all these differing human creatures, and half obliterated, in thought of another, all the interests that were their own.

Through the dreadful night and through the endless sunshine of that day, a June day, lavish of light and pleasure, reluctant to relinquish a moment of its joy and triumph, the height of summer days, the old people, the old general and his wife, the father and mother, travelled without pause, with few words, with little hope, daring to say nothing to each other except faint questions and calculations as to when they could be there. When they could be there! They did not put the other question to each other, but within themselves, repeated it without ceasing: Would they be there before—? Would they be there in time?—to see him once again. They scarcely breathed when the cab, blundering along, got to the entrance of a little street, where it was stopped by a wild figure in a grav overcoat, which rushed at the horse and held him back. Then the old general rose in his wrath: 'Drive on, man! drive on. Ride him down, whoever the fool is.' And then, somewhat as those faces had appeared at the sick man's bedside, there came at the cab window an ugly little face, all puckers and light, half recognised as a bringer of good tidings, half hated as an obstruction, saying: 'All right—all right. I'm here to stop noises. He's going to pull through.'

'Mamma,' said Constance next evening, when all their excitement and emotions were softened down, 'I hope you told Mrs Gaunt that I had been there?'

'My dear, Mrs Gaunt was not thinking of either you or me. Perhaps she might be conscious of Frances; I don't know even that. When one's child is dying, it does not matter to one who shows feeling. By-and-by, no doubt, she will be grateful to us all.'

'Not to me—never to me.'

'Perhaps she has no reason, Con,' her mother said.

'I am sure I cannot tell you, mamma. If he had died, of course—though even that would not have been my fault. I amused him very much for six weeks, and then he thought I behaved very badly to him. But all the time I felt sure that it would really do him no harm. I think it was cheap to buy at that price all your interest and everything that has been done for him—not to speak of the experience in life.'

Lady Markham shook her head. 'Our experiences in life are sometimes not worth the price we pay for them; and to make another pay.'

'Oh!' said Constance with a toss of her head, shaking off self-reproach and this mild answer together. 'It appears that there is some post his father wants for him to keep him at home;

and Claude will move heaven and earth—that's to say the Horse Guards and all the other authorities—to get it. Mamma,' she added after a pause, 'Frances will marry him, if you don't mind.'

'Marry him!' cried Lady Markham with a shriek of alarm; 'that is what can never be.'

Meanwhile, Frances was walking back from Mrs Gaunt's lodging, where the poor lady, all tremulous and shaken with joy and weariness, had been pouring into her sympathetic ears all the anguish of the waiting, now so happily over, and weeping over the kindness of everybody—everybody was so kind. What would have happened had not everybody been so kind? Frances had soothed her into calm, and coming downstairs, had met Sir Thomas at the door with his inquiries. He looked a little grave, she thought, somewhat preoccupied. 'I am very glad,' he said, 'to have the chance of a talk with you, Frances. Are you going to walk? Then I will see you home.'

Frances looked up in his face with simple pleasure. She tripped along by his side like a little girl, as she was. They might have been father and daughter smiling to each other, a pretty sight as they went upon their way. But Sir Thomas' smile was grave. 'I want to speak to you on some serious subjects,' he said.

'About mamma? Oh, don't you think, Sir Thomas, it is coming all right?'

'Not about your mother. It is coming all right, thank God, better than I ever hoped. This is about myself. Frances, give me your advice. You have seen a great deal since you came to town. What with Nelly Winterbourn and poor young Gaunt, and all that has happened in your own family, you have acquired what Con calls experience in life.'

Frances' little countenance grew grave too. 'I don't think it can be true life,' she said.

He gave a little laugh, in which there was a tinge of embarrassment. 'From your experience,' he said, 'tell me, would you ever advise, Frances, a marriage between a girl like you—mind you, a good girl, that would do her duty not in Nelly Winterbourn's way—and an elderly rather worldly man?'

'O no, no, Sir Thomas,' cried the girl; and then she paused a little, and said to herself that perhaps she might have hurt Sir Thomas' feelings by so distinct an expression. She faltered a little, and added: 'It would depend, wouldn't it, upon who they were?'

'A little, perhaps,' he said. 'But I am glad I have had your first unbiased judgment.—Now for particulars. The man is not a bad old fellow, and would take care of her. He is rich, and would provide for her, not like that hound Winterbourn.—Oh, you need not make that gesture, my dear, as if money meant nothing; for it means a great deal. And the girl is as good a little thing as ever was born. Society has got talking about it; it has been spread abroad everywhere; and perhaps if it comes to nothing, it may do her harm. Now, with those further lights, let me have your deliverance. And remember, it is very serious—not play at all.'

'I have not enough lights, Sir Thomas. Does

she,' said Frances, with a slight hesitation—'love him? And does he love her?'

'He is very fond of her; I'll say that for him,' said Sir Thomas hurriedly. 'Not perhaps in the boy-and-girl way. And she—well, if you put me to it, I think she likes him, Frances. They are as friendly as possible together. She would go to him, I believe, with any of her little difficulties. And he has as much faith in her—as much faith as in—I can't put a limit to his faith in her,' he said.

Frances looked up at him with the grave judicial look into which she had been forming her soft face. 'All you say, Sir Thomas, looks like a father and child. I would do that to papa—or to you.'

Here he burst, to her astonishment, into a great fit of laughter, not without a little tremor, as of some other feeling in it. 'You are a little Daniel,' he said. 'That's quite conclusive, my dear. O wise young judge, how I do honour thee.'

'But'—Frances cried, a little bewildered. Then she added: 'Well, you may laugh at me if you like. Of course, I am no judge; but if the gentleman is so like her father, cannot she be quite happy in being fond of him, instead of—? O no! Marrying is quite different—quite, quite different. I feel sure she would think so, if you were to ask her, herself,' she said.

'And what about the poor old man?'

'You did not say he was a poor old man; you said he was elderly, which means'—

'About my age.

'That is not an old man. And worldly—which is not like you. I think, if he is what you say, that he would like better to keep his friend; because people can be friends, Sir Thomas, don't you think, though one is young and one is old?'

'Certainly, Frances—witness you and me.'

She took his arm affectionately of her own accord and gave it a little kind pressure. 'That is just what I was thinking,' she said, with the pleasantest smile in the world.

Sir Thomas took Lady Markham aside in the evening and repeated this conversation. 'I don't know who can have put such an absurd rumour about,' he said.

'Nor I,' said Lady Markham; 'but there are rumours about every one. It is not worth while taking any notice of them.'

'But if I had thought Frances would have liked it, I should never have hesitated a moment.'

'She might not what you call like it,' said Lady Markham dubiously; 'and yet she might'—

'Be talked into it, for her good? I wonder,' said Sir Thomas with spirit, 'whether my old friend, who has always been a model woman in my eyes, thinks that would be very creditable to me?'

Lady Markham gave a little conscious guilty laugh, and then, oddly enough, which was so unlike her—twenty-four hours in a sickroom is trying to any one—began to cry. 'You flatter me with reproaches,' she said. 'Markham asks me if I expect my son to be base; and you ask me how I can be so base myself, being your model woman. I am not a model woman; I

am only a woman of the world, that has been trying to do my best for my own. And look there,' she said, drying her eyes; 'I have succeeded very well with Con. She will be quite happy in her way.'

'And now,' said Sir Thomas after a pause, 'dear friend, who art still my model woman, how about your own affairs?'

She blushed celestial rosy red, as if she had been a girl. 'Oh,' she said, 'I am going down with Edward to the Warren to see what it wants to make it habitable. If it is not too damp, and we can get it put in order—I am quite up in the sanitary part of it, you know—he means to send the Gaunts there with their son to recruit, when he is well enough. I am so glad to be able to do something for his old neighbours. And then we shall have time ourselves, before the season is over, to settle what we shall do.'

The reader is far too knowing in such matters not to be able to divine how the marriages followed each other in the Waring family within the course of that year. Young Gaunt, when he got better, confused with his illness, soothed by the weakness of his convalescence and all the tender cares about him, came at last to believe that the debts which had driven him out of his senses had been nothing but a bad dream. He consulted Markham about them, detailing his broken recollections. Markham replied with a perfectly opaque countenance. 'You must have been dreaming, old man. Nightmares take that form the same as another. Never heard half a word from any side about it; and you know those fellows, if you owe them expense and don't pay, would publish it in every club in London. It has been a bad dream.—But look here,' he added; 'don't you ever go in for that sort of thing again. Your head won't stand it.—I'm going to set you the example,' he said with his laugh. 'Never if I should live to be a hundred,' Gaunt cried with fervour. The sensation of this extraordinary escape, which he could not understand, the relief of having nothing to confess to the general, nothing to bring tears from his mother's eyes, affected him like a miraculous interposition of God, which no doubt it was, though he never knew how. There was another vision which belonged to the time of his illness, but which was less apocryphal, as it turned out—the vision of those two forms through the mist—of one, all white, with pearls on the milky-throat, which had been somehow accompanied in his mind with a private comment, that at last false Duessa being gone for ever, the true Una had come to him. After a while, in the greenness of the Warren, amid the cool shade, he learned to fathom how that was.

But were we to enter into all the processes by which Lady Markham changed from the 'That can never be!' of her first light on the subject, to giving a reluctant consent to Frances' marriage, we should require another volume. It may be enough to say that in after-days, Captain Gaunt—but he was then Colonel—thought Constance a very handsome woman, but could not understand how any one in his senses could consider the wife of Claude Ramsay worthy of a moment's comparison with his own. 'Handsome, yes, no doubt,' he would say; 'and so is

Nelly Markham, for that matter; but of the earth, earthy, or of the world, worldly; whereas Frances'—

Words failed to express the difference, which was one, with which words had nothing to do.

THE END.

A CHRISTMAS RIDE IN 1807.

'THE story of the mailcoach, please, grandfather,' says my little *great-grandson*, when he and his mother spend a short time with me every Christmas-tide.

It is not very much; though to me, at that time a lad of seventeen years, it seemed a good deal; and I like to think of it among other remembrances of days past, after all these years; and sometimes, with an old man's garrulity, to tell it to others besides my great-grandchildren, if I can get any to listen. I am an old man, long past threescore and ten. Born in 1790, ninety-five years are up to this time the days of the years of my pilgrimage; but the circumstances of my story are fresh and clear in my memory.

What changes since my youth! The stage-coache and their gallant teams gone, never to come back; and the scream of the locomotive now echoes where in my day the horn of the mailcoach guard sounded pleasantly over hill and valley, through country road and village street. But time is up, and now they are ready to start, and we climb into the box seat, for which we have duly paid our fare to Salisbury by the half-past eight night mailcoach from Bristol. The coachman deftly gathers up the reins, the guard winds his horn, and we rally briskly, though carefully, out of the capacious inn-yard in the old town of Bristol, on our way to Salisbury. I was taking this journey for my father, who was in business at Bristol, and was intrusted by him with important papers, to be delivered to a friend at Salisbury. Coach-travelling was not without its dangers; and even at the time of which I am speaking, the remembrance of an occasional highwayman had not died out. But the accident which befell us was not of this sort; and although we were in danger of our lives and limbs, our foes cared nothing for money or valuables; and I believe no stage-coach passenger in England, before or since, ever met with danger from such enemies as ours were on this particular night of the 28th of December 1807. Passing through the narrow streets of old Bristol, we left the town by Temple Gate, where now stands the joint station of the Great Western and Midland Railways, over the winding Avon, through Arno's Vale; peaceful then on that winter night, as now and again the moon shone out between the clouds; peaceful, too, still, with its beautiful cemetery. On five miles, through the little town of Keynsham, little changed these seventy-eight years, where the good people were already going to bed, then through Bath, with its stately terraces and mansions, and on to Melksham, rich in corn-mills and sucking manufactories; then through Devizes—'The Vies,' in the vernacular of the eighteenth century peasants—famous in those days for its maling and brewing. Nothing unusual happened on our journey thus far. We changed horses at the stages, and all went well;

but the circumstances of the rest of the journey were so strange, so 'uncanny,' and the feelings of apprehension and mystery formed in my youthful mind were so strong, that seventy-eight years have not impaired the freshness of them in my memory.

We left Devizes with fresh horses—four bays, splendid animals, nearly thoroughbred; but when about three miles of this stage were passed, all four horses began to show unusual symptoms of unsteadiness, and a strong inclination to slacken speed, till at length they could with difficulty be persuaded to walk, and that slowly, and with frequent dead stops. Our coachman, an old roadster, handed me the reins, and got down. To his great mystification and annoyance, his horses were in a state of nervousness and tremor. The night had now become darker and very cold, with a strong south-easterly wind driving huge black clouds before its snowy breath, and with an occasional break in the clouds, showing a keen bright star, or the young crescent moon jewelled in the deep dark winter sky. The roads were frozen as hard as adamant, and sent back the footfalls of the horses in clear ringing notes. Here and there were slight powderings of recently fallen snow. Our coachman was fairly non-plussed. Never knew such a thing before. Looked about with the guard's lantern—harness and gear all right, and remounted the box and took the reins. The horses for some minutes refused to start, but submitted to be led by the guard and one of the passengers a short distance, when they condescended to walk slowly as before, and nothing more could be got out of them. No amount of whip would avail, and when applied too freely, resulted in a series of sharp kicks from one of the wheelers, much to the alarm of the inside passengers. This state of things went on for some hour and a half, as we dragged slowly along on our way towards Salisbury, in a south-easterly direction—right 'up wind,' as a fox-hunter would say—through a bleak country, sparsely inhabited. We had not passed a roadside house for some miles.

One of the 'outsides,' suggested that the Northern Lights might possibly have been the cause of the horses' fright; but though they had been visible at starting, they had entirely disappeared before our present team were put to. This suggestion was not supported. A badger or two had also been seen by the roadside during the lighter intervals of the night; but that was not then very uncommon, and certainly would not account for the condition of our horses. Speculation was useless. A sort of weird influence seemed to be in the air, and none of us felt very lively.

Our next stage was about four miles farther, our coachman told us; and with fresh cattle he should make up for lost time.

'But yet you see, sir,' he said to me, 'there are no four horses on this road that can beat these here for pluck and go; and now look at 'em, that is if you can see 'em, for it's got precious dark this last few minutes.'

Our horses, as if with one consent, stopped suddenly, and appeared very uneasy, and the leaders attempted to turn round, which was the more extraordinary, as the next stage was within so short a distance, and which of

course they knew. The guard thought he heard a confused noise like howling of dogs and shouting—very distant, he said. Every one thought it must be very distant indeed, as no one else heard any sound except that made by the wind. All seemed wrapped in the stillness and darkness of the winter night. After another careful examination of the horses by coachman and guard, they were, by dint of much coaxing, induced to start again, but at no better pace than a walk. Shortly afterwards, one of the passengers remarked that the wind, which had hitherto been blowing from the south-east, had suddenly veered to the south-west, and that, if this continued, we might expect a thaw. Our horses, as if in some way affected by this change, broke into a trot, and we began to congratulate ourselves that we were now getting clear from our state of bewilderment, when, on coming to the brow of a steep hill, the drag was put on, and the horses brought to a walk, and we commenced to descend. At the bottom of this declivity, which was about a furlong in length, ran a small stream, now hard frozen, and on the opposite side the road again rose sharply. Our weather-wise friend said that our hopes of a thaw might be given up, for the wind had now shifted back again to the old quarter. This was when we were rather more than half-way down the hill, and went near to be the cause of a disaster to us, for our leaders again endeavoured to turn back, as they did a short time before; but the guard was quickly at their heads, and by leading and pulling, and with judicious touches of the whip, we got safely to the bottom, where we pulled up to remove the drag before ascending the opposite hill. On both sides of the road hereabout were thick fir plantations, and the darkness was intense, relieved only by the coach-lamps, which in those days were not very brilliant.

The coachman and guard, assisted by two of the passengers, now took out the horses for a more thorough inspection of the harness, pole, splinter-bar, &c., before starting up the hill, when we were startled by the sound of horses being ridden furiously down the hill through the darkness in front of us—we were drawn up close to the 'near' side of the road—and in a moment a riderless horse galloped past us; and close behind, a second horse with the shafts of a vehicle still attached; and we all then heard the howling of dogs only a short distance in our front. Our horses now seemed as it mad, and having been detached from the coach and from each other, they quickly became unmanageable, and broke away from those who held them, and were immediately lost in the darkness.

We now heard numerous long-drawn howls, proceeding apparently from a number of animals rushing down the hill towards us. Those who were in the road quickly clambered up into their places on the coach, and the guard handled the blunderbuss with which the coach was always 'armed.' However, the darkness was too black for us to see much; but the howling of the rapidly approaching brutes, which every one now felt could not be dogs, sent a cold shudder through us. Just as they were upon us, the moon shone through a rift in the clouds, and we quite plainly saw six large gray wolves rushing past in full cry after the horses. We

were stupefied with astonishment; how this could be, what to think, what to do, we knew not.

After some time and talk, it was agreed that we should leave the coach and walk, carrying the mail-bags, to the next stage, at a small village inn about two miles ahead. This we did, keeping together, and it was fortunate that there were no women-passengers, the coachman going first with the lantern, and the guard bringing up the rear with the blunderbuss. On reaching the top of the hill, we came upon a broken-down wagon in the middle of the road; and on making an inspection with our lantern, we found it to be the remains of a large van belonging to a travelling menagerie ('wild beast show,' in those days). The large hindmost doors were open, and on the sides of this van was painted the word 'Wolves.' This accounted partially, but not fully, for our night's adventure. On making further search, we found a man lying in a ditch by the side of the road some fifty yards from the van, grievously torn and insensible, but alive. One of our passengers happened to be a doctor; and under his directions, with such attention as could be given on the spot, and with the help of stimulants, he came to himself in about a quarter of an hour. He told us that he was in sole charge of the van and six wolves, his company being short-handed through illness; that in consequence of an accident, he had started from their last halting-place about ten hours after the rest of the company; that the wolves, perhaps from cold and hunger, were very restless for a considerable time before they escaped (hence the reason of our highly-bred horses, with their instinctive dread of wolves, and their acute scent favoured by the direction of the wind, refusing to approach nearer to the van, far away on the road before them); that he entered the 'keeper's compartment' of the van to see that all was safe, when one of the largest of the animals made a great spring, breaking the old and rusty bars of the cage; this liberated the whole of the wolves; and to save himself, he was obliged to unbolt the outer doors and run for his life. Two of the wolves fastened on him, and would, no doubt, have soon made short work of him, had it not been that his horses in their terror broke away down the hill with loud snorting and neighing, whereupon the two wolves left him, and joined the others in pursuit of the horses. He remembered nothing more, and must have been insensible until we discovered him.

We carried the poor fellow to the village to which we were going; and he was afterwards taken on to Salisbury for better surgical attention. The fire and light of the inn were very welcome after the cold and darkness of the journey. Our horses did not fall a prey to the wolves; but the shaft-horse of the van was killed by them, and partly devoured. The whole countryside turned out with all kinds of weapons, from guns down to heavy sticks, for the destruction of the wolves, which, however, we afterwards heard had committed some havoc in the sheepfolds before the last of them succumbed to a farm-labourer's well-handled pitchfork, a week after his escape.

We were not long permitted to enjoy the comfort

of our inn, for the coach was quickly brought up to the door with a fresh team, with which our Jehu certainly did his best to redeem his promise of making up for lost time.

• AT TREVENNA COTTAGE.

BY T. W. SPEIGHT.

A STORY IN EIGHT CHAPTERS.—CHAP. V.

BETWEEN Thursday and Monday, no telegram or further communication of any kind reached Trevenna Cottage from Mr Saverne. Accordingly, on the afternoon of the latter day, Captain Avory hired a horse and wagonette from the *Clown Hotel* and drove over to Mumpion Junction to meet his cousin. That the captain was nervous and ill at ease, need scarcely be said, and he wished fervently that the next few hours were safely tided over. He had nerved himself with brandy before setting out on his journey; and his first proceeding, after reaching the station, was to make his way to the refreshment counter.

At eight o'clock to the minute, Bosy Groote knocked cautiously at the back-door of Trevenna Cottage, and was at once admitted by Mrs Avory. The two servants had been paid their wages and sent away earlier in the day. Mrs Avory installed Bosy in the kitchen; and after providing him with sundry refreshments and telling him that he was at liberty to smoke, she left him to his own devices.

The train by which Mr Saverne travelled was only a few minutes late in its arrival at Mumpion. Captain Avory stood on the platform, a nervous tremor affecting him from head to foot, as he watched the passengers alight. Presently there emerged from the crowd a face and figure which he recognised at the first glance, unchanged though they were in some measure by the passage of a dozen years. His heart gave a great throb as he went forward quickly with a white face and lips which twitched involuntarily behind the smile of welcome they now wore. A moment later and the two cousins had gripped each other's hand.

Edward Saverne, who was several years younger than the captain, was a thin, slightly built but wiry-looking man, with a sun-embrowned complexion, and a plentiful tangle of brown beard and moustache. He had a pleasant smile and kindly eyes. He was one of those men whom other men—and women too, for that matter—seem to take to and like instinctively, without waiting to ask themselves whether or not it is, wise on their part to do so.

'You are scarcely a bit altered,' said the captain to his cousin as they stood for a moment full in the light of the station lamps. 'You are browner, and perhaps a trifle broader across the shoulders; but I should have known you again anywhere.'

'Time's finger doesn't seem to have scored you

very heavily in passing,' remarked the other smilingly. 'Yet, now I scan you more closely, you look pale and careworn—nervous even, and that is worse than all. What's amiss? Nothing wrong at home, I hope? Or perhaps it's only your liver that's out of order? That poor liver has much to answer for.'

The captain laughed a little dismally. 'There's nothing the matter with me that I am aware of,' he said; 'except that of late I've been suffering somewhat from insomnia. As you say, there's no doubt it's that plaguy liver.'

Five minutes later, they had lighted their cigars and were bowling in the wagonette rapidly along the road to Boscombe, Mr Saverne sitting on the box by his cousin, with his one portmanteau behind.

It was a dark moonless night, with scarcely a breath of air stirring. The few stars that were visible twinkled faintly, as if they were further off than usual. The two men as they drove along had much to talk about; but, truth to tell, the conversation was mainly kept up by Mr Saverne, for, despite all his efforts, the captain's thoughts would wander from the subject in hand, and busy themselves about a certain task which must imperatively be got through before dawn. It was therefore with a divided mind that he listened to his cousin's explanations of the reasons which had induced him to return so unexpectedly to England. By-and-by, a turn of the road showed them the few scattered lights of Boscombe twinkling like glow-worms on the slope of the hill; and a few minutes later, they drew up at the gate of Trevenna Cottage.

The door was wide open, a lamp shone in the hall, and Mrs Avory was waiting at the threshold to receive them. There had been no love lost between her and Edward Saverne in years gone by. He had not liked her, and she had not liked him, and each of them knew it. But all this had happened years ago; and when a long-lost kinsman returns from over the seas, old animosities ought to be quenched, at least for the time being, and a home-welcome extended to the wanderer. Accordingly, Mrs Avory, in her usual quiet, undemonstrative way, was full of cordiality, and in the course of three or four minutes, almost succeeded in making her guest believe that she was really glad to see him again. She ushered him into the dining-room, where a cheerful fire was burning, with a small round table in front of it for two persons.

'There must be no formality, Edward, I beg,' she said. 'Never mind your dress. It is only a bit of supper I've got ready for you and Lucius. We are primitive folk here, and we never dine later than five. You must not mind if I wait on you myself this evening. The fact is,' she added confidentially, 'I had to send away both my servants this morning at a moment's notice. The usual thing, of course—dishonesty. It was impossible to keep them. So we are all alone to-night; but you won't mind that for once, I daresay. I have a cook coming on trial in the morning.'

The captain, meanwhile, had taken the horse and trap round to the stable at the back of the Cottage, having previously arranged at the hotel that he should keep them till next day. There he found Bosy Groote, who proceeded to

groom and feed the horse. A brief colloquy ensued between the two men, after which the captain went indoors and joined his cousin in the dining-room.

Mrs Avory had provided an appetising little supper, to which her kin-man did not fail to do justice; but it was only by an effort that the captain contrived to swallow a few morsels. Of this, however, Mr Saverne saw nothing. Mrs Avory plied him with so many questions, and had so many things to tell him on her own account, that he had no attention left for anything else. 'Really,' he thought to himself, 'Louisa has improved vastly since we last met. I had no idea she could make herself so agreeable.'

When supper was over and Mrs Avory had cleared the table, the two men drew their chairs closer to the fire, for the night seemed suddenly to have grown chilly.

'What would you like to drink? A little hot punch, or what?' asked Avory at the moment his wife re-entered the room.

Edward Saverne hesitated. He was an abstemious man both by temperament and inclination; but to-night he certainly did feel as if a little warm punch would be grateful to him.

'I think I know of something that Edward would like still better,' remarked Mrs Avory sweetly. 'Although so long ago, I have not forgotten that he used to have, what he will excuse me for calling, a little weakness for mulled port—especially, I think, when it had been made by me.—What say you, Edward, to a little mulled port to-night, concocted after the old recipe?'

Edward laughed. 'I think it a very happy suggestion,' he said; 'and I hope to find that your old skill has not deserted you. I tried my hand at it once or twice in Australia, but the memory is a painful one.'

'Punch for me,' said the captain with a laugh. 'I call mulled port a mollicoddle drink, though Lou certainly does know how to brew it.' Speaking thus, he handed his cigar case to his cousin and then took a weed himself.

A tiny copper kettle was singing merrily over a spirit-lamp on the sideboard; and all ingredients being at hand, Mrs Avory at once set about mixing a large tumbler of port-negus for her cousin and one of grog for her husband.

'Try that,' she said as she handed Mr Saverne's glass to him with a smile.

He took a long appreciative sip at it; then he nodded and smiled and said: 'Your fingers have not forgotten their cunning, Louisa. It's a tippie fit for the gods.'

'One request,' she said—'don't neglect to drink it while it's hot.'

The captain was in the act of striking a match at the moment his cousin lifted the glass to his lips, but apparently he forgot to apply it to his cigar, and allowed it to burn itself out in his fingers. Before striking another, he took a long pull at his tumbler, and Mr Saverne could not help noticing how his hand shook as it held the glass.

Mrs Avory opened the folding-doors which gave access to the drawing-room, and seating herself at the piano, she began playing some slow, dreamy melody in a minor key, while the two

men went on with their talk in the adjoining room.

Up to this point, Captain Avory's share in the conversation had been little more than a nominal one; but now he seemed at once to brighten up, and plunged into some reminiscences of his boyish days in which he and his cousin had been mixed up together. The more voluble the captain grew, the more taciturn his cousin became. The room was cosy, the fire was cheerful, his easy-chair was soft and comfortable, and his cigar was of a choice brand. Somehow, as he sipped and sipped again at his negus, the less inclined he became for talking, and the more inclined he became to listen to Lucius, to whose voice the notes of the piano formed a sort of seductive accompaniment. Gradually, and almost imperceptibly, he began to lose all sense of time and place. Twice he caught himself nodding, and drew himself up with a start; but the influence that was upon him was too powerful to be long resisted. For a minute or two longer, Avory's voice droned in his ears, but without conveying any more sense to him than the droning of a wasp would have done; for a minute or two longer, he heard the liquid tinkle of the piano like faint, vague music coming from afar; then his head sank gently back on the cushions of his chair, and he remembered nothing more. The narcotic administered by Mrs Avory in the mulled wine had worked its intended effect.

'He's off!' whispered the captain to his wife a minute later.

Mrs Avory came forward and looked closely at the sleeping man. After carefully testing the action of his pulse, she lifted his lids one after the other and examined the pupils of his eyes.

'Yes, I think he will do,' she said to her husband, with that strange sinister smile which sometimes lighted up her face. 'You see, my dear, that I was a doctor's daughter to some purpose. You had better go and rouse up Bosy Groote and get everything in readiness as quickly as possible.'

The captain went without a word, his face as white as a sheet. He was dreadfully agitated, for he could not help reflecting that it was just possible his cousin might never wake again in this world. He found Bosy asleep on the rug in front of the kitchen fire; but he sprang to his feet at a touch, and at once proceeded to the stable to harness the horse; while Avory induced himself into a rough overcoat, tied a muffler round his neck, and put on his head a travelling cap which he rarely used. Bosy returned in the course of a few minutes; and then he and the captain proceeded to carry out to the wagonette a number of articles which had previously been placed in readiness by Mrs Avory. This done, Avory, followed by Bosy, went back to the dining-room.

Two minutes later, Mr Saverne, wrapped in a blanket, had been safely deposited on a long, horse-hair cushion at the bottom of the wagonette, with an old blue cloak of the captain's thrown lightly over him. Bosy then got into the vehicle and shut the door, and Avory mounted to the box.

Scarcely a word had hitherto been spoken by any of the three. Mrs Avory now said to her

husband: 'I shall sit up till you return. You will get back as quickly as possible.'

'You may rely upon that,' was the answer.—'You don't think there's any likelihood that the jolting will waken him?'

'None whatever; you may make your mind easy on that score. An earthquake would scarcely waken him for the next four hours.'

Two minutes later, they had started on their way to Hoogies. Midnight struck as they wound slowly up the hill. Not a light was anywhere to be seen. Darkness and silence lay all about them. As soon as they had got fairly into the road which skirts the crown of the hill, their progress became a little accelerated, although it was still necessary to drive carefully, in order that the unconscious man might be shaken as little as possible. At length they reached that part of the road where it becomes narrower, and dips abruptly towards the shore, and is shut in on either hand by gloomy masses of foliage. At this point the captain was obliged to come to a stand, he could not see his hand before him. Bosy, who knew the road almost as well by night as by day, suggested the advisability of leading the horse down the hill. To this Avery agreed; so Bosy alighted, and down they went slowly till at length they reached the end of the plantation and emerged on to the level road by the shore. It was necessary to skirt the extreme end of the plantation, so as to reach the sands, and then to go back along them for a short distance, and in that way arrive at the house.

At length they reached the fire-blackened ruin which was their destination. During the whole journey from Trevenna Cottage to Hoogies, they had neither met nor overtaken any one. As soon as they drew up, the captain threw the reins over the horse's back and alighted. Bosy went forward into the house, and presently returned with a horn lantern, in which a candle burned dimly.

'Get up into the trap and see that he is all right,' said Avery in a hoarse whisper.

Bosy, lantern in hand, obeyed. The captain scarcely breathed while the brief examination was being made. 'He's all right—as fast as a rock,' said Bosy as he stepped down.

Captain Avery breathed again; and producing his spirit-flask, he partook of a copious dram, and then gave another to his companion. There still remained much to be done.

The two men went indoors, and, instructed by Avery, Bosy lighted a couple of candles, which he stuck in empty bottles on the chimney-piece. At that hour of the night they had no fear of any one spying on them from without. Bosy's next act was to clear away everything from the middle of the floor. That done, he crossed to the wide old fireplace, and thrusting one arm inside it nearly to his shoulder, he felt for, and found an iron ring attached to a chain, which he pulled down by some exertion, and then fixed it in that position by means of a hook firmly imbedded in the brickwork of the chimney. The moment he pulled the ring, a certain plank in the floor sank about two inches, and then slid out of sight beneath the plank next to it. In the fissure thus revealed were two more iron rings about two feet from each other. Bosy now

came forward, and kneeling on one knee, took hold of one of the rings, while the captain took hold of the other. Pulling thus together, they gradually lifted up a large square trap-door in the middle of the floor, and then fixed it in an upright position by means of a couple of stanchions. At their feet now gaped a huge black cavity or cellar, hollowed out of the soft friable rock on which the house was built. In the olden days, this had been the receptacle and hiding-place for many a 'run' of contraband goods. After his mother's death, there was no one living but Bosy who knew the secret of the hiding-place; but to Captain Avery, when the latter happened to call on him, he had revealed it as being a matter of little moment. It was nothing now but a curious memento of a state of things which had died out long years ago.

As the captain gazed into the yawning cavern, it looked so like a huge grave that he could not repress a shudder. And yet it was to this living tomb that he was about to consign his cousin, who had never done him an injury! Avery was not so hardened in ill-doing as not to feel acutely the turpitude of the deed on which he was bent; but he was as a man who is being dragged forward by the hand of an inexorable Fate, which he is powerless to resist, and from which there is no escape. He had gone so far on the road he had chosen, that no turning back was possible for him. Go forward he must at any and every cost. He shrank back with an inward groan.

Bosy, meanwhile, was bringing in a number of packages from the wagonette. When there were no more to bring, he took a candle in his hand, and by means of a loose wooden ladder, he descended through the trap-door into the cellar, which extended under nearly the whole of the kitchen. It was as dry and as free from damp as on the day it had been hollowed out of the sandstone. It was ventilated by means of a small shaft, which opened into the chimney above. Some preparations for the reception of his guest had already been made by Bosy. His rude truckle bedstead was arranged in one corner; and the empty cask had been brought down to serve as a table, together with one of the three-legged stools, in lieu of a chair; while in another corner stood a large earthen pitcher filled with water.

The captain now proceeded to hand down to Bosy the articles removed by the latter from the wagonette. These comprised candles, a candlestick, matches, a small spirit-lamp and kettle, sundry provisions, a bottle of brandy and another of port, together with a few articles of crockery.

'Looks like a pallis fit for a king—blest if it don't!' whispered Bosy, as he glanced round it admiringly when the last article had been handed to him. 'Wouldn't care tuppence if I was shut up here myself.'

As soon as Bosy had ascended from the cellar, the captain and he held a consultation. They had forgotten to bring with them the rope needful to assist them in lowering the sleeping man into the cellar. Bosy's quick wits assisted him in solving the difficulty. 'There's the reins,' he said; 'why can't we make use of them?'

'The very thing!' exclaimed Avory. 'Get them at once.'

As soon as Bosy had fetched the reins, he and the captain proceeded to lift Mr Saverne—still lying on the long cushion—out of the wagonette and deposit him on the kitchen floor. The reins were then passed under the cushion, one at the head, the other at the feet, after which the conspirators proceeded slowly and carefully to lower the cushion and its burden into the depths below. This safely accomplished, the two men descended one after the other, the reins were removed, and Mr Saverne was then lifted on to the truckle bedstead. The blanket was still round him in which he had been wrapped at the Cottage; and a second one was now laid over him. A fresh candle was lighted, and after that, there was nothing more to be done. Avory bent over his cousin for a moment; the latter was breathing heavily but regularly—it was the breathing of a man in a deep dreamless sleep. Never in his life had Captain Avory loathed himself as he did at that moment.

Two minutes later, the ladder had been drawn up, the trap-door had been lowered, and the mysterious plank had slid back into its groove. There was no trace visible of the deed which had just been enacted.

Captain Avory, who shook in every limb, fortified himself and Bosy with another dram from his flask; then he said: 'In order that there may be no blunder on your part, I will again refresh your memory with regard to what still remains for you to do. Now, listen carefully. As soon as you hear the gentleman below stirring, but not till then, you will leave here without letting him in any way have a knowledge of your presence. Should you not hear him stirring by noon to-morrow, or rather to-day, for it's now past one o'clock, you will hasten at once to the Cottage and inform me of that fact. But, as a matter of course, he will waken up long before that time. The moment you hear him move, you will steal away, and not come near the place till midnight on Wednesday. The noise you will then make will attract his attention, and he will at once endeavour to attract yours. When he has succeeded in doing thus, you will open the trap-door in the same way that it was opened to-night; you will lower the ladder, and you will help him to ascend. You will profess to be as much surprised as himself at finding him there. You have been away in another part of the country for several days, and know nothing whatever of the affair. Who can possibly have shut him up in the place where you have found him!'

Bosy, who had been following the captain's instructions with eager nods and smiles, now broke out with a shrill 'Ho, ho, ho!' in which there seemed to lurk an echo of madness. 'I'm fly, cap'n, I'm fly,' he cried. 'Ah! I fancy I can see the gen's face when he comes blinking up the ladder, and wants to know where he is! But, as you say, cap'n, who could possibly have put him there? Ho, ho, ho!' Then, with a sudden change of tone, he said: 'But you promised me ten more bright yellow boys, cap'n, when the job was done—don't forget that!'

'I have not forgotten. Here is the money;' and with that Avory counted ten sovereigns into Bosy's lean claw-like hand.

Five minutes later, Captain Avory had set out on his way back to Trevenna Cottage.

THE TREATMENT OF CONVICTS AND DISCHARGED PRISONERS.

AMONG the many efforts of Christian philanthropists to alleviate the misery and distress of the unfortunate, few are more worthy of public support and sympathy than the Societies which seek to assist those unfortunates who have been led astray from the straight way, to return to the path of honesty and integrity—no easy matter, when surrounded by every temptation, and no kind friends to receive them on discharge from prison. But strange to say, some of the discharged prisoners themselves seem to have a prejudice against the very Societies organised for their benefit; and it is for the purpose of dispelling such illusions that a correspondent who has made strict investigation into the matter has sent us some reliable information from personal observation.

About six weeks before a convict is to be discharged, he is asked if he wishes to book for one of the Aid Societies. On his deciding on one, he is notified in due time that they will receive him. His gratuities are paid over to the Society; and he can either have his clothing from the prison or from the Society, which is a matter of importance to the prisoners; so (says our correspondent) I purpose taking them and the reader to the Royal Society in Aid of Discharged Prisoners, 39 CHANCERY LANE, London. The prisoners are taken from the prison in a cab, and on arriving at the chambers of the Society, are shown into a room, where a substantial breakfast is set before them, consisting of a large plate of ham with *white* bread—which seems to fill the men with ecstasy, after what they call the 'sawdust' bread they have been used to—and unlimited coffee. After doing justice to these things, they are called singly into the secretary's room, where they are interviewed by a gentleman of the Committee as to their plans and the best way in which the Society can assist them.

These are gentlemen who are in high social positions, who attend personally one day each in his turn; and now and then the President, the Duke of Westminster, goes and talks to the men. They are next taken by a clerk to some upper rooms, well stocked with clothing of all kinds. Those who get their things here, on leaving the prison, are supplied with a suit of clothes, also one cotton shirt, one flannel shirt, with flannel drawers, one pair of socks, and a necktie. The suit is only lent; but the other things, the person who receives them keeps.

Several men were fitted during the writer's visit, and the secretary kindly gave me a bill of one of their outfits. I assert positively that no one could ever dream where that man had got his clothes, or where he had just come from, which cannot be said of those who get their clothes from the prison. The following is the bill of the outfit I have mentioned: Tweed suit, 17s. 6d.; two coloured Oxford shirts, 4s.;

two pair of stockings, 1s. 8d.; black silk necktie, 1s. 6d.; braces, 1s.; serviceable hat, 2s. 9d.; boots, 7s.—Total, £1, 15s. 2d. As this man's outfit came to two shillings less than the sum allowed, he took, besides, two pair of socks and a nife muller. If this outfit had been purchased in the shops, it would have cost considerably more. After being clothed, the man was taken again to the secretary. If he wanted employment, he was supplied with a note to certain employers, and sufficient money for his wants till he called again. But if he was going down the country, he was told what time to be at the station. An agent would meet him there, and give him his railway ticket and a sovereign.

There seems to be an idea that going to the Society means getting 'lagged' again; which report has been raised by men who have been reconvicted, and who declare the Society to be in league with the police. When I hinted this to the secretary, he indignantly repudiated it, and declared that the police have several times accused the Society of withholding information which would have enabled them to capture certain men. But, as the secretary observed, both his duty and inclination prompt him to assist men to get into honourable positions and get an honest living.

Another idea among prisoners is, that unless they have some gratuities to pay into the Society's hands, the latter won't receive them. I looked through the Society's books, and saw a number of cases where men without money and unable to find work had been supported by the Society for several weeks. I spoke to two men who had been treated in this manner, and they were warm in expressing their gratitude for the kindness they had received. Another man came in during my visit to ask for more money. He said he had been to all the places indicated in the note, but could not get any work. I think the fellow never wanted any work; and if he happens to get reconvicted, he is just the one to set the prisoners against the Society by his false statements.

The secretary showed me a letter received that morning from a man he had sent to New York some weeks previously with a letter of introduction to an agent there, who got him employment with an English farmer eighty miles from New York, at five dollars a week and board and lodging. He lived and had his meals with the family. He spoke with rapture of the kindness he met with. His master being a teetotaler, he became one; also, and hoped soon to save enough to take a farm of his own! This is one of many cases where they have been the means of assisting men to regain their lost positions; yet many prisoners persist in believing the reports of wretches who seem incapable of speaking the truth. The secretary, Major Tillbrook, has invited governors and chaplains to come and examine his books, &c.; but very few of them have been zealous enough to take the trouble, so he trusts to time to prove whether he has conscientiously done his duty or not. As for myself, I can heartily recommend all prisoners to look for the Royal Society, 39 Charing Cross, and get their clothing from them. Those who sincerely wish to turn to the path of honesty

will receive every encouragement and assistance from the Society. I would also beg to call the attention of the wealthy to this good cause, and ask them to promote it by their donations.

On the subject of gratuities to convicts, there has been so much written of late years, that any addition may seem superfluous; but, as much of what I have read on the subject could only have been obtained from a secondary source, and as I have had unsurpassed opportunities for several years of observing and studying the subject in all its bearings, I venture to hope my remarks may throw fresh light on the matter, and call the attention of the authorities to the subject.

I am convinced that the only true principles of criminal reformation are these: (1) To create and develop self-respect; and (2) to create and encourage habits of industry. Now, in practice, the very reverse happens. It is, as a rule, through lacking these two qualities, that men become criminals; and seeing that to be the case, it cannot be expected that habits of industry are to be created by setting them to work which they may be unfitted for and by giving them no interest in their labour. Under such conditions, every artificer is resorted to, to evade or scamp their work; whereas, by giving them a fair percentage on the value of their labour, it would cease to be repulsive, and they would gradually acquire a liking for it. As they saw the money accumulating on their credit sheet, they would be stimulated to further exertion by the prospect of being able on their release to start themselves in the way of getting an honest living. Habits of industry, to be lasting, must be spontaneous, not forced. The men in the convict prisons have a certain task to perform, which, as a rule, is an easy one. The same amount of work outside would not support a man. As no one likes to work more than he is forced to do, especially at work he gets little or nothing for, the consequence is, that after a number of years of easy work, it has become a settled habit. On his release, being unable to do more work, he cannot compete with other working-men; and unless he is a man of more than ordinary virtue and resolution, he soon gets disheartened, gives up the struggle, and relapses into crime again; whereupon he is denounced as an incorrigible scoundrel, and gets sent back to prison, to have every hope blasted of being able to raise himself to an honest position. All his heroic struggles against adverse circumstances are ignored; and in the bitterness of his heart, he vows eternal enmity to all laws and society. There you have a man able and willing to commit any crime; one who reflects on the number of years of his life and labour he has been robbed of. He is thereby stimulated by revenge, as well as by the desire to make up at somebody's expense what he considers he has been robbed of.

The longer a man is kept under these conditions, the less are his chances of extricating himself; for, under the so-called 'Prevention of Crimes Act,' a man who has been twice convicted of crime is at the mercy of every policeman who may owe him a grudge; or who, knowing his power over him, may be base enough to misrepresent some little act, such, for instance, as seeing him in certain places where other people may be with impunity. In the case of this man, some sinister motive is alleged and believed, and the

unfortunate creature is sent to twelve months' hard labour; so that these so-called Prevention of Crimes Acts are the means of committing crimes, by occasionally sending innocent men to prison. These Acts are unjust, and utterly inadequate to prevent crime. I assert that the majority of men who get reconvicted, would not have been so, had they had the means, on their release, of a fair start. This can best be done by allowing the prisoner to use his powers of application while in prison to earn by his labour enough to start him in life again; or to emigrate, which is the best thing he can do.

The present system of giving gratuities is unfair and unequal. Convicts doing penal servitude have to pass through the following classes, namely, probation class, one year, of which nine months are spent in separate confinement, during which they receive no gratuity or remission. If they are not reported for misconduct, they go into the third class, and get one shilling a month for twelve months. They next pass into the second class, and get one shilling and sixpence a month for twelve months; after which they enter the first class, and receive two shillings and sixpence a month for twelve months, until they have earned three pounds altogether. By the time they have earned this money they will have done four years; but a man under sentence of five years only does about three years and eleven months, so that he cannot earn the three pounds; yet, provided he has done nine months in the first class, he is eligible to be recommended for a further gratuity not exceeding two pounds; whilst those under sentences over five years can be recommended for an extra three pounds—to get which, he must be in the special class; and to obtain which, he must pass through the first class without any reports. Now, here is the unfairness. One man is doing ten years, is working in the shoemakers' shop, and his labour is worth fourteen or fifteen shillings a week; another man doing five years is closing boot uppers, and his labour is worth about three shillings and sixpence a week; yet, if he has passed nine months in the first class, he gets five pounds; whilst the ten years' man—who has to pass over four years in the first class, and may probably get reported in that time, for, say, speaking to another prisoner, which will keep him from getting into the special class—on discharge will only get three pounds. Even a fifteen or twenty years' man will get no more.

One would think that in making pecuniary awards, the chief thing to be considered would be what a man has earned by his labour; yet practically, that is not considered of any account, for a lazy schemer, who will perhaps be picking oakum or other equally unpaying work, and earning about fourpence a day, providing he does not get reported—and such schemers know how to fawn round the officers, and generally escape being reported—then gets the full gratuity of six pounds. Where is any fairness or justice in such a system? It only encourages laziness and scheming, and offers no inducement to a man to take any interest in his work or try to improve his craft. The consequence is, none of them do what they could or would do, if they were allowed something on all they did.

I ask any reader of this paper to imagine him-

self through some sudden act, intentional or accidental, sentenced to twenty years, perhaps in the bloom and vigour of manhood; and after doing fifteen years, is liberated, when he finds he has nearly forgotten his trade. He is weak, and wants good nourishment; the best years of his life have been wasted; and he has done no good to himself or anybody. Reflect, reader, what a feeling such treatment would raise in your heart. Would it not be one of bitter resentment? I know of many men doing ten, fifteen, or twenty years for striking officers in the army or navy! These men are honest men, and never been in prison before, as a rule. They were tried by courts-martial, composed of the brother-officers of the officers they had struck. I venture to suggest that courts-martial should not be allowed to give such sentences. I submit that if a man commits a crime, he must be punished; and in many cases the judges will acknowledge they give long sentences, not so much for the crime committed, as to make it a long time before he can commit it again. Now, the Government declares it seeks not so much to punish a criminal as to reform him; then why not let the earlier portion of his sentence be made a punishment, while the crime is fresh in his memory, and the latter part be applied to his reformation? This can be best effected by giving him facilities for acquiring habits of industry, by letting him earn money all through his sentence—which will place him in a position to help himself by his own means, instead of seeking, and not finding, help from others.

I think the fairness and justice of these remarks will commend themselves to all humane persons; and I trust may meet with the generous consideration of the authorities.

A WINTER VISIT TO FONTAINEBLEAU

Is the middle of a winter exceptionally severe, my friend came over to Paris to pay me a long expected visit, having seized the only opportunity which a temporary release from home-duties afforded him of leaving England. He was very desirous of seeing Fontainebleau; and although it was unfortunate that he was unable to choose a more propitious season, I determined that not even this opportunity should be lost of paying the place a visit. So off we started to the *gare de Lyon*, and were soon rolling along through the bitterly cold air. Inside the carriage we were cosy enough, having provided ourselves with ample coats and rugs, and having the benefit of two large foot-warmers, which on French railways never belie their name, and which in this instance were entirely at our disposal as the only occupants of the compartment.

But what a picture of starving cold outside! Through the snow, which had been lying three weeks or more on the ground, nothing appeared save the skeleton trees 'standing like ghostly mutes at Nature's funeral, shrouded in the far distance by that steel gray pall to which such weather owes the name of 'black frost.' The windows were covered with a sheet of sparkling ice, which we rubbed away many times with our

hands; but almost before we had time to look through, the space was again frozen over. We were not sorry on such a day to walk the distance—some two miles—which separates the station of Fontainebleau from the town; and by the time we arrived in front of the handsome railing shutting off the large court of the château from the street, all the stiffness and cold of the journey had disappeared. But if the walk had restored our circulation, it had also served to remind us that it was breakfast-time, and a *déjeuner* served in the dining-room of one of the hotels opposite the palace, found us sharp set. Here our excellent hostess, knowing that *es messieurs* must be dreadfully cold, lit us a splendid fire, and drew our table close up to it, so that we enjoyed our meal in warmth and comfort. Thus fortified, we put on our coats, and went across to the *Cour des Adieux* to find a guide. Very loth was the guardian whose turn it was to accompany us to leave the warm room where he and his companions were seated round a large porcelain stove. But having at last unmistakably convinced himself that it was his turn, he buttoned up his coat over his sculler waistcoat, and with a shudder and a sigh, came out, crossed the court, and proceeded to introduce us under the great horse-shoe staircase into the château.

Let us pause here for a moment and carry ourselves back seventy years. See that short pale man who speaks from the staircase to that throng of soldiers who stand round with drooping heads and moistened eyes, moved beyond speech, as his words of farewell fall upon their ears. Now he ceases, the fire dies from his eyes, and the veterans throng round for a last look, through their unvoiced tears, at their beloved leader, ere he turns to go from them, as they think, for ever. But less than a year has passed when the whirligig of events brings him there again, and cheer after cheer rings through the yard from the dense throng of troops, as, with flushed cheek and sparkling eye, he speaks to them of triumph. Off go bearskin and shako, and the throats of a thousand veterans welcome him.

'*Par ici, messieurs*,' says the guardian; and back to the tomb rush the martial shades, nothing left but the snow-covered yard and staircase. The name of the place—*La Cour des Adieux* (the place of parting)—alone perpetuates the episode.

Now at last we are inside that famous palace, a monument of French sovereigns from Louis IX. to Napoleon III. There are many who take but a languid interest in the palace of Fontainebleau. For these, it is a mere collection of beautiful ~~rooms~~ and furniture, with which it is necessary to be acquainted as a topic of conversation, but for which one visits amply suffices. When you have seen it once, you have seen it enough, whereas the beauties of the forest never pall; nay, the more often you visit it, the more beauties you discover therein. But after willingly conceding to the forest all the beauty which it incontestably

possesses, the student of the past must confess that it is difficult to tire even of the palace. It is a place so teeming with associations and memories, that no one, unless an entire stranger to the romance of history, can fail to tread with pleasure, not once but many times, its silent halls. Other royal palaces may be more imposing both in external appearance and magnificence of interior; Versailles, with its vast frontage, and the size and splendour of its rooms, doubtless leaves all others far behind. But none can vie with Fontainebleau for richness of historical incident, nor can any call up so vividly the past glories of the French court.

We enter first the chapel with its quaint side-pews, whence the ladies of the court and nobles, separated by their white-flowered panels from the common crowd, witnessed the royal baptisms and marriages, so many of which have been solemnised there. On next to the suite of rooms occupied by Napoleon I., who of all French sovereigns most loved Fontainebleau. See the table where he reluctantly signed his abdication, and the mark where he dashed his knife into it, in impatient rage. Further on, the bath-room of Marie Antoinette, the panels of which are of looking-glass, painted with festoons of flowers, and as fresh as if of yesterday. Round the ceiling, hanging from it, is a cornice of small flowers in Sevres porcelain. These exquisitely beautiful decorations were brought from Versailles, where they originally embellished a room in the palace of the Grand Trianon. Not less luxurious is the bedroom of the same hapless queen. The coverlet and curtains of the bed, the chairs, the panels of the walls, are all in silk of the same pattern, tasteful festoons of flowers, worked on a light blue ground, with the queen's initials in the centre. Not all the lavish care of numerous succeeding owners has prevented the coverlet and curtains from becoming frayed and worn-eaten; but the hangings still remain perfect masterpieces of the Lyons looms, whence they issued a century ago. The embroidered initials call up sad recollections, so let us go on to the adjoining *Salle du Conseil*, with its round green-covered table and chairs. Here, at this very table, under the warring First Empire, decisions were taken big with the fate of nations; and momentous councils were held under that Second Empire, whose motto was peace, though it, too, was often identified with war. Next comes the throne-room, separated from this by a wall many feet thick, painted dark blue, with gold *flours-de-lis*, a design which carries us back to the time of St Louis. On we go through rooms with elaborate ceilings and inlaid floors of corresponding design, some of which emanated from the artistic mind of the locksmithing Louis XVI., until we reach the library, a long low room, the favourite haunt of Napoleon III. Here he spent many hours in study and in arranging the books, some of which bear his name on the cover.

How can words be found to describe all the beauties of the succeeding rooms or the memories they recall? To do the latter would be to write an entire history of France. Here, over this chimney-piece, an equestrian statue in relief of Henri IV.; this is the study of Francis I.; in that room Louis XIII. was born: indeed, it would

seem that each room brings back a separate reign. Let us linger a few moments in the *Salle des Fêtes*, the ballroom of the palace, and endeavour to do justice to its beauties. Oak panels decorated with silver crescent and golden laurels, with which mingle the initials of Henri II. and Diana of Poitiers. A deep recess, with cushion seats in each of the many windows, where the ladies smile and flirt between the dances. The ceiling by that Italian, honoured, by long residence at the French court, with a French name, le Primatice. A portrait of the old master, painted by himself, goes down to posterity in one of the numerous figures which crowd the ceiling. When the court is tired of dancing, and the strains of the last minuet have died away from the musicians' gallery, the attendants wheel in supper tables from the doors at the other end. Where are now the balls and feasts, which then seemed never ending? Gone, alas, for ever! Bacchus and Terpsichore have joined hands, and fled with that extinct court which invoked their presence, never more to return. Yet now, fancy may picture the moonlight shining in upon the spectres of fair women and brave men, who pace together the stately minuet, while ghostly musicians play instruments which give forth no sound. 'Even in daylight, little imagination enables us to hear again the sound of music and laughter which re-echoed so often from old Primatice's ceiling, and to people once more that ancient hall with succeeding generations of rank and beauty.

Time passes, so we must fain pass on through the room where Pius VII. was held a prisoner during the First Empire. A very tolerable captivity, so far as comfort goes, in rooms with Cordovan leather hangings, Beauvais tapestry and frescoes. Under the glass cover of an inlaid table the signature of the pope in red ink is shown. Last of all the rooms before we come to the theatre is the curious *Galerie des Assiettes*, decorated—as its name implies—with plates screwed into oak panelling, each bearing a representation of a royal palace.

We are now only separated by a passage from the *Salle de Spectacle* or theatre, which must indeed have seen many famous 'spectacles,' comparatively modern though it is. Pull off one of the holland covers of the balcony seats, and look at the splendid golden silk with which it is covered. On the front row, on one side of the gangway, the seat of that unfortunate lady who still lives an exile amongst us; on the other, that of her departed husband. Below, in the pit, sat the officers; above, in boxes, decently separated by a gilded lattice from the effulgence of Empire, the servants of the palace. Behind the balcony are retiring-rooms for the ladies, with luxurious lounges and soft carpets. In this tiny space, the *comédiens ordinaires du roi* (or *de l'Empereur*), bidden by royal command from their splendid house in the Rue Richelieu, performed in the presence of the court. The scenery remains untouched, as it was at the last performance held there, now nearly twenty years ago. The stage is only shown to those who have obtained a special permission, which we had not; but a little persuasion was sufficient to prevail upon the guardian to commit this slight breach of duty; and after assuring himself that no one was following, he produced a key, and let us in

through a small door, which he carefully locked after him. A novel experience it was to tread the boards of that stage, where so many celebrated actors had trod, and to look on the house with its holland-covered seats. We stayed so long wandering about the greenroom and peering into the dressing-rooms, that only a reminder from our guide that we were trespassers, drew us thence. He, however, was substantially rewarded, when at last he ushered us forth again, into the chilly air, and with a '*Bonjour, messieurs*,' hurried back to his warm corner by the stove.

Full as we were of the beauties of the palace, we felt that even at this period of the year our visit would not be complete until we had seen something of the forest; so, having still a little time to spare, we plunged at random into it. The bare trunks and snow-covered ground could only give the faintest idea of its summer splendour, and we were soon content to return and make our way homewards, after resting and marvelling a moment at its supernatural stillness and solitude.

Evil as were the ways of the old courts which had their home at Fontainebleau, the guest departing from this feast of beauty is fain to except them from the old adage, and believe that whereas the evil they did is interred with their bones, the good remains in the pictures, the statues, the tapestries, and all the thousand-and-one beauties of the palace, their muted handiwork, incentives to the achievement of further artistic triumphs by posterity. Though the grave has closed upon the splendour of their lives, utter oblivion can never overtake them while this noble edifice remains their witness.

COQUETTE.

BY HUGH CONWAY.

DEAR, let eyes to me and you
The brightest are and bluest,
Shall storms arise between us two,
The oldest friends and truest?
She smiles on me; my heart is light,
And yours is steeped in sorrow,
And yet the flower I gave to-night,
She'll throw to you to-morrow.
Coquette is she, so say with me
'Let him who wins her wear her;
And fair—however fair she be,
There's many a lassie fairer.'

But if it hap, and well it may,
That each in vain has pleaded,
If all my songs are thrown away,
And all your sighs unheeded,
We'll vow ourselves no hermit's vows,
We'll cross no foaming billow,
We'll bind about our dismal brows
No wreaths of mournful willow;
But show, in spite of her disdain,
We yet can live without her;
And joining hands, we'll laugh again,
And think no more about her!

PLEASURES FOR THE SICK.

CHEERFULNESS and a brave heart win half the battle in many an illness. Why should not the sufferer be made as happy as may be? Happiness and suffering are not such incompatible states as they appear at first sight. The long imprisoned days may after all remain in memory as a happy time. For a child it has perhaps left an impression of a quiet interval when there was much putting out of one's tongue to the doctor, but also much petting and pudding. Why should it not leave for older minds an impression of a gentler interval of life, when there was pain perhaps to be endured, but much also to be enjoyed—more kindness and more of the pleasures that love can create even amid suffering; for what is there that love cannot do? Alas! there is one thing that love cannot do, and it comes readily to mind when we are thinking of the sick—it cannot save. It cannot even spare pain, though it craves to bear the pain instead. Yet, even so, what is there that love will not do? For what it cannot ward off, it can soften. It can devise means for making short the tedious hours; and when suffering is not acute or weakness extreme, it can beguile the sick into enjoying pleasures, which, given with sympathy, may amount even to positive happiness.

Visits are supposed to afford consolation; but what kind of visits are these to be? When a man has toothache, and the landlady or the parlour-maid makes a speech of consolation, it is sometimes a visit that intensifies the aching. 'Ah, sir,' says the compassionate landlady, 'I know what it is to have the toothache, sir. I've had it that bad, sir—it was like shutting my jaws on the edge of a knife, sir!' This comfort is meant to go straight to the sufferer's heart; it generally goes straight to his teeth. When a rustic condoles with a friend who has a sprained foot, he tells him for his comfort all about the boy who got his leg caught in the reaping-machine; and when my lord's valet is privileged to console his master whose gout has appeared alarmingly early, ten

to one that my lord's valet will mention the agonies of his late master 'with the chalk round about his knuckles as big as marbles!' In fact, in some quarters, the ailments of other unfortunates seem to be considered the most encouraging and strengthening topic that can be chosen.

The real object in view ought to be to induce the mind to forget the sufferings of the body. The news of the day, told little by little, is a pleasure to an invalid. Of course, in suggesting these pleasures, we are always presupposing that those only are selected which the sufferer is able to bear. For instance, a hostile political article from the *Times* would hardly be soothing to a statesman incapacitated from work; or adulation of the last new novel would not help an overworked writer to lie still and wait for health. The great secret of success in conversation by the sick-bed is simply to take to heart the interests and the sympathies of those for whose sake we speak. Often enough, unkind sayings are made to travel, and the seeds of dissension fly as readily as thistle-down. Why not collect from memory, instead, the kind things we have heard said of our helpless friend, or of those he cares for most? It would be the sowing of a whole harvest of trusty friendship, all ready for the time of return to outer life and to friends perhaps uncared for before. There are very few of our acquaintance of whom we have not heard kind words, too genuine to flatter in the telling. Not only cheering words and tones, but cheering looks form the pleasures of the sick. If there be a new face in the room, let it be a bright face; there is no sunshine like the sunshine of bright looks. Above all, the constant companion at the bedside should give the pleasure of bright looks, cost what they may.

Reading aloud is supposed to be a certain source of recreation; it is the constant offer of kind-hearted visitors, who never dream that unless well done, it may be, instead, a certain source of headaches and an intolerable bore. Reading for the sick is an art in itself. What is to be read? And how is it to be read? These are questions that must be settled with

care and judgment, differently in each individual case. But a few suggestions may help those who are anxious to make reading a rest and a pleasure in a sickroom. Let us suppose, for example, that a story is chosen. It may be a book like *Alice in Wonderland*; for children's books have a charm for the old in their simplicity, and require but little mental effort. Or it may be a humorous book from the other side of the Atlantic. Or it may be a novel. All through, our case is merely for example; more serious reading is often a source of peace and comfort, but our subject here is merely recreation. The first thing to do is to glance through the book, to choose, and, if need be, to mark with a pencil the most lively or characteristic passages. These passages are to be read and the story told to connect them. Or if the reading-time be long enough, only dull pages or heavy paragraphs might be marked, and all the unmarked parts read, with only a few words told to bridge over the excisions. The narrative need not, as a rule, be scrupulously read from the first page to the last; and if the reader has not quick perception enough to suit it to the listener as he goes along, a few pencil-marks ought at least to warn him of dry or unsuitable passages coming. The best reader will be quick enough to make his changes as he reads, adding a word to explain who speaks in the dialogue, or running on over tedious pages, so as to keep the listener's attention.

A little at a time is a golden rule in reading for the sick. We must read for them as the birds sing for us—with plenty of short pauses. Their thoughts are not so active as ours; leave them quiet moments to follow. Above all, if they enjoy a joke, let them hear us enjoying it too, for there is contagion in laughter; and as long as the gleam of fun lasts, let us not hurry them away to hear other things, and forget it. It is hardly necessary to hint that the reading should be slow, and the voice at once distinct and full of life—not loud, but quiet and clear, with a variation of tone sympathetic with the sense of the reading. In this manner, a book would be known and enjoyed without being laboriously read all through; and a little reading ought to provide occupation for a long time, for there should be many stoppages for talk, like wayside stations on a railway journey. The more amusing the talk, the better; critical remarks, thrown in as we go along, may brighten not only the wayside pauses but the journey itself; like an amusing friend in our railway carriage inclined to talk of what is to be seen by the way.

All occupations ought to be spread out to cover lightly the long day of helplessness. We cannot do with the sick what we ourselves do in health, turn from one duty to another, anxious to lose no moments between, so that the most work may be got through in the shortest time. Their attention has to be gently engaged during their waking hours; these hours can have but

little occupation to cover them, so we must spread it all out lightly with short breaks and gaps. A little thing may occupy weak hands and a weary mind very pleasantly for a long time; there is no losing time then, and there should be no hurry; all is gain that gives an interest to the long helpless hours.

Quiet is necessary between the pleasures of the sick, and then especially it is important to leave in view something pleasant for the eyes to look upon. A bouquet of flowers or, better still, a flowering plant, by day gives a charm to even a dull room; but the plant and the invalid should perhaps part company at night. The decoration of the room will lose its value unless little changes are made; the coming of a new bit of ornament of any kind is, for the sick, something like a new plaything to a child. If the room be dull and somewhat dark, brightness is hardly less needed than whiteness and neatness. We have seen the whole wall of a little room brightened by one fan of Christmas or New Year cards hanging flat against the dingy room-paper; the cards were gummed to a cardboard foundation the shape and size of a large open fan, and a hanging bow of a rich colour was supposed to be the fastening at the point below, where the fan opens. Such decorations as this, placed sparingly and with taste, are better than large pictures for a dull room. The foreign objects that are now sold, as one might say, for half nothing, are very useful, too, for brightening the corners and the mantel-shelf, and making gay some table, whence they ought to banish the useless bottles and spoons that are sometimes a hideous sight in a sickroom. The decoration of the room is one of the pleasures of convalescence, and it is also a necessary pleasure in those very sad cases where a person whose mind is energetic is obliged, perhaps by some painful accident, to lie in the same room for weeks or months. In summer, when it can be managed without danger of cold, a sight of the prospect from the window—a glimpse of the fields and skies—is one of the greatest pleasures for the imprisoned life.

Another pleasure for an invalid is the chance of doing something for those who are well. Even the giving of advice, or giving hints for the household or the room, or for the studies of children, or for the dresses of daughters, is all a cheering change. It means that the sick are of use; and they long to be useful again. Let them help a little, if it be possible; let them even enjoy the delusion that their share in some work is important; certainly it ought to be valued. Fancy-work, and especially knitting or crochet-work with wool, is a good pastime for feminine hands in convalescence. Sometimes the pleasure is greater when the knitted wool is destined for the poor, to whose children such work is very useful. These are some of the pleasures that make home precious contrasted with sickness in hospitals; and for those who are obliged to be hospital patients, some of the home pleasures might be contrived. If people knew how books, pictures, and illustrated papers are prized in hospitals, they would make an effort to provide them, and also toys and Christmas cards for children. But, above all, the

greatest pleasure of the sick is the easiest to give. One comfort at least ought to come with all affliction: it ought to be a revelation of the love that lives for them in other hearts.

AT TREVENNA COTTAGE.

A STORY IN EIGHT CHAPTERS.—CHAP. VI.

STONELANDS is a quiet, old-fashioned country town of about two thousand inhabitants, on the borders of the Peak district. It had been dark for some hours when Mr Muncester alighted at the railway station and inquired his way to the one tolerable hotel of which the little town can boast. Next morning, he sallied forth, and was not long in finding his way to No. 5 Town Row, the address given him by Dr Mayfield. It proved to be a small six-roomed house, one of a number of others similar in size and appearance. There was a card in the window announcing apartments to let, which struck Mr Muncester as being somewhat singular in such an out-of-the-way spot. But he found later on that Stonelands is a great gathering-place for anglers during the fishing season, many of whom prefer to hire quiet rooms of their own, rather than put up with the noise and bustle of an inn.

Mr Muncester, who was a man of quick resolves, crossed the road and knocked at the door of No. 5. His summons was responded to by a tall, thin, faded woman, in deep mourning, whom, from the description given him by Dr Mayfield, he had no difficulty in recognising as Mrs Preedy. Yes, he could have the apartments—a bedroom and a small sitting-room—if he chose to pay a week's rent in advance, she told him in reply to his queries; adding that, in a place like Stonelands, they never troubled gentlemen about references. Two hours later, Mr Muncester was comfortably installed in his rooms. So far, fortune had favoured him more than he had dared to hope. A little later, he discovered that when Mrs Preedy was without lodgers, she lived entirely alone, but that when her rooms were occupied, a neighbour's daughter was called in to assist in the household duties. That first afternoon, Mrs Preedy herself took in Mr Muncester's tea—the old-fashioned hours for meals being still adhered to in Stonelands.

'I am afraid, ma'am, that you have recently lost a near relative?' Mr Muncester ventured to remark, with a glance at Mrs. Preedy's black gown.

She stared at him for a moment or two with a sort of cold suspicion, and then she said drily: 'Yes, sir, a very near relative.—Will you please to ring if you want anything more?' It was evident that no information was to be gained by questioning Mrs Preedy.

Next morning the neighbour's daughter, Maggie, appeared on the scene and took in the new lodger's breakfast. Mr Muncester was not long in finding out that the girl had a tongue, and liked to hear herself talk, especially when Mrs Preedy was not by to check her loquacity. In less than twenty-four hours, Maggie and Mr Muncester were on the best of terms. The girl was flattered by the evident interest which the

pleasant, smiling gentleman from London took in her gossip and chatter.

On the third morning after his arrival, as Mr Muncester was munching his toast, he and Maggie being alone in the house at the time, he said to the girl: 'I see that Mrs Preedy is in deep mourning. I presume that she has lately lost some one very near and dear to her?' He purposely refrained from looking at Maggie as he put the question; he was afraid she might notice the eager light in his eyes.

'She's in mourning for her brother, sir. She was very fond of him.'

'Then she will no doubt feel his loss very much. Did he die here in Stonelands?'

'O no, sir. At some place a long way off—some place by the sea, a deal warmer than it is here. It was consumption he died of. He was ill for more than a year, poor man.'

'No doubt, Mrs Preedy was with him when he died?'

'O yes, sir. She got a telegraph, and was just in time to see him at the last.'

'Did you know this Mr.—Mr.—'

'Mr Sadgrove, sir—Matthew Sadgrove was his name.'

For a moment or two, Mr Muncester scarcely breathed. What startling discovery was he on the brink of? He went on toying carelessly with the butter-knife.

'Yes, I knew him quite well,' continued the garrulous Maggie. 'He was living here in this house, at the time he was first took bad. He was a schoolmaster, sir; and after he lost his wife, he came to Stonelands; but he didn't seem to get on very well, and then his health broke down, and he had to give up the school. After that, he went away, and I never saw him again.'

'Mr Sadgrove had no family, I suppose?'

'One little girl, sir. She's away in France, living with some friends of her mother's. There is a likeness, sir, in the album both of Mr Sadgrove and his little girl. Perhaps you would like to see them?'

Mr Muncester's heart came into his mouth, as the saying is. It was all he could do not to betray his eagerness.

'It is a sad story, Maggie; but life abounds with such,' he replied. 'Yes, I think I should like to see the portraits you speak of.'

Accordingly, Maggie fetched the album out of Mrs Preedy's sitting-room, and pointed out to Mr Muncester the likeness of Mr Sadgrove, and also that of his daughter, a girl apparently about ten years of age. On the latter was written the name 'Florrie Sadgrove.'

Mr Muncester had not forgotten what Dr Mayfield had told him. Florrie was the name which the man who called himself Edward Saverne had uttered more than once in his sleep during the last days of his illness. Here was another link in the chain of evidence!

He gave the album back to Maggie with some commonplace remark, and presently the girl left the room, taking the book with her.

Mr Muncester put on his hat and went out for a walk in the quiet fields. In truth, his blood felt slightly fevered. He could no longer doubt that he held the clue to a daring and ingenious imposture; yet he could not help

marvelling at the series of apparently trivial circumstances which, following one on the other, had ended by placing that clue in his hands.

The question now was, what his next step ought to be; but it was a question which a few minutes' thought sufficed to decide. It was evident that the next link in the chain of evidence must be the identification of Matthew Sadgrove with the man who died at Boscombe Regis and was buried there under the name of Edward Saverne. Dr Mayfield was the only man who was able to settle that point, and there was only one mode by which he could do it. The moment Mr Munceaster saw his next step clearly, he turned back in the direction of his lodgings, but he called in at the post-office on his way. In answer to his inquiry, the official there told him that there was only one delivery at Boscombe Regis on Sundays. That was all he wanted to know. Saturday morning was now here; and on Wednesday next at noon Captain Avory would call by appointment at the London office for his cheque. But Mr Munceaster had made up his mind that when the captain put in an appearance, it should not be a cheque, but checkmate, that he should find in readiness for him. He went back to his lodgings, got out his desk, and made a pretence of being busy letter-writing; but he was, in fact, quietly on the watch, and he sat with the door ajar, listening to every movement in the house. It was needful that, by hook or by crook, he should obtain possession of the portrait of Matthew Sadgrove.

The day wore on; his simple dinner was partaken of, and then he was left alone again, but still he sat waiting. At length his opportunity came. Mrs Preedy went out to make her Saturday purchases; and Maggie, taking advantage of the fact, was soon gossiping over the garden-wall with another young lady similarly circumstanced to herself. The sound of their careless chatter, with now and then a shrill burst of laughter, reached Mr Munceaster in his sitting-room. He rose, and opening his door a little wider, he stood for a minute listening; then with light quick footsteps, he crossed the little passage which divided his room from that of Mrs Preedy, and opening the door of the latter, he went in. One rapid glance round showed him the object he had come in search of. It lay, with some other books, on a table near the window. With dexterous fingers he extracted the photograph he wanted, and then, having replaced the album, he got back undiscovered to his own room. It was an act which under other circumstances Mr Munceaster would never have thought of perpetrating; but in this case he hoped the end would justify the means. In fighting against cunning and chicanery, one cannot always choose one's weapons.

There was just time to catch the evening mail. Mr Munceaster wrote a few hurried lines to Dr Mayfield, in which he asked him to be good enough to inform the writer by return of post whether he recognised the inclosed photograph as a likeness of any one whom he had ever known or attended professionally. He purposely mentioned no names in his note; he wanted the evidence, if any should be forthcoming, to

be unsuggested by any hint on his part. He went out and posted the letter. 'The answer was to be addressed to him at the Stonelands post-office.

The letter reached Dr Mayfield in due course on Sunday morning; but as there is no mail out of Boscombe Regis on the evening of that day, his answer did not reach Mr Munceaster till late on Monday. Dr Mayfield wrote to the following effect: 'The photograph inclosed in your letter, which I now return, is an undoubted likeness of the late Mr Edward Saverne, the gentleman who died a few weeks ago at Trevenna Cottage. That is a point on which there can be no mistake, for, although the portrait would appear to have been taken previously to the commencement of his last illness, his features were of too marked a character, and the resemblance is too striking, to leave any room for doubt.'

Mr Munceaster smiled grimly as he refolded the doctor's note. 'It is just as I thought,' he said. 'In the morning, Mrs Preedy and I must have a little private confab; and after that, hey presto! for London, in time to welcome our friend the captain on Wednesday.'

Mr Munceaster went to bed that night in high good-humour with himself, and yet he was, puzzled—so much puzzled, in fact, that he was able to obtain but little sleep. Judging from what Dr Mayfield had told him of Mrs Preedy, and from what he had seen of her, he could scarcely bring himself to believe that she was a woman who would knowingly allow herself to become an instrument in the perpetration of a fraud of any kind. If his knowledge of human nature was not at fault, then was Mrs Preedy just the opposite of a person of that stamp; yet, on the face of the affair as it now stood, the evidence seemed dead against her. Of her brother, he of course knew no more than Dr Mayfield had told him; but it seemed scarcely open to doubt that in taking another man's name and personality on himself, he must have known quite well what he was about. But then came the question—by what motives were Mrs Preedy and Matthew Sadgrove influenced in conniving at the personation of another man by the latter? Sadgrove himself was dead; in what way, then, was it possible for him to benefit by the fraud. It was a question over which Mr Munceaster puzzled himself in vain. With regard to Captain Avory's motives in the affair, it was not needful to ask what they were.

At breakfast next morning, Mr Munceaster could not help noticing that Maggie had recently been in tears. In answer to his questions, she told him in a hurried whisper that Mrs Preedy had discovered that the portrait of her brother had been abstracted from the album, and that she had said it was impossible that any one but Maggie could have taken it.

Mr Munceaster paused for a moment or two, then he said: 'Set your mind at rest, Maggie. It was I who took the portrait.'

'You, sir? Oh!' exclaimed the astonished girl.

'I had certain reasons for borrowing it for a couple of days; but you may tell Mrs Preedy that I am quite prepared to return it, if she will favour me with a few minutes' conversation as soon as breakfast is over.'

Half an hour later, Mrs Preedy walked into the room, her black-mitted arms folded across her chest, looking as grim and uncompromising as ever.

'Pray, be seated, Mrs Preedy; I hope that I shall not have occasion to detain you very long,' said Mr Muncester, indicating a chair opposite his own on the other side of the little table.

She favoured him with a slight inclination of the head and sat down.

'In the first place, allow me to return the photograph of your brother,' went on Mr Muncester, 'and at the same time to crave your pardon for the liberty I took in removing it from your album.'

'It was indeed a very great liberty on your part, sir,' she answered in a dry, harsh voice, 'more especially considering that you are a total stranger to me.'

Mr Muncester smiled. 'I trust, Mrs Preedy, that we shall not be total strangers to each other after to-day.'

'I do not understand you, sir.'

'You will by-and-by, I have no doubt. It is now due to you to give you my reasons for exceptionally abstracting the portrait of a man who has been so dear to me in my life.'

'It was an act, sir, which nothing can excuse. It was certainly not the act of a gentleman.'

Mr Muncester, at this remark, passed, leaning forward a little with his arms on the table, and fixing his eyes steadily on Mrs Preedy, he said impressively: 'I took the liberty of opening your album, madam, because I wanted to obtain a little information respecting the late Mr Matthew Sadgrove, otherwise known as Mr Edward Saverne.'

If a bomb had exploded at Mrs Preedy's feet she could scarcely have been more startled. Her face turned a ghastly yellow; she half rose from her chair, and then sat down again; she gasped for breath, and the words she tried to speak died away in an inarticulate murmur.

'Take your time, madam, take your time,' said Mr Muncester encouragingly. 'It will be necessary that I should put certain questions to you, but they will be few and simple, and all that I ask from you is a straightforward answer to each of them.'

Evidently Mrs Preedy was a woman of considerable nerve. In a very short time she had recovered her composure, and was to all appearance as cool and collected as usual.

'My brother is dead,' she said at length with a little quaver in her voice, 'and I am not in the habit of talking about family affairs to strangers.'

'Quite right, Mrs Preedy; a very laudable precaution on your part, all things considered. But there are exceptions to every rule, and this is one of them.'

'What is it that you want to know?' she asked after a short silence, looking very hard at Mr Muncester.

'I want to know the reasons which induced your brother, whose real name was Matthew Sadgrove, who was a schoolmaster by profession, and who has a daughter at the present time living in France, to accompany a certain Captain Avory and his wife to Boscombe Regis, and there alive, die, and be buried under the

name of Edward Saverne—a supposed cousin of Captain Avory, who was said to have recently returned from Australia. That is what I want to know, Mrs Preedy.'

Again she changed colour, but she kept on staring stonily into Mr Muncester's eyes, almost as though he had mesmerised her. After a little while she said: 'I know of no right by which you come here and put such questions to me. In any case, I decline to answer them. The matter to which you refer can by no possibility concern you: me it does concern. It is my business, and such I intend it to remain.'

Mr Muncester noticed that she did not attempt any denial of the facts he had put before her, as many people in her place would undoubtedly have done. This seemed to him a hopeful sign.

'If that be your determination, Mrs Preedy,' he said, 'I am sorry to say that I can only look upon you as being equally guilty with Captain Avory as regards the vile fraud which you and he in conjunction would seem to have—'

'Fraud! fraud!' burst out Mrs Preedy excitedly. 'What is the man raving about? I have had nothing to do with any fraud.'

There was that in her tone and manner which went far towards convincing Mr Muncester that she was speaking the truth; so, in order to simplify matters, he now proceeded to enlighten her as to his name, occupation, and the object of his journey to Stonehills, but without telling her the source from which he had derived his information respecting her brother. Never in his life had he seen any one more genuinely astonished than was Mrs Preedy. She was now as ready to volunteer information as she had been reticent before. What she had to tell, when she had in some measure recovered her composure, was to the following purport.

When Matthew Sadgrove's school failed and his health broke down, the prospect before him and his sister was of the gloomiest kind. Mrs Preedy had an annuity of thirty pounds a year, and the cottage in which she lived was her own; but beyond that she had nothing except what she might make by means of a few chance lodgers during the summer months; while her brother was absolutely penniless. From the beginning of his illness, Sadgrove apparently felt sure that he would never recover, and it was this conviction on his part which would seem in a great measure to account for what followed. Another point which preyed on his mind, and was not without its influence on after-events, was the consciousness that in a little while his daughter would be left not only fatherless, but penniless. His wife's friends had taken charge of her for a time, but it was quite understood that the arrangement was merely a temporary one.

It was at Cleithorpes, a quiet little watering-place on the Lincolnshire coast, that Sadgrove, who was there for the benefit of his health, made the acquaintance of Captain Avory and his wife. As to how the introduction came about, Mrs Preedy did not seem quite clear. They may have been lodging in the same house, or they may have met casually on the sands, and have struck up an acquaintanceship, as people often do in such quiet places. Be that

as it may, Captain Avory had not been many times in the ex-schoolmaster's company before he began to sketch the outline of a certain scheme by means of which, according to him, they both might largely benefit. It would appear that Sadgrove in one of his despondent moods had told the captain that he knew himself to be a doomed man, and the latter on his part must have had some inkling of the neccessitous circumstances of the invalid. The proposition elaborated by him little by little, so as to gradually familiarise his hearer's mind with its peculiar features, was to the following effect: Sadgrove was at once to leave the bleak Lincolnshire coast, and go and reside with Captain Avory at a certain sheltered nook on the southwest coast—a change which would have the undoubted effect of prolonging the sick man's life. There he was to have every care and attention which his case might require, free of cost to himself. Further, within three months of Sadgrove's death, whenever that event should take place, the captain would bind himself to pay over to Mrs Preedy the sum of five hundred pounds for the sole use and benefit of Sadgrove's little daughter. In return for this, all that the sick man was required to do was to change his name and identity—to be no longer Matthew Sadgrove, the ex-schoolmaster of Stonelands, but to be henceforward known to the world as Edward Saverne, a cousin of Captain Avory, lately returned from Australia. Of course, not the slightest hint was dropped with regard to the policy of insurance. The captain's explanation of his reasons for suggesting that Sadgrove should personate another man, although specious, was flimsy in the extreme; it seems, however, to have sufficed to satisfy the simple, unpractical minds of the schoolmaster and his sister, and no suspicion of any wrong-doing on the captain's part appears ever to have found its way into their thoughts. What he told them was, that his cousin, Edward Saverne, had been lost several years before in the Australian bush, where he had doubtless either been starved to death or murdered by the natives; but that, in consequence of no legal proof of his death being procurable, certain property of considerable value, at the present time in Chancery, could not be touched or rendered available for the benefit of the surviving members of his family. In short, the captain stated his case so plausibly that Sadgrove was in the end won over to play his part in the plot. We have seen how very nearly the audacious captain's fraudulent scheme was to proving successful.

Such was the story told by Mrs Preedy to Mr Muncaster. It enlightened the latter with regard to several points which had hitherto puzzled him. That there could be found people so simple, so lacking in knowledge of the ways of the world, as to allow themselves to be imposed upon by a lie so specious, but at the same time so transparent, as that told by Captain Avory, seemed to his practical mind most amazing. Yet here was the fact before him. As regarded Mrs Preedy, it was impossible to doubt her *bona fides* in the matter; and if he did not feel quite so satisfied that her brother had been equally guiltless, yet the man being now dead, it was only charitable to give him the benefit of the doubt.

'And you say, sir, that it was nothing but a fraud from beginning to end?' remarked Mrs Preedy, when she had brought the narrative to a close.

'It was that, and nothing else.'

'Who could believe there was so much wickedness in the world! Who would have thought that smiling, smooth-spoken Captain Avory—though I never quite liked him in my own mind—would have turned out to be such a villain?' Then, after a brief pause, she said: 'And so my poor Florrie won't get her five hundred pounds, after all.'

'There is not much likelihood of that, Mrs Preedy,' answered Mr Muncaster with a smile, as he shut up and put away his note-book.

'Well, well, the poor lassie must just come and share my bit and sup. Providence won't let us starve.'

'You surely don't think, my dear madam, that even if Captain Avory had succeeded in getting the five thousand pounds, you would ever have seen one penny of the five hundred he promised you?'

'Why not, sir—why not?' I have his promise in writing up-stairs.'

'Which is not worth so much as the paper it is written on. You may rely upon it that from the first Captain Avory never intended to pay the five hundred pounds, nor a fraction of it. He would have been out of England in less than twelve hours after receiving his cheque from the insurance Company, and you would never have seen or heard from him more.'

MY THEATRICAL DÉBUT.

AN OLD STORY.

How to choose a profession is a problem, the solution of which has puzzled the brains of old and young time out of mind. The antiquated method of thrusting a square peg into a round hole still survives with much the usual result. If the first false step be not quickly corrected, it will need no spur from the vasty deep or necromantic spell to foretell the issue. Mediocrity is simply the grave of misapplied powers; talents run to seed in a soil unsuited to their growth.

Within a few months of attaining my eighteenth year, my apprenticeship was brought to an untimely end in consequence of the sudden death of my master. It was then that this all-important riddle of 'What shall I do with it?' fairly confronted me, demanding an instant reply. With the promptness which comes of inexperience, and the ardour which accompanies youth, I overcame the difficulty by meeting it half-way. The obstacle was transformed into an instrument wherewith I hoped to accomplish a long-desired purpose. Early imbued with a love for the stage, I recognised in this broken engagement an opening by means of which I could attain a position amongst those whose study it was to hold the mirror up to nature; in short, I fancied I saw my way to becoming an actor without infringing any duty human or divine. With boyish vanity, I regarded my physical qualifications for the task with a degree of complacency I have lived to smile at. I saw in imagination my name prominently set forth on every hoarding, the whilst

my talent was acknowledged, and the report thereof dwelt pleasantly on the lips of men. Ah, if only my capacity had equalled my enthusiasm! But I had fallen into the common error of looking at one side of the picture merely.

Notwithstanding my boasted attempt at independent action in the choice of a career, it may be remarked that I was specially careful to conceal my resolve. My predilection for theatrical amusements was no secret; indeed, in our small family circle I was regarded as 'Sir Oracle' in all matters touching the modern drama and its interpreters. So far, so good; but I felt sure that any active co-operation in the rites of Thespis would meet with a storm of opposition it would be unwise to provoke. Nor was the reason far to seek.

Five-and-forty years ago, the brave old histrions of my youth laboured under a ban, inasmuch as they were looked upon as standing but just without the pale of respectability. Smug respectability stood aloof, and with a capital S—affected an utter ignorance of the whole community, excepting in so far as they ministered to its amusement. That this spirit of ultra-exclusiveness was keenly felt and quietly resented, will surprise no one; but who shall say how many a stout heart was wrung in this unequal contest?

Without, therefore, running counter to the wishes of my parents, which I desired to avoid, I saw no immediate prospect of attaining my object, when fate or chance brought about an accidental acquaintance with a near neighbour, who afterwards became a town celebrity, and whose early death is to this hour mourned by all lovers of histrionic art. A kindred ambition to shine behind the footlights quickly ripened a kindly feeling into friendship, and by means of R—'s influence, I was introduced to a Dramatic Club, thence to a private theatre.

The ruling powers of the club to which we belonged had exercised sound discretion in selecting certain pieces supposed to come within the margin of the powers, or as yet undeveloped genius that might be discovered in the persons of its members. Murder was *not* on this occasion to be considered as one of the fine arts, therefore Shakspeare was eschewed. It was finally arranged that we should enact two of Douglas Jerrold's dramas, *The Rent Day* and *Black-eyed Susan*. R— had been unanimously chosen to play Bullfrog and Gnatbrain; while to my share fell the characters of Toby Heywood and Captain Crosscoe. A commendable anxiety to make the thing go well induced us to solicit the assistance, at the last rehearsal, of Smythson, the manager of the 'Minor' Theatre, for the which service a certain consideration was offered, and accepted. I have at this moment a distinct recollection of the expression that stole over the face of the old histrion when two of our company solicited his help—the ultra-regal manner, which from long assumption had become habitual, gave place to a look of incredulous surprise. The request, he alleged, was unprecedented; but he would further offer views to the best of his poor ability!

An off-night was chosen, and we set to work in real earnest. Those among us who came to 'play at acting' were disconcerted at being drilled

into the first rudiments of a craft demanding the exercise of every faculty. Oburgation, entreaty, and command were levied at each of us in turn. We were reminded that for the time being the lofty reputation of the 'Royal Pantheon'—a pet title of the manager's—was in our keeping, and that, moreover, several provincial lessees—'men of worth and substance'—had passed their word of honour to be present at the representation. With one exception, we offered the old actor our most implicit obedience. The Reuben Heywood of the evening—a tripe-dresser by trade—strongly objected to make his first entrance other than over a stile, as directed in the acting copy of the *Rent Day* named above; the orthodox property must be supplied, or he would throw up his part. Finally, he taxed the proprietor with negligence in not providing the article in question.

This imputation wounded the manager in his most vulnerable part—the reputed credit of the establishment. He at once assumed the part of a Coriolanus, and fixed the little tripe-dresser with his glittering eye. 'I beg your pardon, sir,' said he. 'Unquestionably, you are a stranger to the boards of the Royal Pantheon. This stage, sir, has been graced by beauty, and adorned by genius. The temple may be small' [the acting space was about fourteen by twelve]; 'but,' continued he, standing with his back to the orchestra, and extending his arms, 'its resources are unlimited! In evidence of my extreme care and attention, I may inform you, gentlemen'—addressing those of the company who were lounging about the wings—'without any undue breach of confidence, that my friend the respected lessee of the Theatre Royal, Drury Lane, had kindly proffered the loan of the identical property used by James Wallack, Esq., on the original production of this drama. It was in due course transferred to the stage of the Royal Pantheon; but upon careful examination, it was discovered that in its manufacture rusticity had not been sufficiently observed. It was, moreover, frail, and needed readjustment. My master-carpenter—a provincial by birth—is at this moment busily employed in imparting the necessary characteristic features'—here a loud humming is heard below—and I may confidently predict an artistic triumph!

'Hear, hear. Bravo, Smythson.'

'Gentlemen, I thank you.—We will now, if you please, proceed with the business of the scene.'

The following evening—the night of performance—the male portion of our merry company assembled in a low-ceilinged room under the stage. Sundry jets of gas projecting from the walls threw a light on the benches which were attached to three sides of it. A large metal basin filled with water, together with a piece of yellow soap, were placed at one corner near the swing-door, behind which a coarse towel was suspended. Printed bills in various colours of past and forthcoming performances were lavishly bestowed on every available space. Among the rest, of course our own programme figured prominently. But over the mantel-piece, tacked to the frame of the mirror, was a written document advertising the cast of Colman's *Iron Chest*, with the charges demanded from the

amateurs for the performance of the several characters. I append a copy: Sir Edward Mortimer, thirty shillings; Wilford, a guinea; Fitzharding, fifteen shillings; Adam Winterton, sixteen shillings; Old Rawbold, seven shillings; Samson, twelve shillings; Armstrong, ten shillings; Orson, twelve shillings; First Robber, six shillings; Second Robber, five shillings; Third Robber, four shillings; Fourth Robber, four shillings; Robbers' Boy, four shillings; Servant, two shillings. For the personation of the female characters—Lady Helen, Barbara, Blanch, and Judith—no charges were made. The nightly cost of the house to the club, including gas, music, and dresses, was, if I remember right, about four pounds ten shillings.

Whilst I have been recounting the above particulars, the perruquier has been busily employed with R—'s wig, and in giving the finishing touches to his general 'make-up.' The house was reported to be full; and certain premonitory hints had been heard from the band—two fiddles and a piccolo, the drum being absent through indisposition. Impatient of delay, the audience grew restive and noisy. 'Are you ready, Mr Strickland?' shouted a loud voice from the stairs.

'We shall be at your service immediately, sir,' answered the jockey-hairdresser, who at once laid violent hands on the head of Beanstalk, clapping thereon a fiery-red scalp.

'Ring in the overture,' cried the manager.

The sound of the little bell was hailed with uproarious delight by the people in front, and the entire orchestra cheerfully responded by playing a selection from the most familiar street tunes then in vogue.

Again was the stentorian voice of the manager heard demanding the presence of the characters for the opening. A scramble ensued on mounting the narrow stairs leading to the stage, during which the youth who played Old Crumbs received a severe contusion on the eye. With the exception of this untoward accident, all went fairly well from the rising of the curtain to its final fall.

Reuben had not only been gratified in due course with the promised 'style'—which was in truth of the clumsiest description—but he had displayed a good deal of wholesome vigour in the performance of his part, gaining thereby long and loud applause. The young lady who played the characters of Rachel Heywood and Black-eyed Susan also won the suffrages of the audience by her ready conception and emotional sensibility. R— was excessively nervous; but despite this serious drawback, his capacity for comic delineation was made clear. There were indications, too, of that rare faculty of getting *inside* a personality, as it were—a power of complete identification, that made him famous in his latter days.

These tentative efforts did not escape the shrewd eyes of manager Smythson, who had himself been an actor of marked ability in his time. For the moment, he abandoned his stilled phraseology, and addressed him in terms of earnest commendation.

I well remember how deeply R— was touched by this early recognition, and how

during our walk home over Waterloo Bridge into Lambeth, we dwelt with enthusiasm on the events of the night. The unaccustomed plaudits had been most musical, and the sweet sounds were still dwelling in our ears. Looking back to this event through the long vista of many years, I do not remember that we indulged in any vain estimate of our joint successes; proud we certainly were; but the predominant feeling was a profound satisfaction that we had not altogether failed. Anyway, a most important point had been gained by this adventure, inasmuch as it had opened our eyes to the fact that we were thoroughly ignorant of the simplest rules of technical routine. The acting copy of the drama gave copious directions as to entrances and exits; but how to effect these steps with propriety was an enigma yet unsolved. Crossing the stage was held to be almost as difficult as rounding Cape Horn. How to stand, how to walk, how to take a chair, and how to sit on it, were questions not easily decided. But of this we were quite clear—that it was necessary we should know something of the English tongue, and how to speak it with due emphasis and discretion. It was also confessed that dancing, fencing, and a cognisance of music were desirable acquisitions. It dawned upon us very gradually that these difficulties were not to be evaded, that prior to becoming competent journeymen in the profession, a long, and possibly a tedious apprenticeship would be necessary.

Let it at once be noted that this view of the case did not deter us from seeking other interviews with our friendly mentor in Catherine Street. Besides being a teacher of elocution, he was also a theatrical agent. A large apartment on the first floor was made to serve a double purpose, a greenroom by night, an office during the day, business hours eleven to three. Here, with an adroit dexterity, did manager Smythson endeavour to supply the various needs of his country clients. To the uninitiated, a catalogue of these wants would have been mysterious and bewildering. A 'heavy man' and a 'singing chambermaid' were required at B—; a 'low comedian' to sing between, was solicited to make up the company at M—; the lessee of the theatre at F— demanded at once a 'walking gentleman' with a share of juvenile business; a 'good old man' would be gratefully received at the Theatre Royal, P—. A 'leading man of experience to undertake the duties of stage-management' was urgently desired to apply without delay to the proprietor of the R— Theatre, somewhere in the neighbourhood of the Potteries. Openings for gentlemen who aspired to the functions of 'general utility' were numerous and pressing.

Within a brief period of our joint début, the which our flattering manager loudly extolled as a 'histrionic triumph,' I and my friend mounted the well-known stairs leading to the official sanctum, bent on trying our fortunes in the provinces. Here, amid heaps of playbills, letters, and other official documents, sat our 'philosopher and friend,' clad with all the authority of imperial Jove. With such a regal air did he dispense his favours, that the financial preliminaries contingent thereon seemed to savour of impertinence. Nevertheless, our fees were accepted with serene benignity;

and the interview terminated with much good counsel, an 'impressive 'God bless you, my children,' together with a note of introduction to our respective managers. R—— was despatched to Bristol as 'second low comedian' at an accepted salary of one guinea per week; whilst my humble talents as 'walking gentleman' were entered for active service on the Kentish circuit, which included Ramsgate, Deal, Dover, &c., at the modest stipend of twenty shillings for the same period. Thus, then, was 'My Theatrical Début,' springing from a mood half sportive, half earnest, made the harbinger of a life's career.

THE LOST BEAR-HUNTERS.

I.

It was December* in the early part of the present century. The winter had commenced in good earnest, although the fall of snow was less than usual in Canada. Time has wrought changes in the district of London, Ontario, since then. At the date of our story it was very thinly peopled; the settlements were few and far between. Facilities for emigration were few; there were no steamships to bridge the Atlantic; railroads had not been dreamed of; the British government was less liberal with land-grants, and there were fewer inducements for that varied enterprise which is now making the wilderness to blossom as the rose.

Some gentlemen 'in reduced circumstances,' whom necessity had driven to seek to repair their fortunes in that land of deep snows and long winters, had obtained possession of large tracts of land, which they sought to let at a very low rental to the poorer class of settlers, in order to found for themselves or their successors extensive estates as landed proprietors after the English model. Mr T—— held one of these extensive tracts, almost equal to a modern-sized county in dimensions. Among the few who accepted his terms as settlers were John Howay and Thomas Nowlan. Howay was an Englishman by birth, and had been some years in Canada. Nowlan was an American, and had spent the whole of his long life as a barkwoodman, which means that he was inured to all kinds of difficulties and dangers, and that he was not lacking in the ordinary resources of a man who had spent his best years in the wilds. Howay, though a younger man, was past the middle age.

Early on a December morning, Howay started from his loghut for a day at wood-cutting. Besides his axe, he had his gun and his dog Lion. He soon discovered the tracks of three bears, which they traced to a large tree three miles distant. Bears are not comfortable neighbours; and cows and sheep and pigs are not safe within their reach; besides which, their skins could be utilised for various purposes; while, if young, their flesh would prove an acceptable addition to the winter's stock of food; and moreover, the fat, if not sold for bear's grease, would be useful for many other purposes.

Perhaps it was his eagerness to secure one of the bears, or even all three, as his own prize, which led him on to immediate attack, instead of returning to the settlement for help, as he should have done. He began, therefore, at once to cut

down the tree. But as the tree was at least sixteen feet in circumference, this was no light work. It was needful, too, that he should keep a good look-out, in case his movements should disturb the bears. This he began to do, but, slackening his attention, he was presently put on the alert by the fall of a large piece of bark. Looking up into the tree, he discovered, to his no small consternation, the largest of the bears descending the tree, tail foremost. The appearance of the bear warned him to prepare for the worst; so, putting down his axe, he seized his gun, with the intention of firing. Second thoughts, however, led him to hesitate. He might wound but not kill the animal, and so exasperate him, and increase his own danger. While he was thus deliberating, the bear had nearly reached the ground, when the dog set up such a furious barking that the bear worked swiftly up the tree again. On reaching the top of the trunk where the limbs branched out, he paused, and turning round, surveyed both man and dog with a fierceness which was truly alarming.

Howay wished now that he had sought the help of his neighbours, for his position seemed more and more perilous. Rallying his courage, however, he seized his gun, and lodged a ball in the animal's neck, which brought him lifeless to the ground. But, strange to say, this success rather excited the fears than stimulated the courage of Howay. He could not make sure of killing the others, and in turn he might be their prey. Instead, therefore, of climbing the tree, he made the best of his way to the aid of some neighbours. He returned with two men, three dogs, and another axe. The tree was soon cut through, but, in falling, it struck against another, and broke off just about the middle, at the identical part where the bears had stationed themselves. Stunned and confused, the animals ran so close to one of the men that he actually put the muzzle of his gun close to the shoulder of the larger bear, and lodged two balls in its body. The other made off and escaped unhurt, while the dogs engaged the wounded one until he shook them off with their flesh badly torn.

It was now nearly sunset, and the men returned to their homes for the night. The next morning, Howay was again on the track of the bears, having now only one companion, Thomas Nowlan. They were provided each with a rifle, an axe, about six charges of powder, and bread and meat sufficient for one meal, hoping to be back before nightfall.

The manner of hunting bears in Canada is that of tracking their footsteps through the snow to their winter retreats; and the knowledge that these tracks sometimes take the hunter forty or even fifty miles from his starting-point, should have forewarned the men to have been better provisioned, knowing also that their return must be on their own footprints, and that if there should come a thaw, or a snowfall, they would be left without a trail of any kind.

The 12th December passed, and the adventurous hunters did not return. The next day, and the next, came and went in like manner, and still they did not appear; the only tidings of them being that about two o'clock on the 12th they had been observed crossing a river, which, in accordance with the name of London given

to the district, is called the Thames. It is a considerable river, and flows in a direction south-west by west into Lake St Clair.

Their friends and neighbours now became alarmed, and concluded that they had perished with hunger and cold, or had been killed by the wounded bear. A son of the proprietor of the district, under whom some of them held their farms and lots, therefore assembled a large party of the settlers pertaining to the townships of London and Nassau, with the purpose of seeking the lost men. They doubted not, however, that they had fallen a prey to the weather, even if they had escaped harm from the bears, for the cold was intense, their clothing was slight for the winter season, they had no under-box, and were entirely without means of any kind to protect them from the severity of the weather. The party in quest prepared themselves in every way for their hazardous undertaking. They stocked themselves well with provisions, pocket-compasses, trumpets, abundance of ammunition, sufficient clothing, and the apparatus for lighting fires; and, in addition, they took with them some of the best dogs in the country.

There was one thing which added to their difficulties—a thaw had taken place, and the snow had wholly disappeared from the ground, excepting in low and swampy situations. They had, therefore, no tracks whatever, and no idea of the direction the lost men might have taken, only the hint obtained from the men who had seen them crossing the river on the day of their departure. They had, as a consequence, no very sanguine hopes of finding them. They continued their search, however, for two days, exploring thousands of acres of forest and swamp, where they saw no trace of the foot of man. Giving up all hope of finding them, either living or dead—for they had not once come upon their track—the party returned home.

There was one consideration which tended to mitigate the distress of the situation, to render the event less distressing than it might have been: the men had no family, so far as was known, to mourn their loss, or to suffer by their death; it was simply the neighbours who were grieved by the sad and painful end which they concluded Howay and Nowlan had come to.

Thus day followed day, and Christmas morning dawned. Young Mr T— was just in the act of despatching messengers to take an inventory of the property of the lost men, when the news reached him that they had returned a few hours before, alive, but in a condition of the most utter wretchedness. As soon as possible, therefore, he went to see them, being anxious to know for himself that they were really alive, and to hear from them an account of their adventures and sufferings. It was a sight no one need wish to see, nor, having once seen, to behold a second time. They were spectacles of woe and misery and wretchedness almost beyond description—their garments torn, their countenance emaciated, their eyes sunk, their flesh withered away, and their whole appearance more like spectres than living men. They were only the ghosts of their former selves, and to converse with them seemed like holding intercourse with the spirits of the departed. Their pangs and sufferings

had been so great, that the record of them seems more like romance than sober history; their protracted endurance was so astonishing, and their deliverance so remarkable, that it may be alike interesting and profitable to listen to a relation of their adventures.

II.

It was on the 12th of December, that Howay and Nowlan started in pursuit of the bear. They soon came upon his track, which they followed in a north-westerly direction for at least twenty miles, when night came on. With difficulty they succeeded in making a fire, getting a light by placing a piece of dry linen on the pan of a flint-lock gun while flashing it. Supperless they lay down to rest, and sleepless they spent the night, which was exceedingly cold, its rigour being moderated by the warmth of their ample fire. At daylight, after breakfasting on the small fragments remaining from yesterday's dinner, they started again on the track of the bear, their faithful dog having shared with them the crumbs of yesterday. The bear's track now became very much involved, winding and doubling in a manner so perplexing that, about noon, when they must have proceeded twenty miles, they resolved to give up the chase; for having no compass, and the sun not being visible, they were unable to distinguish north from south. Their condition was most perilous; in the depth of winter, without food or shelter or any knowledge of their relative position, lost in the boundless forest. To make matters worse, a thaw had set in; the snow was disappearing, and the rain was increasing hour by hour. They now recollected that in the early part of the day they had crossed the track of another bear, which they thought might lead them to some settlement. They hoped, too, that if it did not conduct them to the abodes of men, it might lead to the bear's retreat, and that if they were successful in killing him, its flesh would afford them food and his skin serve as a bed. They followed the track, therefore, until they lost it by reason of the melted snow. What to do or what course to take, they did not now know. Hunting the bear gave place to an effort to ward off starvation and to get home.

They soon found themselves on the bank of a small river, which they conceived to be a confluent of the Thames. Here they passed the second night, at the close of a day of hunger, disappointment, vexation, and fatigue. The situation was dreary enough. It rained in torrents, and their only shelter was a few strips of bark. The wolves howled around them, and the tempest was so fierce that trees were torn up by the roots and strewn around in wild confusion. The scene was unchanged when morning broke. About noon, the violence of the storm abated; but the rain fell relentlessly the whole of the day, while the cold was unabated. They again pursued their journey, still sustained by hope. Towards sunset, Howay fired at a partridge, but missed it, and they went supperless once more.

On the fourth day, they felt the pangs of hunger so that they could have eaten almost anything, and their thirst was so insatiable that they were compelled to drink every few minutes.

Sixty hours had now elapsed since they had tasted food, and the appalling idea of death by starvation forced itself upon them. Just before sunset, however, Nowlan succeeded in shooting a partridge, half of which they consumed for supper, and devoured the other half for breakfast the next morning. But so ravenous were they that, as they afterwards declared, their hunger was no more appeased by eating this bird than it would have been under ordinary circumstances by swallowing a cherry. Little more than one charge of powder was now left them, and this they determined to reserve for lighting fires; for, as the frost had now again set in, exposure for a single night without fire would result in speedy death.

The fifth night was extremely cold, and Nowlan found in the morning that his feet were badly frozen. But this was not all. To the excruciating tortures of frost-bitten feet were added an unappeasable thirst and burning fever. Hitherto, they had walked, or rather run, from sunrise to sunset, doing about fifty miles a day; but now it was with great difficulty, and with almost unbearable pain on the part of Nowlan, that they accomplished half that distance.

On the afternoon of the sixth day, the sun appeared for a few moments, and convinced them that they were not on the banks of the Thames; and as they had crossed that river to the north, they could only conclude that they were on one of the rivers which flow either northward into Lake Huron or westward into Lake St. Clair. In either case they would be a long distance from home, and in a region then unsettled by white people. Still, as it led somewhere, they chose to follow its course, as it might conduct them to some Indian settlement.

In a short time they discovered a boat on the opposite side of the river, and, a little further down, a canoe. The appearance of these craft inspired them with the hope that there might be some human habitations or fellow-creatures near. But after travelling several miles, they came to the conclusion that the boats had been driven down the river during the recent thaw and storm. They were just commencing to cut down a tree for the night's fire, when they observed a stack of hay a short distance before them, on their side of the river. The haystack convinced them they were near some settlement, and it afforded them a comfortable bed for the night, where they slept soundly for some hours, which was their first proper sleep since leaving home. Refreshed by their repose, they started with new energy, still keeping the bank of the river. The dog, however, their faithful companion hitherto, could follow them no longer; when they started, he staggered a few paces, and then fell. The gnawings of hunger suggested that they should kill him to help to sustain their own life; but humanity, and affection for the companion which had served them with such fidelity, got the better of all such promptings. They had hardly proceeded a mile on their journey, this seventh morning, when a new difficulty appeared in the shape of an impassable swamp, which compelled them to leave the bank of the river and strike out into the pathless waste. They walked all that day and the next, and about four o'clock on the ninth day they came upon the tracks

of two men and a dog. Hope leaped to the conclusion that they were now near some settlement, and that their toils and sufferings and the withering hunger would soon be over. Alas! they were doomed to disappointment. After following the tracks for some time, they were brought to the very spot where they had rested a few nights before. The footprints were those of their dog and themselves.

Despair now seemed to lay firm hands on them. They sat down without even taking the trouble to kindle a fire, feeling that it would be better to be frozen to death than to seek to prolong a miserable existence. They gazed on each other with countenances full of the most painful emotions; tears flowed freely down their haggard cheeks; and their chief dread was that one might survive the other, to die unpitied and unseen. The apprehension, too, that their bodies would be devoured by animals, was one that added point to their misery.

After they had both been the prey of melancholy for an hour or more, Howay seemed to regain his composure, and told his companion it was their duty still to employ means for their own preservation, as He who gave them being had alone the right to take away their lives. Roused by these considerations, they set about kindling a fire, using their last flash of gunpowder for the purpose. There seemed then no hope that they could possibly exist beyond the night of the following day. The morning found them in a state of apathy; but they roused themselves to pursue their journey, and at nightfall they reached the haystack where they had had their only sleep. The dog was still alive, but unable to rise, and was a mere skeleton.

The desire of life once more revived in their breasts, and they ate with ravenous appetite a large quantity of the inner bark of a species of elm. This soon produced delirium, and they lay down among the hay in the greatest mental agony. By daylight the next morning they were better, and would have risen; but recollecting that their materials for making a fire were exhausted, they resolved to roll themselves up in the hay again and await the hour of death. Scarcely had this resolution been formed, when they heard the sound of a cow-bell, coming apparently from the opposite side of the river. The sound of a cow-bell, they knew, was a certain sign of a human habitation at no great distance; they therefore arose at once, as it gifted with new energy, and soon perceived a loghouse, as if recently erected; but no sign of inhabitant. They could hardly believe their eyes, thinking the loghouse might be, after all, a creature of their imagination, disordered by long abstinence. At length, convinced of its reality, they began to search for means to ford the river, which turned out to be the Sauble. Finding a crossing-place, they were not long in reaching the opposite shore, where they were met by a white man and two Indians, who took them to the house of a man named Townsend, who was well known to them, and from whom they received every mark of kindness their forlorn condition required.

The ringing of the cow-bell was a happy circumstance for them. The river flowed into Lake Huron at a point one hundred miles from any

settlement, and they were only thirty miles from the lake when, meeting with the swamp, they had inadvertently bent their steps back into the woods along their own track. Townsend's loghut was fifty miles from their home, and had only recently been erected near a salt spring he had discovered some time before.

Mrs Townsend attended to the frozen feet of Nowlan; and after they had rested and sufficiently recovered strength, they started for their own settlement by the aid of a blazed line—bark taken from trees with an axe by a previous traveller—and on Christmas eve, thirteen days after they had left them, they had once more the happiness of entering their own homes and enjoying the comforts of their own firesides.

OUR PARLOUR MAID

IN TWO CHAPTERS. CHAP. I.

I AM the wife of a medical man in London, who, I am thankful to say, possesses an excellent practice. Our house is in Notting Hill; but I need not particularise the exact locality, as it has nothing to do with my story. We employ three servants indoors—cook, housemaid, and parlour-maid. As we have no children, we do not require a nurse. And I am sure, from my own experience, when I hear people declare that there are very few good servants to be had now, and that doing their duty is generally the very last thing they think of, I sympathise and agree with them from the bottom of my heart. I am convinced there are few such faithful, attached domestics to be had now, as there used to be in my grandmother's days. I am a most indulgent mistress, and yet I have not been able to get servants to stay with me. If, by great good fortune, I have found one to suit me, she was sure either to quarrel with the others, or take offence at some trivial matter, or discover that the situation was not good enough, and that she ought to 'better herself;' and then all the wearisome round of registry offices, advertisements, correspondence, and interviews have had to be gone through again.

At the time of which I write, however, I was fortunate enough to have a tolerable cook, and a housemaid who seemed all that was desirable; but I could not meet with a parlour-maid. My last was a stately middle-aged woman, with manners fit for a palace, who had come to me with a recommendation from a lady of title. But, alas! I soon discovered that she drank. Finally, she returned one Sunday evening hopelessly intoxicated, and my heart died within me at the prospect of having to hunt for another. I advertised again, and had several applications. One was from a young woman who had been living for three years at a country vicarage in Surrey. She referred me to her late master, the Rev. Wentworth Allardyce, who was then at Folkestone, where he was staying on account of his health. I wrote to him at the address

given, which was a fashionable hotel; and received a reply, giving Eliza Willis such a high character for honesty, sobriety, and conscientiousness, that I engaged her at once.

A more prepossessing girl I never saw. Imagine a Madonna face, framed in smooth soft brown hair, pensive hazel eyes, a sweet smile, a neat trim figure, most winningly deferential manners—and you have the portrait of Eliza Willis. She was a thoroughly competent servant, who seldom needed directions, and never had to be told a thing twice; a fact which spoke volumes for her efficiency, as any old housekeeper could certify. So domestic peace at last seemed to settle down upon us, and for a time I lived in a paradise. From morning till night, Eliza laboured to save me trouble and annoyance. If I forgot anything, no disaster ensued, for her admirable memory supplied the deficiency. If I had a headache, she would smooth my pillow and bring me tea with the dexterity of a professional nurse, superadded to the tenderness of a personal friend. She could sew better than any girl I ever knew, and was invaluable to me in repairing the household linen and in executing any little alteration in my wardrobe. Her skill in waiting at table and her politeness to all visitors delighted everybody who came to the house. She performed all these various functions, too, with such sweetness, that that alone was a high recommendation. No one ever saw Eliza ruffled or out of temper. Neither hurry nor delay made her cross. She was so willing and obliging, that she never objected to doing anything required of her.

She was also honest to a degree—absolutely honest, I used to say. One night, for instance, very late, when I was sitting up for Charlie, she came down wrapped in a shawl, hours after she had gone to bed, to say that she recollected she had given me change a penny short on returning from an errand that day, and she could not sleep for thinking about it. She assured me so fervently, as she handed me the coin, that she had never wronged anybody of a halfpenny in her whole life, that from that moment I would have trusted her with untold gold.

She had been with us about two months, when that very unpleasant experience few mistresses entirely escape, of finding things mysteriously disappear or lessen in quantity, became mine. At first I scarcely noticed it; but by-and-by I had no choice but to admit very unwillingly that there must be a thief in the house! I don't know a more miserable sensation than that produced by such knowledge. The articles missed were all little trifling things, such as an ~~inexpert~~ thief would take, under the impression that their very insignificance rendered it safe to steal them. I missed note-paper and envelopes, reels of cotton and silk from my work-basket, ribbons from my drawers, and similar odds and ends. Some change received from the milkman, and temporarily deposited on the dresser in the

kitchen, was never accounted for. But the climax was the loss of a valuable sapphire ring, which, being in a hurry one day, I had placed in a drawer of my dressing-table. I turned the key in the drawer, but omitted to take it out; and when, an hour later, I came upstairs to put it on, the ring had disappeared.

I could hesitate no longer. My husband was away, and I had none but my own counsel to rely upon; and as it was almost certain that the thief must be one of the servants, I decided to call them separately into my bedroom and interrogate them; and if they persisted in denying all knowledge of the ring, I should then make them turn out their boxes before me. I first summoned the cook, whom I knew to be honest, and did not for one moment suspect. I was not surprised to hear her emphatically deny that she had ever touched my things. I went up-stairs with her, and stood by while she turned out her trunk as a matter of form; and when nothing was discovered, I dismissed her, and told her to send Jane the housemaid to me. She was a stout hearty country girl, who had come to me with an excellent character about six months before. She was quick-tempered, and at once fired up when I asked her whether, on her honour, she had any knowledge of the matter.

'Ma'am, I never took a pin of yours or anybody else's in my life!' said Jane, with an emphasis which seemed most sincere. 'And as to your ring, ma'am, I'd give a month's wages to find it, for I can't bear to think that there are people in this house who are not honest. But, ma'am—though it's perhaps mean to say so, and I know you don't encourage us servants to tell tales of one another—still I feel as if you ought to know that I'm sure one of us is a thief!'

'It is not cook,' I said.

'No, ma'am; it's Eliza. You think all the world of her, ma'am; but you're deceived in her. As sure as my name's Emma Jane Collins, you're deceived in her!'

The girl's manner was so earnest that I felt disagreeably shocked.

'Are you quite sure of what you say, Jane? It is a serious thing to bring such a charge, and I never had a servant more attentive and obliging than Eliza.'

'I can't say I ever saw her steal anything, ma'am,' said my handmaiden vehemently. 'But I'm as sure as possible that she took your ring, and nobody else.'

'Well, Jane,' I said, anxious to sift the matter as soon as possible, 'I hope you are mistaken in what you say; but, as a matter of form, I must see your box emptied, as I have already seen cook's.'

'Very well, ma'am; I'm sure I've no objection.'

So I led the way to the large attic where all the three girls slept. Jane opened her two boxes with the utmost willingness, and stood beside me with a smile on her face, as much as to say: 'You will see what an entirely needless business you have undertaken!'

I lifted up some collars and cuffs. What could this be? Note-paper and envelopes with my monogram, E. C. L.—Edith Catherine Lester!

Hidden away among piles of winter clothing was a miscellaneous assortment of our property, some of which I had not missed as yet—small nicknacks out of the drawing-room, a volume of Sir Walter Scott, a pair of sleeve-links of my husband's, two of my best pocket-handkerchiefs, and, rolled up in an old newspaper, a pot of my strawberry jam! I turned indignantly to look at Jane, and denounce her as the thief she was; when, to my utter amazement, I saw she was staring at the plunder with an expression of such complete and stupefied astonishment, that a stranger would have supposed she had never seen the things before, and was puzzled to know how they came there. At the very bottom of the box was a small package of white paper, loosely tied round with thread. Opening it, I saw, to my joy, my missing ring.

'You wicked, wicked girl!' I said, as I slipped it on my finger. 'Now, what have you to say for yourself?'

'If I never speak another word, ma'am, she returned undauntedly, 'I never saw those things before, and I never put them in my box.'

'You can hardly expect me to believe that,' I said, indignant at her falsehood and effrontery. 'They could not get into your box without hands.'

'I never put them there,' returned Jane, beginning to cry. 'I don't know who did; unless it's some wicked person who wants to ruin me. O ma'am, O ma'am!' she implored earnestly, 'do believe me when I say I never took them!'

'That is nonsense, Jane,' I said sternly. 'Telling a lie will not make better of it. Turn out your other box, and let me see what else of mine you have stolen.'

There proved to be nothing in it but caps and her Sunday hat. She never ceased to protest amid her tears that she had never touched my things, until I was quite exasperated at her hardihood.

'Now, Jane, you had much better confess without telling any more falsehoods. Lying will not do any good. If you will confess—'

'I won't confess to doing what I never did, ma'am,' she answered defiantly.

'Very well, then. I shall call the others, and show them these things, that they may know who is the culprit; and then you leave my service at once.'

So I rang for cook and Eliza, and, pointing to my belongings on the floor, said that the thief was found. Eliza offered to turn out her box, saying that it was only right that she should do so as well as the others. Of course there was nothing of mine in it; but it was much tidier than either of the others, with her treasured Bible and Prayer-book neatly wrapped in tissue-paper and lying on the top.

I then told Jane to come to me in the dining-room, where a most unpleasant scene ensued, for she stoutly maintained her innocence. I am rather cowardly, like a great many women, about prosecuting dishonest servants. Rather than appear as a witness against her, I would have condoned a great deal; and I did not like the idea of sending such a young girl to prison. Her mother I knew to be an honest, hard-working widow, who would be heart-broken at Jane's

behaviour. So I told her that, on account of her previous good character and my respect for her mother, I had decided not to call in the police; but that she must leave the house immediately, and need never refer to me for a character; and I hoped my being so lenient would induce her to repent and reform.

She listened without the smallest softening, that I could see; and turned at the door to say: 'Well, ma'am, I can only say you've been deceived. Some day, you will know the true from the false.'

She departed. Kind Eliza helped her to pack her boxes, fetched a cab for her, and gave her a tract at parting, with, as cook afterwards told me, some excellent advice. I must say this made me admire and respect the parlour-maid more than ever. There are not many who will say a kind word to a detected thief.

Then came up the disagreeable problem of getting another housemaid at a moment's notice; but here, fortunately, Eliza came to my relief. She knew a girl, she said, a distant connection of her own, who was just leaving a situation at South Kensington. I wrote to her mistress, who gave her an excellent character; and in a few days she was installed in our house. She was not quite so prepossessing in appearance as Eliza, as she had rather a cast in her eyes; but she proved an excellent servant, and now that Jane had gone, I was not annoyed by petty pilferings.

It is not often that my good husband finds fault with anything in the house; but one evening, as we were sitting at dinner, he did take exception to the tarnished condition of our plate generally, and especially of one piece on the sideboard—a large silver salver, which we used for a tea-tray on state occasions; two very massive cups; and a fine tankard, quite eighteen inches high, which had belonged to his grandfather. 'Yes, I know it wants cleaning badly,' I said. 'I intend to have it all done one of these days. The London atmosphere soon tarnishes it.'

We had a great deal of plate—most of it very old, and which had been in my husband's family for generations. As he was an only child, he had inherited it all. I had also a good many handsome silver articles among my wedding-presents. I hope I shall not be accused of boastful arrogance, when I say that, between us, we had almost more than we knew what to do with. It was a nuisance to keep clean, and a constant worry to me. We kept it all in the house. We had tried leaving it at our bank; but that method was very inconvenient when we were giving a dinner-party and needed a number of extra articles. Also, my husband liked to have it to look at, as also to show occasionally some particularly old and valuable piece to some connoisseur-friend. So, though we had often been threatened by our friends with burglars, and warned that we should have our plate stolen, we continued to store it, except those articles in use, in a small room at the head of the stairs, next to our bedroom, where we must hear any sound there in the night. The plate was not in a safe, being so large in quantity; but we had had an especially strong oak-press, with double doors lined with iron, made expressly for it. The press was fitted with shelves and drawers lined with green

baize. Connected with it was an electric bell, which must infallibly ring if any unaccustomed hand essayed to open the outer lock. The locks themselves were of complicated construction; and we never left the house in the daytime without at least one servant in it. Oh the rare occasions on which I could persuade my husband to indulge himself with a few weeks of holiday, we always sent all the plate to the bank. I may add that the door of the plate-room itself was always kept locked and the key in my possession; and that the window was protected by heavy iron bars inside.

My husband laid but few restrictions upon me; but there was one point upon which he was resolute—nobody must ever go to the plate-room but me. No matter how trustworthy the servants might be, I was never to give them the keys, or even allow them to know how much plate we had. Charlie's firm belief was that at least three-fourths of the burglaries that occur were planned either by the servants or by associates and friends of theirs.

I must say I found the restriction sometimes rather tiresome, when I was busy preparing for a dinner-party, and the housemaid came to say that she wanted more spoons and forks and other articles for the table. It would often have been an immense relief to me to hand her the keys and say: 'I am very busy; get what is required yourself.' But I never did, although I might think Charlie over-cautious.

The very day after my husband had spoken being pouring wet, and the servants not having much to do, it occurred to me that I had better go to the plate room and get out what silver required cleaning, and let them have it. It was always a tedious operation. So I went up-stairs, got out my keys, opened the press, and began work. It was more than a year since most of it had been cleaned, and I looked over everything, determined to have it all done, and well done, in readiness for our next dinner-party. The articles which needed polishing I put down on the floor, for there was neither table nor chair in the room, nothing but the press.

'If you please, ma'am,' said a soft voice at my elbow, 'here is a letter the postman has just brought.'

It was Eliza. I must say that for half a minute I felt vexed to think that, no doubt hearing me staring about, she had followed me in here. True, I had never told any of the servants not to come into that room, for I had not thought it worth while. However, here Eliza was; and I saw her gaze wander, very naturally, to the open press with its well-filled shelves, and the accumulation on the floor.

'O ma'am, what beautiful things!' she said admiringly.

'Yes, are they not?' I said. 'Dr Lester is very proud of his silver; for most of it has been a long time in his family. I want you and Sarah to clean the plate to-day. I will put what requires cleaning outside the door; and you can come and fetch it.'

Eliza went out with—I could not help fancying—just the slightest shade of unwillingness in her manner; and I carefully locked the door, after leaving some of the things outside. In due time they were brought up-stairs again brilliantly

polished, and I put them all away, feeling rather heroic for resisting the temptation to call in Eliza to help me. Had it not been for my pledged word to my husband, I certainly should have done so.

Two days afterwards, late in the afternoon, Eliza came to me in my bedroom with a glowing face and handed me a gentleman's card: 'REV. WENTWORTH ALLARDYCE, Oakwood Vicarage.'

'It's my dear master—my dear late master, I mean, ma'am,' she said, looking quite overjoyed. 'He was in London, and he called to see how I was getting on; and he would like to speak to you, ma'am, if you are not engaged.'

I went down to the drawing-room willingly enough. Eliza had often told me about this Mr Allardyce, who had been very kind to her; and I was really glad to see any one who was interested in so excellent a servant.

The clergyman was a handsome man of about thirty-five, with dark vivacious eyes and a pleasant smile. He was got up in the most correct style of High Church costume, with long straight coat, buttonless waistcoat, a round collar, a cross suspended to his watch-chain, and a flat felt hat.

'Mrs Lester, I believe,' he said, coming forward most courteously. 'I trust you will not think I have taken a liberty in calling to see a domestic who served me faithfully for three years, and in whom I shall always take a sincere interest.'

'I am very glad to see you, Mr Allardyce,' I said.

'And I assure you it gives me great pleasure to make the acquaintance of a lady of whom I have heard so much. Eliza often writes to me, and is eloquent in her praises of you, and her gratitude for your kindness.'

'She is a very good girl,' I said.

'She is a good girl—a thoroughly good girl—conscientious and sincere,' he answered, as if he felt pleased at my praise. 'As an inmate of my household she was admirable in every particular. I also had the pleasure of preparing her for her confirmation. That being the case, I was naturally anxious not to lose sight of her when she came to London.'

'She has often spoken of you to me, Mr Allardyce. She often praises your beautiful garden, and the pretty meadows near your vicarage. We poor Londoners envy you your privileges.'

'Yet this is a delightful part of London,' he said, with a glance out of the window.

'O yes, we like it very well. Only the summer is coming on, and we naturally yearn for the country. The parks are a poor substitute for it.'

'My garden is beginning to look very pretty now. You and Dr Lester must really run down to Oakwood—it is only an hour's journey from town—and gather strawberries for yourselves, and taste our country cream. I can promise you these simple pleasures at least, and a game at tennis. I should like you to see my roses.'

'Thank you; you are very kind.'

'Is Dr Lester at home? I hope I shall have the pleasure of making his acquaintance before I leave.'

'I expect him in every minute.' He said

when he went out that he should not be long.'

'I understand he has a very large practice?'

'Very. And he is particularly busy just now.'

'A most enviable profession, his,' remarked Mr Allardyce, gazing round the room as he spoke. 'To soothe pain—to relieve suffering—to awaken hope—I can imagine few things more delightful to a man whose heart is in his work.'

Eliza—all smiles and delight—now entered with afternoon tea, and while she handed it round in her peculiarly deft and pleasant way, Mr Allardyce talked to her.

'Your mistress says she is very fond of the country, Eliza, and some day she is coming to Oakwood, to eat strawberries and cream and sit under the trees.'

'Oh, how nice, sir!' cried Eliza.

'I think she would admire the roses. You remember that large bush in the middle of the lawn? The frost killed that in the winter.'

'Did it, sir? Oh, I am so sorry!'

'And poor old Nat Welsh, my gardener, is dead. Oh, and Mrs Allardyce told me not to forget to tell you that the Sunday-school is most flourishing. There are a hundred and—yes, a hundred and twenty children in it now.—I hope you keep up your good habits, Eliza, and go regularly to church, and read your Bible as you used to do at Oakwood?'

At that moment I heard my husband's latch-key in the door, and I stepped out into the hall. 'Mr Allardyce is here, and is anxious to see you,' I said, as he came in; and added, *sotto voce*, 'he is such a nice man! Do come and speak to him.'

Charlie followed me into the drawing-room, where Mr Allardyce carefully came forward, while Eliza removed the tea-things. And then ensued a delightful chat of about an hour's duration. To give even an outline of the conversation would take too long; but I remember that we touched upon a great number of topics. Our guest seemed to have travelled much, both in England and on the continent; and he related some very amusing experiences for our entertainment. I could see Charlie was delighted with him.

'Are you making a long stay in town, Mr Allardyce?' he asked, as the half-clock struck six.

'No; my time is not my own, and I must return to-night.'

'We should be most happy to offer you a bed.'

'Thank you; you are very kind; but I promised Mrs Allardyce I would return to-night. She gets nervous in my absence, and imagines burglars and all sorts of horrors.'

'But you will stay and dine with us? Our hour is six.'

'Thank you; I should like to do so very much, if I can manage not to miss the half-past nine o'clock train at Waterloo, which I said I should return by.'

'I can promise that; I will send you in my brougham,' said my husband. And then Eliza came to say that dinner was on the table; and we went into the dining-room.

The meal was a very pleasant one, for our guest exerted himself to be agreeable. We were both charmed with him.

'You will excuse my remarking what very fine specimens of antique plate you have on your sideboard, Dr Lester,' said Mr Allardyce, when we were sitting at our modest dessert. 'I flatter myself that I am a connoisseur in old silver; and I never saw more splendid designs.'

'I confess I am rather proud of them,' said my husband, highly gratified, as he always was when anybody alluded to his hobby. 'Would you like to examine them?'

Our visitor rose with a graceful bow and smile to me, and went to the sideboard, where he handled the cups with evident appreciation. 'How massive they are! and how beautifully ornamented! I suppose they are Jacobean?'

'The date of the tankard is 1684; the cups are five years older,' said my husband, who was learned in Hall-marks, and knew the date of every piece of plate we possessed. (It may not be generally known that by means of letters, which represent figures, the precise date of any piece of Hall-marked silver may be ascertained.)

'Very fine indeed,' said Mr Allardyce. 'Even my neighbour, Lord Fitz-george, has nothing better. What a massive salver! Your coat of arms in the centre, I suppose?'

'Yes. All these things belonged to my grandfather. Since you so much appreciate such things, Mr Allardyce,' said my husband in a state of high gratification, 'I should like to show you a few other specimens I possess. I have a Queen Anne tea-service—genuine Queen Anne, dated 1712—which has been admired very much. We do not keep it in every-day use, and indeed we never leave more silver out than is absolutely necessary, on account of thieves. I will show you my plate-room and what I have there.—But won't you take another glass of wine?'

'No, thank you,' said Mr Allardyce eagerly. 'I should so much prefer to see your plate. I have quite a passion for old silver.'

'Edith, dear, you have the keys,' said my husband. 'If you will go and unlock the door, we will follow you.'

It was still broad daylight, being June. I went up-stairs and unlocked the doors, and then the two gentlemen came in. Our visitor was delighted at one thing; after another was brought out. 'Charlie had never had such an appreciative critic before.'

'A most beautiful and valuable collection,' said the clergyman after he had examined everything. 'But do you think it safe to keep so much plate in an ordinary dwelling-house?'

'Oh, perfectly,' said my husband. 'You see the bars on the window; and the doors are always kept locked. Besides, any one who incautiously touched the press must ring this bell,' he added, showing where it was and how to avoid ringing it.

'I suppose you have locks of complicated construction?'

'Very.—Where are your keys, Edith?—See, Mr Allardyce. This is the key for the inner door, and that for the outer. You perceive they are of very peculiar make, and they are never allowed out of my wife's possession.'

A knock at the door, and my husband opened it an inch or two to be informed by the housemaid: 'Please, sir, you're wanted in the surgery.'

It was always the way when we had visitors. Charlie went rather reluctantly; and I had scarcely turned to Mr Allardyce to say I was sorry my husband had been called away, and I hoped his patient would not detain him long, when I heard Eliza's voice at the door, saying: 'If you please, ma'am, may I speak to you a minute?'

I asked Mr Allardyce to excuse me, and went out into the passage.

CHRISTMAS-TIDE.

Oh, how the aged faces glow

Around the cheerful fire to night,

While whisp'ring lower bending low

Thrills 'neath the smile of shy delight

That tipples o'er the gentle face,

Whose modest beauty charms him so,

And tempts him with its winning grace

To kiss it 'neath the mistletoe!

Pass round the bowl of sparkling wine;

Our toast shall be that happy pair.

May kindly fortune round them twine

Love's fairy garland, in thy shade

The joys that loving hearts may hoard,

Unspoiled by envy, greed, or pride!

May they recall our hearts to-night

With grateful joy each Christmas tide!

Fill up once more, ye jovial band!

Our store is not exhausted yet.

Our best we place at your command.

And doubt not that our sole regret

Is that we cannot more bestow

On friend and kinsfolk gathered here,

With looks that set our hearts aglow,

While sharing thus our humble cheer!

Blithe hearts are bounding here and there,

In merry time to dancing feet;

Bright eyes are shining every where,

Where honest hands in friendship meet!

Sweet baby faces laugh between,

White frothy beard, and hoary head,

Still shimmering through the silvery sheen,

As peep through snow the berries red!

The streets are cold, our hearth is warm;

Come, little waif, and be our guest!

Seek not to hide thy shivering form;

Our Christmas wall will richly bless

When o'er thy wistful face shall steal

The smile of heavenly gratitude,

Which consecrates the festive meal

However coarse, however rude!

Ring on, ring on, ye joyous bells!

Ten thousand grateful hearts respond;

For while your rapturous music swells,

'King Christmas' waves his magic wand

Above the loving hearts that greet

Each other round the ingle-side—

Best birth of love, and friendship sweet,

Oh, happy, happy Christmas-tide!

FANNY FORRESTER.

CHRISTMAS IN OTHER COUNTRIES.

THE old salute of 'A merry Christmas and a happy New Year' again resounds on every side. Christmas—the season for balls and parties, for an endless routine of gaieties, for the reunion of long-parted friends, for the giving of presents and the interchange of compliments—has again arrived. Let us now see how this ancient festival is held in other countries.

Christmas day in Norway! To many this will only convey ideas of a bleak wintry region. But do not shudder, my fair reader, at the idea of a Christmas in such a latitude. You need not, I assure you; for if the lakes are frozen and the rivers ice-locked, the air is clear and exhilarating, and the sun shines brightly over a cloudless heaven, as it lightens up the wide expanse of snow into a brilliant sparkle. Then the people themselves are a hardy, kindly, hospitable race, and welcome the stranger with open hands and a warmth that quite makes up for any cold without. Indeed, the Norwegians possess in a high degree this primitive virtue of hospitality; it is looked upon as a national duty; and he who should omit to practise it would be regarded as a grave offender against the proprieties of life.

On the morning of the festal day the roads are thronged with sledges conveying visitors to their destinations; the brass bells which decorate the hardy little Norwegian horses making a merry tinkling in the frosty air. The very air itself seems to palpitate with the sweet chimings of the bell-melodies; and is not a sleigh-ride one of those delights that defy rivalry?

The day always begins with divine service. The churches are very plain, and the worship simple; and whenever the service is over, relations and friends assemble at different houses according to invitation, where a preliminary repast, consisting of a variety of viands, liqueurs, and sweets, is partaken of before dinner, which (woe to the dyspeptic!) follows immediately after.

The first courtesy, however, shown to a male

guest on entering a Norwegian house, no matter at what hour of the day, is a pipe of tobacco. The dinner is a lengthy affair; fish, poultry, meat, entrées, cakes, and preserves go round and round again and again. Between the courses, intervals are allowed for the singing of national songs, the giving of standard toasts, and the drinking of healths. To the Norwegian, the words *Gamle Norge* ('Old Norway') have a powerful spell in them, and on festive occasions like the present they cannot be resisted. In an instant *Gamle Norge* is repeated by every voice; the glasses are filled and drained; and then bursts forth in a simultaneous chorus the national song of Norway, *For Norge*. There is no nation in the world that can surpass Norway in this enthusiastic love of country.

When the dinner is over, the chief guest rises, saying, *Tak for mæden* (Thanks for the meal, or entertainment), which is responded to by all present, who bow to the host and hostess at each end of the table. At seven o'clock, tea is handed round; then a little later in the evening, comes a knock at the door, and some four or five boys enter dressed in white mantles; the tallest of these holds a large coloured lantern shaped like a star; while another bears a small illuminated glass box containing two little wax Dutch dolls, one of which represents the Virgin Mary sitting in a chair, and the other the infant Jesus lying in a cradle. A bit of rattle is moved by a wire from side to side of the lantern, making it appear as if the doll-mother was rocking the cradle at her feet; and the lantern is meant to represent the star in the East which guided the Magi to the lowly manger. These mysteries are all explained during the exhibition in the words of a carol, chanted by the boys.

After these lads are dismissed with some slight refreshment or bonbons and a little money, another band of masked performers, rather older than the last, make their appearance. They are dressed in military fashion, with cocked-hats on the head, tattered-looking uniforms, purposely decked with tinsel, and wooden swords suspended

at their sides. (They are very like our own November Guys, only much more interesting.) These maskers perform all kinds of fantastic tricks for the amusement of the spectators, conspicuous among them being a pantomimic military review. No one in Norway ever refuses to admit these performers of their annual mummeries, or sends them away empty-handed.

Numerous diversions and games new follow among the household; supper is announced and partaken of; the gentlemen settle down for a general smoking; and the ladies disappear upstairs, where an eager talking and clatter of tongues goes on as they put on their wraps. Then come the sledges to the door; hearty shakings of the hand, with loudly expressed good wishes, are exchanged all round; and the happy guests are borne swiftly over the snow, glittering in the moonlight, to their respective homes.

In Sweden, the old saying that 'cleanliness is next to godliness' is exemplified then, and evidently appreciated; for the dwellings of all classes are thoroughly renovated for the occasion. An almost universal custom exists there of tying a sheaf of corn to a pole, which is placed in the garden or near the house, for the benefit of the birds, which suffer severely at this season from the meclenomy of the weather. Thus they do not forget, when all the land is rejoicing in a general feast, to show kindness to the inferior animals. After supper, masked figures come in bearing a bell and a basket of presents for the household and friends; and every house is illuminated, and the members of each made happy in the witnessing and partaking of the many pleasures of the season.

Christmas in Italy, as elsewhere, brings round a yearly sanctification of home, and is a festival which blends devotion with the kindest and tenderest feelings. The greatest events of the year are the sumptuous banquets which are given on Christmas eve; and as it is mostly fish, done up in wonderful and diverse ways, that is then consumed during the whole week before the great fast night, little business is transacted save at the fish-market. The churches are largely attended at this season; although the scene at midnight mass is avoided by the more respectable members of the community, comprising, as it does, more than one-half of drunken revellers, and showing a strange lack of either reverence or decorum from the priests or congregation.

The Log—a real Christmas log—is in full blaze in the kitchen; the great dining-hall is also crackling with its roaring fire; and the whole house has received as thorough a warming as if the feast were to last throughout the year. Boys and girls now vie with each other in reciting and showing off their accomplishments, which have been learned expressly for the day, to please and surprise their parents by their progress in the past months; and their presents of work, learning, or ingenuity are duly admired. Then comes a handsome supper, making the children's eyes glisten as they feast on the delicacies and delights before them. After the repast is over, the parents, with some of the elders, retire behind a large curtain erected in the hall, which, when withdrawn, reveals a table loaded with carefully wrapped-up parcels; conspicuous among

which is an urn—the urn of fate. The elders range themselves behind the table in demure silence, as, at a given sign, the sons and daughters, relatives and friends, in order of their age, are summoned to approach and bidden to thrust their hand into the urn and draw their lot. 'This urn is to the Italian children what the Christmas-tree is to the Germans. Many a blank is drawn amid merry laughter; but in the end each has a present; and before the guests depart, exchanges are made among the little ones, till every one is satisfied and has secured what best suits his or her wants.

No one is allowed to be unhappy at that time of the year, at least none whom a small money donation or a piece of firewood can relieve from immediate want; while from the highest to the lowest each has a Christmas-box.

Nowhere is the abuse of 'boxes' more so than in France, where of late years the custom has been growing to an almost ruinous excess. There, amid all the fits and starts, when the whole population is bent upon amusement, it is not so much the loving gift that pleases, as it is the cost of that gift that counts. And when, with extravagant toys and presents to the family and servants, friends and guests, postmen and shop-messengers, it is no wonder that the poor *Paterfamilias* groans at the thought of the new year.

New-year's eve is also an important evening with the Germans. In almost every house are parties met to celebrate the old year out with dance and sport; and the instant the city-bell is heard to toll, '*Prosit neu Jahr*' (Happy new year) starts at once from every lip, while a general touching of glasses and drinking of healths and happiness for the coming year ensues. Then the young people present each other, their parents and friends, with verses composed in honour of the occasion, which, being read aloud, are often the cause of banter and renewed merriment. The tables are crowded with dainties, chief among them being large, ornamented cakes, and gingerbread in the shape of little hearts, these being thought indispensable to the entertainment. The next morning, every one that meets you salutes you with the same exclamation of '*Prosit neu Jahr*'. It is from Germany that we have taken our Christmas-tree; from the Germans that we have learned to make our social Christmas more a gala day for the children, than, as formerly, one of feasting and riot for ourselves.

The German housewife and mother think nothing a trouble which can add to the pleasure of the home-circle; her services, which are many and various, are never begrudged, but are heartily given in the service of love. If she spares no pains on ordinary days for her family's benefit, how much more then does she try to exert herself in the cause of Christmas joys. Her Christmas-tree is of entire home-growth; and in the presents that are made, the toys that are bought or invented to hang upon its branches, as it displays its annual glories and diffuses radiance from its hundred lights on the happy faces about it, not one member of her household but is remembered and represented on that tree of love. Their Christmas is, in truth, a beautiful sight. It is the feast of the Child, and therefore, for His sake, of all children; and the parents derive their true

enjoyment and delight in giving happiness to their little ones. A blessing, many blessings, on the innocent, hearty merriment of such Christmas days! Our homely German cousins have caught the true meaning of the festival.

In America, as in Norway, sleigh-riding is a great feature of this season; and there are few who, on Christmas eve, can withstand the merry chime of the bells, or the fleet riding over the snow-flaked avenues. There is sure to be snow then; and that purest of white mantles spreads on all sides, over everything, as the stars, twinkling in an unclouded sky, shed a subdued light on a scene that rivals description. There, too, Santa Klaus (or St Nicholas) makes his annual appearance, and drops his many gifts into the stockings which the children have hung up before going to bed.

A curious feature of an American Christmas is the egg-nogg and free lunch, distributed at all of the cafes and hotels, on Christmas day; and it is needless to say that many, especially the epicures of the town, flock to the festive boards, where large tables are spread out with a luxury and delicacy peculiar to the Christmas custom. It seems also to be a popular time for marriages; and the Christmas week is a merry one for the honeymoon, as little is thought of but gaiety until the new year has begun. The presentation of 'boxes' is also much in vogue, and all classes have then modes of enjoyment in festal succession.

In Australia, New Zealand, and Africa, the joyous week which ushers the old year out and the new year in falls at a time when the season is at its busiest, and not, as in England, when labour of all kinds is little required, owing to the inclemency of the weather. Christmas is held, of course; but the working members of society have no leisure then for its enjoyment, and indeed, it pressed with orders, have often to spend the day itself in hard work. It cannot then be celebrated, except by a special few, with the hearty pleasure and care-forgetting rest with which it is welcomed in England, Holland, Germany, or indeed the whole of Christian Europe.

In Alexandria, flags hang from the roofs of the consulates, English, American, French, Portuguese, and others; and the guns fire salutes from the Christian vessels in the harbour.

From time immemorial, Christmas has been the most prominent festival in the calendar, and in almost all countries, this social gathering round the household altar, which creates and keeps alive the brightest sympathies of the heart, has been hailed with joy and gladness; and amid the depressed trade and disturbances of the present times, which have more or less affected every link in the chain of society, Christmas nevertheless brings with it a certain charm. Everywhere men give a joyful parting salutation to the old year, and greet with acclamations the advent of the new.

Christmas day in England is very much like a Sunday, the streets being thronged by the same band of steady church-goers, answering to the call of the parish bells. Full services take place in all the churches, which are profusely decked with holly and evergreens. Worship over, the spirit of merriment breaks forth, the festivities of Christmas eve, however, being nearly as lively as those of Christmas itself. Towards evening, the

church-bells peal merrily; blithesome parties gather round the fire; sports and games commence; and the preparations for the morrow go on apace.

In Scotland, although Christmas is yearly becoming of more importance, the pre-eminence is decidedly given to New-year's day and eve. In the days of our forefathers, not only relations assembled in the house, but all the retainers, youth and age, rich and poor, alike participated in the mirth attendant upon the season. But in England, many ancient customs are falling into disuse; indeed, scarcely more than a shadow now remains; for if Christmas is still a religious festival and a family gathering, it has lost the distinction of a fest that bound all ranks together, and that led to a community of feeling between high and low. It was something to speak of long ago. The huge Yule log was drawn by the servants into the great hall, where each member, sitting down in turn on the log, sang a Yule song, and drank a cup of spiced ale to a merry Christmas and a happy new year. The log was then cast on the blazing fire, with prayers for the safety of the house and the happiness of its inmates until the next Christmas-tide should come round again. Then was the riotous time of the reign of the Lord of Misrule; then were the delicious Yule cakes; then were pleasures provided for all; and then, when the huge candles were lighted, and the exertions in dancing, flirting, romping, laughing, kissing under the mistletoe, singing, talking, and last, though by no means least, eating and drinking, had pretty well exhausted the company, did the revellers gather round the crackling log in the capacious chimney, singing songs or telling legendary tales, until the midnight chimes dispersed the happy group.

A superstition, common among the ignorant peasantry, existed till quite lately. This was, that if you stole quietly into the cowhouse at midnight on Christmas eve, you would find the cattle kneeling down immediately after twelve o'clock, as commemorating the supposed similar case of the oxen in whose resting-place Jesus of Nazareth was born; also that bees might be heard to sing in their hives at the same hour. This belief has taken long to be uprooted.

In the old halls and at College tables, the chief dish of the feast was the boar's head—not the goose and turkey of nowadays—which was perfumed with rare spices, and decked out with garlands of holly and rosemary. It was brought in with pompous state by the head-cook, a song being chanted in its honour, either during or after the repast; which song is still sung at the bringing in of the boar's head at Queen's College, Oxford.

The boar's head in hand bear I,
Bedecked with bays and rosemary;
And I pray you, my masters, be merry
Quot exis in convivio,
Caput aprî deferro,
Reddens laudes Domino.

The boar's head, as I understand,
Is the rarest dish in all this land,
Which, thus bedecked with a gay garland,
Let us serve cantic,
Caput aprî deferro,
Reddens laudes Domino.

Our steward hath promised this
In honour of the King of Bliss,
Which to this day to be served is
In Regumest Atrio,
Caput apud defero.
Iddens laudes Domino.

Then, too, through the clear crisp air of winter was heard the voice of the wandering singefs, last remnant of English minstrelsy, appealing to the charity which at that season rarely failed them, and reminding their hearers in the simple carol strains of the sacred reason for their happiness. Thus singing of carols dates from the very earliest period of Christmas celebration, when songs of gladness were considered as appropriate to the occasion. Jeremy Taylor says that the first Christmas carol was the *Gloria in Excelsis* of the Bethlehem shepherds. Carol-singing, however, has lost much of its original character. It is the custom now for the common people in England to go about in bands in the early morning, serenading the neighbours with songs relating to Christ's birth; and besides these, we have, both in England and Scotland, the modern 'waits.' The 'waits,' who are but indifferent substitutes for the sweet carols of early times, appear on the scene, with their not always most musical instruments, in the three weeks preceding Christmas; yet there is something solemn in listening to the music that arises in the silence of the night; and something touching, too, as we lie in our warm beds, to think of these poor men playing away in the pinching cold with their numbed fingers.

If the spirit of charity does not now manifest itself in motous feasts and revelling on festivals, let it still dwell among us in benevolent deeds. Saddened spirits there must be as each Christmas day bears witness to the loss of some dearly loved one; but even for those whose hearts have been scarred and wounded, there is still one thing left that makes the Christmas festival endurable, that is—the children. And so long as there are shivering outcasts who stand in need of some helping hand; of hungry mouths to fill; of bruised spirits to bind up, and broken hearts to heal; so long will there be an opportunity for us to consecrate our Christmas season in the spirit of Him whose name we thus commemorate.

AT TREVENNA COTTAGE.

A STORY IN EIGHT CHAPTERS.—CHAP. VII.

WHEN Captain Avory set out from Hoogies on his way back to Trevenna Cottage, Bosy Groote led his horse by the head as far as the high-road, then, after a few last words, the two men bade each other good-night; and while the captain drove on his way, Bosy sauntered back to the house. There was a heap of wood in one corner of the kitchen; taking an armful of it, Bosy proceeded to light a fire, which, if it did not throw out much heat, served by its blaze to make the place seem a shade less cheerless. The two candles in their empty bottles were still alight on the mantel-piece. The captain had given Bosy a cake of tobacco,

which he now proceeded to cut up for smoking; then he lighted his pipe, and sat down on his three-legged stool by the chimney corner. Time passed while Bosy smoked pipe after pipe, crooning to himself some half-marticulate ditty between whiles. More than once he put fresh wood on the fire, more than once he opened the door and stood for a minute or two staring into the darkness outside. By-and-by he fell into a fitful sleep, with his back resting against the chimney-piece. When he awoke, the candles were spluttering themselves out, and the patch of sky visible through the unboarded space of the window was growing gray in the dawn. Bosy stood up, yawned, and stretched himself. The fire had burnt itself out, and he felt chilled to the marrow. He stood listening intently for a minute or two, but no sound reached him from below. It was evident that the strange gentleman still slept.

Most people in Bosy's place would have puzzled their brains with trying to guess what Captain Avory's motive could possibly be for acting as he had done; but Bosy never troubled himself about anything so abstruse as any one's motives; all that he cared about was the results which might accrue therefrom in so far as they affected himself.

As he stood there staring vaguely about him, and feeling more lonely in the dawn than he had felt in the dark, a longing came over him to seek the companionship of his fiddle. It was true he had promised Captain Avory that he would wait in silence till the sleeping man should awake, and that he would then steal away without letting him become aware that any living being was near him. But the man was not yet awake, otherwise Bosy would have heard him stirring. He might not awake for hours. Meanwhile, there was his old friend staring him in the face it was light enough now for him to discern the fiddle where it hung from a nail in the corner—and seeming to ask, 'Master, what have I done?' and they had always so much to say to each other, those two! There was only one voice between them—that of the instrument—a voice evoked by Bosy's fingers; but sometimes it was Bosy who talked to the fiddle, and sometimes it was the fiddle which talked to Bosy. They understood each other so well.

Bosy could resist no longer. He took down the fiddle, touched it fondly with his lips, wiped it carefully with a silk handkerchief which he kept for the purpose, and then, after a little preliminary screwing-up of the strings, he sat down on his stool near the black fireplace, crossed one withered leg over the other, and began to play; but the score of what he played would have been found written nowhere save in his own fantastically constituted brain. Sometimes wild, fitful, and eerie, sometimes plaintive and almost sobbing, as it were, the notes rose and fell, and floated out on the soft gray of the October morning. It was the touch of untutored genius, which, under other circumstances, might perchance have given the world something it would not willingly have let die.

Bosy, sitting with shut eyes, had become so absorbed in his music as to have forgotten time

and place, his promise to Captain Avory, and even the existence of the man in the dungeon, when he was suddenly startled back into reality by hearing a voice, which seemed to come from a great distance, calling 'Help! help!'

Bosy started to his feet with wildly-starting eyes. For a moment it seemed to him as if he had heard a voice crying from the tomb; then everything came back to him in a flash 'Help! help!' again called the voice.

'It's only the gentleman a-waking up,' said Bosy. 'It gave me a turn at first, though. How surprised and nonplussed he must have been when he opened his eyes and stared round him. I hope, though, he didn't hear me playing, because I'm supposed to be miles away from here at the present time; but it can't be helped, if he did.'

Again came another half-smothered cry for help. Bosy suggested, 'Ho, ho! my noble prince, you'll have to cry out a long time before anybody hears you at Hooges!' You must make yourself as jolly as you can till midnight to-morrow, when I'll come and let you out. And maybe you've got some money about you, and maybe you won't forget to reward poor innocent Bosy for helping you to see daylight again! Ho, ho!'

He had risen, and was putting his fiddle into its green baize covering, by this time. Then, after a last glance round, he crossed the floor lightly and opened the door. 'I'll take the sheep-track through Perry Wood,' he said. 'There won't be a soul about at this hour of the morning. By ten o'clock I shall be fifteen miles away.' He shut the door, turned up the collar of his coat, and with his fiddle under his arm, he set out, a last faint cry for help sounding in his ears as he left the house.

When Edward Saverne awoke from his long sleep and stared around, he felt that he must still be dreaming. Vague, confused visions and fancies, some of them pleasant, and some of them the reverse, had been floating through his brain for some time before he awoke, and he felt that what he saw now was only one more vision added to the number—only, about this one there was an air of reality which had been lacking in all that had gone before. There was a strange pain and heaviness across his forehead, and yet the back of his head felt just as strangely light and wanting in balance. Again he stared about him, taking in his surroundings item by item, as far as he could make them out by the dim light of the candle, which was now burning to its end. Was he really awake, or was he still asleep? He pinched himself in the soft part of the arm, and then gave a sharp tug at one of his ears. The pain in both instances was enough to convince him that he was no longer dreaming. Then he sat up on his pallet, put his hands to his head, and tried to think, perceiving, as he did so, that he was still dressed in the tyeed suit in which he had travelled down from London.

But how long ago was it since he came down from London? Was it days, or weeks, or even months ago? As well as his aching head would allow him, he set himself quietly to recall all that happened from the time he left the train

up to the moment when consciousness deserted him. First there was the meeting with his cousin Lucius at Mumpton Junction, and their drive through the dark to Trevenna Cottage. Next came his reception by his cousin's wife, who had welcomed him more warmly than he had thought she would have done. After that came supper in the cosy little dining-room, followed by a cigar and a glass of that delicious mulled port which Louise knew so well how to concoct. But beyond that point, his thoughts refused to travel. He remembered well how he nearly fell asleep in his easy-chair in front of the cheery fire, while Louise was playing softly in the adjoining room, and Lucius, who seemed to have become talkative all at once, was recounting some bird nesting adventure of their youthful days: all this he remembered, and then followed an utter blank. Did he really fall asleep in that seductive easy-chair? and if so, had he slept till now? If that were the case, what place was this in which he had come back to consciousness; and why, and by what means, had he been brought here?

Very few moments sufficed for these thoughts to traverse his brain; but the questions he asked himself he was utterly powerless to answer. He was still staring round him like a dazed man, when suddenly the sound of music fell on his ears. As he listened, his first thought was that Mrs Avory must still be playing, and that perhaps he had not been asleep for more than a few minutes; but next moment he recognised that the notes to which he was listening were not those of a piano, but those of a violin. The music seemed to come from somewhere overhead, although that was a point respecting which he could not feel positive, but, in any case, it was evidently no great distance away.

The dizziness and strange feeling in his head had passed away in some measure by this time, and he now felt as if he dare venture to rise from his pallet without the fear of falling; but he sat for a few moments on the side of it before venturing to stand upright. Evidently the first thing to be done was to explore the strange place in which he found himself, and try to discover some means of egress. He rose and crossed to the empty cask, the top of which had been made to serve the purpose of a table. On it a candle was burning in a flat tin candlestick, with more candles and a box of matches close by. Near at hand were some provisions—a loaf of bread, a piece of cheese, some butter, together with a small jar of minced beef and one or two other articles. On a wooden stool stood two bottles, which looked as if they might contain wine or spirits. Wondering more and more, he took up the candlestick and began his exploration.

The music was still going on, and he now recognised that it came from somewhere overhead. Holding the light aloft, he made a survey of the ceiling. He found that it was of wood, and was supported on great beams and rafters, black with age and festooned with cobwebs. He concluded that, in all probability, it formed the floor of another room over the one in which he was. Next he made an examination of the walls. In the dim light, it had seemed to him that they were of plaster yellow-washed, as

the interiors of many houses are in country places; but he now discovered that they were composed of a sort of soft yellow sandstone, in which he could easily have cut his name with his pocket-knife. The floor, to all appearance, was of the same material as the walls. Was it possible, Edward Saverne asked himself, that he was shut up in some under-ground place, some vault or dungeon hewn out of the rock?

But, the means of egress? For a few minutes, in his surprise at other matters, he had forgotten that important point. There must surely be a door, or a staircase, or an opening of some kind somewhere. Two minutes later he sat down on the edge of his pallet, feeling dizzy and sick at heart. Neither door, nor window, nor staircase, nor opening of any kind was to be found. Again he asked himself, by whom and for what purpose had he been brought to this place. He started to his feet. Wherever he might be, he was not quite deserted and alone. The music told him that a human being of some kind was near at hand—one, surely, whose help he might claim. The thought sent a glow back to his heart. Hollowing both his hands, and putting them to his mouth, he called loudly for help, *once*, twice, and then stood with strained ears waiting for some response. But none came. Scarcely had the second cry left his lips when the music ceased—ceased as abruptly as it had begun, and was succeeded by profound silence.

After the lapse of a minute, he shouted again; but the silence remained unbroken. That his cry for help had been heard was indicated by the sudden cessation of the music. Why, then, had it not been responded to? Could it be that he had been brought here of set purpose and for some nefarious ends, such as he could not even guess at? and that he was to be left here, helpless and alone, till it should please those who had thus imprisoned him to set him at liberty? But who were the unknown people who had treated him thus? Could his cousin Lucius, and that blinking woman with the white eyelashes, his wife, have had any hand in it? And if so, to what purpose? What conceivable object could they have in view in treating him thus? None, none, that he could think of. A wild chaos of questions surged through his brain, to not one of which could he find a satisfactory answer. Again and again he lifted his voice for help, but with no other result than before.

Once he thought he heard a slight noise overhead, as if some one were cautiously crossing the floor; but as the sound was not repeated, it might only have originated in his own excited fancy. Although, of course, he did not know it, had the weather been at all stormy, he would have heard the heavy beat of the waves on the shore; but the night was utterly windless, and the tide came lapping up the sands as gently as though its tiny wavelets were the caressing fingers of a child.

He had not bethought himself till now to look at his watch. On consulting it, he found that it had stopped at four o'clock, doubtless for want of winding up. How many hours had passed since that time, or whether it was now day or night, he was unable to judge. After replacing his watch, he drew out his purse, and on opening it, he found that the gold and silver

there had been in it when he left London were still there, but that three notes for ten pounds each, which had been in one of the side-pockets, were not to be found. The robbery of his notes served only to deepen the mystery by which he was environed; otherwise, it affected him but little; his mind had far more serious things to dwell upon.

He thereafter made a more careful examination of his prison, searching minutely for the signs of some hidden door or secret opening; but to no purpose. Evidently, his first judgment was a correct one: he was immured in a dungeon cut bodily out of the living rock.

The candles, the supply of provisions, the wine, the jar of water in one corner, all seemed to indicate that the intention was to keep him a prisoner for some time. But why and with what object? That was the question which again and again reiterated itself in his brain. But all his self-questionings ended where they began—in a maze of utter bewilderment, in the midst of which he vainly strove to find the slightest clue. At intervals, he kept on calling for help, but only to be mocked by the silence, which seemed to weigh upon him with tenfold heaviness the moment it had swallowed up his cry. As hour passed after hour, this death-like silence, in conjunction with the gloom and solitude of his prison, and the feeling of being utterly cut off from and lost to the rest of the world, began to press upon him more and more, till at length he found himself wondering how much longer it would be possible to endure it without his brain giving way. He drank of the cold spring water in the jar eagerly and frequently, but beyond that he took neither bite nor sup. And so Time's pendulum swung slowly on.

MAKE-BELIEVES.

ADVERTISEMENTS, like many other things, have their uses and abuses, and we are not going to find fault with the long-established columns, which are of such service in supplying social wants, but with the dishonest practices of which the most respectable newspapers are ignorantly made the medium. There is abroad a plague of petty dishonesty, which trades upon and lives by the credulity, principally, of inexperienced women—educated ladies—who, by dire necessity, are ready to grasp at straws in the hope of saving themselves from penury. This is the class who not unfrequently have been known to spend their last pound to supply themselves with materials for work promised, or for stamps and fee, in order to secure an appointment offered. Of course, it will be alleged by those who thus prey upon human credulity that the applicants failed to come up to the standard of requirement. We do not write without data, or without having justly considered the ineligible; but it is to the system we demur; and the evidence we have before us comes from women of culture, whose ability is as indisputable as their testimony is unimpeachable. We therefore assert fearlessly, that infinitely more cruelty and more social injury are being perpetrated by these semi-professional,

semi-artistic traffickers, than has ever resulted from the dishonest puffing of the tradesman.

By the semi-artistic traffickers, ladies may be duped only to the extent of stamped, addressed envelopes, for which they are to be shown how to earn from two to eight shillings a day; or in some cases, merely a 'good addition to a small income.' This is to be done in several instances by the sale of a particular kind of button, mirrors, or watches, or some article of consumption in daily use, for which a commission will be given. The five shilling fee is to realise many more advantages, inasmuch as it promises a home with nominal duties to an educated lady not over twenty-five. Letters in the first instance are sent, to be followed by a personal interview at an address which shall be nameless. The response was made by a young lady, whom we shall call Miss Green, who took the precaution to inquire of an art in living in the locality if he could give any information as to the owner of the said house. 'No, miss, I can't,' he said; 'but I wouldn't advise the like o' you to go there. I've seen ladies go in and come out w' nothing but disappointment in their faces. Ye won't say as I told ye, miss, but I can't a-bear to see it.'

A few weeks later, the same young lady noticed an advertisement in a London paper promising exceptional privileges, and desiring stamped envelope to be addressed for reply to J. Brown, Esq., — Street, Exeter. On this occasion, the services of a friend were called into requisition. She drove into the old city from the environs where she resided, thinking how much astonished Miss Green would be, could she see the position indicated by the address, but resolving, nevertheless, to satisfy herself, no less than save the inquirer from being duped beyond the extent of the twelve stamps, and stamped addressed envelope already forwarded.

Leaving her carriage at some distance and going a little way up the street, she was directed to a small dilapidated cottage at the top of a garden in the rear of a larger house, and probably rented for the business that was to be enacted there, under the assumption that it would all be done simply by correspondence emanating from the advertisement in a London paper. The door of the cottage was opened by a working woman, who said Mr Brown was away for a week; she was his servant. But the lady had seen more than enough in the heap of stamped envelopes which lay on the table, which were doubtless to yield a small income to an impudacious impostor, who had never even answered Miss Green's letter, or probably the letters of hundreds of other applicants.

Another artful and common trick is, when in addition to stamps for 'postage and preliminary inquiries,' as it is called, for the advantage of permanent occupation, a post-office order is demanded for materials supplied by themselves, with which the work is to be done. In one case, as much as three pounds was paid out on this condition, with the magnificent result to the payee of seventeen and sixpence in three months for work which probably brought two pounds more to her employer. An enormous trade has been carried on for the last two years in a spurious

kind of art production, for which materials were supplied and instruction given at its commencement for two pounds. Now the same privileges are offered for five shillings. We have before us, too, the statement of a lady who was the dupe of another similar advertisement. A carte-de-visite photograph was sent to her, which she enlarged to a picture eighteen by twenty inches, and painted in oils, for six shillings, the bait having been held out of having twenty a week supplied to her, should this first specimen prove satisfactory; which it is needless to say it did not, though the man sold it for twenty-five shillings! This pseudo artist asserting, when remonstrance was attempted, that the art required no previous knowledge, and he was employing twenty girls at three and sixpence a week to produce such pictures, and not a penny more would he pay.

Of literary agencies, their name is legion, but their usefulness nil. Of course what we have to say will not apply to well-accredited agencies or Societies, but to those whose ostensible object is to furnish channels for amateur productions, but whose real object is to enrich their own pockets without regard to the interests of the payee. In these, as in advertisements of another class, it is often refined and educated women who are made the victims of this cowardly practice; and we think the statements which follow only require to be made public to enlist the consideration of chivalrons, high-minded men, who may, by their influence or generosity, protect women from this added element of anxiety in their struggle for existence.

For instance, assistance was required by advertiser from a lady accustomed to literary work, which could be supplied at home, and a liberal equivalent offered. After some preliminary correspondence, applicant was requested to call at the office in the Strand for further particulars. Instead of replying personally, she did so by deputy, the gentleman who volunteered to make what he deemed necessary inquiries being in the police department of the Civil Service. One statement made to him was, that the advertiser had a large newspaper clientele to whom he constantly supplied articles written by women. This assertion being confirmed during the interview, a list of the papers was asked for, which numbered thirteen of the leading journals of the day. But the request having perhaps taken the advertiser a little by surprise, he asked impudently: 'Pray, sir, are you Miss —'s brother?'

'I am not.'

'Are you her solicitor?'

'I am not; but there is my address,' said the gentleman, putting down his card. 'I wish you good-morning; but I may add I think no lady would present herself at an office like this without inquiry by a gentleman to ascertain the nature of the transaction to which she was to pledge herself.'

Satisfied the whole thing was a hoax, the gentleman then despatched a detective to the various newspaper offices mentioned, only to find that in one solitary instance a lady had sent a short article from the office in question. Thereupon, a duly accredited officer was sent to take down the depositions of the applicant; but

the matter was carried no further, as the lady, being young, could not be prevailed on to appear in court.

To this statement may be appended another—namely, the advertisement of a certain Agency, or so-called Association for Governesses, Lady-housekeepers, &c. Applications to be made to a certain individual, who varies his addresses as well as his names, though both are in the north-western division. One of these is presumably his private residence; the other is an old-clothes shop, kept by an old woman, who receives the letters with their inclosures of half-guinea fee, which it is especially requested may be made by postal order. The police having had numerous complaints of the advertiser in question, it would be well that any person allured by his advertisements should communicate with Scotland Yard, to see if he is known to the police.

Another dodge is to ask for contributions to Christmas Annuals which have large circulation, and of which a specimen copy will be forwarded for twelve stamps. Accordingly, it arrives; and the shilling contributor finds she has thrown away her money on a magazine containing about as much matter as the *Argosy*, more than one half of which is filled by the writing of the pseudo-editor himself, and the rest mere penny-a-lining, which few, if any, would trouble themselves to read, though the advertiser probably makes a pretty good harvest out of his dupes.

Four years ago, the writer was subjected to similar wholesale robbery by sending manuscripts of carefully selected translated matter, regarding which some preliminary correspondence had taken place with an embryo editor who was projecting a new venture. The papers received high commendation, and payment was to be made when they were printed, according to a tariff not yet finally decided. Months passed away without any intimation or reply to letters; and the same gentleman who had acted in the 'permanent home employment' matter now called at the address to which the papers were sent, only to discover that the 'editor' had had a letter-box there for many weeks; but neither his name nor present habitation being known, the manuscripts were never forthcoming. As, in this age of new ventures, it is impossible to read all that comes out, in all probability these and hundreds of other papers sent by the unwary were utilised for the benefit of the advertiser, who must have laughed in his sleeve at those by whom he had made his dishonest gain.

Perhaps one of the most flagrant of these swindling transactions is the announcement how an income of one hundred and twenty pounds a year can be made without risk by sending a stamped addressed envelope to advertiser inclosing postal order for two shillings and sixpence, when the reply comes—'Do as I do.' Thus postal orders have their abuse as well as use, since no names can be traced where they are employed.

Besides the general, literary, and artistic beguiling advertisements referred to, there is another class which we will designate 'Social,' inasmuch as they are supposed to promote domestic comfort, and supply a social want to those who are not privileged to enjoy the happiness of family

life. These announcements generally appear towards the close of the London season, though they are tolerably frequent all the year round. We have no doubt that in some cases many advantages are to be met with in the houses of those who conscientiously fulfil the promises they have held out. With these we have nothing to do. But there are hundreds of designing people who have not the slightest intention from first to last of carrying out any of the stipulations made by those who have answered their advertisements, no matter how much they may have pledged themselves to their fulfilment.

We will cite one glaring specimen of this kind, replied to by two or three ladies of the writer's acquaintance, who journeyed very considerable distances to avail themselves of the special privileges offered in this 'Home in a Private Family.' The advertisement ran thus: 'A Lady residing with her father on their own estate in a prettily situated house, surrounded by pine-groves, offers a refined, delightful home during the summer months, or permanently. Good, well-appointed table. Carriage kept for use of visitor.' This statement was on inquiry supplemented by one from the 'lady' herself, who wrote that every exertion was used to make it a home of comfort on the most moderate terms; society, not emolument, being the advertiser's object. It was further said that the house was easy of access from the station. So it was

—by means of a five shilling cab fare; when one was landed at a detached red-brick gabled building, standing a few yards off the high-road, with a small overgrown garden in front, an empty little greenhouse on one side, and an orchard on the other. There certainly was a small pine-wood beyond the garden at one end; but it formed no part of the 'estate' in question, though it had another use to the inhabitants, inasmuch as its fine undergrowth of bilberries supplied the usual second course at the dinner-table of the old farmer and his daughter. This 'lordly dish,' with other unappetising and insufficient food, was placed on a table, which, like other pieces of rickety furniture in the house, was patched together, to save the cost of repairs. But there was little enough for use, and none for comfort anywhere, the two sofas from the parlour having been appropriated by a lady who was renting a sitting and bed room under the same roof, and who was also tended by the one maid-of-all-work of this ill-appointed, dirty house. The 'carriage' was an old shandydandy basket contrivance; and no matter what the state of the roads, it was washed but once a week, and when in its highest state of polish—that is, such parts as were polishable—it resembled only besmeared boots on a muddy day. The horse, too, was a rare antique, and was always groomed by the master, who forthwith went straight from the stable and sat himself down to supper, as probably he had been wont to do all his life. He also gathered the peas and performed other little outdoor services, before he took his daughter out for her duties in the 'carriage,' in which the guests were alternately offered a seat. So the drives culminated in a mile and a half on the same road day after day, and the drive to church on Sunday. But no one attached blame to the old

man; the daughter 'ruled the roast;' the honest Paterfamilias was the victim of his eccentric daughter's unscrupulous proceedings to edge herself into society in any way she could devise; whilst he was perpetually lamenting that 'things was not as they wuz when he were a boy.' The moral of all this is, to make careful inquiry ere parting with either postage-stamps or postal orders to advertisers whom we know nothing about.

OUR PARLOUR-MAID.

IN TWO CHAPTERS.—CHAP. II.

Eliza's communication was not a very important one, merely referring to a small domestic matter which might have waited a little longer. But that was just like Eliza: she was so conscientious that she could not bear to run the slightest risk of failure in her duty. And when the slight domestic affair was disposed of, she still seemed inclined to keep me talking.

'Don't you like Mr Allardyce, ma'am?'

'I do indeed,' I said. 'Dr Lester is charmed with him.'

'I knew you would like him, ma'am. I'm so glad he called to-day. He was so kind and good to me, and you've been so kind and good to me, that I've often wished you knew each other. And Mrs Allardyce is a very nice lady too, ma'am; I'm sure you would like her if you knew her. Oh, just one minute, if you please, ma'am. I broke one of the claret glasses just now as I was carrying the tray down-stairs, and I couldn't rest until I told you. I'm so very sorry, ma'am, I hope you won't be angry with me.'

'Accidents will happen,' I said sagely. 'And now, Eliza, I really must go. I have left Mr Allardyce all by himself.'

'Shall I light the gas in the drawing-room, ma'am?'

'Why, no. It's not dark yet.'

'But when it is dark?'

'Certainly,' I said.

I found our guest standing in the middle of the plate-room with his hands in his pockets, softly whistling *Nancy Lee*.

'I must apologise for running away,' I said, as I began to lock up the press. 'I am sorry Dr Lester has been called away also. If you can find your way down to the drawing-room, I will put my keys away and follow you.'

'Thank you very much for affording me such a great pleasure,' he said courteously as he went out on to the landing. He descended the stairs, as I locked the outer door of the press. As I did so, I felt something crunched beneath my feet. I picked it up, and found it was a small piece of white wax. I did wonder for half a minute where it could have come from, as I never carried candles into the plate-room, which was lighted by gas, and nobody but myself had access to it. But the matter passed from my mind as I rejoined our visitor in the drawing-room and Charlie came in. Eliza brought in

coffee, after which we had a little music; and I could hardly believe Charlie when he said that the time had come for ordering the brougham to take our guest to the station. Mr Allardyce bade us a friendly farewell, and was most urgent in his desire that we should visit Oakwood before long. We promised to do so, and parted, delighted with our visitor, whose pleasant manner had charmed us both.

A few days afterwards I received the following letter.

OAKWOOD VICARAGE.

Saturday, July 6.

DEAR MRS LESTER—I trust you and Dr Lester have not forgotten your promise to come and visit us this summer. This glorious weather makes the country especially enjoyable, and Mrs Allardyce and I propose to give a garden-party on Thursday next, at which we should be very glad to have the pleasure of your company. Some famous local tennis-players have promised to come, with whom your husband ought to try his skill. In case Dr Lester's engagements should not permit him to remain here for the night, there is a train for town at nine p.m. We trust you will come early, and we will meet you at the station.—With kind regards, I remain very sincerely yours,

WENTWORTH ALLARDYCE.

After some little discussion, we agreed to go, but decided that it would be better not to stay all night. So I wrote a note to that effect, and despatched Eliza with it to the post, telling her that Mr Allardyce had invited us to visit Oakwood, and that we were going on Thursday. The good girl was delighted to hear it.

On the morning of Thursday, my husband started very early on his rounds, while I made an elaborate toilet in honour of the occasion; and by twelve o'clock we had reached Waterloo, and were in the train for Oakwood. The only other person in the carriage was an elderly clergyman, very gray and fragile-looking, but with a good kind face. He asked me whether I liked the window up or down; and from remarking on the fine weather and one thing and another, he and Charlie soon got into conversation. People always talk to my husband when he is on a journey. I suppose his genial face and manner attract them. At all events, I never knew him travel any distance without somebody entering into conversation with him. He and the clergyman began discussing politics, and sympathised most cordially, being both ardent Conservatives. Then they talked on general topics for a few minutes, and then rambled on to continental experiences. Our companion told us that he had a living in Surrey, but that his health had been so bad lately that he had been compelled to travel abroad for three months, his duty being taken by a clerical friend meanwhile.

'I was in Manchester for many years,' he said. 'I had a very populous parish, and the work was so hard that I was glad to have the offer of a quiet country vicarage. But Oakwood lies so low, and there are so many trees, that it is sadly unhealthy.'—

'Oakwood?' I involuntarily asked.

'Yes, Oakwood in Surrey, near Guildford. Do you know the place?'

'We are on our way there now,' I said, 'to a garden-party at the vicarage.'

'At the vicarage?' he repeated, looking very much astonished.

'Yes. I suppose there are two churches in the place—yours, and another?'

'No, my dear madam, only one—St Paul's, of which I am the vicar.'

I never felt so puzzled in my life; and he looked equally bewildered.

'But the vicar of Oakwood is Mr Allardyce.'

'My name is Wentworth Allardyce.' He took up his travelling-bag and showed me his name and address engraved on a small silver plate. Charlie and I exchanged glances. Our companion was evidently a gentleman, and we could not think of doubting his assertion. On the other hand, who was the other charming Mr Allardyce?

'Have you a son or any other relative of the same name?' asked Charlie. 'A young man with dark hair and particularly agreeable manners?'

'I have no children. My wife has been dead for years. My only nephew, John Allardyce, is in Canada with his regiment.'

'Well, really, this is most incomprehensible!' said Charlie, astounded. 'Our parlour-maid, Eliza Willis, whom you recommended to us'—

'My dear sir,' said the clergyman, looking at him as if he thought he must be an escaped lunatic, 'I never had a servant called Eliza Willis in my life; and I certainly never recommended her to you or any one else.'

'I am Dr Lester of Notting Hill,' said Charlie, producing his card. 'Really, this is a most extraordinary thing. We engaged a parlour-maid about three months ago, who said she had been living at Oakwood Vicarage with Mr Allardyce. She said he was then at Folkestone; so we wrote there, and received an excellent character'—

'Excuse my interrupting you, but I never was at Folkestone in my life.'

'And a few days ago, a "Mr Allardyce" called to see her as he was passing through London. He spent the evening with us, and we were both delighted with him. To-day we are going, at his invitation, to a garden-party at Oakwood Vicarage.'

'Then, my good sir, I fear you have been imposed upon,' answered the clergyman. 'Some unprincipled person must have made use of my name. I have been abroad for three months, and am just returning to Oakwood. I assure you, I have not the slightest intention of giving a garden-party; my bachelor household does not admit of gaieties of that kind.'

'O Charlie, our plate!' I cried, as a suspicion flashed across me like lightning. And my husband turned pale.

'We have a good deal of plate,' I hurriedly explained. 'This man, who passed himself off for you, professed to admire it very much; and we showed him all we had, and, O dear! how we locked it up, and everything.'

'I should fear he had designs upon it. It is a most mysterious affair all through. Of course you have only my assertion that I am Wentworth Allardyce'—

'We don't doubt that for one moment,' said my husband.

'But if you come to Oakwood,' went on the vicar, 'my parishioners will be able to certify that I am their vicar, and no other.'

'Indeed, I think we ought to go back to London at once,' said my husband, who was evidently uneasy. 'I fear we have been duped by a persuasive stranger, and that this garden-party pretence is only a dodge to get us out of the way. Our house is probably now being robbed.'

'But, Charlie, there is Eliza!'

'Mr Allardyce knows nothing about her. Her character must have been a forgery.'

'So it must,' I said, feeling completely overwhelmed. 'Oh, I wish the train would stop, so that we could get out and go back to London.'

'It stops before long at Marsham junction,' said Mr Allardyce. 'You can catch a London train there.'

'Is not wax used to take the impression of a key?' I asked, as another recollection came to me. 'I found a piece of wax on the floor of the plate-room, Charlie, after—after that man had been there.'

'Then we may say good-bye to our Queen Anne tea-service!' said my husband grimly, as the train gave a warning whistle.

'This is Marsham,' said Mr Allardyce, letting down the window. 'I trust you will let me know how you found things at home,' he added kindly, as we got out. We gave him a hurried farewell, and dashed down the platform, where a porter told us the London train was just going.

We had a fearful scramble, and, quite out of breath, were bundled into a carriage at the very end of the train, which was already moving. It was third class and not over-clean, but we were only too glad to get in at all.

During the brief journey back, Charlie told me what he intended to do; and as he did not think it would be safe for me to go back to the house at first, I agreed—though very unwillingly—to wait at a neighbour's until he came for me. He took a hansom at Waterloo, and we dashed homewards at great speed. At the police-station nearest to our house, Charlie got out, and after a few minutes' conversation with the inspector, we resumed our way. Four constables, under the command of a sergeant, were to follow in another cab immediately. We got out at the end of our road, where the policemen were also to do, so as not to alarm any one who might be in our house with the sound of wheels stopping at the door. Charlie let me at my friend's house, and turned back to meet the cab full of policemen which was just in sight. My friend's house was nearly opposite our own, and, after a hurried explanation, I took my stand behind the curtains in the dining-room window to watch, feeling quite sick with apprehension. In front of our house, hitched by the reins to the lamp-post, was a small truck, drawn by one horse, such as might have belonged to any respectable tradesman; and that was the only external sign of anything about to happen.

I saw Charlie and his company come down the street. One policeman quickly descended into the area, and stood there ready to arrest

anybody who attempted to escape that way; two remained on guard outside the front door; the others slipped off their boots, and Charlie noiselessly adapted himself and them with his latch-key.

I had watched for about twenty minutes in an agony of dread, when I saw the door open, and my husband came out. He was by my side almost immediately, and told me what had passed. Nobody met them in the hall, and they made their entry quite unperceived. It may be wondered at that no one was on the watch to give the alarm. But the plate-room was at the back of the house, away from the road; and besides, we were supposed to be safe at Oakwood by this time—where, but for a most fortunate accident, we should have been—and 'Mr Allardyce' and his gang thought themselves perfectly secure from interruption. Charlie and his party crept cautiously up the stairs, hearing voices and laughter coming from above. On the first landing was a wooden piano-case, in which ingenious and innocent receptacle our plate was to be packed, and put on the truck which was waiting at the door; in which guise it might safely be trusted to elude the notice of every policeman in London. The thieves were so secure in their fancied safety, that when the door was pushed open and they found themselves surrounded by the policemen with drawn truncheons, they were blank with amazement. 'Mr Allardyce'—not in clerical costume this time, had opened the press with the false keys, which the wax impressions he had taken enabled him to make. A second man, the driver of the truck at the door, was standing by with a chisel; and my saintly parlour-maid, laughing at the ruse which had been successfully practised on her master and mistress, was helping the house-maid to roll up the plate in green baize bags.

'Mr Allardyce' drew a revolver; but before it could be discharged, he was stunned by a blow from the sergeant's truncheon. The others were quickly secured, and escorted by the policemen, were driven off to the nearest police court, to be charged before the sitting magistrate. Our plate was saved; but it had the narrowest escape in the world. Only ten minutes more, and the thieves would have got clear off with their booty, and we should never have seen a vestige of it again.

The conspirators had contrived to send Cook on an errand which would detain her an hour or two, soon after Charlie and I left. The house-maid—who, it will be remembered, came to me through Eliza—was in the plot; and they thought themselves safe. The parlour-maid in whose I trusted so implicitly was a member, *sub rosa*, of the swell-mob, of which distinguished profession 'Mr Allardyce,' who had received a good education, was one of the brightest ornaments. He had written the letter from Folkestone by means of which she entered my service. Eliza derived her knowledge of Oakwood and of Mr Allardyce's affairs through having once stayed there for a few weeks with a family in whose service she was. For four or five years she had played a game similar to that she had tried on me, getting mistresses to confide in her, and then, when she had found out where their plate and valuables were kept,

betraying the house to her accomplices. These burglaries remained profound mysteries, thanks to her consummate hypocrisy; her complicity in them never having been suspected. Her entering my service was not the result of chance, but the consequence of one of the gang one day hearing a remark that Dr Lester of Notting Hill had some valuable plate. At first, she and her confederates thought of carrying it off in a night attack; but the difficulties in the way, thanks to Charlie's wise precautions, caused them to change their plans, and they concluded to try the stratagem I have recorded.

The four were tried, and each sentenced to long terms of penal servitude. A few days after the trial was concluded, I was astonished to receive a call from my old housemaid Jane, who had been dismissed for dishonesty. She told me that she had only just heard of what had taken place; and that had emboldened her to come and tell me that she was sure Eliza, knowing her box would be searched, had purposely placed articles belonging to me in it that very morning, to insure her dismissal. She said that one or two things Eliza had said to her indicated very little regard for other people's property; but, finding that Jane was honest, Eliza pretended to turn it all off as a joke. But from that time forth she no doubt made up her mind to get rid of Jane, as an obstacle in the way of her schemes. It is needless to say that I at once took Jane back into my service, and that she is with me now.

We had had a lesson. We sent all our plate off to the bank the next morning. People who come to dine with us, see a good deal of silver, as they imagine; but it is chiefly electro-plate. One attempted burglary is quite enough in a lifetime.

We renewed the acquaintance with the real Mr Allardyce, so strangely begun, and he is now one of our most valued friends. We often joke about his 'garden-party' which never came off. But if our parlour-maid had succeeded in her nefarious designs, there would really have been no joke in the matter.

A TALE OF A SIXPENNY TELEGRAM.

THE sixpenny telegram may prove a priceless boon to the British nation at large, but at present it stands to my individual mind as the symbol of something intensely disagreeable. On that un auspicious first of October when the new arrangement was thrust upon us, I received a message, handed in at a London office, which ran as follows:

'To FREDERICK AUGUSTUS SMITH-SIMPKINS, 56 Langham Hotel.—Bring Digby on Saturday. JENKINS.'

A very innocent and ordinary communication, to all appearance, and yet that innocent-seeming message was the means of breaking off one marriage, of precipitating another, and of losing me a fortune!

The sender had curtailed his name and omitted his address in order to compress his telegram within the sixpenny limit; but there was no

doubt in my mind as to the identity of the sender. I knew only one man named Jenkins—my mother's eldest brother, Albert Victor-Emanuel Smith-Jenkins. The wisdom which declined to pay an extra halfpenny on each of those high-sounding baptismal designations was certainly to be extolled. It was only a pity, I thought, that they could not be similarly suppressed on all the other occasions of life. The taste which our family has always displayed for a lengthy and would-be imposing nomenclature has been anything but a source of pleasure to me; for nearly five-and-twenty years I have positively groaned under the burden of my own four names; and the tiny tax levied upon the Smith-Paynes, the Smith-Jenkinases, and the Smith-Simpkinases, is the only thing connected with the new telegraphic regulations which wins my cordial approval.

To return to my uncle and his message. It was perfectly plain and intelligible, in spite of its brevity. A favourite niece, to whom he had been lately playing the part of father, was to be married next Saturday, from his house, to a baronet. I had been invited to the wedding; and here was a further request that I would bring young Digby, a mutual acquaintance, with me. It was a somewhat odd and informal manner of inviting him; but my uncle was an eccentric man, accustomed to do things of this sort. He had returned within the last few months from a trip to the antipodes, accompanied by a widowed sister and her daughter, the Australian belle who was to be married on Saturday. The young lady, or her mother, had evidently contrived to captivate the old gentleman during the short time they had known him, for he had already signified his intention of leaving her the half of his fortune, provided that she married to his satisfaction. This condition she was just about to fulfil, so that her inheritance might be regarded as perfectly safe. The other moiety of his property was to be bequeathed to me, and in my case there was a condition of general good behaviour, without any specific demand.

I had never heard Uncle Bert speak of Digby, and therefore had no idea what terms of intimacy they were upon. My own acquaintance with him was of a somewhat casual though very pleasant sort. Three seasons ago, I joined four or five other men in hiring a Highland moor, and he had been one of our party. I was so unfortunate during our sojourn in those remote regions as to dislocate my ankle; and in the absence of regular medical aid, Digby showed himself a skilful amateur surgeon, and afterwards relinquished many hours of sport with his friends, in order to sit by my sofa and help me to while away the tedium of my idle days. We all liked him exceedingly for his ever-falling *bonhomie*, and for a certain charm of presence and manner that no one could resist. I always understood that he came of a good old

stock, but knew very little about his people or belongings. When our party broke up, he told us that he was going to sail for Melbourne in a few weeks; and we each shook him heartily by the hand and wished him a prosperous voyage.

I never set eyes on the man again from that day to the 30th of September last. I had been up in town for a week, and had been dining that evening with my old chum, Bob Collier, a good fellow, but gifted with an unsurpassed genius for plunging himself into scrapes and for dragging in his friends after him. After dinner we adjourned to a certain well-known music-hall. Bob ecstasies the British drama, and patronises no public place of amusement in London other than a music-hall, on principle—at least he says so. We had not taken our seats more than five minutes, when we simultaneously recognised Digby's noticeable face only a few yards away from us. I went up to him and tapped him on the shoulder, and he remembered us both in an instant. I said to myself, after a little scrutiny of his features, that he must have been living his life pretty fast out there in Melbourne. The last three years had set their mark upon him; but he was still strikingly handsome, and his manner was just as bright and gay and genial as ever. We spent the rest of the evening together, and in the course of our talk it came out that Digby had met Uncle Bert in Australia.

'And do you know my cousin, Fanny Dasher, who is to be married on Saturday?' I inquired.

'I have met her,' he answered, and then began rather humbly to speak of something else.

We separated soon after midnight, Bob reminding me, as we said good night, of an engagement I had made with him for the following week. He was the owner of a small yacht, and we were to take a cruise in her, weather permitting, after his return from a few days' shooting in Essex. The yacht was then undergoing some repairs, but by that time she would be ready for us at Eritth.

'Now, don't throw me over, old man,' Bob entreated plaintively, 'with a tale about important business, &c., &c. I shall be back in town in a week or ten days, and shall depend upon you.'

'All right, Villikins,' I answered, giving him the nickname which, for certain reasons connected with a then popular song, we had fastened upon him in our school-days. 'I shall be in town again, too, before then, and you will find me as usual at the Langham.'

This arrangement having been satisfactorily concluded, we departed our several ways.

The above is a brief account of my acquaintance with Lancelot Digby: the story of my uncle's connection with him has yet to be told.

It was on the following morning that I received the telegram; that was, on Thursday, and the wedding was to take place in two days. I wrote a note to Digby, at the address he had given me, intimating my uncle's desire that he should grace Miss Fanny Dasher's nuptials, and then sallied into the street to look up a friend. At the very first corner, I came suddenly face to face with

Digby again, and repeated the substance of my now superfluous note.

'That is a very funny joke,' he said, looking at me with an odd expression; 'and if you knew all I knew you would think it a good deal funnier.'

'It's no joke at all,' I said. 'Here's the telegram.' I happened to have thrust it into my pocket in a fit of absent-mindedness, instead of tearing it up, the most natural proceeding, and now drew it out and showed it to him. We stood in the doorway of a tobacconist's shop, and he stared at the four words of the message and at the sender's name for some moments, in apparent bewilderment; then his eyes flashed with sudden comprehension, and he broke out into a loud fit of laughter.

'What is there to laugh at in that?' I exclaimed.

'I beg your pardon,' he said, quickly sobering down. 'There is really nothing to laugh at. I am a fool. I don't know whether I shall be able to go; but I'm much obliged to him for the compliment all the same.' And then he hastily left me, saying that he had an appointment to keep.

I returned to my home in Liverpool on Friday evening, without having seen or heard anything more of Digby. Uncle Bert lived at Southport; and the next morning I took a train which would give me time to reach his house about half-past ten. I had just entered an unoccupied first-class carriage, when I saw Digby on the platform, arrayed in a wedding garment of faultless cut and fit. I beckoned to him from the window, and he came in and took his seat beside me. One glance at the man showed me something unusual in his look and manner. He talked in a distracted, unconnected fashion, and once or twice broke out into snatches of colonial songs. He was paler, too, than ordinary, and, while lighting a cigar, his hand trembled so that he could hardly hold the match. I did not like these signs at all, and began to feel vaguely uncomfortable and apprehensive.

We took a cab from the station to Palmoral Lodge, one of the largest and most imposing-looking houses in Southport, representing the accumulated gains of three generations of Liverpool shipbrokers. For years, there had only been one thing wanting to complete my uncle's earthly happiness—the affiliation by marriage of our family to the titled class. This dream of his life was now about to be realised; and I pictured to myself the way in which he would come forward to receive us, his normal propensity aggravated tenfold, in order to do credit to the occasion and to his 'friend Sir Marmaluke Fitzhugh.' He was not visible, however, when we entered, although we heard his voice in the distance anathematising the butler for having put out the wrong claret. The page-boy requested us to walk up into the drawing room; and we followed him across a wide hall, adorned with beautiful ferns and flowering plants.

Digby tramped noisily across the marble floor, switching to right and left the gloves that should have been upon his hands, reckless of the flowers; and at the foot of the stairs he contrived to throw down a stand of sticks and umbrellas with a dreadful clatter.

'Gently!' I whispered reprovingly.

He turned upon me with a half-laugh, and his lips parted to emit some indistinct guttural sounds. I really believe that he was on the very point, just then, of breaking out into one of his camp-fire songs. He preceded me on the staircase, and just before we reached the top he turned round and caught me by the shoulder. His face was flushed now, instead of being pale, and there was a wild light in his eyes.

'I say, old man,' he said, 'how would you feel if you were coming to this wedding in the character of Young Lochinvar, or the Master of Ravenswood, or something of that sort? You wouldn't manage to look quite so dour and well-behaved then, I fancy.'

I don't know how I looked, but I remember very well how I felt. Digby's strange words and reckless bearing seemed to threaten some horrible catastrophe, and I could not rid myself of the idea that I was in some way responsible for him. In another instant the page had thrown open the drawing-room door and announced us. It was too late then to turn back or to try to make my escape. I must go through with the adventure to the bitter end.

There were over a dozen persons in the room when we entered, besides the six bridesmaids. Mrs Dasher was not present; she was assisting in the adornment of the bride, and her place as hostess was, for the moment, filled by a Mrs Cochrane, who seemed to be a sort of second cousin to nearly everybody there. This lady was all smiles and amability, as befitting the occasion. She welcomed me effusively, although I had never met her more than twice in my life, and said something soft and pretty to my companion, who was quite unknown to her.

I had taken very little interest in this wedding, either in bridegroom or bride. I suppose that no woman could have been present at such a ceremony without being at the pains to make herself acquainted beforehand with a dozen details, of which I remained contentedly ignorant. My masculine cursorness took everything for granted. Perhaps I might have concerned myself more about those romantic accessories which popular imagination has grouped around the every-day fact of a wedding, if the bride had ever inspired me with any interest. But I had seen very little of her during the few months she had been in England, and although we were first cousins, we were almost strangers to each other. I was told that she had been the belle of her native township in Australia, but neither her looks, style, nor manner commended themselves to my taste. The bridegroom I had not even seen. The match had been made up by my uncle, somewhat hastily, and I suspected that it was more or less of a *marriage des convenances*.

For the present, I was too much occupied in watching Digby to have thoughts or eyes for anybody else's concerns. The prettiest of the bridesmaids came up and began to talk to me, and I answered her at random, while my eyes wandered off every other minute in his direction. He was apparently behaving very well, talking politely to a feminine fogey, the bride's great-aunt. After a while, I noticed that he glanced again and again through the partially closed door.

What was the meaning of that? I discourteously abandoned my young lady, and took a seat on the opposite side of the room, where I also could command a view of whatever that half-open door might reveal. It revealed nothing—nothing but the empty corridor. Presently, it occurred to me that the time was going on very fast. The bride must speedily appear, unless we intended to drive the ceremony perilously near twelve o'clock.

A lady saw me looking at the clock, and said: 'Oh, you need not be afraid. I was never at a wedding yet where the bride was not dreadfully late, and yet the service was always over in time. There's a special providence to watch over marriages.'

'Or a cunning demon,' whispered an incorrigible bachelor at my elbow.

Just then, a late guest, who had missed his train, came in. His entrance caused a little bustle; and when it had subsided, I looked round, and saw that Digby had disappeared. A moment later, and our ears were greeted with an hysterical scream.

'Ah, poor darling! it has been too much for her nerves,' the ladies exclaimed, and rushed out pell-mell into the corridor; while the men looked at each other in bewildered discomfort.

I followed the feminine part of the company, and beheld my cousin Fanny, arrayed in her bridal robes, reclining in a fainting-fit upon a sort of divan, and partially supported by Lancelot Digby's arm.

There was the usual fatuous attempt to soothe the sufferer by crowding around her, and the customary panic-stricken cries for water, smelling-salts, a fan. Some one asked, 'Where is her mother?' and as soon as the words were uttered, Mrs Dasher appeared upon the scene. She had gone to her room to make her own toilet, after putting the finishing touches to her daughter's, and had lost herself in herself into a gown of gorgeous crimson satin, as soon as she heard Fanny's scream. As she made her way through the sympathetic group, her eye fell upon Digby, and then she, too, uttered an exclamation, and sank down pale and breathless upon the nearest chair. The same instant, we heard my uncle's voice shouting out a concluding admonition to the butler, as he ascended the stairs.

'Come, come,' he said, bursting in upon us; 'it's time to go—not a moment to spare. Keep your hysterics till afterwards. What the—'

And then he also became white and speechless.

This promised to be diverting. Was he going to follow the example of his sister and niece, and collapse in a fainting-fit? I looked round, and saw that there was no chair at hand. If he fainted, he must fall to the ground, unless some of the ladies were kind enough to sustain him in their arms. But he did not faint; his pallor was only the pallor of a white-hot rage. Quickly recovering his power of speech, he broke out into a storm of incoherent anathemas; then suddenly remembering the presence of the ladies and the necessity for preserving appearances, reiterated once more that there was not a moment to spare, and drove us all down-stairs before him, and into the

carriages that were waiting at the door. I never knew exactly what became of Lancelot Digby at this point, or how he got out of the house. He had ceased to support the robust form of the fainting bride, who was borne off to her own room by her mother and a bevy of excited maid-servants; and in the general confusion, I lost sight of him.

We found the bridegroom and his best-man waiting at the church. The sight of Sir Marmaduke Fitzhugh's puny figure and Dutch-doll inane face led me to think that if Fanny Dasher had consented to marry him for his name and position, despising him in her heart, it was not to her credit; and if she did not despise him, her own taste was truly to be deplored. The service was to have commenced at eleven; at half-past, the bride had not appeared. The two clergymen who were to officiate conferred anxiously with the gentlemen of our party, and the poor little bridegroom's distress and nervousness were pitiable to witness. The minutes went by—our watches pointed to the quarter now; it was perfectly evident that there could be no wedding to-day. Nevertheless, we lingered in the church for another five minutes, to see whether anything would happen. Then the clergymen took off their surplices; and the luckless wedding guests, with the still more luckless bridegroom, re-entered the carriages, amid the jeers of the crowd that had collected round the church doors, and drove back to Balmoral Lodge.

Uncle Bert and his sister received us upon our return with a discomfiture which they tried very ineffectually to conceal. Fanny, they said, was suffering from a nervous attack, and had declared that she could not go to church that day—could not, or would not, it was much the same thing with a young lady. . . . an affection of the nerves. So the bridegroom went back to his hotel, and all the guests departed, with the exception of one or two old friends who were staying in the house.

But what on earth was the explanation of this singular fiasco? Why had this terrible wedding guest been invited? Above all, why was the outrage of his presence to be visited upon my head?

My uncle's fury burst out with the utmost violence as soon as we were left alone together.

'Why, you asked me to bring him, yourself,' I said.

'Don't fling a he in my very face, sir!' he retorted; and I found it impossible to make him listen to a word of reason.

'It was a very clever trick of yours to bring that man here,' he shouted out after me as I was leaving the house; 'but you will find that you have outwitted yourself. You will regret that you did it, to the last day of your life.'

On my way back to Liverpool, the thought occurred to me, was there really anything wrong with that telegram, which my uncle so strenuously denied all knowledge of? I had unthinkingly destroyed it by this time, and so had only my bare word to urge against his. Was it a stupid hoax, perpetrated by some idiotic acquaintance, or a clever device of Digby's to gain entrance to my uncle's house?

I had not long to wait for a solution of this

part of the puzzle. Arriving at home, I found a letter from Bob Collier, which I transcribe at length:

DEAR SIMPKINS—I presume you got my telegram all right on Thursday. I lost no time in sending off one of the new sixpenny ones, but don't see that they are such a wonderful improvement, especially when you have to wire to fellows with names like yours. I shall be back in town on Friday or Saturday week, and hope to find you at the *Laughan*, per agreement. Will Digby be able to join us? He seems a very agreeable fellow, of the quiet and steady sort. [Bob's perception of character was not very keen.] I hate going out with a man whom you're not sure of, and who is as likely as not to lug you into some scrape. Send me a line before the end of the week.—Yours ever, • B. C., alias 'VILLIKINS.'

P.S.—Be sure to give my most affectionate regards to your dear uncle; you know he has always doted upon me.

So it was Bob who had sent the message, and the post-office clerks had converted 'Villikins' into 'Jenkins.' Why had I not connected him with the muddle and mystification before, by a natural association of ideas? It may be his fault or it may be his fate, but if he has only so much as his little finger in any affair, it is sure to end in an unpleasure. This is the worst turn, however, that you have ever done me yet, Master Bob, and I don't find it easy to forgive you. Why need he have telegraphed all my four names at length, and then rigidly curtailed all the important part of the communication within the sixpenny limit, as if an extra penny or three-halpence were a matter of vital consequence to him? Why, indeed? It was just one of his usual fatuous proceedings, which no one could have explained, not even himself.

That same evening, I was passing the entrance to the North-western Station, when I saw a cab drive up, from which alighted Lancelot Digby, and a lady so closely veiled and muffled as almost to elude recognition. Nevertheless, I felt certain that it was my cousin Fanny; and following the couple warily in the crowd, I saw them enter a first-class carriage in the up-train that was just on the point of starting.

Next day, it was known all over Liverpool and Southport that Fanny Dasher had eloped with a fortune-hunter from Australia, on the very day on which she was to have been married to Sir Marmaduke Fitzhugh.

By degrees, I learned other details, which made the story clearer to my understanding. Fanny Dasher had possessed a fortune of her own before she had had any thought of inheriting Uncle Bert's money; and he had found her, upon his arrival in New South Wales, surrounded by a swarm of interested suitors, of whom Lancelot Digby was the most favoured. He had carried her off to England, away from them all, intending that she should make a brilliant marriage, of which he would reap some of the honour and glory. Digby followed her, without, I believe, any settled plan of action, but trusting to his handsome face and the chapter of accidents; and the result justified his faith. Many of Fanny's friends commiserated her for having become his

prey; but their pity was scarcely deserved. She was twenty-five years old, and she knew the world—knew it much better than most young women of her age. As for Digby, he might not be a very eligible partner, but he was externally one of the most charming men and perfect gentlemen whom it has ever been my lot to meet.

It is I who am really most entitled to commiseration. Uncle Bert will never forgive me for my involuntary part in the affair, and has already willed away all his property to charities. He persists in believing that I aided and abetted Digby, in the hope of profiting by Fanny's disgrace, and stigmatises my account of the telegram as a my-tification, if not something worse. I called upon Bob Collier to corroborate my statement, but with the worst success. Such a witness only served to damage my case. My uncle has always detested him, and promptly saluted him as conspirator number three.

This is the conclusion of my story—a most unsatisfactory one, so far as I am concerned. They say that all vexations and calamities carry with them some counterbalancing good, in the shape of wisdom and experience. I don't know that my late disagreeable adventure has brought me any such gain, unless it be a deepened impression of the value and beauty of brevity in proper names. I now write myself plain Frederick Simpkins. From this time forward, let none of my acquaintances address me as Frederick Augustus Smith-Simpkins, on pain of the cut direct.

'PAPA WILL PAY.'

'It is all right; papa will pay.'

Few people have any notion of the misery wrought in many a middle-class family by the conduct of some shopkeepers in the matter of juvenile debtors. A lad, indeed, only needs to have impudence enough and heartlessness enough to obtain any trouble he craves for, so readily is this class of tradesmen to accord credit to the sons of well-to-do parents. We say 'sons' advisedly; for no instance of a young lady bringing trouble into the domestic circle in this way has ever come under our notice. Juvenile debtors of the fair sex may certainly exist, but they are rare; whilst so easy is it for a middle-class boy to get over head and ears into debt, to say nothing of pawning anything in the shape of family valuables he can lay hands on, that we are compelled to believe the habit of obtaining goods on the one hand and of relying on the dictum, 'Papa will pay' on the other, to be sadly common. Here are a few facts.

The youthful A and B, aged respectively eleven and thirteen, took it into their heads one afternoon to quit their homes and put up at a little country inn, some distance off, whither their parents, middle-class London folks, living on between two and three hundred a year, had once taken them to as a holiday treat. Now, the proprietor of this house must have been perfectly well aware that something was wrong. Children are never sent to Inns alone under any circumstances; and people of small means would never dream of putting themselves to the expense of hotel accommodation for the sake of affording two boys a little treat. The duty of the host

and hostess was as plain as day; they should have interrogated the lads, and at once written to their parents. Instead of doing anything of the kind, they gave them supper, a bedroom, and breakfast next day, and would, I daresay, have kept their young customers for weeks. In the meantime, the boys' non-appearance had of course created the gravest alarm; telegrams were sent to all the police stations in London, and all kinds of harm were supposed to have happened to them. With the landlady, it was simply a question of papa will pay. And when the boys were accidentally discovered, of course papa did pay. Ought such a creditor to have received one farthing?

Take the case of C, a promising lad of seventeen, who wished to have a tricycle, a handsome one too. 'It is all right,' smiled the youth, to the too ready shopkeeper; 'papa will pay.' The delightful machine was brought home, where it was supposed to be a loan, or hired upon savings out of weekly pocket-money, and so on. Your juvenile debtor is of course obliged to part company with truth at an early stage of his career. The tricycle is enjoyed till papa is dunned, and the truth comes out. And of course, hard as it is to a man in such circumstances to spare the money, yet, on reiterated promises of better behaviour from the culprit, the debt is paid. Not that the law compels a father to discharge such claims; on this subject it is very explicit: 'Infants, when not living with their parents, may contract to a certain extent, namely, for necessities.' But in this case the 'infant' was living under the paternal roof, so the objects contracted for were certainly not necessities. Take the case of Master D, a lad living in a country town with his father, who contrived to run up bills to the extent of many pounds for nicknacks, luxuries in the way of eating and drinking, fopperies in the shape of haberdashery. These tradespeople were within a few hundred yards of the supposed guarantor. Why did they quietly supply the goods and hold their peace? Just because they knew that papa would pay.

But why, it may be asked, does Paterfamilias act thus weakly towards those who show so little conscience in their dealings with him-self? The reasons are obvious. No right-minded man can support the burden of debt, and the debts incurred by his children are felt to be as much of a disgrace as his own. Nor can he endure the thought that hard-working tradespeople, however unscrupulously they may have supplied the goods, should be wronged. A tricycle can of course be returned, but not an object of a more perishable nature; there is a dead loss to the purveyor. A man, moreover, of susceptible mind does not like to publish to the world that so far the moral training of his son is a failure. He hopes to soften the boy's heart and bring him to a better way of thinking. Again, men do not like to be spoken ill of, as they assuredly would be if, in the first place, they cannot prevent their children from getting goods on credit, and in the second, they shake off all responsibility concerning such wrongdoing.

It seems to us that much as may be said on behalf of the parents, little excuse can be made for the tradesmen. We may bring up our boys

as carefully as we will, yet we can never feel quite sure that some latent germ of evil may not make itself apparent at some time or other. But the shopkeeper knows perfectly well what he is about, the pawnbroker also. Would respectable parents, for instance, if reduced to some unexpected strait, send a child of thirteen to the pawnshop with a family relic in the shape of plate or jewellery? Explicit as is the law, it is not nearly explicit enough on the subject of juvenile debtors. Why should not an order, written and signed by the head of the family, be exacted of a minor when purchasing luxuries, instead of the careless, 'Papa will pay?' Why should not some such precaution be obligatory on the pawnbroker also? Worthy parents cannot help their sons turning out reprobates; more's the pity. The most anxious-minded father in the world cannot have a perpetual eye on the doings of his children. But juvenile debtors would be rarer and many a parent's burden lighter, if a boy belonging to the middle ranks of life could no longer obtain so much as a gooseberry tart on the strength of 'Papa will pay.'

ON THE THRESHOLD.

I.

Rise out, O bells, ring silver-sweet o'er hill and moor
and fell!

In mellow echoes let your chimes their hopeful story
tell.

Ring out, ring out, all jubilation, this joyous glad refrain
'A bright new year, a glad new year hath come to us
again.'

II.

Ah, who can say how much of joy within it there may
be

Stored up for us, who listen now to your sweet melody?
Good-bye, Old Year! Tired, trust you'd, thy tale at
last is told.

O New Year, write thou thine for us in lines of
brightest gold.

III.

The flowers of spring must bloom at last, when gone
the winter's snow;

God grant that after sorrow past, we all some joy may
know.

Though tempest-tossed our barge awhile on life's
rough waves may be,

There comes a day of calm at last, when we the
haven see.

IV.

Then ring, ring on, O pealing bells! there's music in
the sound

Ring on, ring on, and still ring on, and wake the
echoes round,

The while we wish, both for ourselves and all who
hold dear,

That God may gracious be to us in this the bright new
year!

CHRISTMAS FARE

ABOUT the latter end of the old, and the commencement of the new year, Leadenhall Market becomes one of the sights of London, and may perhaps, without exaggeration, be considered one of the wonders of the world. Those desirous of seeing the preparations made to enable the millions of Londoners to feast on goose, turkey, and game-pie, cannot do better than pay a visit to this the most largely patronised of all the markets in the metropolis. They will at least acquire a notion of the number of victims that have been sacrificed that London may dine. This market, originally established for the sale of grain about 1115, after passing through many vicissitudes, became a market for meat and fish, then it was a market for raw hides, afterwards for wool, and is now celebrated for its poultry. A great part of it was rebuilt in 1730; and it was further enlarged and restored in 1811. The corporation is at present engaged in the laudable effort, so far as the limited space will permit, of making this market more worthy of the richest city in the world. They are replacing tumble-down shanties and narrow passages by wide arcades and good shops, so that the Leadenhall Market of the future bids fair to be one of the city's chief ornaments. Unfortunately, the whole of the market does not belong to the corporation. Private enterprise is, however, following their example, though we think it a pity that the alterations were not made under one ownership, unity of design forming the chief beauty of a market.

On entering the market, our attention is immediately attracted by the number of turkeys. The thought crosses our mind that we have strayed into the regions of pantomime, and that the clown has just been performing one of his pantomimic tricks, and transformed the bricks, windows, shops, nay everything, into turkeys. Every available space is literally crammed with them. Rows of turkeys shut out the light from the shops, festoons of them hang round the door-

ways; turkeys hang from the ceilings inside, mountains of them are piled everywhere. The wonder is how, amidst this mass of turkeys, it is possible to find room for the herds of geese and the thousands of head of game, both English and foreign, which are here.

Twenty years ago, our Christmas fare was not so varied as it is at the present day. Thanks to the facilities afforded by railways, fast ocean-going steamers, and the new method of refrigerating, not only the distant countries of Europe contribute of their best for our benefit, but the western hemisphere sends us several species of game; and we may buy prairie-chicken or canvas-back ducks almost as readily as though we were living in the United States.

Turkeys seem to be brought from all parts. A great number come from France, Belgium, and Ireland; most of the English from Norfolk, Suffolk, and Cambridge. The dealers all agree that the Cambridge birds beat all others for fineness and flavour. There are breeders in that county and in Norfolk who have a reputation for the superior quality of their turkeys; they have reduced the art of feeding to a science, and can command a high price for all they send to market. Most of the birds are consigned to wholesale dealers, who dispose of them to the retailer, in London and the suburbs. They are sold by tens, twenties, fifties, and even hundreds, to the poulterers. Each of these has a certain class of customers to provide for, so that what will suit one retailer in appearance, size, and quality, will not do for another. We have been told that one wholesale dealer in the market has been known to sell two thousand turkeys before breakfast!

The male turkey, when alive, does not bear a good character; he is pompous and choleric—a bad husband, and an unnatural father. In short, he deserves nothing better than to be stuffed, roasted, and eaten. It is after death that his good qualities become pre-eminent. Several of the most efficient professors of the culinary art in that country, across the Channel where

alone it has been elevated to an art, varied with each other in giving to the world various recipes for the proper preparation for the table of the largest and most savoury of all domestic fowls; and a few enthusiastic gastronomers have in their delight apotheosised the turkey. There is no doubt that a good turkey of the year, about Christmas-time, stuffed with Périgord truffles, is a dish of which to dream until Christmas comes again. Even to those who do not care to pay as much for the stuffing as for the bird, the turkey, when properly roasted, and brought to table on the largest of dishes, presents a noble appearance. He may be a helpless, headless object, sprawling on his back with his legs in the air; still his breast is inflated in proud defiance, and he is proud and able to contend for the honour of the day with any other biped or quadruped on the table. There is one thing upon which all the authorities seem to agree—never to boil a turkey. Hot or cold, the flavour of a roasted turkey is as superior to the boiled as it is possible to be.

But let us turn from the imperious turkey to the humbler fare the market supplies. In point of number, the geese appear to approach next to the turkey, but do not absorb so much care or attention, as they are thrown down anywhere, and not displayed with the loving care given to the turkeys. They are plentiful enough, in all stages of obesity, white, yellow, and brown samples of greasy fatness. The fact is, the goose is not at his best at this season of the year; he has been plied with foreign-food, and has accumulated an enormous quantity of fat without improving the quality of the flesh. You may have a gosling in June; but Michaelmas is the time when geese are at their best. Later on, the flesh becomes tough and tasteless. A great many geese are sent to market much too old to be eaten; and it is not easy for those who are not experts to tell a young bird from an old one. In answer to our inquiry, we were informed by our friend the salesman—to whom we are indebted for some curious items of information respecting the ways of the profession—that the feet are the best guide. In a young goose, these should be soft and yellow—not red: if they are the last colour, the bird is either old or stale.

Ireland sends a great number of geese to this country in the season, but they are not held in very high estimation by the best class of poulterers. Vast flocks of these birds are brought from Holland and Germany; and there are establishments conducted on a large scale in this country which are devoted to the process of fattening them. Judging by the specimens to be seen around, the purpose is thoroughly fulfilled. Lincolnshire is the county where the rearing and fattening of geese are especially studied; and of all the home-bred specimens sent to market, these are the most highly esteemed. Sussex has of late become rather famous for its geese, but few of these find their way to London, good markets being found at Brighton, Hastings, and other towns on the coast.

Game is here also in astonishing numbers. Pheasants in heaps, as though shot down by cartloads, are lying in all directions, before being

sorted according to size, age, and condition. Hares and rabbits in such numbers, that surely the farmers will have no cause for some time to grumble at the superabundance of ground-game. These are sent up old and young, one with another, in huge square hampers, and are diligently sorted, as the pick of the consignments fetch a higher price. The best are bought by the poulterers who have shops in those neighbourhoods where price is not so much an object as superior quality.

As we have said, the most distant countries of Europe contribute some of their choicest kinds of game to this wonderful market. Russia, for instance, occasionally sends us numbers of woodcocks and pheasants, as well as several kinds of wild-fowl. From Hungary we have some magnificent hares, which fetch a high price, and are held in great estimation; and sometimes a wild boar, which does not appear to be so well appreciated. From Norway and Sweden we get large consignments of ptarmigan, which, in their snow-white winter plumage, make a pretty show, in contrast with the quantities of blackcock and capercaillie, the largest and fiercest of all game-birds, and for which our markets are almost entirely dependent on these countries for a supply. When the weather is cold, wild-fowl in abundance and of excellent quality are furnished by Holland. As if all this were not enough, the New World sends us sides of prairie-fed beef—which many people are now learning to appreciate—a few wild turkeys, and various species of grouse in large quantities. The most plentiful of these is the pinnated grouse, or prairie-hen, which is excellent eating; and we have also seen the pheasant-tailed grouse, or cock of the plains, a very large bird; but as it feeds chiefly on wormwood, its flesh has a pungent flavour which is not agreeable to every one. There is also the capercaillie, which seems to be identical with the Norway species, though some declare that it has a finer flavour. The ruffed grouse—so called from the ruff of black feathers on each side of the neck—is also excellent eating, and comes both from Canada and the United States. But the greatest delicacy of all, and the one held in the highest esteem by all gastronomers, is the canvas-back duck, which is peculiar to the United States. It is a sea-duck, and frequents the bays and estuaries on the east coast, particularly Chesapeake Bay, where it arrives after the breeding season in the far north in prodigious numbers. It is somewhat like the common pochard, which is a regular winter visitor to this country from the extreme north; and numbers are sold in the London markets. The canvas-back and the pochard both have red eyes, which at once distinguishes them from most other species. The peculiarity and excellence of flavour of the canvas-back, which has a suspicion of celery about it, is attributed to its food, and doubtless because of this flavour it is said to feed on wild celery. The fact is, the shoals of the bays these ducks frequent are covered with vallisneria, a well-known water-weed; for thus it dives, tearing it up by the roots, upon which part alone it feeds.

It may not be out of place here to mention, though it is not in connection with this particular market, that for the last year or two,

perfectly fresh, good, and wholesome salmon have been sent in refrigerators from America at this season of the year. As this is a close-time in all our lakes and rivers, it is certainly a novelty to be able to buy salmon at about one shilling the pound. Those accustomed to Scotch and Severn salmon will, however, miss the delicious flavour for which these are so celebrated, in this foreign substitute.

There are, of course, many other things in the market which we have not noticed in this short account of Christmas fare, such as ordinary fowls, ducks, sucking-pigs, venison, and many more. We have attempted only to call attention to the most noticeable. We have been unable to procure any reliable figures to show the vast number of turkeys, geese, and heads of various kinds of game that pass through Leadenhall Market at this season. But after all, figures never convey so much to the mind as the actual objects themselves. Let those, therefore, who feel an interest and a desire to know more on the subject, pay a visit to the market, and see for themselves what it takes to feed London with poultry alone at this season.

AT TREVENNA COTTAGE.

A STORY IN EIGHT CHAPTERS.—CONCLUSION.

As previously stated, when Captain Ivory and Bosy Groote took their midnight drive from Trevenna Cottage to Hoogies, they neither met nor overtook any one by the way; as a consequence of which, they flattered themselves that a knowledge of their nocturnal expedition was confined to themselves and Mrs Ivory alone. But in this they were mistaken. On the night in question, a certain pensioner, Joel Clitheroe, who had been a sergeant in the army, was on his way home from Boscombe to Cawdray, the little hamlet situated a mile or more beyond Hoogies. Joel had made one at a birthday party at Boscombe, which had not broken up till a little before midnight. At that hour the only way for him to reach home was to walk the distance; but of that he thought little, being hale and hearty for his years; besides which, the exercise and the cool night-air would tend to clear his brain in some measure and mitigate the effects of his too frequent potations. Joel had reached that part of the road where it dips towards the shore and is overshadowed by the plantation on each side of it, when he heard the sound of approaching wheels. The road at this part is not only in deep shadow, but it is narrow and tortuous as well, and devoid of any sidewalk for pedestrians. Hearing the vehicle drawing rapidly nearer, and having no fancy for being run over in the dark, the old soldier contrived to scramble up the bank on one side of the road and there support himself by passing his arm round the trunk of a tree. The night was so dark, and he was so entirely in the shade of the brushwood, that it was impossible for any one to see him from the road.

Captain Ivory, driving the wagonette slowly and carefully, had only passed Joel some half-dozen yards when he came to a halt. Then it was that Bosy got down, put on the drag, and

began to lead the horse downhill. A few words, and those in an under-tone, passed between the captain and Bosy, but they were sufficient to enable Joel Clitheroe to recognise the voice of the latter. He had known Bosy ever since his return to Hoogies, five years before; he had, in fact, known him thirty years before, when Bosy was a boy; and he felt convinced that he was not mistaken in the voice.

'What's in the wind now?' he said as he scrambled down and resumed his journey. 'What's Bosy Groote doing in a trap at this time o' night, and who's the man that's with him? Maybe, they are after a bit of quiet smuggling. If so, it ought to come natural to Bosy, if one-half that's told about the old house is true.'

He went on his way, keeping in the rear of the wagonette, although he could only judge his own position by hearing and not by sight. In a little while he came near to the point where the plantations ended and the road reached the level of the shore. Then all at once the sound of wheels in front of him ceased. He halted and listened, but nothing could be heard. Had the wagonette come to a stand in the middle of the road? If not, what had become of it? Suddenly he gave his leg a slap, as he had a trick of doing when a fresh thought struck him. 'Why, of course, that's it!' he said. 'They have turned off on to the sands by the end of the plantation, and that's why I can no longer hear the wheels. They are taking the turn round to Hoogies. A bit o' smuggling, without a doubt. I thought it was about put a stop to in these days. Well, well, it's no business of mine, though a pound or two of tobacco or a keg of cognac wouldn't come amiss to a poor man—but who was the fellow that was with Bosy, I wonder?' Joel Clitheroe now quickened his pace, and reached home about half an hour later, without having seen or heard anything more of the wagonette or its occupants.

He was later than usual in rising next morning, his over-night potations having had the effect of making him sleep heavily. He was a little cross and out of sorts, as men are apt to be who have overstepped the line they usually draw for themselves, and for the time being he forgot all about his adventure. Soon after his mid-day meal was over, a neighbour, another pensioner, who had nothing to do, came in, and the two sat for an hour or two, smoking, drinking thin ale, and gossiping of bygone days. A casual mention of Hoogies by his friend brought back to the old soldier's mind what he had seen and heard last night in connection with Bosy Groote. It would be something fresh to talk about, so he proceeded to relate all there was to tell.

'What say you, Martin?' he remarked, when he had brought his narrative to an end. 'Shall we walk as far as the old house, and see if we can find any traces of last night's work? A bottle or two of brandy, or a few cakes of tobacco, now—eh, Martin?'

Martin was nothing loth. Life at Cawdray was certainly very stagnant, and anything that promised a little variety was welcome. So the two set out together. Evening was creeping on,

and in less than an hour it would be dark. They took the road along the shore in the direction of Hoogies, smoking and talking as they went. When they reached the point where the end of the plantation comes down close to the shore, Joel said to his companion: 'This is the spot where the trap turned off the hard road on to the soft sand. There ought to be some wheel-marks hereabouts. The tide hardly ever reaches as high as this.'

A minute's search enabled them to find not merely the marks of wheels, but those made by the hoofs of a horse as well.

'And here's the track made by 'em when they came back,' said Martin, who was a quick-sighted old fellow.

The two men pressed on more eagerly; the adventure began to look promising. The wheel-tracks led them direct to the fire-blackened ruins of the house. When a few yards from it, they halted to reconnoitre. No faintest curl of smoke was issuing from the chimney; there was no sound or sign of life anywhere. Still, that was no proof that Bosy Groote was not at home; but might there not be some one with him—some one who might resent the intrusion of strangers? It was just as well, Joel thought, that he had not ventured here alone. But he was an old campaigner, not easily daunted, and the vision of that keg of cognac floated pleasantly before his mind's eye. 'There can be no harm in taking a peep, eh, mate?' he said to Martin in an under-tone.

'They can't bite our heads off, any way,' growled the latter as he turned over the quid in his cheek.

They drew nearer the house, their foot-steps making no noise in the yielding sand. When they reached the rude door which opened into the kitchen, they paused again, to listen; but all was as silent as a dwelling of the dead. Then Joel lifted the latch gently, and pushing open the door a little way, he craned forward his long neck and peered round the desolate room. 'We needn't have bothered ourselves,' he said with a grunt of disappointment. 'There ain't a soul here.'

'Still, they must ha' been here last night, else why the wheel-tracks?' returned the other. 'Perhaps, though, it was only to stow something away. There's said to be many a queer hiding-place about these old walls.'

They had entered the kitchen by this time and were peering eagerly around; but the place was even more empty and dismantled than usual.

'There's the remains of a fire on the hearth, and that's all,' grumbled the ex-sergeant.

'It's a funny caper, say what you will,' answered Martin. 'Two men and a trap at this blessed run at one o'clock in the morning! They must have had business here, or they wouldn't ha' come. Very well, then, the question is, what was that business?'

Before Joel could frame any reply to this perplexing problem, there came a sudden cry. 'Help! help!' called a voice, that sounded strangely near and yet far away; but whence it proceeded, the two startled men could not even guess. The eyes of one went up to the roof, while those of the other went down to the floor;

then they reversed their gaze, and then they stared at each other blankly.

'Here's a start!' said Martin in a whisper. 'Where did it come from, mate?'

'Blessed if I know. Down the chimney, it seemed to me.'

'They do say as how there was a murder done here years ago. Maybe it's the'—

'Help! help!' cried the voice again.

'That's no ghost's voice; it's real flesh-and-blood,' exclaimed Joel sturdily. 'There's some poor soul hereabouts as needs a helping hand. What say you, Mart?'

'Right you are. I'll stand by you through thick and thin.'

'Then I'll give him a haul,' said Joel, who had lived so long among fisher folk that he spoke like one to the manner born. 'Hillo, mate,' he called out, 'where be you?'

'Here, here,' responded the mysterious voice.

'Where be here?'

'I'm shut up in a dungeon under your feet—just below where you are standing.'

The two men gave a leap. 'Under our feet!' Then it did not come down the chimney, after all, said the ex-sergeant.

'Who brought you here?' he asked, going down a little stiffly on one knee, in order that his questions might be more distinctly heard.

'That is more than I know; I was insensible at the time.'

'Bless us and save us! I shouldn't wonder if he was hid away at the bottom of the trap that passed me on the road last night,' said Joel. Then he called again. 'How long have you been here?'

'About a day and a night, as nearly as I can judge,' came the answer; and indeed to poor Mr Saverne the dreary hours had seemed twice as long as that.

'Make your mind easy, sir. You are among friends, who will help you, never fear.' The instinct of the old soldier had told him that he was talking with a gentleman.

The two men consulted together. What was to be done? The kitchen was in almost complete darkness by this time, and they had no means of obtaining a light. They were at a loss to know in what way they could most readily effect the release of the imprisoned man. Their belief was that, like themselves, he was in the dark, only the darkness down there must be far more intense than it was above ground. They groped about on the floor for some traces of a trap-door, but could find none. At length it was decided that Martin should go back to the village for lights and assistance, leaving Joel meanwhile to keep watch and ward till his return.

This determination was communicated to Mr Saverne, who did not fail to express his thanks; and then Martin set out at a quick pace for the village. Joel, having lighted his pipe, began to pace slowly to and fro outside the door. It reminded him of the time when he had 'gone sentry-duty' twenty years before.

Martin was back in less than an hour, bringing with him half-a-dozen volunteers, among whom was the village carpenter with a bag of tools. There, too, by a fortunate chance, was Dr Mayfield in his gig. The doctor had

been returning from visiting a patient, when he had overtaken the little crowd on their way to Hoogies; and on hearing that their errand was the rescue of a gentleman who was said to have been shut up in a dungeon of the old house for four-and-twenty hours, he had determined to accompany them. It might be that in such a case his services would have to be brought into requisition, besides which, his curiosity was aroused.

Half-a-dozen candles were quickly lighted, and then the carpenter set to work. A brief examination of the floor sufficed to convince him of the existence of a trap-door; but he utterly failed to discover the means by which it worked. There was, however, no time to waste in experiments while the prisoner below was waiting to be released; so he rolled up his shirt-sleeves, marked a square with chalk on the floor, and opened his tool-basket. In less than half an hour he had cut an opening in the thick planking large enough for a good-sized man to squeeze himself through. A dozen necks were eagerly craned forward as the last piece of planking was torn away, and, to the surprise of every one, a faint gleam of light was seen to irradiate the darkness below.

‘Hurrah!’ shouted the little crowd heartily. No doubt, there would be unlimited beer and tobacco at the end of such an adventure as this.

‘Here you are, sir, all alive O!’ cried the ex-sergeant in his cheery tones.

By this time the dark figure of a man could be discerned, dimly outlined by the faint glimmer in the dungeon.

‘Thank you, my friends—thank you, every one,’ responded this figure. ‘But will you please tell me how I’m to get out?’ I see no stairs, no!’

‘Here be a ladder,’ called out a voice. Every one turned, and two ladders were knocked off, as one end of Bosy’s ladder was pushed unceremoniously through the crowd.

Two minutes later, Mr Saverne was standing among his new-found friends, shaking hands with each of them in turn. Joel and Martin were the first for whom he asked, and then the sturdy carpenter came in next for his thanks. But not to cold thanks alone, which fill no man’s stomach, was their reward to be limited, as he at once led them to understand.

Then Dr Mayfield introduced himself. ‘I thought it not unlikely, from what our good friends here told me, that my services might be required. Although it is scarcely professional of me to say so, I am heartily glad to find that they are not. But my gig is outside, and if I can give you a lift anywhere, I shall be happy to do so. For the present, I will refrain from inquiring how it happens that I find you in so strange a predicament.’

‘I am really much obliged to you, doctor,’ answered Mr Saverne gratefully; ‘but, first of all, can you tell me how far I am from Boscombe Regis?’

‘A good three miles.’ Is that the place you want to go to?’

‘It is, and as quickly as possible.’

‘Then I’m your man. Boscombe Regis is where I live.’

‘Then perhaps you are acquainted with a certain Captain Avory?’

‘I certainly have that pleasure,’ answered the doctor drily. ‘Is Trevenna Cottage your present destination, may I ask?’

Edward Saverne hesitated for a moment, then he said: ‘It is.’

What other answer, he asked himself, was it possible for him to give? Before he could decide upon anything, he must see his cousin and demand certain explanations from him, which explanations would have to be very complete and satisfactory indeed. Yes, whatever his after-course might be, he must certainly go first of all to Trevenna Cottage. Meanwhile, not even to this worthy doctor, who seemed to take such an interest in him, would he say a word that would seem in any way to inculpate Lucius.

‘When you are ready, I am at your service,’ said the doctor.

But Mr Saverne would not leave till he had divided the contents of his purse among those who had done him such good service. He took down in his pocket-book the addresses of Joel and Martin, and promised to visit them at Cowdray in the course of a few days. After this, the doctor and he mounted the gig, and set off amid the plaudits of the little crowd. By this time it was quite dark, but the evening was clear and starlit, and the doctor had driven over the road for years. They had halted for a little while to breathe the mare on the brow of the hill, when Mr Saverne said, after rather a long silence: ‘I must apologise for not introducing myself earlier to you. My name is Edward Saverne. I am a cousin of Captain Avory, and I have but lately returned from Australia.’

If his companion had announced himself as being a veritable ghost, Dr Mayfield could scarcely have been more stultified than he was for a moment or two. He drew away from him as far as the limits of the gig would allow, and stared at him in wide-eyed astonishment—a look which the other could feel rather than see. Then he said to himself: ‘Pooh! the fellow’s an impostor.’

‘What you tell me, sir, is simply impossible,’ he remarked aloud. ‘Mr Edward Saverne, the cousin of Captain Avory of Trevenna Cottage, and late of Australia, died and was buried at Boscombe Regis close on a month ago from the present time. I, sir—Julius Mayfield, at your service—attended Mr Saverne professionally during his last illness, saw him within six hours of his death, signed the certificate of his burial; and, if you choose, sir, to accompany me to-morrow morning, I shall have much pleasure in—Ahem!’ I mean that if it will be any satisfaction to you, I can point out to you his grave.’

It was now the other one’s turn to stare. A brief silence ensued. Then Mr Saverne said, in that slow, dogged way which was habitual with him in certain moods: ‘Well, doctor, I don’t know what the fellow you buried called himself, but I do know this—that the man beside you is the real Simon Pure. If that’s not so, why did my cousin Lucius meet me at Mampton station last night, and drive me to Trevenna Cottage? Why did his wife welcome

me as her kinsman from Australia, and provide a nice little supper for me? Why—— But I need not pursue the subject further. If it's not out of your way, doctor, perhaps you won't mind setting me down at Trevenna Cottage, and then? He paused. And then, what? he asked himself. Was he in a land of witchcraft, or where was he? If he had been puzzled and mystified before, he was a hundredfold more puzzled and mystified now.

'I will gladly set you down at Trevenna Cottage,' answered the doctor as he whipped up the mare. A horrible misgiving was beginning to take possession of him. He had not forgotten the hints and suggestions of foul-play thrown out by Mr Muncester. Other little things he had not forgotten which he had noted in his memory at different times. What if there should be some foundation of truth behind all these ugly surmises! The thought turned him sick.

Turning to his companion a little abruptly, he said: 'Pardon me, sir; but if you are the person you represent yourself as being, you can hardly fail to remember the contents of the will you made previously to leaving England. Would you mind enlightening me as to the nature of one or two of its clauses?'

'Not at all, since we seem to be altogether at cross-purposes. My will contained but one clause. By it I bequeathed to my cousin, Lucius Avory, as my nearest living relative, the proceeds of a policy of insurance on my life for five thousand pounds. Nothing could be more simple.'

It was some moments before the doctor could find his voice, and when he did, it trembled with an emotion he could not control. 'If what you say be true, sir—and I dare not doubt that it is—then it becomes my duty to inform you that you have been made the victim of one of the vilest frauds it ever entered the heart of a wicked man to conceive and carry out. To-morrow—Wednesday—at noon, Captain Avory is due at the Stork Insurance Company's office in London, there to be paid a cheque for five thousand pounds, the same being the amount due on a policy of insurance bequeathed him by his cousin, the late Edward Saverne, who died on the 12th of last month, and was buried at Boscombe Regis.'

When the two men reached Trevenna Cottage, they alighted. As they walked up the garden pathway, they noticed that there was not a light to be seen anywhere. Nevertheless, Mr Saverne knocked loudly and tugged vigorously at the bell. But there came no response, as, indeed, somehow, he hardly expected there would. Again and again the summons was repeated, but with no better effect. The darkness and silence remained unbroken. At length the two men turned away without a word, weary and sad at heart.

Wednesday was here, and the City clocks, with more or less of unanimity, had just proclaimed the hour of noon, when Captain Avory, immaculate in French gray gloves and snowy gaiters, and with a flower in his button-hole, jauntily ascended the steps of the Stork Insurance office, and requested the liveried janitor who

opened the swing-doors for him to direct him to Mr Muncester's room. Whatever inward misgivings may have possessed him, they betrayed nothing of themselves on the surface. If his eyes were not smiling, his lips certainly were, and his sharp white teeth gleamed through the rift in his moustache. He was carelessly humming a little air under his breath as the first janitor passed him on to the second, who finally ushered him into Mr Muncester's room.

Mr Muncester looked up, nodded, and smiled as his visitor entered. 'Good-morning, Captain Avory—glad to see you,' he said. 'There's nothing like punctuality in these matters. We are quite ready for you, I am happy to say. Pray, take a chair for one moment.' Then he resumed his writing.

Captain Avory sat down as requested; but somehow the smile died away on his lips, and he ceased to warble under his breath. Mr Muncester's greeting might be a pleasant one, but there was a cold, green glitter in his eyes which made the captain shiver, and seemed to bode but little good.

But not much time was allowed him for thought of any kind. Mr Muncester's letter was quickly finished and handed to the messenger who answered his summons. As soon as the man was gone, he took up a tube, one of several which hung close to his chair, and after blowing through it, he put the mouthpiece to his ear. 'Yes, sir,' came the answer in tones hollow enough to have done credit to a transatlantic ghost. Placing the mouthpiece to his lips this time, Mr Muncester said: 'Tell Davies that Captain Avory is here, and let me know at once whether everything is in readiness.' Only a few seconds had he to wait for the response. 'Everything is in readiness, sir,' Mr Muncester nodded and smiled to himself.

Meanwhile, Captain Avory, whose hands were perspiring most unpleasantly for so cool a morning, had slowly pulled out his French gray gloves. No doubt his signature would be required presently to some document or other, and it was just as well to be in readiness.

'And now, captain, I am at your service,' said Mr Muncester pleasantly. 'Will you kindly step this way?'

For a moment he hesitated and glanced around. 'Everything is in readiness for what?' whom? he asked himself. 'Why, to pay me over the cheque for five thousand, of course,' was his own answer to his own question. And yet, strange to say, he felt very much like a fly which was deliberately walking into a spider's web, half suspecting the while the doom that lay in wait for it.

Mr Muncester, holding open an inner door, was looking at him with a peculiar smile. He hesitated no longer, but passed through the door, which closed at once behind him. Together the two men traversed the corridor beyond, at the end of which were two more silent swing-doors, where stood two men, one in liveries and the other in plain clothes; and so they passed forward into another large empty room.

'Just a single moment,' said Mr Muncester with uplifted finger, and with that, he strode forward, and opening the door of a further room, peeped in.

Captain Avory, holding his hat in his hand, came to a halt with military precision in the middle of the floor. His heart was thumping like a steam-hammer, and his lips were strangely parched and feverish. He moistened them with his tongue, then he snuffed at the flower in his button-hole, and then he threw up his head with an air of defiance.

Mr Muncester beckoned to him with an ominous finger. 'If you please, my dear sir—if you please,' he said in his most dulcet tones.

Captain Avory squared his shoulders, gave a loud 'Heu!' and marched forward as stiffly as if he were going on parade. He heard the door close behind him, and was somehow dimly conscious that another man, in addition to Mr Muncester, had followed him into the room. And then he looked round. He had no need to take a second look; he saw it all at a glance. He was trapped—brought to bay by three men! Fronting him sat three people, two of whom, sitting in that place and on that occasion, would have been to him as an infallible symbol of doom. First of all, there was good, simple-hearted Dr Mayfield, the man whom he had hoodwinked and bamboozled as easily as he might have done a child, who was now gazing at him through his gold-rimmed spectacles more in sorrow than in anger, and with a tear lurking somewhere in the corner of his eye. Next to him, all in black, sat Mrs Freedy, as grim, rigid, and angular as a monumental effigy; in her eyes shone no moisture of pity, but rather a cold stony glare, pierced through by one venomous spark of hatred. Lastly, came a face far more terrible to him than the others—that of his much-wronged cousin. By what strange miracle was he here? He was looking straight at him, with eyes that were stern indeed, but which yet had a sort of sad surprised questioning look in them, as though they were asking 'Can this be the man whom I trusted and treated as a brother?'

He could bear no more. He gave a great gasp, made a clutch at his heart, and staggered back like a drunken man towards the door, those three accusing faces still following him with their eyes. Suddenly, a strong hand, which seemed at once to support and to hold him, was thrust under his arm, and a voice said in his ear 'Captain Avory, you must consider yourself my prisoner. I hold a warrant for your arrest on a charge of—'

But Captain Avory heard no more; for the only time in his life, he had fainted. At this point he may well pass from our sight for ever.

Mr Saverne could not be persuaded to take any legal proceedings against his cousin. 'I cannot forget that Lucius and I were like brothers together when we were boys,' he said; 'and whatever may have been his errors and misfortunes since that time, he is still my nearest living relative. He will be sufficiently punished without my adding to the burden he will have to bear.'

But the Stork Insurance Company took no such merciful view of Captain Avory's misdeed. They had a duty to perform to themselves and the public, and they performed it. On this point it is unnecessary to say more.

Mrs Avory disappeared as completely as though no such person had ever been in existence. She could scarcely fail to read in the newspapers the account of her husband's arrest and examination; and not knowing how far the law might choose to take cognisance of her share in the matter, she probably decided that the wisest thing she could do would be to drop out of sight as quietly and unobtrusively as possible.

Boz's Groote was another individual who was seen no more in those parts which had known him best; while Noggies, it is pleasant to relate, has long ago been levelled to the ground.

Mr Saverne was a man who occasionally did things which other people would rarely think of doing. He sought out little Florrie Sadgrove, and finding her to be a clever and interesting child, he caused her to be educated at his expense, and later on, he set her fairly on her way in life. It is a good thing to know that she has not failed to do credit to his generosity.

ELVES, PIXIES, AND WITCHES.

THERE is a small blue lake at the foot of some of the Welsh mountains which the ancient inhabitants, descended from the old Druidical school, suppose to be the abode of the fairies. These old Britons, driven out from their English homes by the invading Romans, and seeking shelter and safety among the Welsh and Cornish fastnesses, held many superstitious fancies. They saw tokens and charms in all nature, and believed as truly in good and bad spirits, in mischievous sprites and pixies, in witches and wizards, and the machinations of the Evil One, as they did in their law-giving Druids, their vates, and their legend-singing bards. Nature was their book of the unknown, behind whose untorn pages lurked things beyond their simple comprehension. A brave and fearless nation to foes that they could face openly, yet were they the veriest cowards before the slightest and most harmless thing in nature that they, in their ignorance, failed to account for. Thus, their pixies and their sprites visited many houses; and in nearly every lane and hedgerow had their haunts, and under many of the wide-spreading trees did they dance their midnight dance and hold their fairy revels. They visited the milk-pails and upset their contents, and they turned the cream, and prevented its churning into butter. They rode the horses left in the fields at night until they half killed them, and they used for these mad rides the hairs pulled from the unfortunate animals' necks or tails, twisted into stirrups to rest their tiny feet in. They led astray those people whom they found abroad after nightfall; and the only remedy to secure safety from their pranks was to turn some article of clothing upon the body. They stole or changed children who had been left in their cradles, and they invariably appeared dressed in rags.

But these were pixies of the mischievous order; there were others—the good and industrious—who worked at the looms all night and did

the washing for any family which they happened to take a fancy to, or they busied themselves by thrashing the corn in the barns; but one and all of this hard-working sort were ragged and dirty; and the mortals to whom they rendered such valuable assistance, upon finding out to whom they were indebted, in gratitude supplied them with gay new clothes; and the pixies in seeming delight donned these garments, and departed, singing as they went—

Now the pixies' work is done,
We take our clothes and off we run.

And off they did run indeed, for their kind offices for ever afterwards ceased.

So much for the pranks of the pixies. The witches were quite another kind of thing; and if offended, would cast an 'evil eye' upon the cattle or the family of the offending one! In that case the cattle died, and the family became sick, and sometimes died also. Thus, to guard against the evil that one witch worked, another was propitiated, and gave a counter-charm, that alleviated, or entirely removed the ills worked by her sister-witch. Some witches assumed the forms of dogs, hares, and cats, as in the well-known legend of Pendle Forest, in consequence of which tale as told by the Robinsons, eighteen persons were tried at Lancaster, and seventeen of these unfortunate creatures were found guilty of witchcraft, and six out of that number forfeited their lives upon the scaffold.

'The Lancashire Witches,' still a standing toast of the county, given with brimming glasses, leads some of us to forget for a time the bonnie girls to whom the term applies in these our days, and to allow our thoughts to wander far back into the past, when, in place of the mills and factories, the land was covered with giant trees, gorse, and bracken, and the deer and other wild animals roved at will in their picturesquely beautiful domain, wherein the foot of man seldom trod. And musing of those bygone days when Pendle was one of the largest forests of our isle, we forget the handsome lasses of the county, and muse on the legend of the forest wherein the Irwell first finds its source.

Do you, my readers, know how the tales of the wood-cutters were credited by a superstitious nation?—how, in a violent storm in Pendle Forest, Robinson said that he saw by the flashing of the lightning the terrible witch of the forest perched upon a high crag, and that he felt her cat rubbing itself against his legs, and that the cat expressed itself in good English, and informed him that the witch would meet him at Malkin Tower? Then the legend proceeds to tell that young Robinson went into the forest the night before his father's journey, and that he saw two beautiful greyhounds, with collars of gold about their necks; and while he admired the dogs, a hare came upon the scene, and he, seeing so good an opportunity for a hunt, tried to urge on the dogs, and even struck them to compel them to do his bidding; but in spite of all his endeavours, the dogs remained passive; and while he looked in wonder at them, one was suddenly transformed into the witch of the forest, and the

other into a little boy. Young Robinson went on to state that the witch forced him to remain where he was, and even offered him money to keep silence; but her money he refused; and then immediately the little boy was transformed into a white horse, and young Robinson was placed in front of the witch upon its back, and it galloped off to a place in the forest known as the spot where 'the witches' Sabbath' was celebrated. At this place, about fifty witches were assembled; and a young woman presented Robinson with a steak set upon a golden dish; but he was unable to eat it on account of the taste, which was quite disgusting. Subsequently he found himself in a barn, where there were six witches, who were engaged pulling ropes suspended from the ceiling, by which the choicest and richest articles of food descended. Then a great cauldron was procured, and the witches performed and used various incantations around it; during which ceremony Robinson managed to escape, and was pursued by the whole troop of witches.

The tale runs, that after his adventure, young Robinson became ill, and raved for a whole week about witches; whereupon, the tale of his adventures getting wind, eighteen poor women were tried for the offence of witchcraft. One of the unfortunate creatures was so much frightened, that she imagined she was actually a witch, and is said to have made certain confessions before her death relative to her dealings with the Evil One.

Still, though all our island teemed with the tales of the supernatural, the most credited and renowned tales of elves, pixies, sprites, witches, and the like appear to have had their origin along the western parts of our island, and more particularly in Wales. Some historians, however, ascribe our great poet Shakespeare's ideas concerning fairy elves to have originated in the Isle of Wight, where many tales of these little creatures' domes were current at the time of his supposed visit to that garden of England. But it is not to be wondered at that the Welsh should hold many superstitious fancies. Ancient Britons as they were, they believed implicitly in the Druidical egg inclosed in gold bars about the necks of their priests. Pliny tells us that this egg was the emblem of the Druids, and that its shell was cartilaginous and full of little cavities like those upon the arms of the polypus. The origin is said to have been derived from serpents, a number of whom entwined themselves together, and whose hissing sent up the egg into the air, where it was caught ere falling to the ground. The person who caught the substance used a clean white linen cloth for the purpose, and was mounted upon a very fleet horse; and having secured his prize, he galloped off at headlong speed, pursued by the angry serpents, which stayed not their chase until they reached running water. If the egg was genuine, it was incased in gold, and would then swim against the stream. The power of the egg was considered miraculous, and those who wore it were insured against almost every known evil. The belief in it was certainly sincere, for the great Druidical temples of Avebury, Stonehenge, and of Carnac in Brittany, together with many others, were dedicated to the worship of the sun and the serpent.

But the tales that were the most pleasant were those concerning the pranks or kindly actions of the little people, and it is to these that the following legend relates. The tale that we now have to do with is, of course, only a fairy tale relating to a family of good pixies who dwelt beyond a Welsh lake under the shadow of lofty hills—Avernus, as the Mabingog, or fables of the Welsh, call these little sprites. Well! On the first day of May, many, many years ago, after the poor Britons had been compelled to give up the hills and valleys, the woodlands and meadow-land, the rivers and streams, of dear old England, and hurry for shelter to the more secure fastnesses of Wales, away from their Roman invaders, there was a door in the rocks that opened close down to the water. This door gave access to the fairy domain; and if any curious mortal wished to penetrate the secrets of this abode of the little folk, he must cross the water on this first day of May, and enter the door, where he would find a fairy page in attendance, who evinced his readiness to conduct the visitor to the favourite haunt of the fairy queen and her court. Following the page, the visitor observed winding passages spread out in every direction from a common centre. These were carpeted with the softest mosses, some of a bright emerald green colour, others of a rich brown and yellowish tint. The feet of the visitor sank with noiseless tread upon this velvet-like carpet, which was softer and thicker than the richest velvet-pile of our day. Traversing one of those passages, the fairy page paused, and tapped with a small wand upon what looked to the visitor to be a massive wall of flinty rock. Once he tapped, and paused to listen; then again he gave his summons, and waited for the same length of time; then again he repeated his knocking. At this, his third summons, the rock opened in the shape of a door, which swung open upon invisible hinges; and the page immediately stepped forward into the enchanted precincts, and beckoned to his guest to follow him, when the door was closed behind him. Thus they found themselves in a beautiful passage or corridor, the roof of which was covered with magnificent stalactites of all shapes and sizes, that glittered and sparkled with all the hues of a rainbow, and seemed to emit sparks and flashes of light as they were passed. As the visitor followed his guide through this winding passage, he caught glimpses of numberless other passages diverging from it. Each and all were decorated with flashing stalactites of quaint and artistic forms. The floors of some were strewn with fine sparkling sand; while others were paved with polished black, white, or speckled marbles, or shining spar. Diverging at length into one of these, the visitor stood in awestruck admiration at the wonders displayed before him; for there, in wild profuse confusion, lay bright violet anemones scattered promiscuously over beds of emeralds, looking like enormous violets blossoming amongst a wealth of bright green leaves. Farther on were sapphires, again amongst masses of emeralds, their pale-blue colour representing the pretty modest little pumpkin.

Turning to the other side, the visitor beheld corresponding beds of gems, with masses of

emeralds for the foundation; but with flowers represented by the ruby and garnet, in place of geranium and other stars of earth of a scarlet or pinkish hue. Still further on the diamond flashed out its light like so many glow-worms half-hidden amongst the grass and leaves; while further still, the yellowish tints of the amber clearly showed itself like vast beds of marigolds, or the yellow cup-flowers that children call orange and lemon. Then the fairy flower-garden ended, and the sea-garden commenced; bright-red, yellow, brown, or green seaweeds making themselves conspicuous, studded with sprays of red, pink, and white coral. Then further on pearls of all sizes, sorts, and shapes hung in bushes and sea-trees, looking like the snowball bushes of our gardens. Amongst all this fairy scene rose trickling, sparkling fountains; and behind the boughs of the sea-plants peeped grottoes and caves formed of pearl and bright-coloured shells.

At length a rippling lake appeared in view, with a fairy skiff moored thereon, in waiting for the visitor. Entering this frail little craft, it was pushed out from shore into the dancing waves of the lake, over which it skimmed lightly, until its keel grated upon the shining sands of an island. On this island was the home and castle of the Tylwyth Teg or Fair Family; and on the shore, for the purpose of welcoming a mortal visitor, stood the fairy queen with all the members of her court. The beautiful little lady with all her train advanced to welcome the stranger, who was struck with such marvellous beauty, which was so far beyond mortal conception. The visitor in amazement landed, and the queen with all her courteous subjects commenced to show him all the beauties of their fairy domain. They first led him through wonderful gardens, where grew the finest and rarest of flowers, some of which they plucked and presented to him. The wonderful perfume of some of these odorous flowers almost intoxicated the visitor; observing which, the fairy company hastened to lead him away from their flower to their fruit gardens, where he regaled himself with the sweetest and most luscious fruits imaginable. Subsequent to this the little people entertained him with exquisite music and foretold things that would happen in the future.

This mortal was allowed to help himself to anything he saw, but was warned that evil would befall him if he ventured to carry any of the enchanted things away. And thus it once happened that one of the visitors of the Tylwyth Teg secreted one of the fairy flowers to carry away with him. The fairies, who knew all about it, let him depart, showing him every courtesy until they closed their doors after him. When he reached mortal ground the flower had disappeared, and he had lost his senses. Never after this disobedience to their commands did the Fair Family open their grounds to mortals. Soft sweet music is occasionally heard proceeding from the enchanted spot in sweet summer mornings, when the birds are twittering and calling to each other to awake; or on some dewy night when the stars are brightly twinkling in the sky, waiting to welcome their queen—the Silver Moon—but the Fair Family themselves never appear.

It is said that the inhabitants of that part of the country tried to do away with the fairies and their enchanted home, thinking no good came of

harbouring such uncanny folk. But of the truth of this I cannot say, and let us indulge in the romantic hope that the little people are still enjoying their lives among their fruit and flower and gem gardens.

CURIOUS MARRIAGES.

ACCORDING to some of the novels of the present day, it is only the lovely nymphs of seventeen or eighteen, and the fascinating swains of three or four and twenty, who have any business to think of matrimony. The poor plain ones, or those who have passed the meridian of life, are looked upon as completely shelved; the hymeneal torch is not to be lit for them, and the little god of Love passes them over with contempt. But is this really the fact?

On the contrary, there were never more extraordinary contradiotions than we find in the history of marriages; we see women marrying men young enough to be their grandsons, crabbed Age and Youth often live together in perfect harmony; and May and December are constantly united with the happiest results. Almost every marriage is a nine-days' wonder, and creates much astonishment, speculation, and lifting up of hands. Quite recently, a Dorsetshire clergyman of eighty years of age electrified his congregation by publishing his own banns in the parish church. It is always necessary to be prepared for these surprises. The blind, deaf, halt, and maimed, are not exempt from the contagion of matrimony; and so far from youth and loveliness being the only victims of Hymen, we find some of the loveliest women consigned to single-blessedness; while their less favoured sisters are happy wives and mothers. The particulars of many curious marriages are not revealed to the public; but during the last century, less reticence was observed in the matter; the ages of the respective parties were frequently put down without reserve, and the fortunes of the ladies were mentioned with much unction and gusto.

Among these announcements, a few of the more remarkable are worth selecting. Here is one from an old magazine for June 1778: 'A few days ago, was married at St Bridget's Church, in Chester, Mr George Harding, aged one hundred and seven, to Mrs Catherine Woodward, aged eighty-three. So singular a union could not fail of exciting the admiration and surprise of a numerous congregation, before whom the ceremony was performed. The bridegroom served in the army thirty-nine years, during the reigns of Queen Anne, George I., and part of George II. He is now particularly hearty, in great spirits, and retains all his faculties to an extraordinary perfection. This is his fifth wife; the last one he married in his one hundred and fifth year; and he is Mrs Woodward's fourth husband. It is also worthy of observation that the above old man's diet has been

for the last thirty years past chiefly, buttermilk boiled with a little flour, and bread and cheese.' As a pendant to this, we come across another announcement a few years later: 'Mr Thomas Dawson, of Northallerton, aged ninety, to Miss Goughly, a bouncing damsel of sixty-four. The anxious bridegroom had been a widower almost six weeks.'

As instances of youth and age going together, we may give the case of 'Mrs Horn, an agreeable widow with a genteel fortune, aged seventy-nine, who married Mr William Steptoe, aged about thirty.' We are again startled by the following announcement in the month of January 1805: 'At Tyngmouth Church, a young man about twenty-three to a woman aged eighty-six, who had been the mother of seventeen children. Notwithstanding the banns had been but twice published, the experienced lady repaired to the church, where she was soon joined by her lover, and declared she would not leave it without her errand. She waited till the forenoon service was over, during which time she was frequently requested to leave the vestry, but all to no effect. She complained bitterly at her negligence in having forgotten to bring her pocket bottle and tobacco-pipe with her. The bridegroom apologized for not being acquainted with the form of the church, as he had never been in one since he was christened; and if appearances could be believed, water did not seem to have been up on his face since that period.

We find another curious marriage, which is announced in the following terms: 'Lately, at Newcastle, Mr Silvertop to Mrs Pearson. This is the third time that the lady has been before the altar in the character of a bride, and there has been something remarkable in each of her three connubial engagements. Her first husband was a Quaker; her second, a Roman Catholic; and her third is a Protestant of the established church. Each husband was twice her age. At sixteen, she married a gentleman of thirty-two; at thirty, she took one of sixty, and now, at forty-two, she is united to a gentleman of eighty-four.'

A great sensation was created in the year 1778 by the marriage of the then celebrated female historian, Mrs Catherine Macaulay, who was far advanced in years, with a surgeon's mate, under age, of the name of Graham. Mrs Macaulay was quite a literary lioness, and Dr Wilson, an elderly and learned admirer of her talents, had actually built a house for her, called Albert House; this he presented to her with furniture and a valuable library. He even went so far as to have medals struck in her honour. Great, therefore, was the amazement amongst the literary and fashionable world of Bath when Mrs Macaulay, who had always been considered a rock of sense by her friends, made this extraordinary match.

In Mr Chadworth's interesting book, *Round about Bradford*, he mentions the low status of the

colliers of Wibsey in the year 1851, and says that the humiliating spectacle of the wedding of 'Johnny and Betty' is not yet forgotten, nor the collection of oddities and absurdities that passed through the streets of Bradford in that year, on the way to the parish church. On a couple of yards of painted calico, the secret of this rejoicing was told in the following words:

At John's and Betty's wedding,
We will merry be,
For Johnny's sixty-five,
And Betty's seventy-three!

Mr Chadworth also relates that the incumbent of Wilsden, Mr Barber, was once called upon to perform a 'marriage in trust.' There was a person living at Haworth parish known by the name of 'Moses o' Lanks.' Moses having persecuted a woman to take him 'for better, for worse,' they appeared at Wilsden Church to be married, but when the knot was tied, the happy couple had no money to pay the fees! Moses promised to pay the reverend gentleman in *hansons*, and honestly kept his word. This reminds us of a couple who, not having the wherewithal to buy a wedding-ring, the large key of the church door had to be temporarily used for the purpose.

Ireland was not behind hand in the oddity of its marriages; we come across whole clusters of them in Walker's *Ulsterman Magazine*. Among them are the following: 'Mr John Hearty, of Ballymull, County Dublin, aged twenty, to Mrs Flood of said place, aged eighty-six.' 'The Rev Athanasius Huang, aged eighty-two, to Mrs Carr, aged twenty-two, an agreeable young lady, with a fortune of fifteen thousand pounds.' 'Mr Richards, gentleman, to Miss Mary Roper. The bridegroom is in the sixty-second year of his age, and five feet four inches high; the bride aged twenty-one, and only two feet eleven inches in height.'

A match in high life between a certain baronet and a handsome Irishman, Mr Blusey, created a great deal of heart-burning and envy. Hanbury William, one of the reported suitors, composed some very spiteful verses on the occasion.

The problem how to unmarried a couple was attempted by a clergyman in the West Riding of Yorkshire in the year 1805. He found out on inquiry that he had married a young man and woman who were brother and sister by marriage (probably a deceased wife's sister). The clergyman, afraid that he might be punished for uniting this couple, attempted to unmarried them by taking the bride's bonnet from her head and placing it on the church Bible thereon; but the charm was not successful; and the loving pair firmly resisted the innovation of undoing the hymeneal knot.

Some very curious changes of names have taken place in marriage. In Derbyshire, there now lives a woman who has been married three times. Her maiden name was Wildgoose—quite a common one in that locality—she changed it first for that of Fox, then for that of Goodlad, and finally settled down as Mrs Derbyshire. A Mr Bacon was once married to a Miss Beans; and a Miss Pane married a Mr Glass. Abundant instances of the same

sort might be multiplied; but enough have been given to show how strangely things sometimes work out in the important matter of matrimony.

DROLL DEFINITIONS.

An idea, says a clever writer, that can be best expressed in one line you may be sure is a good one. 'An idea well focused will burn a hole clean through creation,' he adds; 'but most people can't define a knot-hole without taking a page to do it in and spoiling a ten-foot plank besides.' Hoping to spare both the plank and the page, we venture some gossip on definitions of a humorous nature.

The word gossip was amusingly illustrated by the child who said: 'It's when nobody don't do nothing, and somebody goes and tells of it.' No marvel that gossip flourishes when we are reminded of the shortness of life—only four letters—'three-quarters of it a "he," and half of it an "if." There are wit, humour, and satire in that description. Wit and humour are said to be the 'seasoning of every-day life,' and satire, according to Swift, who ought to know, 'is a sort of glass wherein beholders generally discover everybody's face but then own, which is the reason so few are offended with it.' True sarcasm is in the point, not in the shaft of the arrow,' says the author who defined a sarcastic wit as 'a kind of human polecat.' 'A jest has the advantage of sarcasm, that it is something sharp enough to be noticed, and not rude enough to be resented—something that a fool admires, and a wise man laughs at.'

'The glory, jest, and riddle of the world,' says a poet, 'is man.' Mankind is divided by a philosopher into 'those who know but little, those who know less, and those who know nothing at all.' Nothing, by the way, used to be defined as a 'footless stocking without a leg;' but a cooper's little son lately gave his idea of nothing as a 'bung-hole without a barrel round it.' A tyrant has been hit off as 'one who never puts a stop to his sentences,' and 'one who kills worms lest they turn.' 'An egotist who loves his fellow-man for himself alone,' is a terse reckoning up of a cannibal. 'A genius,' we are told, 'can run anybody else's machine, but can't run his own for half what it is worth;' and an antiquary 'is commonly a clever fellow enough, who can see no value in an iron kettle until time has made it worthless by knocking a hole in the bottom of it.' 'A prophet is a good guesser who gets things wrong four times out of five, and whose excuses for his failures are more ingenious than his prophecies.' 'A prig is a fellow who is always making you a present of his opinions.' 'A successful man is one who succeeds and lets other folks quarrel over the theory of it.' 'A dandy is a sort of football for men, and a pincushion for women.'

'Knights of the *clavis* are Aunt-Sally-men.'

and 'clothes-observers—tailors.' The definition of an angler is well known, but every one is not aware that the 'complete angler is—Euclid.' A lawyer is said to be 'a man who disproves the proverb that barking dogs do not bite;' and a polite man is 'one who listens with interest to things he knows all about when they are being told by a person who knows nothing about them.' One notion of a bachelor is 'a man who has lost the opportunity of making a woman miserable;' while another is—'a sour grape hanging by the twig of obstinacy on a wall of great expectations.' 'A delicate parcel' is a humorous idea of 'a lovely young lady wrapped up in herself;' 'silent thunder' a comical one for a worthless woman; and 'matchless women' for maiden aunts.

Amongst scores of definitions of love, 'the toothache of the heart' is easy to remember. An American writer declares love at first sight to be 'the greatest labour-saving machine the world ever saw.' 'A factory where honeymoons are made to order' is a matrimonial agency; and a wedding-ring is 'a domestic circle.' 'A hasty match' has been wittily hit off as 'a loose affair (lunatic);' while the man who marries happily may be said to be 'transported for life.' As a coloured wife has been called a 'black tie,' a red-haired girl's marriage may be described as a 'Vesuvian match.' In answer to the question, 'What is the meaning of matrimony?' a young-ster said: 'I don't know exactly, but mother says she has had enough of it.'

Children, as many find to their cost, are 'running expenses' and 'household troops;' the baby's cry being 'a call to arms.' The price of a family cradle is 'hush-money;' while 'home-rule,' as many a husband acknowledges, 'is petticoat government.'

'Gas,' according to a boy who was watching a distended balloon, 'is melted wind.' Sleep is 'an armistice in the battle of life;' but a boy called snoring, 'sleeping out loud.' A little Scotch girl, in answer to 'What is patience?' answered 'Bide a wee and dinna weary.'

While a phonograph 'speaks for itself,' a telephone may not naughtily be termed 'a sound instrument;' and a heliograph, 'a flash friend.' A lighthouse suggests a 'light-headed friend to be avoided.'

Good nonsense we are reminded is 'good sense in disguise;' and gravity, 'the wisdom of fools.' 'Velocity,' to quote a young pupil, 'is what a man puts a hot plate down with.' 'Congealed light' is an odd description of a crystal; and 'striking oil' not a bad one of harpooning a whale; while 'the world's drop-scene' would be a scene-painter's idea of Niagara Falls.

A proverb has been defined as a saying with out an author. Impossible things are said to be 'those things that have not been discovered yet,' by a writer who also declares that 'we can't define

our own happiness without making it look suspicious.' Curiosity is 'the desire of knowing what is unknown for that reason alone.' Idleness is defined as 'hard work to those who are not used to it, and dull work to those who are.' Medicine, said a medical student, 'is the art of killing people without necessitating the interference of the police.'

Perseverance 'is the son of faith, the twin-brother of pluck, and the grandfather of success.' Pluck is 'a nice compound of pride, vanity, and virtue.' Luck is 'the lazy man's logic;' opportunity being another name for good-luck. 'Imagination is exceedingly disposed to run away with Reason, which is a very light rider, easily shaken off.' 'Truth is the only thing that can't be suppressed upon;' and wisdom, in a child's opinion, is 'information of the brain.' 'A lie is nimble of foot, but short in the wind, and can travel in one day farther than it can get back in two.' 'Impudence is the effect of too little knowledge, and modesty often the effect of too much;' while false dignity is 'the effect of new clothes, no brains, and moral victuals.' True happiness consists 'either in being somebody else, or living what you cannot get; consequently, there is not enough to go round.'

THE MONTH:

SCIENCE AND ARTS.

At a recent meeting of the Anthropological Society, Mrs Bryant, D.Sc., read a paper concerning the Characters of Children, which was remarkable for its originality, and was, moreover, of a most interesting nature. A class of girls whose age averaged thirteen years were directed to describe from memory a certain object, such as a picture or a room. The information which was sought from their answers was their powers of perception, of inference, and of imagination. The most noteworthy result was that due to a faculty which Mrs Bryant calls emotionalism. The emotional girls, who in their description used such adjectives as 'beautiful,' 'lovely,' 'sweet,' &c., showed a deficiency in more valuable traits of character, and it would seem that in these cases emotion superseded thought. These tests would, it is believed, prove valuable in education and in the choice of a profession. We are inclined to think that if it were possible to extend this new system of tests to the higher intellectual faculties, and thus supersede the ordinary competitive examination method of selecting candidates for public appointments, we should have fewer square pegs in round holes.

Diving operations for the recovery of treasure which the sea has swallowed up are always invested with peculiar interest. In February last, the steamship *Alphonso XII.* sank in two and a half and a half fathoms of water at Point Gando, Grand Canary, and with her went down into the deep one hundred thousand pounds in gold. Divers from England were sent out in the hope that this treasure might be recovered. After blowing up the upper part of the wreck, the

bullion-room was reached, and one of the boxes of gold was recovered. A telegram was lately received by the Marine Insurance Company to the effect, that the recovery of the remainder of the treasure is certain. It is noteworthy that the diver who was instrumental in recovering the first box of gold from a depth of more than one hundred and fifty feet is the same man who, by aid of the Fleuss diving apparatus, stopped the flooding of the Severn Tunnel a year or so ago. It may be remembered that a certain iron door in the drainage tunnel had inadvertently been left open. It was situated a quarter of a mile from the shaft; and this brave fellow, whose name is Lambert, crept that distance through a narrow passage full of water, and closed that door. This act enabled the pumps to overcome the volume of water which was flooding the pit, and the completion of the tunnel was proceeded with.

Sir Theodore Martin has recently published some particulars of the lead-mining industry in Wales, which show what disastrous results can be brought about by foreign competition. The imports of lead into this country have been for the past three years 99,000, 123,000, and 186,000 tons respectively. This ore came chiefly from Spain, where the mines are not so deep as the Welsh mines, and where the best workmen are paid only fourpence a day. As a result, one hundred and sixty-seven lead mines have been closed in this country, and many thousands of miners have been thrown idle.

A remarkable instance of the power of the sea in cutting through the hardest rock is afforded by the disappearance of a huge mass of basalt, which, until lately, formed a landmark for sailors on the coast of Denmark. This rock, or cliff, which was about one hundred feet high, rose out of the water, and had the appearance of a monk, hence its name, Munken. A portion of it fell last year; and now the remainder has been cut off just below the water-line, forming a dangerous reef. Floating ice-blocks have no doubt helped the waves to cut through the mass.

According to *Nature*, prizes are being offered by the Bremen Aluminium and Magnesium Manufactory for the two best lamps for burning magnesium. This offer is prompted by the discovery that magnesium can be produced by electrolysis at a price much less than that at which it has hitherto been purchasable. Magnesium as an illuminant has until now been used only for experimental work, where a very bright and actinic light has been required for a short period. The most common form of magnesium lamp is one in which the metal, in the form of ribbon, is delivered by clockwork at a regular speed to the mouth of a tube which forms the point of ignition.

A correspondent of the *British Medical Journal* writes concerning a remedy for sea-sickness, which in the case of his son seems to have been successful. The traveller started for Calcutta on October 5th, taking with him a solution of hydrochlorate of eucaine; and he subsequently wrote from Port Said as follows: 'Sailing on

Monday, I was ill on Tuesday night and Wednesday morning, but quite well between the attacks. Once more, when the weather was very rough and the ship rolling terribly, I felt squeamish, but two teaspoonfuls of the eucaine put me all right.' He adds that previously, in other voyages, he has always suffered more than any other passenger, and that he thinks the eucaine must be credited with the improvement. Perhaps some of our readers may have an opportunity of testing the efficiency of eucaine, and of kindly reporting. The subject is an important one.

It would seem, from a Report furnished to the Academy of Science by the chief of the Paris Municipal Laboratory, that genuine brandy is becoming a rare commodity even in France itself. For the ten years preceding the year 1850, the quantity of alcohol distilled annually in that country averaged twenty-five million gallons, and the major part of this was obtained in the form of brandy from wine. Now, although the total amount of spirit distilled is more than doubled, the price of the grape does not contribute half a million gallons to the sum. The rest comes from grain, cider, petty, beetroot, molasses, and potatoes. This inferior kind of spirit is not properly rectified, and is charged with poisonous agents of the most deadly character. The compiler of this Report, M. Girard, attributes the increase of insanity in certain localities wholly to these imitations of French brandy. Our readers may perhaps be ignorant of the fact that thousands of gallons of raw grain spirit are sent to France from this country, to be doctored, and returned as genuine French brandy.

It is becoming difficult to point to any article which cannot be constructed of that useful material which we call paper. The ingenious Japanese have taught us how it can be applied to many of our domestic wants, including even clothing, and other manufactures which were hitherto believed to be inseparable from textile fabrics. But a Breslau manufacturer has turned it to a far more surprising purpose, in the erection of a factory chimney fifty feet in height. The blocks or bricks of which this curious structure is composed are made of compressed paper pulp, joined together with silicious cement.

We extract from *Iron* a few particulars relating to the Transcaucasian Railway. This important line starts from Fort Michailovski, on the eastern shore of the Caspian Sea, and leads in a south-western direction into the interior of Central Asia. Part of it—one hundred and forty-three miles—is opened for traffic; and a further length of one hundred and thirty miles, extending to the Persian frontier, is nearly finished. The various cuttings and embankments of the railway are constructed of sand, and in many places screens are erected, or hedges planted, to counteract sand-drifts. The sleepers employed are saturated in naphtha, and the same agent supplies light throughout the route and fuel for the engines. A scarcity of water is at present one of the chief obstacles to working the railway.

The petroleum sent from the United States to this and other countries has hitherto been sent in casks. The new system of exporting it in bulk is now being tried, and the ship *Chusader* of New York has recently arrived in London with the first cargo of oil sent over in that manner. The

vessel is fitted with forty-five cylindrical tanks, with a total capacity of nearly two hundred thousand gallons. The oil was pumped into these receptacles from tank-lighters in New York, and was pumped out again into similar lighters on arrival at London. Here it will be barrelled for market. Should this new system prove to be more profitable than the older method, it will doubtless be extended to the conveyance of other liquid cargoes.

Another advance in photography is indicated by the new method of silver-printing by machinery invented by Mr John Urie of Glasgow, and just brought into notice in London by Messrs Marion. A ribbon of paper is caused to travel by clock-work, panorama fashion, beneath a negative which is let in to the top of a light light box. Above the negative is a powerful gas-burner, which is turned up and down automatically, as the paper pauses in its passage every few seconds. The strip of paper, which at the end of a few minutes bears perhaps twenty latent images of the negative beneath which it has been travelling, is now developed by a suitable chemical agent to make those images visible. The paper is then cut up into twenty pictures, which are mounted on card in the usual way. A special kind of paper, known as Alpha paper, is used in this process, and the results given are not only beautiful but permanent.

Weather-predicting, which only a few decades back represented a curious mixture of ignorance and superstition, is gradually becoming a more and more important branch of science. Thoughtless people may laugh at it, and point to the storms prophesied from the other side of the Atlantic which do not always visit our shores; but careful attention to statistics will show that a large number of the forecasts given are justified by subsequent events. In America itself, the study of the phenomena of tornadoes has been so successful that fairly reliable forecasts of their coming are now made. Mr Eddy, of the Signal Service Bureau, points out that out of thirty-eight predictions respecting coming tornadoes in April and June of last year, eighteen were verified. But the figures for this year show a far higher degree of accuracy. In June and July, nineteen were predicted, and no fewer than fifteen were verified. Even where actual tornadoes failed to appear, the occurrence of wind and hail storms at the critical periods showed that the observers were not far wrong.

Following the example of Manchester, Chester is now also anxious to bring the sea within its reach for mercantile purposes. It has no need to cut a canal, for the river Dee forms a waterway, but its gradual silting up has caused Chester to lose its old position as an important port. Extensive works have already been undertaken to provide the river with a navigable channel having a depth of about seventeen feet, reaching from the sea to the city. The works not only comprehend extensive dredging operations, but the construction of embanking walls. When these works are completed, large vessels will be able to discharge their cargoes at Chester, instead of sending them by rail from the Mersey.

It is a curious fact that the various species of flat-fish so familiar in British waters are not so well represented in America. The National Fish

Culture Association have lately tried the experiment of transporting a number of these fish, consisting of turbot, soles, and brill, to the American coast. The greatest possible care has been taken to make the experiment successful. The fish were captured on the Essex Coast by special trawlers, and were then sent by rail to Liverpool, where they took their passage for New York in the Cunard steamship *Galbia*. On board this vessel, tanks were fitted up for the reception of the fish, with all the necessary apparatus for oxygenating and changing the water. The result of this experiment will be looked forward to with great interest.

Some interesting details respecting the next great Exhibition in London have been published. Thus, the Colonial and Indian Exhibition, will form the latest of the series of which the 'Fisheries' formed the first, and the recent Health Exhibition the second. The coming Exhibition will far surpass in grandeur and importance the two wonderful shows which preceded it. It is organised by a Royal Commission, of which the Prince of Wales is executive President; and the whole of the space was actually allotted to intending exhibitors several months ago. Very few of our colonies will be unrepresented. Even the food served to visitors will be Indian and colonial, for it has been determined that such produce shall alone be used. A market, too, will be opened for the sale of this produce under the superintendence of the School of Cookery. The Indian section of the Exhibition will probably form its most interesting feature. An Indian palace and shops, which will be peopled by native artificers, have been under construction by native workmen for some months. The attractive fountains and electric illuminations will remain as in the former Exhibitions.

A correspondent writes to us: 'When in Vicksburg lately, a cotton planter there gave me some interesting particulars as to the means adopted for preventing the plague of the army worm. This worm is the larva of an insect which is very destructive to the cotton-plant, and often strips whole acres nearly bare of foliage. At the time when the moth or butterfly, which is the product of it, is on the wing, an electric light is suspended over a large flat vat containing molasses or oil. The moth is attracted by the light, and after fluttering round, settles down, as it supposes, on the ground, but really in the oil or molasses, which drowns it. They tell me that one light is sufficient for twenty thousand acres of land, and that in this way they can now control the army worm.'

Dr Aschrott, the German expert examined by the Parliamentary Committee on National Provident Insurance in July last, has written to Canon Blackley a letter containing the following information with regard to the German law of compulsory insurance: '(1) The law of insurance against accident has been declared to be in full force from the 1st of October 1885. (2) It has been found that the number of persons covered by the law of insurance against sickness to insure is about four millions. Beside this number, most of the local authorities have availed themselves of the power to compel further classes of the population to insure against sickness, so that the total number of persons who are subjected to the law of

insurance against sickness is a much larger one. In Berlin alone this number is estimated at two hundred and forty thousand (nearly one-fifth of the population). (3) By an amendment to the laws of insurance against sickness and against accident (dated June 6, 1885), the compulsion to insure will from the beginning of next year be extended to the whole administration of the post, the railways, the telegraph, and to all trades connected with transport. (4) There is now a great movement to extend further the compulsory insurance; especially Professor Schaffle has suggested to introduce compulsory insurance for old age. (5) We have found that the introduction of the laws of insurance has not at all led to a diminution in the number of members of friendly societies or trade-unions; on the contrary, nearly all the trade-unions have had an enormous increase since the establishment of compulsory insurance; for instance, the Union of Cabinetmakers, which had, in the first quarter of 1884, thirty thousand two hundred and seventeen members, had in the first quarter of 1885 about seventy-two thousand members.

The *Medical Press and Circular* says that the falsification and adulteration of honey is carried on in an unusually barbaic manner. A large quantity of what is sold as honey is neither more than clarified treacle and simple worth about twopence per pound. Glasses are exposed for sale labelled 'New Honey,' the only portion of which taken from the beehive is the piece of honeycomb occupying the centre, from which the honey has been previously extracted.

Sir John Lubbock, on the occasion of the unveiling at Birmingham of a marble statue of the late Sir Josiah Mason, the founder of the Mason College there, said that such an institution as the Mason College was all the more needed on account of the extraordinary manner in which science is still neglected in our public schools. There were, indeed, according to the Technical Commission, only three schools in Great Britain in which science is fully and adequately taught. The majority of schools have less than three hours out of forty. Scientific men claimed for it six hours, which, with the same number for mathematics, ten for modern languages, and two for geography, would still leave no less than sixteen for classics. He advocated the general teaching of science, because it would add to the interest and brightness of life, would purify and ennoble the character, and because, with our rapidly increasing population, it was almost a necessity, if our people were to be maintained in comfort. This national necessity for science was most imperative. Even now we required to purchase food to the amount of one hundred and fifty million pounds a year. A century hence our coal would be approaching exhaustion, our population would be trebled, and we should require, to speak moderately, four hundred million pounds to pay for food. Nothing, he said, but the development of scientific training and appliances would enable us, under these circumstances, to maintain our population in happiness and comfort. We had, in fact, the choice between science and suffering.

In a recent number of the *Journal* (No. 96), we made reference to an invention by Professor

Dunnington of the University of Virginia for the preservation of chalk diagrams and drawings. We now learn that Mr Thompson, Orientalist, High School, Edinburgh, has for some years employed a method whereby such drawings are rendered permanent, by sketching on black tissue-paper with a specially prepared chalk of his own invention.

LESSENED RATE OF MORTALITY IN ENGLAND.

FROM a supplement to the Registrar-general's Report of Births, Deaths, and Marriages in England in 1885, containing a review of mortality in England for the ten years 1871-80, we learn that the mean annual death-rate over this period has fallen to 21.27 per thousand, the lowest average since civil registration began. This lower rate is, however, unequally shared by the population, and is higher and lower in different localities. There is a fall in the male death-rate of 4.24 per cent., in the female rate of 6.02, as compared with the previous ten years. There is a positive increase, however, in the death-rates in the later periods of life, and the gain seems to have been in the earlier periods.

Dr Ogle, successor to Dr Farr, writes a prefatory letter to this Report, in which he is inclined to give the credit of the lessened death-rate amongst young people to improved sanitation, which has removed many fruitful sources of mortality. On the other hand, sanitary reform, by adding the survival of weakly persons, may have had a tendency to increase the death-rate of the later periods. The intensity of the struggle for existence at present has also a bearing on the case, along with the migration of so many country people to the town, where the death-rate is higher. A quotation from the Report puts the national gain in longevity in a striking way. 'The changes in the death-rates have given to the community an annual addition of one million eight hundred thousand and forty-seven years of life shared amongst its members; and, allowing that the changes in the death-rates are the direct consequence of sanitary interference, we must regard this addition of nearly two million years of life as an annual income derived from our investment in sanitation.'

It is also interesting to know, as Dr Ogle points out, that the rate of mortality from all zymotic diseases has fallen, with the exception of whooping-cough, this remaining stationary. The decrease of deaths from smallpox among persons in the later periods of life appears to show that while vaccination confers immunity from the disease in childhood, its protective influence requires to be renewed from time to time. The deaths per million by scarlet fever have fallen from 972 to 716; by typhus and other fevers, from 885 to 484; by diarrhoea, from 1076 to 935; and by phthisis, from 2475 to 2116. The deaths of women in childbirth appear to have remained stationary for the past thirty years, amounting to less than five for every thousand living children that are born.

The death-rate of different occupations yields some curious results. Taking as a basis of

comparison the mortality of all males of similar ages in England and Wales as 1000, the death-rate of the class mentioned is compared with this as a standard. When the rate of the examined class exceeds this number, that class forms an example of unhealthy occupations; when it falls short, it belongs to the healthy occupations. Thus, the first place among healthy occupations is held by ministers of religion, the death-rate of this class being 556. Next, we have gardeners and nurserymen, who stand at 599; farmers and graziers, 631; agricultural labourers, 701; schoolmasters, 719; the other trades which follow closely on these being grocers, coal-merchants, paper-manufacturers, lace and hosiery manufacturers, wheelwrights, ship-builders and shipwrights, and coal-miners. The figure of mortality for all these trades is under 775.

On the other side, that of the unhealthy occupations, the first place is held by the trades which are concerned in the manufacture and distribution of intoxicating drink, and which, as is well known, entail many temptations to drink it to excess. The list of unhealthy occupations is headed by the class of inn and hotel servants, whose figure mounts up to 2205; being nearly double that of the medical profession. The highest places next to them are held by general labourers in London and by costermongers, hawkers, and street sellers, the former class with 2020, the latter with 1879. It is probable that both are largely made up of broken men, the wrecks of other callings. Innkeepers, publicans, spirit, wine, and beer dealers follow, with a figure of 1521; and brewers, with 1361. In support of the belief that these high rates of mortality are chiefly due to alcoholic excess, Dr Ogle has

compared with them the mortality assigned to diseases of the liver, the organ through which such excess chiefly declares itself, and has obtained results which are entirely in harmony with those of the trade returns. Next to the trades concerned with alcohol, the highest rates are furnished by occupations which involve the breathing of dust—other than coal-dust—and especially of dust of a sharp and gritty character or largely composed of mineral matters; next, those in which there is exposure to lead-poisoning, as with plumbers, painters, and file-makers. The earthenware manufacturers, who are much exposed to mineral dust, have a figure of 1742; file-makers, who work upon a leaden cushion, reach 1667; and plumbers and painters, who are also exposed to lead, reach 1202. It will furnish a remarkable contradiction to a prevailing impression that butchers have a high death-rate, their figure of mortality amounting to 1170, the causes of death among them being partly due to the diseases of intemperance, and partly to phthisis and other maladies from which they have long been supposed to enjoy an especial immunity.

Volume II. of the Fifth Series of CHAMBERS'S JOURNAL is now completed, price Nine Shillings.

A Told-page and Index, price One Penny, has been prepared, and may be ordered through any bookseller.

An elegant cloth case for binding the whole of the numbers for 1885 is also ready.

Back numbers to complete sets may at all times be had.

In the first Part for the New Year will be given the opening chapters of a Novel of powerful interest, by MR GRANT ALLEN, entitled:

IN ALL SHADES;

and the first portion of an interesting Novolette, by FRED. M. WHITE, entitled:

A GOLDEN ARGOSY.

END OF THE SECOND VOLUME.

Printed and Published by W and R Chambers,
47 Paternoster Row, London, and 339 High Street, Edinburgh.

All Rights Reserved.
